*a manual of the*  
**FLOWERING PLANTS**  
*of CALIFORNIA*

*by Willis Linn Jepson*

For more than a quarter of a century Jepson's *Manual* has been "the well-worn threshold for thousands of students to an understanding and appreciation of the remarkably diversified vegetation of the state." This book, the first truly comprehensive description of the flora of California, is now presented in a new printing.

The *Manual* contains descriptions of 4,019 species of the fern-allies and flowering plants and indicates their distribution throughout the state. The 1,023 drawings, prepared under Jepson's direction, accurately delineate the morphology of the flower, the feature of the plant most often used as a guide to identification.

Willis Linn Jepson (1867-1946) was one of the greatest of American regional botanists and the principal interpreter of the flora of California, having devoted a fruitful half century to the systematic botany of his native state. Among his other works are *Flora of Middle Western California* (in two, very dissimilar editions, 1901 and 1911); *The Trees of California*, a popular handbook; the monumental *A Silva of California*; and the uncompleted, monographic *A Flora of California*.

# ARIZONA FLORA

by Thomas H. Kearney,  
Robert H. Peebles,  
and collaborators

Prefaced by a description of the topography of Arizona, its geology and soils, and its climate, this book considers the approximately 3370 species of flowering plants, ferns, and fern allies growing wild in the state.

"In view of the fact that the standard regional floras quickly go out of print and cannot be found even in some of the principal public and institutional libraries of the areas covered, it will be advisable for the Kearney and Peebles *Arizona Flora* to be acquired... before it has to be hunted up and paid for at rare-book rates. It is safe to say that it will long remain standard.

"Kearney and all his collaborators are to be congratulated on the completion of a notable addition to the too-small group of currently useful state floras. It will be essential for everyday use by those who need to identify Arizona plants, and must also be consulted by all who are broadly concerned with plant distribution, even if they never see Arizona."

—*Scientific Monthly*

"Botanists will welcome this up-to-date account of the flora of the fifth largest of the United States, which is a meeting-ground of a remarkable number of floral elements, from 'alpine' to tropical."—*Journal of the Royal Horticultural Society*.

# An Illustrated Manual of CALIFORNIA SHRUBS

HOWARD E. McMINN

A systematic and descriptive account of the shrubs of California. Lists about 800 species and 200 varieties of native shrubs, together with 12 species of introduced shrubs that have been naturalized. The descriptions are unusually clear and complete and include information on biology, cultivation, and distribution. The *Manual* shows the truly enormous scope of the word "native" in relation to shrubs, and the wealth of possibilities for new planting.

676 pages

# An Illustrated Manual of PACIFIC COAST TREES

HOWARD E. McMINN and EVELYN MAINO

A comprehensive guide to native and introduced trees on the West Coast giving descriptive notes on about 400 introduced species, in addition to a thorough presentation of the native species. It is a full guide in the field, accurately describing and picturing what trees are to be seen, whether or not they are native to the Pacific Coast. Twenty-two photographs illustrate the Palms and Palm-like trees and 393 text figures give the user of the *Manual* a pictorial representation which has instant meaning even for the untrained eye, yet supplies the detail required by the skilled botanist. Lists of trees recommended for various uses form a valuable appendix.

# OUTLINE OF GEOGRAPHIC DISTRIBUTION OF SEED PLANTS IN CALIFORNIA

The flora of California is one of the distinctive floras in the region of Pacific North America. While continental floras are not sharply delimited, because there are no abrupt limits to climatic areas, it is possible, nevertheless, to determine, in a workable manner, the geographic bounds of the California flora or California province.

From the standpoint of plant provinces the term California must be defined in a sense different from that of its political boundaries. The natural biological province of California is primarily determined by its mountains and the Pacific Ocean. The two great mountain ranges, the Sierra Nevada on the east and the Coast Ranges on the west, enclose the bowl of the Great Valley—the plains of the Sacramento and San Joaquin. This main area is supplemented by two mountain masses, one (coastal Southern California) lying between the deserts and the ocean, an area very closely related botanically to the California area proper, the other mountain mass (the Klamath Mountains) lying at the northwesterly end of the bowl and equally related to the California area. There are, then, excluded the Colorado and Mohave deserts and desert slopes in the south, and also the interior plateaus, slopes and ranges belonging to the Great Basin and extending from Inyo County to Modoc County and thence to eastern Siskiyou County.

The northern boundary of the California province requires a particular description. In the western United States, there are only two rivers, aside from the Columbia River, which break through the main Sierra-Cascade axis and drain lands of the Great Basin, the Klamath River and the Sacramento-Pit River. There are thus three major physical breaks or barriers in the axis. As marking botanical boundaries, neither the Sacramento-Pit Gap nor the Klamath Gap is of as much significance in this connection as the Rogue River. Of the various physical features which distinguish the northern margins of the California province, the Rogue River is one of the greatest importance as defining by a mainly physiological barrier the botanical boundary of the California province northward. While the Klamath Gap marks the northern or southern extension of a number of species it is of secondary importance as compared with the Rogue River. There are a large number of species of Washington and Oregon which extend south to, or nearly to, the Rogue River, while a very large number of species of California extend north to, or nearly to, the Rogue River: the significance of these two categories is markedly greater than that of those widely-ranging species which cross the Rogue. A number of California species, to be sure, cross the Rogue but extend northward only a short distance. Similarly a number of Oregon species cross the Rogue but extend southward only a limited distance. The Rogue, in addition, therefore, as to such species, represents a mean of the physical conditions in a transition area.

The boundaries of the botanical province of California, in the largest sense, are, therefore, the Rogue River, the crests of the main Sierran axis, and the pass in the peninsular chain of mountains at or near the southern boundary of the state. The province thus consists of the bowl of the Great Valley, its great bounding chains east and west, and the contiguous coastal mountain masses, one at the south end, the other at the northerly or northwesterly end of the oblong bowl. This region is physiographically compact, and represents a very natural biological area; although it is at once obvious that there are marked intrusions from other floral provinces. A considerable element, arctic species, from the far north, enters the region along the summits of the high Sierras, as well as many boreal species from the Hudsonian and Canadian regions which are respectively subalpine and high montane in the Sierras. Important invasions from the floras of Washington and Oregon occur at middle altitudes in the mountains or in the coastal belt; while the flora at the lower altitudes, especially southward, shows in a marked degree the mingling of a large representation of species whose main center of distribution is in northern Mexico. It is, therefore, sometimes said that there is no such category

as a Californian flora, but, instead, a flora of the southwest United States and northern Mexico and a flora of the Northwest. To this argument the following rejoinders may be made: 1. The mass of endemic species in the California flora is large and of very marked character, as will be shown later in this outline. 2. The province is well characterized by a large number of species which have within the province their greatest development and extend little beyond it. 3. The species of the tongues of intrusion from neighboring floras have their highest development in botanical provinces to the north or to the south. 4. The thrusts from the north and the south lie at altitudinally different levels or occupy separate subclimatic areas, and do not intermingle or only to a limited degree.

### The Life-Zones

As a result of the varying combinations of climatic factors in the area, intensified by distance from the ocean and by altitudes, the vegetation of California is markedly stratified into horizontal bands called life-zones. Six life-zones are here recognized, the terminology in their designation being that of C. H. Merriam (*Life Zones and Crop Zones in the United States*, 1-79—1898), namely, 1. Lower Sonoran. 2. Upper Sonoran. 3. Transition. 4. Canadian. 5. Hudsonian. 6. Boreal. The isothermal lines of a temperature chart of California correspond in a general way, though not exactly, with these life-zones, while a contour rain-chart shows similar correspondence. Annual rainfall, which is slight in the deserts of the Lower Sonoran, increases one-half inch for every one hundred feet in proceeding up the west slope of the Sierra Nevada. Insolation increases to the southward and increases markedly with altitude. Humidity is greatest along the coast and diminishes most sensibly toward the interior and in the south.

The response of species to the climatic factors varies greatly, and consequently they differ in their capacity for altitudinal distribution as well as in horizontal distribution. Certain general categories may be noted: 1. A few species occur in three or four zones, such as (a) aquatics or cosmopolites (*Potamogeton pectinatus*, *Myriophyllum spicatum*) or (b) species of wide range (*Populus trichocarpa*, *Barbarea vulgaris*, *Radicula curvisiliqua*, *Trifolium involucreatum*, *Hypericum anagalloides* and *Achillea millefolium* var. *lanulosa*). 2. A large number of species occur in two zones (examples are *Juncus bufonius*, *Brodiaea ixioides*, *Castanopsis sempervirens* and *Eremocarpus setigerus*). 3. A large proportion of—in some cases half—the species of a zone occur only in that zone or are not well developed beyond its borders. Of these certain ones are selected as "Indicators" of the zone, or Index Species. The characteristics which determine an Index Species are: (a) restriction to the life-zone or, if it be abundant, weak transgression beyond its limits; (b) wide range in the zone; (c) abundance of individuals. It is now necessary to describe the climatic and vegetational features of the life-zones within the state of California and cite some important index-species, so far as may be done within the brief limits of this outline.

The Lower Sonoran Zone comprises three distinctive areas: (a) Colorado Desert or Colorado Sonoran, (b) the Mohave Desert or Mohave Sonoran, (c) the Great Valley or Valley Sonoran. The two deserts are characterized by a typical desert climate. They have a low humidity and a low rainfall, the annual precipitation varying from about 0 to 5 inches. They have high summer temperatures, averaging from 90° to 130°; they have low winter temperatures, varying from about 15° to 50°; and finally, as to temperature, they have a great annual temperature range and a great diurnal range. Drying winds of gale force are prevalent. The vegetation has the characteristic aspect or facies of plants of desert regions, that is, there is everywhere exhibited a marked development of structures to inhibit transpiration, or of physiological devices for the conservation of water. These various forms may be described, in general, under five headings: (a) Plants with condensed bodies such as the species of *Cereus*, *Mammillaria*, *Echinocactus* and *Agave*. (b) Plants with reduced or obsolete leaf surface, such as *Cercidium torreyanum*, *Ephedra californica* and *Parosela spinosa*. (c) Plants with fleshy leaves, such as *Lycium andersonii*. (d) Plants with resinous, woolly, or scurfy covering to

the whole body, such as *Atriplex hymenelytra*, *Grayia spinosa* and *Tidestromia oblongifolia*. (e) Ephemeral annuals whose life history from germination to seeding is accommodated to the short period (often only a few weeks) of late winter or vernal rains and of moderate temperatures. These annuals are represented by numerous species and often by vast numbers of individuals. Certain shrubs or small trees show a similar adaptation in that their leaves appear only during the rains (*Fouquieria splendens*).

The Colorado Desert lies at a low altitude, mainly between 0 and 500 feet. Characteristic species of chenopods are *Atriplex hymenelytra*, *lentiformis*, *polycarpa* and *canescens*. *Achyronychia cooperi* is prostrate on the desert sands. *Parosela emoryi* and *schottii* are low bushes. Other common species are *Astragalus sabulonum*, *Euphorbia eriantha*, *Thamnosma montana*, *Petalonyx thurberi*, *Langloisia setosissima*, *Chilopsis linearis*, *Orobancha cooperi*, *Filago depressa*, *Encelia farinosa*, *Palafoxia linearis* and *Baileya pauciradiata*. Only a few species of trees occur, such as *Olneya tesota*, *Prosopis juliflora* var. *glandulosa* and *Prosopis pubescens*, all the arborescent species being limited to stream beds and the borders of springs or low-lying valleys. This desert passes gradually into the Mohave Desert; the most practicable line of separation extends from Morongo Pass easterly to Riverside Mt. on the Colorado River. The low-lying Palo Verde Valley thus falls within the Colorado Desert.

The Mohave Desert lies at a higher level than the Colorado Desert, the altitudes ranging from about 2000 to 5000 ft., and the rainfall is usually somewhat greater. In other respects it has a desert climate similar to that of the Colorado Desert, and its vegetation presents a similar desert facies. Hundreds of square miles exhibit the dark green of *Larrea tridentata* var. *glutinosa*, a shrub commonly 3 to 6 feet high with very small resin-covered evergreen leaves, the individuals widely but rather regularly spaced in response to the meagreness of soil-water. Low shrubs or bushes of gray hue are abundant, and include such widely distributed species of the desert valleys as *Atriplex confertiflora*, *parryi*, *hymenelytra*, *lentiformis*, *torreyi*, *polycarpa* and *canescens*, *Franseria dumosa* and *Encelia farinosa*. *Chrysothamnus nauseosus* and *Acamptopappus sphaerocephalus* are abundant and widely distributed on the mesas, while *Lepidium fremontii* is a frequent low bush. *Salazaria mexicana*, *Lycium andersonii* and *cooperi* are roughish or spiny shrubs. *Suaeda suffrutescens* is characteristic of alkaline valleys, while *Thamnosma montana* is a small switch plant of the arid slopes. Characteristic desert herbs are *Hesperocallis undulata*, *Calochortus kennedyi*, *Chorizanthe rigida*, *Chorizanthe thurberi*, *Eriogonum trichopodum*, *inflatum*, *baileyi* and *mohavense*, *Achyronychia cooperi*, *Dithyrea californica*, *Lesquerella palmeri*, *Lepidium flavum*, *Astragalus layneae*, *tricarlinatus* and *dispermus*, *Petalonyx thurberi*, *Phacelia minor*, *Orobancha cooperi*, *Monoptilon bellidiforme*, *Aster carnosus*, *Hymenoclea salsola* and *Palafoxia linearis*. Extensive groves of *Yucca brevifolia*, the individuals 16 to 30 ft. high, lend an added touch of strangeness to the xerophytic populations. Save for this one species, true trees are mainly absent except that along stream courses, about springs or in low valleys where roots may go down 20 to 70 feet to a low-lying water stratum, a few species occur, such as *Prosopis juliflora* var. *glandulosa* and *Prosopis pubescens*.

The Valley Sonoran comprises the plain of the Great Valley of California except the lower or central delta portion. It is a grass land formation, varying in altitude from 10 to 500 feet, with less extremes of temperature than the desert areas and a greater rainfall. In its primitive condition it is characterized by vast numbers of annuals which germinate with the winter rains and flower during the vernal period, such as *Trifolium tridentatum*, *Gilia tricolor*, *Phacelia tanacetifolia*, *Allocarya stipitata*, *Orthocarpus erianthus*, *purpurascens* and *densiflorus*, *Mimetanthe pilosa*, *Layia platyglossa* and *Achyrrachaena mollis*; while very characteristic perennual herbs are *Eschscholtzia californica* and *Grindelia camporum*. Large areas of alkaline flats are encountered, especially on the west side of the valley. These have a characteristic vegetation such as *Distichlis spicata*, *Anemopsis californica*, *Nitrophila occidentalis*, *Allenrolfea occidentalis*, *Atriplex cordulata*, *bracteosa* and *expansa*, *Spergularia macrotheca*, *Lepidium latipes*, *Astragalus tener*, *Trifo-*

*lilium fucatum*, *Sida hederacea*, *Frankenia grandifolia* and *Cressa cretica*. On the valley floors or undulating plains the traveler finds small depressions a few yards square and a few inches deep which fill with water in the rainy season. When a little deeper, well-defined and numerous, they take the name of "hog wallows." With the coming on of the dry season the water evaporates and the beds of these pools in late spring or early summer give rise to a distinctive flora composed of such species as *Lepidium latipes*, *Boisduvalia cleistogama* and *B. glabella* var. *campestris*, *Lythrum hyssopifolia*, *Navarretia leucocephala*, *Downingia elegans* and *pulchella*, *Mimulus tricolor*, *Psilocarphus brevissimus* and *Evax caulescens*. The narrow curtain of trees along the streams is composed of *Platanus racemosa*, *Populus fremonti*, *Salix nigra* var. *vallicola*, *laevigata* and *lasiandra*—though the willows are not confined to the valley floors.

The Upper Sonoran Zone may often, in certain districts, be divided into two subareas, the lower foothill belt and the chaparral belt. The lower foothill belt is a grass-land formation, sometimes with a scattered growth of *Quercus douglasii* and *Q. engelmannii*. Its characteristic herbs are *Odontostomum hartwegii*, *Chlorogalum angustifolium*, *Allium serratum*, *Collomia heterophylla*, *Trichostema lanceolatum* and *Plantago erecta*. Next above the lower foothill belt is the chaparral belt, or *hard chaparral*, a very remarkable formation, so called by the writer to distinguish it from the soft chaparral. It has an average altitude of 1000 to 4000 feet and is characterized by the presence of extensive brush lands consisting of shrubs, some of which have been reduced in size from tree species (Jepson, *Silva of California*, 39). Most of the species represent extreme arid-land types and possess various markedly xerophytic structures, such as small or reduced leaves, entire leaves, thickened epidermis, hard and very dense wood, vertically placed leaves, small flowers, and seeds adapted to xerophytic conditions. The most widely spread and characteristic species are *Ceanothus cuneatus*, *divaricatus* and *sorediatus*, *Arctostaphylos glauca*, *glandulosa*, *viscida* and *canescens*, and *Cercocarpus betuloides*. One of the most extreme of chaparral types in xerophytic character is *Pickeringia montana*. Other species associated with the chaparral species but exhibiting less extremes of xerophytic structure, are *Dendromecon rigida*, *Photinia arbutifolia*, *Rhamnus californica*, *Rhus diversiloba*, *Fremontia californica* and *Eriodictyon californicum*. Many of the species of true chaparral grow to large size, simulate trees in shape and hence form what is called a pigmy forest. For the most part they inhabit rocky or gravelly slopes or ridges and grow on well-drained slopes. True or hard chaparral is always a mixed formation. Chamisal, characteristic of the same sub-life zone, is commonly a pure formation of *Adenostoma fasciculatum*.

Chaparral is, for the most part, a firetype formation and shows evidences of long-continued fire-ravage. In all likelihood the factor of fire has contributed to the xerophytic character of the chaparral, because fire has, without doubt, run through the chaparral belt for many thousands of years, very likely one hundred thousand years at least. Of all the genera in the chaparral the genus *Arctostaphylos* has the largest number of species represented in the formation and shows the most marked responses and most evident adaptations to age-old fire conditions. The responses are of two main kinds and I have named them as follows: 1. *Empyroism* (*Empyrophytes*). Under which the individual continues to live. Some species, such as *Arctostaphylos glandulosa*, develop the root-crown horizontally in the form of woody platforms at and just below the surface of the ground after fire, and from these woody platforms crown-sprouts arise for the replacement of the shrub crown. As fires run year after year, or decade after decade, the woody platform continues to increase in diameter horizontally, and often become 3 to 5 feet broad. Other species, such as *Adenostoma fasciculatum*, form bulbous or carrot-like root-crowns which continue to enlarge under successive fires. 2. *Pyrodaptism* (*Daptophytes*). Under which the individual dies. Certain species, such as *Arctostaphylos sensitiva*, are shallow-rooting and are killed outright by chaparral fires. They have not the capacity to develop root-crowns horizontally or bulbous-wise. They must depend for regeneration of the species wholly upon seeds. Seeds are produced in great abundance, germi-

nate freely after fire and promptly establish seedlings on a burn. Such seedlings have the power to come into the reproductive stage in a short period—sometimes in five or six years. This is a clear adaptation of the species to reproduce in a span of years fewer than the years of fire interval. This species and *Arctostaphylos manzanita*, *stanfordiana*, *viscida* and *mariposa* are true fire-type shrubs.

A list of some characteristic herbaceous index species of the Upper Sonoran Zone would comprise *Carex tumulicola*, *bolanderi* and *barbarae*, *Juncus balticus* and *effusus*, *Chlorogalum pomeridianum*, *Allium hyalinum*, *Brodiaea laxa*, *Chenopodium californicum*, *Clematis ligusticifolia* and *lasiantha*, *Sedum spathulifolium*, *Trifolium variegatum*, *Hypericum concinnum*, *Helianthemum scoparium*, *Viola douglasii*, *Datisca glomerata*, *Sanicula bipinnatifida*, *Emmenanthe penduliflora*, *Salvia columbariae*, *Lotus scoparius*, *Micropus californicus*, *Psilocarphus tenellus*, *Hemizonia virgata*, *Layia glandulosa*, *Baeria chrysostoma*, *Monolopia major*, *Helenium puberulum* and the shrubs *Artemisia californica* and *Baccharis pilularis*.

Coastal Southern California lies, below about 4000 or 5000 feet, mostly in the Upper Sonoran Life-Zone. It has many Upper Sonoran species peculiar to the area or extending into Lower California. Some of the more important are: *Calochortus concolor* and *plummerae*, *Quercus engelmannii*, *Oxytheca trilobata*, *Clematis pauciflora*, *Romneya coulteri*, *Streptanthus campestris*, *Rhus laurina* and *integrifolia*, *Ceanothus macrocarpus* and *spinosus*, and *Mimulus brevipes*.

The Transition Life-Zone is well defined, especially on its lower borders. The Sierra Transition lies between average altitudes of 2000 and 5000 feet, has a mean temperature of 55° to 60° and an average rainfall of 25 to 35 inches. It includes the main forest belt, and is repeated in the mountains of Southern California and in the Coast Ranges, where these latter rise to sufficiently high altitudes. This life-zone is distinctive and on the whole rather definitely circumscribed. It contains, for California, a greater number of species of trees and shrubs than any other life-zone and has, in addition, a very large population of herbs.

Widely developed in some parts of the state and very narrow in others, the Arid Transition of the Great Basin underlies the lower margin of the main Humid and Sierra Transition. It is, in California, a drier and more exposed subarea, often with a preponderance of brush slopes and scattered trees. Its most characteristic species are *Pinus ponderosa*, *Artemisia tridentata*, *Arctostaphylos patula*, *Garrya fremontii* and *Prunus subcordata*.

The Sierra Transition has a high development and forms a broad band. It carries the less open part of the forest belt. The dominant forest species are *Pinus ponderosa* and *lambertiana*, *Libocedrus decurrens* and *Abies concolor*. *Sequoia gigantea* is a marked feature of this zone in the southern part of the Sierra Nevada. The dry or more open forest or forestless slopes present many shrubs of wide range such as *Corylus rostrata* var. *californica*, *Ribes roezlii*, *Rubus parviflorus*, *Amelanchier alnifolia*, *Rhamnus rubra*, *Ceanothus integerrimus*, *velutinus* and *prostratus*, *Cornus nuttallii*, *Rhododendron occidentale* and *Arctostaphylos patula*. On the dry flats or open forest slopes typical herbs are *Sporobolus confusus*, *Stipa elmeri*, *Allium campanulatum*, *Fritillaria parviflora*, *Habenaria unalaschensis*, *Corallorrhiza maculata*, *Asarum hartwegii*, *Silene lemmonii*, *Lathyrus graminifolius*, *Gayophytum diffusum*, *Pterospora andromedea*, *Pirola picta*, *Apocynum androsaemifolium* var. *pumilum*, *Gilia aggregata*, *Draperia systyla* and *Aster integrifolius*. In the wet meadows or in swamps grow such species as *Agrostis oregonensis*, *Veratrum californicum*, *Polygonum bistortoides*, *Ranunculus orthorhynchus*, *Heraclium lanatum*, and *Vaccinium occidentale*.

The Redwood Transition, which comprises the coastal Redwood belt, extends from sea-level to 2000 or sometimes to 3000 feet altitude. It has, therefore, a very much lower altitude than the Sierra Transition. From the standpoint of precipitation, it is at a somewhat higher physiological level, because it has a greater rainfall, varying from 25 to 122 inches. From the standpoint of temperature it enjoys a lower annual range and lower diurnal range. Being wholly within the coastal fog belt and lying next the ocean, it has much

greater humidity. Proceeding from the Great Valley to the coastal edge of the Redwood belt, one passes through formations similar, in an ecological view, to those met with in ascending the Sierras from the Great Valley, since there are met successively the dry barren plains, the barren foothills, the chaparral and finally a narrow band of *Pinus ponderosa* and *Quercus kelloggii*, which is Arid Transition. In its greatest development the Redwood forms pure stands. In other parts of the belt it is dominant but with it is associated *Lithocarpus densiflora*, *Pseudotsuga taxifolia*, *Tsuga heterophylla*, *Picea sitchensis* and *Abies grandis*. On the inner side of the Redwood belt is a marked band of *Arbutus menziesii*, *Pseudotsuga taxifolia* and *Quercus garryana*. The forest floor of the Redwood belt is characterized by certain herbs which, often shade-loving, occur in great abundance and are, in California, restricted to the belt, such as *Torresia macrophylla*, *Scoliopus bigelovii*, *Clintonia andrewsiana*, *Maianthemum bifolium* var. *kamtschaticum*, *Trillium ovatum*, *Asarum caudatum*, *Vancouveria parviflora*, *Achlys triphylla*, *Saxifraga mertensiana*, *Oxalis oregana*, *Viola sarmentosa* and *ocellata*, and *Mimulus dentatus*. Certain shrubs form a very low understory and often occur in heavy stands, as *Ceanothus thrysiflorus*, *Vaccinium ovatum* and *Gaultheria shallon*. What I have called *soft chaparral* refers to a shrub formation of the Transition Zone. It is composed of such species as *Physocarpus capitatus*, *Holodiscus discolor*, *Rubus parviflorus*, *Vaccinium ovatum* and *Symphoricarpos albus*. Soft chaparral occurs in the Coast Range Transition, the Redwood Transition, the Sierra Transition and frequently as islands in the Upper Sonoran.

The Canadian Life-Zone is not well defined in the Sierra Nevada and has, as a separate zone, only a shadowy or wavering existence. Its natural place is on the average between 5000 and 7000 feet, where there is a mean annual temperature of 50° to 55°, and an average rainfall of 40 to 50 inches. The most useful index species in this life-zone are *Abies magnifica*, *Pinus ponderosa* var. *jeffreyi*, *Pinus monticola* and *Pinus contorta* var. *murrayana*. The first three species are, however, often found in the upper part of the Transition Zone, associated with typical Transition species, while the fourth is frequently a characteristic species of the next life-zone above, the Hudsonian. The following herbs and shrubs may be considered as belonging to this zone: *Prunus emarginata*, *Arctostaphylos nevadensis*, *Nema lobbiai*, *Hesperochiron californicus*, *Mimulus lewisii* and *Pedicularis semibarbata*.

The Hudsonian Life-Zone is the timber-line zone, and is fairly well defined as to its upper borders. It has an average altitude of 7000 to 9000 feet, a mean annual temperature of 45° to 50°, and an average rainfall of 50 to 55 inches. The most important index species are *Pinus albicaulis*, *Juniperus occidentalis*, *Juncus drummondii* and *parryi*, *Calochortus leichtlinii*, *Salix lemmonii* and *geyeriana* var. *argentea*, *Polygonum shastense*, *davisiae* and *imbricatum*, *Eriogonum pryrolaefolium*, *Ribes cereum*, *viscosissimum* and *montigenum*, *Epilobium latifolium* and *obcordatum*, *Kalmia polifolia* var. *microphylla*, *Cassiope mertensiana*, *Polemonium confertum* var. *eximium*, *Castilleja culbertsonii*, *Orthocarpus pilosus*, *Pedicularis attollens* and *groenlandica*.

The Boreal Life-Zone is true alpine. Its altitudinal range varies from 9000 to 14,500 feet, with a mean annual temperature of 40° to 45° and an average rainfall of 60 to 70 inches. The most important index species are *Trisetum spicatum*, *Carex breweri* and *nigricans*, *Oxyria digyna* (which extends north to the arctic circle), *Silene watsonii*, *Ranunculus eschscholtzii* (which extends north to the arctic circle), *Aquilegia pubescens*, *Dicentra uniflora*, *Parrya eurycarpa*, *Saxifraga tolmiei* and *bryophora*, *Potentilla procumbens*, *fruticosa*, *gordonii* and *muirii*, *Epilobium anagallidifolium*, *Primula suffrutescens*, *Erigeron compositus* and *radicatus*, *Hulsea algida* and *Senecio muirii*. *Draba lemmonii*, *breweri* and *glacialis*, and *Eriogonum ovalifolium* are typical cushion plants. The Boreal Zone presents marked plant formations on the Salmon Mountains, Mt. Shasta, Lassen Peak and the high Sierra Nevada. It recurs evidently, though represented by few species, on Mt. San Geronio in the San Bernardino Mountains and feebly on Mt. San Jacinto in the San Jacinto Mountains.

### Irregularities in the Life-Zones

The temperatures given above are of the Fahrenheit scale. While they are mean annual temperatures, and do not, therefore, represent the critical temperatures for plant life or plant growth, they do give an idea of the climate of the various life zones from the standpoint of temperature. However, these life-zones must not be thought of as marked by rigid horizontal lines or even by regular contour lines. The local boundaries of the zones are irregular or jagged for the following reasons:

1. *Insolation* increases markedly on proceeding southward, and normal temperatures increase correspondingly, so that, for example, the timber line on Mt. Shasta is at about 7500 feet, while on Mt. Whitney, 400 miles south-easterly, it is at 11,000 feet. In addition, normal temperatures fall with increase in altitude about  $1^{\circ}$  for each rise of 330 feet (S. S. Visher, *Climatic Laws*, 20). That is, all the zones gradually increase in altitude southward.

2. *Exposure* is related to local changes in the zones. The southerly or westerly slopes of a mountain receive a greater amount of direct heat from the sun, and a forest belt or a plant formation will run much higher on such a slope. The easterly or north slopes are much cooler, since partially protected from the direct rays of the sun, and a forest or a characteristic vegetational belt will run much lower on such slopes than the average boundary of the life-zone in that region.

3. *Steepness* of slope affects the regularity of the zone since it causes marked local changes in drainage, temperature and insolation.

4. *Accumulating blocks of hot air* at lower levels may cause local variations in the boundaries of the life-zone above, since hot air rises along definite slopes or air-lanes, avoiding others on account of topography.

5. *The flow of cold water and cold air* down a cañon will cause plants of a zone to extend to lower levels in that locality.

6. *Physiological Islands*. By reason of local topography and moisture and temperature conditions, a small area may be isolated from its proper life-zone and yet carry characteristic index species of that zone. Such areas are called "islands." They are surrounded by physiological barriers which sometimes delimit them sharply, almost as sharply as an oceanic island surrounded by the physical barrier of salt water. A well-marked Canadian Life-Zone island, carrying *Pinus contorta* var. *murrayana*, occurs in the lower part of Yosemite Valley (Transition Zone) under the shadows of the great cliffs about Bridal Veil Fall and the rock of El Capitan. A large island of the Lower Sonoran occurs in coastal Southern California between the Santa Ana and San Jacinto mountains, while a long but narrow island of the same zone occurs in the upper part of the Salinas Valley and Carissa Plain. These two islands lie in the Upper Sonoran.

7. *The role of fire* now and for many centuries past is and has been a major one in the Californian forests. Forests of the Transition Zone, when destroyed by fire, are often completely replaced by brush lands. In areas of deficient rainfall or slopes where high erosion results in thorough denudation of surface mulch, the brush areas may become permanent on the lower boundary of the Transition Life-Zone; such an area often goes over, in its vegetation, to the Upper Sonoran Life-Zone, and displays typical chaparral.

Expression of the distribution of life by means of the life-zone concept, while imperfect, furnishes a practical working plan from which may be derived substantial and useful results, especially in the light thrown on the problem of species. Botanists in flat countries, as in the eastern United States, often evince strong distrust of the life-zone concept but it is to be said that these vegetational bands are marked actualities in a region where mountains rise from or near sea-level to heights of from 10,000 to 14,500 feet within a distance of ten to thirty miles, and where localized climatic areas bring hygrophytic forests within a short distance of arid deserts. The life-zone nomenclature has a practical value as giving expression to certain observations and will remain useful until this concept is replaced by a superior hypothesis. The concept of centers of distribution as worked out by C. C. Adams (*Biol. Bull.* 3: 115-131—1902; 9: 53-71—1909) is one which may give a clearer

and more truthful picture of geographic distribution. Analysis of our flora along such lines must, in the main, look to the future, although the chaparral formation has been intensively studied by W. S. Cooper and the results published in an admirable paper (*The Broad-Sclerophyll Vegetation of California*, 1-124, pl. 1-20). In this brief sketch of the life-zones only the broadest outlines are indicated, the statements are condensed, and the short lists of species are purely illustrative or suggestive.

### Plant Distribution and Geologic History

Even an outline of geographic distribution of plants in California and the main factors causing distribution as we find it, would be incomplete without a short note on the relation of local floras to geologic history, since the earth movements on the California coast in recent geologic periods, especially since the Pleiocene, have been numerous, with subsidence and uplift of great extent. It is to such physiographic changes that we must appeal for explanation of certain restricted floras or "islands." Along the coast of California grow a number of local species, either highly localized or limited in range and thus forming "islands" or floristic remnants. *Cupressus macrocarpa* and *goveniana* form a small "island" at Monterey, *Pinus radiata* occurs in small "islands" at Ano Nuevo Point, Monterey, San Simeon, and on two of the Santa Barbara islands, while *Pinus torreyana* occurs in two small "islands," one at San Diego, the other on Santa Rosa Island. *Lyonothamnus floribundus* is confined to four of the Santa Barbara Islands. *Pinus muricata* is rather localized on the north coast.

During the Pliocene there was elevation of the whole west coast and the Sierra Nevada became elevated again. At the close of the Pliocene and in early Quaternary the elevation of the west coast continued, causing great cañons to be formed in the Sierras and Coast Ranges. In the early Quaternary the Coast Ranges stood 2000 to 3000 feet higher than now. Increasingly lower temperatures accompanied this period of elevation and culminated in the Glacial Epoch; the Sierra Nevada was covered with glaciers and a much higher rainfall prevailed than at the present time, especially in the coastal region (J. P. Smith, *Sci.* 30: 346-351—1909). It seems certain that during the Glacial Epoch, an extensive hygrophytic forest stretched southward along the south coast and that, due to elevation, the continental area included the Santa Barbara Islands, and that, following uplift and subsidence, more arid conditions ensued and the insular species were left as littoral relicts.

During the Glacial Epoch the main mass of the California flora of lower altitudes must have migrated southward. After the Glacial Epoch another era of subsidence began, carrying the shore line 300 to 700 feet lower than now. After this a renewed elevation was followed by a subsidence which flooded coastal valleys, resulting in the present shore-line harbors. With the final migration of the flora northward, after the Pleistocene, there was introduced or developed in the Great Valley and in the foothills a flora, profuse and diversified, that has its relationships or origins mainly with the regions southward, chiefly in northern Mexico.

The Coast Ranges are the most recent of the great structural features of California. At times, during the Eocene and Pleiocene, and again in the Pleistocene, the Great Valley was an inland sea (W. C. Anderson, *Proc. Cal. Acad. ser. 4*, 3:6, 7, 32—1908) and into it the sea-waters from the ocean ran through one or more of the tidal gaps of the Carquinez, Pacheco Pass, Panoche Pass and Waltham Pass. The relicts found on the summits of Mt. St. Helena, Mt. Diablo, Mt. Hamilton and Loma Prieta are doubtless connected with this history: such endemic relicts as *Allium breweri*, *Streptanthus hispidus*, *Sanicula saxatilis*, *Phacelia phacelioides* (and perhaps *F. breweri*), and *Campanula exigua*, all of which are survivals on the mountain peaks.

The Yollo Bolly, Scott, Salmon, Marble, and Siskiyou mountains form a group of chains known geologically as the Klamath Mountains (J. S. Diller, *Bull. U. S. Geol. Sur.* no. 196). Their rocks are older and harder than those of the Coast Ranges and similar to those of the Sierra Nevada. During the Miocene the Coast Ranges were submerged and during the Pleistocene there

was a downward movement of 1500 feet of the whole coast of northern California and southern Oregon. This succession of movements, subsidence and uplift, helps to explain localized distribution. In the region of the "Klamath Mountains" there occur a number of species restricted to that area and not recurring in neighboring areas, such as *Picea breweriana*, *Quercus sadleriana*, and *Garryana* var. *breweri*, *Lewisia cotyledon* and *oppositifolia*, *Draba howellii*, *Saxifraga fragarioides*, *Potentilla daucifolia* and *howellii*, *Rhamnus californica* var. *occidentalis*, *Viola cuneata*, and *Pedicularis howellii*. There also occur in the Klamaths some equally marked or singular species which are not found elsewhere except in the southern Sierra Nevada. These are *Pinus balfouriana*, *Erythronium citrinum*, *Lewisia leana*, *Dicentra pauciflora*, *Hazardia whitneyi*, and *Raillardella scaposa* var. *pringlei*.

At the north end of the oblong bowl of the Great Valley the landmark of Mt. Shasta rises to 14,350 feet. It is a volcanic cone of quite symmetrical outline, save for the subsidiary cone, Shastina. The mountain is of more recent origin than the Sierran axis or Klamath group, and in consequence does not belong historically either with the Sierra Nevada or Klamath Mountains, but is a part of the volcanic chain of Cascade peaks, namely, Mt. Pitt, Mt. Mazama, Mt. Hood, and Mt. Adams. Its flora is less rich than that of the high Sierras, and although its summit for about 5000 feet lies within the Boreal Zone, it carries a less number of the boreal species that distinguish the high peaks of the Sierra Nevada, Mt. Dana, Mt. Lyell, Mt. Goddard, Mt. Whitney, and many others. *Ranunculus eschscholtzii* is a true boreal found on high Sierran peaks and is one of few species which goes north to the arctic circle, but it is not found on Mt. Shasta. Other boreal or high montane Sierran species not found on Mt. Shasta are *Lewisia nevadensis*, *Draba lemmonii*, *breweri* and *glacialis*, *Mitella breweri*, *Phyllodoce breweri*, *Primula suffrutescens*, *Gentiana holopetala*, *Chrysopsis breweri*, *Hulsea algida*, and *Raillardella scaposa*. *Leucothoe davisiae* of the northern Sierra Nevada does not occur on Mt. Shasta but recurs in the Klamath Mountains area westerly. *Gaultheria humifusa* is likewise common to the two regions just mentioned, but is not known on Mt. Shasta. This list can be extended by a perusal of the body of this text (cf. also C. H. Merriam, Biological Survey of Mt. Shasta, 75).

Lassen Peak is similar to Mt. Shasta in that it belongs to the Cascade group of peaks. While it is, like Mt. Shasta, weak in boreal elements, it is, however, only 10,437 feet in altitude and is probably relatively stronger than Mt. Shasta in true alpenes. For example, *Arenaria nuttallii*, *Draba aureola*, and *Gentiana newberryi* are found on Lassen Peak but not on Mt. Shasta. Other species which occur on Lassen Peak but have not been found on Mt. Shasta are *Trifolium lemmonii*, *Collomia larsenii*, *Mimulus leptaleus*, *Raillardella argentea*, and *Senecio pauciflorus*.

### The Endemic Populations

This Manual describes a total of 4019 species, 3727 of these being native plants, aside from 292 species of alien immigrants. Of these native species, 1416 species are endemic, that is, they are found only in the region covered by this Manual, the state of California. In other terms, the endemic species are about 40 per cent of the whole native population. A certain portion of the endemics have a rather wide range in the state and may be called broad endemics; other have a narrow range or are confined to a single station or a few associated stations and are called narrow endemics. Narrow endemics may be of two kinds and owe their restricted status to essentially different causes. First, we have narrow endemics which are relicts or reliquial species persisting in a locally favorable station, being remnants of a once wide distribution. Second, narrow endemics may be species which have recently originated at that station and have not yet been afforded opportunity for wide distribution. Very remarkable endemics are *Lyonothamnus floribundus*, *Carpenteria californica* and *Arctostaphylos myrtifolia*. On morphologic, systematic, and geologic grounds these species may be regarded as reliquial species, while on similar grounds *Downingia concolor* and *D. ornatissima* may be considered as recent species. In the case of broad endemics definite

endemism areas in certain cases emerge as our knowledge of species and their distribution becomes known in greater detail. They are closely involved with the life-zone areas and are often best considered as subareas of the life-zones with marked longitudinal limits. Some of the most outstanding or most significant of these endemism areas with their characteristic endemics I have named as follows:

1. THE LOW FOOTHILL AREA. An area of the Upper Sonoran Zone surrounding the Great Valley and extending out into its rolling, gravelly or more elevated plains: *Pinus sabiniana*, *Odontostomum hartwegii*, *Chlorogalum angustifolium*, *Brodiaea multiflora* and *volubilis*, *Calochortus luteus*, *Fritillaria pluriflora*, *Chorizanthe membranacea*, *Silene californica*, *Isopyrum occidentale*, *Calycanthus occidentalis*, *Lithophragma affinis*, *Potentilla elata*, *Lathyrus sulphureus* and *californicus*, *Linum californicum*, *Aesculus californica*, *Oenothera graciliflora*, *Eulophus californicus*, *Linanthus filipes*, *Collinsia sparsiflora*, *Pogogyne douglasii*, *Galium bolanderi*, *Microseris acuminata*, *Lessingia virgata*, *Calycadenia truncata* and *ciliosa*, and *Lagophylla dichotoma*. The altitudinal range of the Low Foothill Area is about 100 to 1500 (or 3000) feet.

2. THE TEHAMAN AREA. An area of the Transition Zone, forming a curved band, somewhat like an inverted U, extending from Lake Co. to Shasta Co. around the head of the Sacramento Valley, thence southerly from Shasta Co. to Mariposa Co., at about 3000 to 7000 ft. Sometimes an endemic of this area extends into southern Oregon. The following are to be noted: *Cupressus macnabiana*, *Schoenolirion album*, *Calochortus coeruleus* and *nudus*, *Polygonum davisiae*, *Eriogonum ursinum*, *Berberis pumila*, *Peltiphyllum peltatum*, *Boykinia major*, *Brickellia greenei*, *Madia bolanderi*, *Senecio mendocinensis*, *Crepis acuminata* var. *pleurocarpa*, and *Erigeron miser*. The climatic significance of this area is emphasized by species of Washington and Oregon which enter it from the north and whose range in California is nearly or quite coextensive with the area: for example *Melica subulata*, *Carex densa* and *laeviculmis*, *Lithospermum ruderales* and *Chamaesarcha nana*.

3. THE TEHACHAPAN AREA. An area somewhat like an ox-bow set on end, extending in the Transition Zone from the San Bernardino Mountains through the San Gabriel Mountains to Mt. Pinos and Frazier Mountain, thence through the Tehachapi Mountains to the southern Sierra Nevada in Kern and Tulare counties: *Oxythea parishii*, *Potentilla wheeleri*, *Astragalus pachypus* (at low altitudes), *Collinsia childii*, *Pentstemon rothrockii*, *Aster adscendens* var. *delectabilis*, *Wyethia ovata*, *Chaenactis santolinoides* and *Senecio ionophyllus*. The genus *Oreonana* is limited to this area.

4. THE MOHAVAN AREA. An area of the lower Sonoran Life-Zone, about coextensive with the Mohave Desert: *Calochortus palmeri*, *Chorizanthe spinosa* (a narrow endemic), *Oxythea watsonii* and *luteola*, *Canbya candida*, and *Nicolletia occidentalis*.

5. THE DEATH VALLEY AREA. An area of the lower Sonoran Life-Zone inclusive of the bounding foothills of Death Valley: *Phyllogonum luteolum*, *Boerhaavia annulata*, *Oxystylis lutea*, *Astragalus atratus* var. *panamintensis*, *Brickellia knappiana*, *Salvia funerea*, *Viguiera reticulata* and *Enceliopsis argophylla* var. *grandiflora*.

6. THE KLAMATH AREA. Described above in the section on Geologic History.

7. THE NAPA-LAKE AREA. An area including the lower mountains (800 to 3000 ft.) and valleys in northern Napa Co. and Lake Co.: *Brodiaea rosea*, *Chorizanthe clevelandii*, *Delphinium uliginosum*, *Astragalus clevelandii*, *Antirrhinum virga*, *Cordylanthus pringlei*, *Senecio greenei* and *clevelandii*, and *Arctostaphylos elegans*. *Raillardella scabrida* and *Epilobium nivium* are at higher altitudes on the north side of this area.

8. THE LUCIAN AREA. This area includes the Santa Lucia Mountains, the only mountain range of the California coast overhanging the Pacific Ocean: *Abies venusta*, *Cupressus goveniana*, *Chorizanthe vortriedei*, *breweri* and *palmeri*, *Streptanthus lemmonii*, and *Ribes sericeum*.

9. THE SANTA BARBARA INSULAR AREA. An area which includes all the Santa Barbara Islands: *Dissanthelium californicum*, *Quercus tomentella* (also on Guadalupe Isl.), *Eriogonum arborescens* and *giganteum*, *Arabis filifolia*,

**SOME ENDEMISM AREAS IN CALIFORNIA.** The numbers on the map refer to the numbered paragraphs on pages 12 and 13. The letters refer to three remarkable endemics: *a*, *Carpenteria californica*; *b*, *Arctostaphylos myrtifolia*; *c*, *Lyonothamnus floribundus*.

*Ceanothus arboreus*, *Convolvulus macrostegius* (also on Guadalupe Isl.), *Phacelia lyoni*, *Hieracium argutum*, *Hazardia cana*, and *Hemizonia clementina*.

10. **THE FRANCISCAN AREA.** This is an area extending from northern Monterey County to southern Mendocino County. It contains a large population of endemic shrubs (Jepson, Fl. W. Md. Cal. ed. 2, 4), and it is thought, a larger number of endemics than any other endemic area in California, but the area has not, as yet, been sufficiently studied from this viewpoint and its geographic limits are not clearly determined. Only a few species can here be listed: *Iris longipetala*, *Chorizanthe pungens*, *Montia gypsophiloides*, *Arabis blepharophylla*, *Acaena pinnatifida* var. *californica*, *Thermopsis macrophylla*, *Hystrix californica*, *Ceanothus foliosus*, *papillosus*, *sorediatus* and

incanus, *Dirca occidentalis*, *Navarretia abramsii*, *mellita* and *heterodoxa* *Orthocarpus floribundus*, *Cordylanthus mollis*, *Corethrogyne californica*, *Lesingia ramulosa*, *Micropus amphibolus*, *Layia chrysanthemoides* and *calliglossa*.

### The Alien Populations

Exotic species which have, through accidental or other introduction, become an integral part of the California flora number 292. These immigrants have been derived from all continents of the earth but chiefly from the Mediterranean region. The number 292 gives no proper concept of these alien populations, since the species are often very aggressive, produced in countless numbers of individuals and have an important significance in relation to the dominance or persistence of native species which, in many cases, they successfully dispossess. In the low valleys and in the open foothills there are many districts where the aliens make 50 to 75 per cent of the total population. Only aliens which are really established and have a true competitive status are included in this text. Many alien species that have been introduced are not as yet well established or are only accidental or casual and often disappear. Likewise are excluded those cultivated plants which are transiently spontaneous or which may persist only in a protected spot.

### The Concept of Genera and Species

The treatment of genera and species in this work differs markedly from that of certain authors, more particularly from those who have published new genera and species in an isolated manner and not in revisions, monographs or floras. The differences are sometimes very great, as, for example, in the genus *Eschscholtzia*. This text includes 7 species for California; Fedde in *Das Pflanzenreich* makes 100 species as occurring in California. The genus *Ptelea* is represented by one species as viewed by this Manual; Greene (*Contrib. U. S. Nat. Herb.* 10) has 6 species for California. Such instances might be multiplied almost indefinitely, and necessitate a statement as to the principles worked out and employed by the writer in the preparation of his systematic papers. A genus, in the view of the writer, should include all species of close genetic connection which have a marked natural resemblance or are closely bound together by structural peculiarities which indicate a close line of descent or form a compact natural group. Genera so founded are sufficiently large to establish relationships on a recognizable scale and to bring out the intimate relationships which exist between floras of different regions or countries as a result of past migrations. Genera having marked characters should not be subject to a segregation which reduces the generic character to the level of a species character. It is, however, necessary that the limits of genera should, with increase of knowledge of their structure, probable phylogeny, geographic history and ecology, be subject to revision and modification. No genus has any vested rights on account of long usage or approval by great masters. Continued research, increased knowledge and an enlarged viewpoint must continually find vent in new generic expressions. Otherwise devotion to the past becomes a species of mental slavery wholly at variance with the spirit of scientific research.

Similar observations apply to the species unit. It must consist of individuals having the same genetic constitution, that is, bound together by intimate genetic connection as determined by the morphology, detailed structure, life history, genetic evidence, geographic history and ecologic status. The species should represent a natural unit, more especially from the geographic standpoint. It should be, as an objective aim, distinguishable from related units. It must have practical value or utility, that is, it must be useful in the scientific sense. Every effort should be made to give it clear definition. Ordinarily such a species will possess structural and ecological characters by which its identity can be established. Since species are so much more numerous than genera, the problems have likewise been more numerous than in the case of genera. Investigation by the author of a vast amount of original plant material and of a very large number of segregate

species published for California and its neighboring states has developed certain guiding principles which are here set down as a condensed outline of his practice and serve to indicate broadly his mode of research, and the principles on which that mode is based.

1. RANGE OF VARIATION. By measurements and observation it has been the practice to secure as full data as is possible regarding variation in the organs of a species, especially from one individual or from a series of individuals, where these have common parentage, either directly known or obviously inferred. Such a mass of statistics is of primary importance in the problems of species.

2. SPECIAL MORPHOLOGY. By field observations, by garden cultures or by laboratory methods the structure, character and presence or absence of plant organs has furnished invaluable data for determining the validity of species. The specific mark of a segregate, for example, is often described as the possession of an organ which is, in reality, present in all the segregate forms referred to. On the other hand microscopic study of morphologic detail has often revealed structural differentiae of the greatest importance for segregating new species or validating old ones. An illustration of the latter instance is afforded by the study of the trichome-like processes in the glands of *Calochortus* which furnished a new and more satisfactory basis for species differentiae in that genus (Jepson, Fl. Cal. 1: 291-302).

3. LIFE HISTORY. The entire life history of the plant forms an invaluable record in determining relationships and phyletic descent, because the successional stages of development in the individual exhibit certain characters or structures which, as critically weighed, are repetitions in a greater or less degree of the history of its race or line. This theory is summarized in the well-known biogenetic law, a renewed and able defense of which has recently been made by E. C. Jeffrey (Sci. 60: 531—1924). *Osmaronia cerasiformis*, a well-known species of the soft chaparral, belongs to the family Rosaceae, a family characterized by the presence of stipules. In *Osmaronia* stipules are absent or feebly developed only on young shoots; they are, when present, short vestigial structures and significantly indicative of ancestry. In connection with this general principle, it is to be noted that juvenile characters in certain individuals are sometimes prolonged or reappear in the adult stage, and have been seized upon as the basis for specific segregates. In addition specimens which merely represent extreme maturity on the one hand or extreme youth on the other, are frequently used as the basis for specific segregates. This is so commonplace that it would not require mention save that segregates with such a basis are sometimes published at botanical centers of admittedly high reputation. In general fuller data regarding juvenile stages are available than are data regarding extreme maturity, especially the stage of senescence or of death. An illustration of the value of what I here call a *senescence character* is furnished by *Cordylanthus pilosus*, in which the writer has observed that the lower of the two sepals is deciduous in extreme age. This is a true senescence character. This species belongs to the subgenus *Eucordylanthus*, in which the calyx is diphyllous; in the section *Hemistegia*, which is here regarded as congeneric with *Cordylanthus* and not accepted as a separate genus, the calyx is monophyllous from the beginning, the upper sepal only being present. *Physocarpus capitatus*, a shrub of the soft chaparral, loses its stipules in extreme maturity and fails, therefore, to show a well-known family character at this stage. The valves of the capsule in *Juncus drummondii* become more distinctly retuse after dehiscence, in extreme age. This mark of senescence is a valuable specific character. All such instances, which appear like departures from the set family, genus or species character, should not be regarded by the student as annoying or irritating exceptions but as evidences of evolutionary trend which are full of genetic significance and pregnant with phyletic meaning.

4. MUTILATION. Excision of the crown of an adult individual or of a portion of it or of particular organs or parts of organs, under appropriate conditions, often results in the production of a range of form not normally exhibited by the individual or not at that age. Such structures often throw

valuable light on phylogeny. Annual species of *Gilia*, as an example, are often characterized by early or basal leaves of quite different shape or size from the floral leaves. By mutilation, a plant may be induced to exhibit only the type of leaves associated with the flowering stage. Not infrequently accidental mutilation may occur in a state of nature and individuals of this sort have been collected and, by certain authors, named and described as if good species.

5. GARDEN CULTURES. Very few native plants have as yet been treated as cultures. This work is necessarily a slow one but the practice yields invaluable data regarding genetic relations and specific limits. As an illustration the case of *Eschscholtzia* may be cited. By transplanting individuals of *Eschscholtzia californica* from the Great Valley to the seacoast the writer was enabled to observe changes in a given individual which corresponded to characters of certain so-called segregates, while in the Great Valley he was enabled to demonstrate (Fl. Cal. 1:564-572) that one individual showed successively, during the long flowering period, certain phases which correspond with some five or six of the most extreme segregates in the large number of segregates artificially split away from that species. This work had great significance because it justifies the reduction of *Eschscholtzia* species from the total of 123 to a much smaller number, say about 10 or 20. Important results in the case of other genera are also on record.

6. FIELD STUDIES. The importance of field studies cannot be overestimated, for it is in the field that plants are growing under natural conditions. The most valuable records are those which relate to habit, life-history, soil, exposure, and associated species. The array and inter-relationship of forms in a plant community provides an exhibit of living phenomena which suggests solutions or clues to many problems which may be further developed by critical investigation. Vestigial structures often have great weight in relation to phylogeny and are often most easily discovered or clearly perceived in the field; while excellent examples of range of variation in organs can often be satisfactorily worked out in the field. For this purpose, in the course of the author's investigations, expeditions have been made to all parts of California over a period of several decades and have always been fruitful of results.

7. INDICATION OF RANGE. No two species react similarly to a given combination of the climatic factors, but for each species there is an optimum area where it has its greatest development. In this area of greatest development the species has greatest range of tolerance and often grows in the widest variety of situations. As it radiates from this area it shows a more and more limited tolerance along each of the various lines of radii; that is, each radius exhibits it as keeping to a narrower and narrower set of conditions until the species reaches its limits. Since a species can, in certain respects, be studied to greatest advantage at the limits of its range, an attempt is here made to indicate range limits more accurately than has hitherto been attempted.

8. BIO-GEOGRAPHIC STATUS. Most species grow under a comparatively narrow range of climatic conditions. The determination of geographic position and climatic status is always of importance in relation to validity of species. It not infrequently happens that the range of a species is successfully predicted in advance of exploration. Contrariwise it often happens that plants published as separate species but without geographic data seem, on the basis of their descriptions, lacking in the essentials of good species. It not infrequently falls out that the later investigator of such proposed species is enabled to determine that the forms in question belong to the same division of a life-zone, and he is thus afforded helpful clues to, or even essential confirmation of, specific identity. Complete elucidation may follow naturally from the known laws of geographic distribution in the region.

9. FIELD RECORDS. Records of observations or experiments in the field, must, in order to have real value, be made on the spot and at the time, and be further validated by herbarium specimens. Truly useful herbarium specimens consist of ample series and represent the widest possible phases of the life history.

10. WRITING OF DIAGNOSES. The writing of diagnoses proceeded upon a definite plan, in order to give the best possible expression to the author's results. The ideal descriptions give an exposition of relationships and phylogeny which is in as nearly complete accord as possible with the facts of nature. All data, structural, morphological, ecological and physiological may aid in this task, while of course the herbarium is a constant resource. The construction of diagnoses, according to such a standard, is one of intense and prolonged labors, but such work not only serves to approximate a truthful account of the flora of a region but it also affords a means of judging proposed new species. The original description of a species and the type specimen are invaluable for determining identity, but that once done, the original description has served its purpose. It is necessary that this original description, resting commonly on few individuals, or on a single one, or even on a slight fragment, should be supplanted by a diagnosis of the species which covers the species population as the species exists in a state of nature. Imperfect or diluted original descriptions have been made, too frequently, a plausible pretext for publishing segregates without real value. The writing of sound diagnoses is a highly important art because it helps to stabilize specific units.

It might seem that such a procedure as has been indicated is so obvious or so natural as not to require a statement of this kind. On the contrary, descriptions in certain floras are so frequently copied from other works that the fact of copying has come to be assumed, by many botanists, as if it were universal in the case of floras. Even E. Warming (*Oecology of Plants*, 1) speaks of "the compilation of a Flora." New descriptions, the result of prolonged field studies or garden experiments and containing new life-history material, are by the copyist conveniently copied, not infrequently under the impression that these descriptions are themselves copied ones. Even the copying of good descriptions serves no useful purpose, simply because the making of floras by copying results in a mass of unrelated and unorganized material, a way of doing things which has done much to promote the multiplication of useless species.

11. SCIENTIFIC APPROACH. All problems of relationships and phylogeny that arise in a group must be resolved and interpreted after acquiring ample knowledge of the group and after fullest determination of the facts, without preconceived rules or prejudice. This is so well known and so fundamental a principle that it scarcely requires mention here, save that a contrary principle embodied in an ancient fallacy constantly reappears under a new and often engaging guise. By some method, it is said, the riddle of relationships for all plants can be solved: by the use of physiological traits, by the use of the carpel, by the use of stamens, by the use of biometric measurements (and so on down through the centuries), the species of the books may, by a given method, be made uniform. The answer to this is that characters of evaluation for a given group cannot be determined in advance. This matter can be partly illustrated by the writer's studies on the genus *Arctostaphylos*. From the standpoint of the practice of evaluation by morphologic characters, or by biometric measurements or by any other method determined in advance, scarcely more than five or six species could well be recognized for California. In this Manual 25 species are described, a larger number for California than has hitherto been accepted in any work. Based upon morphologic character these 25 species fall into a number of groups of 3 or 4 species each, the species being separable in herbarium specimens only by minute differences in pubescence, glaucescence, or foliage and the like, too slight for good evaluation. In their relation to chaparral fires, however, the species within each group react in a fundamentally unlike manner—some kill outright under fire of even slight intensity, others lose their crowns, but persist by root-crown sprouting even after the most destructive of chaparral fires. That is, the responses are constant and fundamentally unlike. This specific segregation is further correlated with geographic and ecologic segregation and we have an excellent example of the working out of what I have called the *biogeographic principle* (Jepson, *Madroño*, 1: 76-96). This one illustration proves sufficiently that a scientific method cannot be determined in advance.

### Climatic and Edaphic Variations and Parallel Variations

The object of the diagnoses is to set forth the families, genera and species by descriptions based upon the prevailing or dominant type in each rank. It is hoped in this way to exhibit as clearly as possible the probable phylogeny, so far as it can be done in a linear sequence, and to bring out the salient facts which indicate relationship. No attempt is made to cover the range of mutating or fortuitous variation, or the ordinary climatic or edaphic variations. To do this fully in all its bearings might well require a volume of this size for a single species. To expect a diagnosis to apply exactly to an individual rather than to the species population which it describes is to demand that species be fixed invariable entities. No biological fact is, perhaps, better established than the fact of variation. No two individuals of any species of a seed-plant, we will say, are exactly alike. The student should, therefore, when making determinations, assemble by dissections and by observations and records the fundamental morphologic evidence in connection with field data. He should bear constantly in mind that careful determination represents exercise of the critical faculties. Even professional botanists sometimes imagine that the identity of a species and its phylogenetic position can be named offhand. This is merely a notion, and is, of course, entirely fallacious. For these reasons, the inexperienced user of this Manual should keep in mind the principle of non-inherited variations. A few illustrations of climatic and edaphic variations of this sort are indicated as follows:

1. Plants in rich soils or unusually favorable moisture conditions become much larger or ranker than the average of the species. One must, to be sure, on the one hand, distinguish between seasonal or local rankness and, on the other hand, large forms which represent gigantism, a condition which is inherited. Minor and major forms occur in many genera. Typical *Brodiaea laxa* represents gigantism; its minor form is *var. nimia*. Typical *B. coronaria* is a minor form which has a major form in *var. mundula*.

2. In sterile soils or under unfavorable seasonal conditions a species may develop very small individuals, much smaller than described for the species. This is particularly true of the large number of annuals in the Californian flora. A single illustration will suffice. In Sierran swales or under forest untold millions of individuals of *Gilia leptalea*, simple-stemmed and only 1 to 3 inches high, grow in the granite sand. This species at lower altitudes is normally branched and 10 to 18 inches high. Extensive areas of dwarfs occurring with such marked uniformity are, to be sure, worth ecological notice, but they do not represent a genetic variation. One must again, however, distinguish between these seasonal dwarfs and true pygmies, the latter representing nanism which is inherited.

3. In many species size of flowers or size of heads is proportionate to size and vigor of the individual plants. *Pentachaeta bellioides* furnishes a striking illustration.

4. In wet soils or in swamps the plant tends to become succulent and also glabrous.

5. In valley loams growth is commonly much more rank than on hillsides or clay flats.

6. On hilltops plants tend to become dwarf and also stemless, as is frequently seen in the case of *Eschscholtzia californica*.

7. In cold soils or in beaten ground, stems and branches often tend to spread or even to become prostrate.

8. In strongly alkaline valleys or near the sea the tissues of individuals often tend to become more succulent or fleshy.

9. In subsaline soil the stems and foliage of many species are more vigorous and the flowers larger than on stiff clays or adobes.

10. In the deep shade of woods leaves become thinner and larger, the internodes longer and the plants taller. In the shade of Redwoods on upper San Leandro Creek, for example, the shrub *Cornus californica* exhibits leaves 3 to 5 inches long; in the open 100 yards distant, its more usual situation, the leaves are 1 to 2 inches long and much thicker in texture. In shade, also, plants tend to become glabrous.

11. In intense sunlight plants tend to be compact with short internodes and small leaves.

12. At high altitudes the flowers are larger in proportion to stature and brighter in color.

13. Plants growing in water have longer internodes and longer and often pointed leaves as compared with the terrestrial form with shorter blunt leaves. *Jussiaea californica* in deep water has elongated pointed leaves; the terrestrial form has shorter internodes and short and broad subrosulate leaves very obtuse at apex.

14. Plants growing in dry places or in situations which inhibit vigorous growth sometimes have entire leaves instead of serrate ones, as is the case with *Pentstemon newberryi* growing on lava cones.

15. Plants growing normally in wet or moist situations sometimes tend to become spinescent in arid situations, as is the case with *Navarretia leucocephala*.

16. Plants which in their early stages are subaquatic and produce fistulous phyllodes at this stage fail to develop phyllodes in dry seasons, though going on to maturity, as in the case of *Eryngium vaseyi*.

17. In early and warm rainy seasons annuals and biennials sometimes tend to become perennial.

18. Habitual similarity of unrelated species. The phrase habitual similarity, as here used, refers to the appearance of parallel or analogous structures in unrelated species, the structures evidently representing adaptation or physiological response to a like combination of the climatic and edaphic factors. A few apt illustrations may be grouped in types which I have named as follows:

A. *Polymitism* (*Mitophytes*). Represented by annuals with numerous filiform or slender stems having a "bushy" habit, illustrated by such unrelated species as *Eriogonum spergulinum* and *Nemacladus ramosissimus*.

B. *Prophalism* (*Prophalophytes*). This habit is assumed by annuals which produce a single flower or a single head or a single spike of flowers at the ground under the earliest seasonal impulse, further growth being inhibited by dryness; or on the other hand, if favorable conditions continue, there will ensue a development of many ascending or decumbent branches proliferous from beneath the initial flowering, these later shoots giving rise to profuse flowering. This habit guarantees at least some seed in case of seasonal drought and occurs in such plants as *Navarretia prostrata* and *Oenothera trichocalyx*, species from families widely separated phylogenetically.

C. *Simulism* (*Simulophytes*). This is a case of pure habitual similarity, a similarity in branching, in hue or in foliage, and is illustrated by the resemblance of such widely unrelated pairs of species as the following: forms of *Navarretia squarrosa* to forms of *Centromadia pungens*; *Collomia rawsoniana* and *Clinopodium mimuloides*; *Lomatium parryi* and *Cymopterus anisatus* (of the Great Basin); early stages of *Dodecatheon jeffreyi* and *Rumex occidentalis*.

D. *Proliferism* (*Proliferophytes*). Certain species with a slender stem or main axis produce proliferous branches and in habit assume analogy to other species, as: *Pentachaeta exilis*, *Rigiopappus leptocladus*, *Navarretia prolifera*.

Obviously the student should be on his guard, against being misled by analogies or superficial resemblances, especially in the absence of reproductive organs from the material. A specimen of an old and well-known California species of *Prunus* (family Rosaceae) has recently been published by an American botanist as a new species of *Lycium* (family Solanaceae). He was misled by habitual similarity due to definite external conditions ("epharmonic convergence"). The student, therefore, should always secure the fullest possible evidence from the sexual reproductive organs, especially the gynoecium or pistil, because the reproductive organs are, as to structure, removed (normally) from external influence. On the other hand the vegetative organs are freely subject to edaphic influence because they are directly concerned with the struggle for existence in the individual. In determining the morphologic value of an organ the facts should be established in the order of their importance, namely: 1. Position (the most important consid-

eration). 2. Structure (also highly important). 3. Shape (of secondary value). 4. Size (of quite secondary value). 5. Color (its value is very slight). If the plant or material bears no sexual reproductive organs the student should observe great caution and reserve in determining its systematic affinities or phylogenetic position.

#### Acknowledgments

This volume provides the first Manual of the flowering plants and ferns of California. During the progress of its preparation, many thousands of notes and specimens have been contributed by Mr. Frank W. Peirson on the flora of the San Gabriel Mountains, by Mr. Joseph P. Tracy on the flora of Humboldt County, by Dr. A. L. Grant on the flora of the Sierra Nevada, by Dr. P. B. Kennedy on the flora of Fresno and Eldorado counties, and by Dr. L. N. Upton on the flora of the deserts. Many other correspondents, too numerous to mention, have sent special but important data. For all this valuable and timely aid the author returns his grateful thanks as well as to those contributors whose names appear in the text as authors of special families or genera. Dr. A. S. Hitchcock and Mrs. Agnes Chase furnished the manuscript for Gramineae, Mr. K. K. Mackenzie provided that for Carex, Mr. C. P. Smith contributed the text for Lupinus, while the Cactaceae were done by Mr. S. B. Parish. For certain other parts I am indebted to my students: Dr. Alice M. Ottley did the genus *Lotus*, Miss E. M. Zeile attended to *Castilleja* and Mr. H. L. Mason drew up keys for *Phlox* and *Polemonium*. The drawings were chiefly done by Miss Joyce M. Saunders under the author's direction. Finally must be mentioned the work of Dr. C. B. Bradley in accentuating the Latin names, a task characterized by his usual scholarship and erudition.

Department of Botany,  
University of California,  
Berkeley, July 15, 1921.

WILLIS LINN JEPSON.

#### NOTE ON THE ACCENTUATION OF THE LATIN NAMES

By CORNELIUS BEACH BRADLEY, LL.D.

The scheme for marking the accentuation of plant-names in this work is that used in the current manuals. Both the acute and the grave accent-marks indicate that the vowels to which they are attached are to be stressed; but the grave [ˊ] indicates further that vowel has its long sound in English, while the acute [ˋ] indicates either its short sound or some other variation from the long. The accepted accentuation has been followed save in a few cases where it has seemed to be clearly mistaken. One such case is the little group of English surnames like *Forbes* and *Jones*, in which the *e* is silent, and the words are monosyllabic. There seems to be no good reason why the addition of Latin suffixes should not only give sound to the silent *e*, but also ridiculously lengthen it. I have therefore treated all such stems as monosyllabic, precisely as *Johns* would be treated in like circumstances; as, e. g. *Jòn[e]si*, *Jòn[e]sia*, *Jòn[e]siàna*, etc. Another such group are the personal names ending in *-son*, with short, unstressed *o*. All the Latin forms built up from such stems have therefore been accentuated on that basis, thus: *Jòhnsóni*, *Jòhnsóniàna*, but *Johnsònia*.

In Latin, moreover, there are many quasi-compounds, like our hyphenated compounds, in which both elements retain their separate accentuation. Such a compound is *sempervirens*—cf. *Oxford Dictionary* s.v. *Semper*. Naturally, therefore, the word has been regularly pronounced *sémpervirens*—both by scholars and laymen. But some wiseacre has made the discovery that the *i* of the penult is short, and a determined effort seems to be made to spread the "correct" pronunciation *sempèrvirens*! The matter would deserve no notice here were it not that the attempted innovation seems almost an insult to our noble Redwood.

There remains a word more to be said concerning the unlucky suffix *-oides*, which seems to be generally mispronounced as a dissyllable, with the *o* and *i* coalesced into a diphthong, after the analogy of *ovoid*, *thyroid*, and *mastoid*. All such tabloids are of modern manufacture, and suited to the haste and impatience of our modern life. But *-ò-ì-dès* is a leisurely and dignified mouth-filling trisyllable, and has been such at least ever since the Trojan War.

# GENERAL KEY TO THE FAMILIES

## I. SUBKINGDOM **PTERIDOPHYTA**, FERN PLANTS

Plants with typically distinct alternation of generations, the leafy plant (sporophyte) reproducing by non-sexual spores. Spores developing prothallia or flat plates of tissue (gametophyte) bearing antheridia (containing male cells or sperms) and archegonia (containing a female cell or oospore). Oospore fertilized in the presence of water by a self-motile sperm. Flowers or seeds none. Ours herbs.

*Stems* not jointed or rush-like.

Stems small in comparison with the leaves, often very short, usually unbranched.

Land plants, or at least essentially terrestrial; sporangia borne on the lower side or edges of the leaves; spores all of one kind and size (isosporous).

Leaf 1, erect in the bud; sporangia borne in spikes, the spikes simple or branched, not green...OPHIOGLOSSACEAE, p. 25.

Leaves several to numerous, circinate in the bud, often large and characteristically much-divided; sporangia borne in clusters (sori) on the back or margin of green leaves.....

POLYPODIACEAE, p. 26.

Aquatic or subaquatic plants; sporangia and spores of 2 kinds.

Sporangia borne in special conceptacles; stems not corm-like.

Plants floating in water; leaves minute, entire or 2-lobed....

SALVINIACEAE, p. 39.

Plants rooting in mud; leaves 4-foliate or filiform.....

MARSILEACEAE, p. 39.

Sporangia borne in the leaf-axils; leaves awl-like or linear, clustered on a flattened or corm-like stem...ISOETACEAE, p. 43.

Stems more or less elongated, freely branching, closely clothed or imbricated with small awl-like or scale-like leaves; sporangia borne in or near the leaf axils.

Spores of one kind.....LYCOPODIACEAE, p. 41.

Spores of two kinds.....SELAGINELLACEAE, p. 41.

*Stems* jointed or rush-like, hollow, the reduced leaves joined into a toothed sheath at the nodes; sporangia borne on the under side of the scales in a terminal cone-like spike; spores of 1 kind.....EQUISETACEAE, p. 39.

## II. SUBKINGDOM **SPERMATOPHYTA**, SEED PLANTS

Plants without distinct alternation of generations, the sexual phase (gametophyte) much reduced and parasitic upon the sporophyte; egg-cell fertilized through the intervention of the pollen-tube, the developed embryo forming a resting body called a seed.

### CLASS 1. **GYMNOSPERMAE**, CONE-BEARING PLANTS

Ovules and seeds borne naked on the surface of a scale; stamens and ovules in catkin-like clusters; cotyledons 2 to 17; cone-bearing trees or shrubs, all of ours evergreen; true flowers none; leaves needle-like, narrowly linear, awl-like or scale-like.

*Trees*, rarely shrubs, with resin.

Fruit a woody cone (soft and berry-like in *Juniperus*), containing several to many seeds; ovules in catkins.

Cone-scales imbricated, with a conspicuous or minute bract at base on lower side; leaves needle-like or narrowly linear; seeds 2 to each scale, bearing a thin wing.....PINACEAE, p. 44.

Cone-scales without bracts.

- Leaves narrowly linear and 2-ranked in flat sprays, or lanceolate or awl-like and disposed all around the branchlet; cone-scales not imbricated, ending in broad flattish summits; seeds 2 to 9 to each scale, not winged. . . . . TAXODIACEAE, p. 54.
- Leaves minute and scale-like, thickly clothing the ultimate branchlets; cone-scales imbricated, or with broad flattish summits and not imbricated; seeds 1 to several to each scale, winged or wingless. . . . . CUPRESSACEAE, p. 55.
- Fruit berry-like or drupe-like, one-seeded; ovules solitary; leaves narrowly linear, in flat sprays. . . . . TAXACEAE, p. 59.
- Shrubs without resin; deserts. . . . . GNETACEAE, p. 60.

## CLASS 2. ANGIOSPERMAE, FLOWERING PLANTS

Ovules borne in a closed sac or ovary, which becomes the fruit and encloses the seed; cotyledons 1 or 2; plants with true flowers, typically with an abbreviated stem (receptacle) bearing regular whorls of perianth parts, stamens, and pistils.

### SUB-CLASS 1. MONOCOTYLEDONEAE

Leaves parallel-veined (except Trillium); parts of the flower usually in 3s, rarely in 2s, 4s or 5s; vascular bundles scattered irregularly through the pithy tissue, not in rings or annual layers; embryo with 1 cotyledon; perennial herbs commonly with rootstocks or bulbs, or annuals, or a few trees or shrubs.

#### A. PERIANTH NONE OR CALYX-LIKE WITH SCALE-LIKE DIVISIONS; PARTS OF THE FLOWER MOSTLY UNEQUAL IN NUMBER; CARPELS 1 TO SEVERAL, DISTINCT, OR SOMETIMES UNITED BUT SEPARATING AT MATURITY.

##### 1. *Flowers not in the axils of dry chaffy bracts; ovary superior; herbs.*

Leafless minute aquatics, the stems represented by leaf-like floating fronds. . . . . LEMNACEAE, p. 194.

##### Leafy plants.

Immersed aquatics; leaves fliform or linear, or some floating ones with broad blades; flowers inconspicuous, naked or with a very small calyx, borne on a spike or spadix; stamens 1 to 4; ovaries 1 to 4. . . . . NAIADACEAE, p. 63.

##### Plants of marshes or rising out of water.

Flowers monoecious; reed-like plants with linear leaves.

Inflorescence a dense cylindrical spike. . . . . TYPHACEAE, p. 61.

Inflorescence a dense globose head. . . . . SPARGANIACEAE, p. 62.

Flowers perfect, rarely polygamous, in racemes or spikes.

Inflorescence with a spathe; calyx none; stamens 6. . . . . ARACEAE, p. 193.

Inflorescence naked; calyx of 6 (or 3) distinct sepals, or none; stamens 6 or 1. . . . . JUNCAGINACEAE, p. 68.

##### 2. *Flowers in the axils of dry chaffy bracts, arranged in spikes or spikelets.*

Stems mostly terete and hollow; leaves in 2 rows; sheaths mostly split open opposite the blade; bractlets 2 to each flower; fruit a grain (seed mostly adnate to the pericarp). . . . . GRAMINEAE, p. 72.

Stems mostly triangular, solid; leaves in 3 rows; sheaths entire; ligule obsolete or minute; bractlet 1 to each flower; fruit an achene (seed free from the pericarp). . . . . CYPERACEAE, p. 144.

#### B. PERIANTH ALWAYS PRESENT, ITS SEGMENTS IN 2 SERIES, RARELY IN 1, OFTEN COROLLA-LIKE; PARTS OF THE FLOWER USUALLY EQUAL IN NUMBER; CARPELS UNITED INTO ONE COMPOUND OVARY (EXCEPT ALISMACEAE).

Inflorescence without a spathe.

##### Pistil 1.

Ovary superior; perianth regular; stamens 6, sometimes 3 or 4.

Perianth-segments distinct, green or brown, not petal-like; flowers small or minute; rush-like plants. . . . JUNCACEAE, p. 196.

- Perianth-segments distinct or partly united, at least the inner petal-like; flowers mostly showy; plants not rush-like.....  
LILIACEAE, p. 208.
- Ovary inferior; flowers perfect, mostly conspicuous; perennial.  
Perianth regular; ovary 3-celled.  
Stamens 6; leaves (in ours) fleshy, in a basal rosette.....  
AMARYLLIDACEAE, p. 252.
- Stamens 3; leaves 2-ranked, sword-like and sheathing.....  
IRIDACEAE, p. 253.
- Perianth irregular; stamens 1, rarely 2; ovary 1-celled; leaves sheathing, often reduced to scales... ORCHIDACEAE, p. 255.
- Pistils several, distinct, 1-celled, superior, becoming achenes; perianth of 3 sepals and 3 petals; stamens 6 to many..... ALISMACEAE, p. 69.
- Inflorescence with a spathe; pistil 1.  
Herbs.  
Ovary inferior; 1 to 3-celled; stamens 3 to 12; aquatic plants; leaves opposite or whorled..... HYDROCHARITACEAE, p. 72.
- Ovary superior.  
Aquatic plants; leaves ribbon-like..... PONTEDERIACEAE, p. 195.  
Marsh or bog-perennials; leaves broad..... ARACEAE, p. 193.  
Trees; flowers on a spadix or fleshy spike..... PALMACEAE, p. 193.

SUB-CLASS 2. **DICOTYLEDONEAE**

Leaves commonly netted-veined; parts of the flower mostly in 4s or 5s; vascular bundles in a ring around a central pith, the stem, when perennial, increasing in girth by annual layers; embryo with 2 cotyledons; herbs, shrubs or trees.

I. **APETALOUS DIVISION.** Corolla none; calyx present, herbaceous or often petal-like, sometimes none.**A. Flowers monoecious or dioecious, one or both kinds in catkins; trees or shrubs.***1. Leaves opposite.*

Flowers dioecious.

Catkins erect; maritime shrub..... BATIDACEAE, p. 340.

Catkins drooping; montane shrubs..... GARRYACEAE, p. 731.

Flowers monoecious; ovary superior, 2 or 3-celled..... BUXACEAE, p. 606.

*2. Leaves alternate.*

Both kinds of flowers in catkins.

Flowers 1 to each scale or bract; calyx none.

Fruit a 1-celled many-seeded capsule; seeds with a coma; flowers dioecious; foliage deciduous..... SALICACEAE, p. 261.

Fruit waxy-coated, berry-like; flowers monoecious or dioecious; foliage evergreen or deciduous..... MYRICACEAE, p. 279.

Flowers 2 or 3 to each scale or bract; calyx present; staminate catkins long. pendulous. the pistillate small, spike-like, maturing into a woody cone containing small nutlets..... BETULACEAE, p. 269.

Only the staminate flowers in catkins, the pistillate flowers solitary or clustered, rarely in catkins.

Leaves simple.

Fruit a nut set in a scaly cup or bur (acorn or chestnut)..... FAGACEAE, p. 271.

Fruit a nut enclosed in a leafy tubular involucre.. CORYLACEAE, p. 270.

Leaves pinnately compound; fruit a nut with a fibrous coat..... JUGLANDACEAE, p. 279.

**B. Flowers perfect or unisexual, not in catkins.****1. OVARY SUPERIOR, THAT IS, FREE FROM THE CALYX.***a. Flowers hypogynous.***\* Calyx present; corolla none.****Pistil one.****Ovary 1-celled; styles or stigmas 1 or more than one.****Fruit indehiscent (circumscissile in some *Amaranthaceae*).****Fruit dry (an achene or utricle); stamens 1 to 9.**

Herbage with stinging hairs; flowers very small, monoecious,  
in a catkin-like inflorescence; sepals 4; stamens 4;  
herbs.....URTICACEAE, p. 280.

**Herbage without stinging hairs.**

Plants commonly scurfy, of alkaline or maritime habitat;  
sepals herbaceous, or in unisexual flowers, the  
pistillate without calyx and enclosed by 2 bracts;  
bractlets none; stamens 1 to 5; leaves alternate,  
rarely opposite or leafless; stipules none.....

CHENOPODIACEAE, p. 319.

**Plants not scurfy.**

Calyx not tubular; leaves alternate or opposite or  
basal.

Fruit a triangular or lenticular achene; calyx  
colored or herbaceous, 5 or 6-cleft or  
-parted; flowers with or without bract-  
lets; stamens 3 to 9; stipules present or  
none.....POLYGONACEAE, p. 286.

Fruit a utricle; calyx scarious, 5 or 3-cleft or  
-parted; flowers with bractlets; stamens  
3 to 5 (rarely 1); stipules none.....

AMARANTHACEAE, p. 333.

Calyx tubular, corolla-like, the base of the tube hard-  
ening and enclosing the achene; stamens 3  
to 5; leaves opposite, without stipules.....

NYCTAGINACEAE, p. 335.

**Fruit fleshy.**

Fruit a berry; leaves tritermately compound; herb.....

ACTAEA, p. 374.

**Fruit a drupe; leaves simple, alternate.**

Sepals 6, petal-like, distinct; stamens 9, the anthers open-  
ing by valves; evergreen tree. LAURACEAE, p. 396.

Calyx 5 or 6-parted, greenish; stamens 5 or 6, the anthers  
opening by longitudinal slits; deciduous tree...

ULMACEAE, p. 282.

**Fruit dehiscent (a capsule); leaves opposite.****Calyx synsepalous, 5-lobed.**

Stipules none; erect perennial herb.....GLAUX, p. 756.

Stipules present; prostrate annual.....CYPSELEA, p. 341.

**Calyx of 5 distinct or nearly distinct sepals.....**

CARYOPHYLLACEAE, p. 352.

**Ovary 2 to 5-celled.****Flowers dioecious or polygamous; trees or shrubs.**

Fruit a capsule; styles or stigmas as many or twice as many as  
ovary-cells.....EUPHORBACEAE, p. 594.

**Fruit a samara or drupe; leaves opposite.**

Styles 2; fruit a double samara.....ACER, p. 611.

Style 1; fruit a simple samara or drupe....OLEACEAE, p. 759.

**Flowers perfect.**

Stamens distinct; calyx inconspicuous; herbs...AIZOACEAE, p. 341.

Stamens monadelphous; calyx showy; shrub...FREMONTEA, p. 636.

Pistils more than 1 and distinct; sepals commonly 5, sometimes 3 to 9, distinct,  
often petal-like; stamens 10 to many.....RANUNCULACEAE, p. 372.

**\*\* Calyx and corolla both wanting; pistil 1.**

Flowers perfect, borne in a spike.

Spike without an involucre; herbs of woods.....ACHLYS, p. 395.

Spike subtended by a conspicuous colored involucre; herbs of saline habitat.  
SAURURACEAE, p. 286.

Flowers monoecious.

Terrestrial plants.

Flowers in clusters, the clusters often surrounded by a petal-like involucre resembling a perianth; stamens 1 to many; capsule 3 (or 1) -celled; juice often milky.....EUPHORBIACEAE, p. 594.

Flowers in ball-like clusters scattered on a slender axis; trees.....  
PLATANACEAE, p. 476.

Aquatic or palustrine plants; leaves opposite.

Leaves dissected; ovary 1-celled, in fruit a spinose or tuberculate achene.....CERATOPHYLLACEAE, p. 371.

Leaves entire; ovary 4-celled, splitting when ripe into 4 parts.....  
CALLITRICHACEAE, p. 602.**b. Flowers perigynous, that is, the stamens borne on the calyx or on a disk.**

Flowers solitary or clustered or in heads.

Stipules present; flowers perfect.

Fruit an achene; herbs or shrubs.....ROSACEAE, p. 476.

Fruit a utricle; small herbs.....CARYOPHYLLACEAE, p. 352.

Stipules none.

Flowers perfect.

Leaves opposite; herbs.

Calyx turbinate; stamens numerous; fruit a circumscissile capsule.....SESUVIUM, p. 342.

Calyx salverform; stamens commonly 5; fruit an achene.....  
ABRONIA, p. 337.

Leaves alternate; calyx 4-cleft; stamens 8; fruit drupe-like; shrubs.....THYMELAEACEAE, p. 663.

Flowers dioecious; leaves opposite, silvery; shrubs.....  
ELAEAGNACEAE, p. 663.

Flowers in little umbels; fruit a drupe, often berry-like...RHAMNACEAE, p. 613.

**2. OVARY INFERIOR, THAT IS, MORE OR LESS ADHERENT TO THE CALYX.**

Flowers dioecious or the pistillate with stamens.

Stamens 8 to 12; fruit a 1-celled capsule; leaves alternate, divided.....  
DATISCEAEAE, p. 653.Stamens 3; fruit a berry; leaves opposite; plants parasitic on trees.....  
LORANTHACEAE, p. 282.

Flowers perfect or sometimes unisexual.

Leaves alternate; terrestrial plants.

Lobes of the calyx 3; ovary 6-celled; fruit a capsule; leaves cordate or reniform.....ARISTOLOCHACEAE, p. 284.

Lobes of the calyx 4 or 5; fruit indehiscent; leaves not reniform or cordate.

Ovary 3 to 9-celled; succulent herb.....TETRAGONIA, p. 342.

Ovary 1-celled; root-parasite.....SANTALACEAE, p. 284.

Leaves opposite; aquatic or palustrine plants.

Fruit a 4-celled capsule; capsule many-seeded.....LUDWIGIA, p. 666.

Fruit consisting of 1 to 4 nutlets; nutlets 1-seeded...HALORAGEAE, p. 690.

**II. CHORIPETALOUS DIVISION. Calyx and corolla present; petals distinct or essentially so.****A. Ovary superior, that is, free from the calyx.****1. STAMENS HYPOGYNOUS, MORE THAN 10.****a. Pistils 2 to many, simple and distinct.**

Leaves simple, entire to divided, or compound; pistils becoming achenes or follicles.....RANUNCULACEAE, p. 372.

Leaves peltate; aquatic plants.....BRASENIA, p. 372.

*b. Pistil 1.*

Leaves alternate or basal.

Ovary 1-celled, the styles or stigmas often more than one.

Sepals caducous; petals 4 or 6, twice as many as the sepals. . . . .  
PAPAVERACEAE, p. 397.

Sepals persistent or at least not caducous.

Plants with scapes and basal leaves; petals 5 to 16; sepals 2 to 8; leaves succulent. . . . . LEWISIA, p. 350.

Plants with leafy stems.

Petals 5.

Leaves pinnately compound; calyx 4 or 5-toothed; fruit a legume. . . . . ACACIA, p. 514.

Leaves simple, entire; calyx of distinct sepals; fruit a capsule.

Sepals 2; styles 3. . . . . CALANDRINIA, p. 344

Sepals 5, the 2 outer smaller and bract-like; style 1. . . . .  
CISTACEAE, p. 641.

Petals 1 or 2; sepals about 4; fruit a berry; leaves compound. . . . .  
ACTAEA, p. 374.

Ovary more than 1-celled.

Stamens distinct.

Petals 5; sepals 5; leaves basal, pitcher-shaped. . . . .  
SARRACENIACEAE, p. 448.

Petals 10 to 20; sepals 5 to 12; aquatic herbs. . . . . NYMPHAEA, p. 371.

Stamens not distinct.

Ovary 5 to 30-celled; stamens numerous, united in a tube around the pistil; flowers perfect or unisexual; leaves rounded, palmately veined to palmately divided. . . . . MALVACEAE, p. 626.

Ovary 3-celled; stamens 10 to 15, united in sets of 5 in a central column; flowers unisexual; leaves rather narrow. . . . .  
ARGYTHAMNIA, p. 596.

Leaves opposite, simple.

Stamens disposed in 3 to 5 indistinct bunches; fruit a capsule. . . . .  
HYPERICACEAE, p. 637.

Stamens distinct; fruit capsular or separating into distinct carpels. . . . .  
PAPAVERACEAE, p. 397.

## 2. STAMENS HYPOGYNOUS, 10 OR FEWER.

### *a. Pistils more than 1, distinct; flowers regular.*

Pistils distinct and exceeding in number the sepals or petals; leaves mostly palmately divided or lobed. . . . . RANUNCULACEAE, p. 372.

Pistils of the same number as the sepals or petals (4 or 5), becoming follicles; leaves fleshy, entire. . . . . CRASSULACEAE, p. 449.

### *b. Pistil 1, the styles or stigmas 1 or sometimes more than one.*

\* Flowers irregular; ovary 1-celled; leaves alternate or basal.

Flowers papilionaceous; petals 5 (1 petal in *Amorpha*); stamens 10, united in 1 or 2 sets (distinct in several genera, 4 in *Krameria*, 7 in *Cassia*, these two with subregular corolla); leaves compound (simple in a few genera); fruit a legume, rarely indehiscent. . . . . LEGUMINOSAE, p. 510.

Flowers not papilionaceous.

Petals 5, one with a spur; sepals 5, auricled; stamens 5. . . . . VIOLACEAE, p. 642.

Petals not spurred.

Stamens 6, slightly united in two sets; leaves compound. . . . .  
FUMARIACEAE, p. 404.

Stamens 3 to 40, distinct; leaves simple. . . . . RESEDACEAE, p. 642.

### \*\* Flowers regular.

Flowers cruciferous, that is, with 4 sepals, 4 petals, 6 stamens (4 long and 2 short, rarely 4 or 2); ovary 2-celled, rarely 1-celled, sessile (except *Stanleya*), becoming in fruit a silique or silicle. . . . . CRUCIFERAE, p. 409.

Flowers not cruciferous.

Leaves not palmately compound.

Ovary 1-celled.

Leaves simple.

Calyx of 2 distinct sepals; stamens commonly 5; ovary 1-celled; capsule 3-valved. . . . . PORTULACACEAE, p. 343.

Calyx not of 2 distinct sepals.

Leaves opposite.

Placenta central; stamens 5, alternate with the petals, or 10 (5 alternate, 5 opposite); rarely fewer; calyx tubular and 5-toothed, or of 5 distinct sepals; capsule 3 to 10-valved or toothed, or the fruit 1-seeded and indehiscent. . . . . CARYOPHYLLACEAE, p. 352.

Placenta basal but parietal; stamens 4 to 7; calyx tubular, 4 or 5-toothed; capsule 2 to 4-valved. . . . . FRANKENIACEAE, p. 639.

Leaves alternate or basal.

Leaves basal; stamens 5, opposite the petals.

Calyx funnelform, 5-toothed; fruit an achene. . . . . PLUMBAGINACEAE, p. 757.

Calyx saucer-shaped, 5-parted; fruit a capsule. . . . . DROSERACEAE, p. 448.

Leaves reduced to scales, borne along the stem; sepals distinct; saprophyte in forests. . . . . PLEURICOSPORA, p. 740

Leaves pinnately compound.

Petals 6; stamens 6; anthers opening by uplifted valves; fruit a capsule or berry. . . . . BERBERIDACEAE, p. 393.

Petals 5; stamens 10 or 7; anthers opening by lengthwise slits; fruit a legume. . . . . LEGUMINOSAE, p. 510.

Ovary more than 1-celled.

Stipules none.

Flowers perfect; petals 5 or 4; leaves simple.

Stamens distinct.

Styles 2 to 5; flowers 5-merous. . . . . LINACEAE, p. 586.

Style 1; flowers 5 or 4-merous.

Leaves entire or merely toothed; fruit a capsule. . . . . ERICACEAE, p. 735.

Leaves dissected; fruit separating into 5 sub-globose carpels. . . . . LIMNANTHACEAE, p. 592.

Stamens united in a tube, 5 perfect stamens alternating with 5 staminodia at summit of tube. . . . . AYENIA, p. 637.

Flowers unisexual or polygamous; stamens 2 to 4; trees or shrubs.

Ovary 2-celled; petals 2; leaves opposite, pinnate; fruit a samara. . . . . OLEACEAE, p. 759.

Ovary 6 to 9-celled; petals mostly 3; leaves alternate, simple; fruit a drupe. . . . . EMPETRACEAE, p. 752.

Stipules present; leaves opposite, at least the lower.

Fruit a 2 to 5-celled capsule; stamens 2 to 5; leaves simple. . . . . ELATINACEAE, p. 638.

Fruit splitting into 5 carpels or nutlets; stamens 10 (sometimes only 5 with anthers); petals 5; sepals 5.

Styles 5, united around an elongated axis, free only at tip; carpels separating elastically when ripe, tailed by the persistent coiled styles; leaves or leaflets parted, cleft or toothed. . . . . GERANIACEAE, p. 589.

Style 1; carpels not tailed; leaves pinnate, the leaflets entire. . . . . ZYGOPHYLLACEAE, p. 603.

Leaves palmately compound with 3 to 5 leaflets.

Calyx with less than 6 sepals.

Sepals 5; petals 5; stamens 10, more or less united at base; ovary 5-celled, sessile.....OXALIDACEAE, p. 587.

Sepals 4; petals 4; stamens 6, distinct; ovary raised on a stipe, 1 or 2-celled.....CAPPARIDACEAE, p. 406.

Calyx with 6 sepals in 2 series; stamens 6.....VANCOUVERIA, p. 395.

3. STAMENS PERIGYNOUS, THAT IS, ON THE CALYX OR ON A MORE OR LESS EVIDENT DISK; COROLLA REGULAR.

*a. Stamens borne on a hypogynous disk or on a disk lining the base of the calyx; trees or shrubs.*

Fruit a double samara; stamens 3 to 10; leaves opposite, simple.....  
ACERACEAE, p. 611.

Fruit not a double samara.

Leaves palmately compound, opposite, the leaflets 5 to 7; stamens 4 to 9; petals clawed, slightly irregular; fruit a 1-seeded dehiscent pod..  
SAPINDACEAE, p. 612.

Leaves simple, pinnately compound or 3-foliolate.

Stamens numerous (15 to 50); pistils 2 to 9, distinct; petals 5; seeds with a fimbriate aril.....CROSSOSOMATACEAE, p. 475.

Stamens 4 to 10.

Stamens as many as the petals and alternate with them, or twice as many.

Leaves with minute stipules or mostly so.

Style 1 or none; fruit a capsule or follicle; seeds with an aril; leaves alternate or opposite.....  
CELASTRACEAE, p. 609.

Styles 3; fruit a bladdery pod; seeds not arillate; leaves opposite, pinnate.....STAPHYLEACEAE, p. 610.

Leaves without stipules.

Style 1.

Leaves glandular-dotted or aromatic, simple or 3-foliolate.....RUTACEAE, p. 604.

Leaves not glandular-dotted, alternate.

Disk 10-lobed; leaves pinnate or reduced to scales.....SIMARUBACEAE, p. 606.

Disk not lobed.

Leaves pinnate; seeds not winged.....

BURSERACEAE, p. 607.

Leaves simple, scale-like; seeds winged....

KOEBERLINIACEAE, p. 609.

Styles 3 to 5; leaves alternate.

Leaves broad; herbage with resinous or acrid juice..  
ANACARDIACEAE, p. 607.

Leaves minute, appressed; juice not acrid.....  
TAMARICACEAE, p. 640.

Stamens as many as the petals and opposite them; leaves simple, alternate (opposite in *Adolphia*).

Shrubs; petals commonly hooded; fruit 3 (or 2) -celled, dry, splitting into 3 (or 2) one-seeded parts, or drupaceous.....RHAMNACEAE, p. 613.

Woody climbing vine; petals not hooded, caducous; fruit a berry.....VITACEAE, p. 625.

*b. Stamens borne on the calyx.*

Stipules present (except *Holodiscus* and *Aruncus* and sometimes in *Osmaronia*); pistils one to several, sometimes partly united to the disk; petals 5; stamens 10 to numerous; leaves alternate, simple or compound (opposite in *Lyonothamnus* and *Coleogyne*).....ROSACEAE, p. 476.

Stipules none; leaves simple.

Pistils many, concealed in a hollow receptacle; petals many; stamens numerous; leaves opposite; shrubs.....CALYCANTHACEAE, p. 393.

Pistil 1; stamens 3 to 10 or numerous.

Styles or stigmas more than 1; petals commonly 5 (4 to 8).....

SAXIFRAGACEAE, p. 454.

Style and stigma 1; capsule enclosed by but free from the calyx.....

LYTHRACEAE, p. 664.

## B. Ovary inferior, that is, more or less adherent to the calyx.

### 1. TREES OR SHRUBS.

Stamens more numerous than the petals; petals 5.

Leaves alternate; fruit a pome.....ROSACEAE, p. 476.

Leaves opposite; fruit a capsule.....WHIPPLEA, p. 466.

Stamens as many as the petals and opposite them; petals 5, hooded; capsule 3-celled, 1 seed in each cell; shrubs or small trees....CEANOTHUS, p. 615.

Stamens as many as the petals and alternate with them.

Style 1; petals 4; stamens 4; flowers small, in cymes, or if in a head, surrounded by a conspicuous corolla-like involucre; fruit drupe-like; leaves opposite.....CORNACEAE, p. 732.

Styles 2, more or less distinct; petals 5 (or 4); stamens 5 (or 4); flowers in racemes or solitary; fruit a smooth or prickly berry; leaves alternate, commonly with stipules.....RIBES, p. 467.

### 2. HERBS.

Petals 5 or fewer.

Flowers in umbels; stamens 5.

Umbels compound, often simple, sometimes capitate; petals inflexed at tip; styles 2; fruit splitting into 2 one-seeded carpels.....

UMBELLIFERAE, p. 691.

Umbels simple, paniced; petals not inflexed at tip; styles 5; fruit berry-like.....ARALIACEAE, p. 691.

Flowers not in umbels.

Styles or stigmas 2 to 5; calyx 5-lobed; petals 5; stamens 5 or 10; fruit a 1 to 5-celled capsule.....SAXIFRAGACEAE, p. 454.

Style 1.

Sepals and petals 4 (rarely 5 or 2), the stamens commonly twice as many; fruit commonly a 4-celled capsule.....

ONAGRACEAE, p. 665.

Sepals and petals 5; stamens numerous; fruit a 1-celled capsule opening at the top; rough-hairy herbs, sometimes small bushes.....LOASACEAE, p. 648.

Sepals 2; petals 4; stamens 7 to 20; style mostly 3 to 8-parted; fleshy herb.....PORTULACA, p. 352.

Style none; stigmas 4; leaves in whorls; aquatic plants.....

HALORAGACEAE, p. 690.

Petals and stamens numerous; fruit 5 to 12-celled, dehiscing at summit; succulent maritime herbs.....MESEMBRYANTHEMUM, p. 342.

## III. SYMPETALOUS DIVISION. Calyx and corolla both present, the corolla with the petals united, at least at base.

### A. Stamens more than 5.

#### 1. COROLLA URN SHAPED TO TUBULAR OR CAMPANULATE, OR AT LEAST MARKEDLY SYMPETALOUS.

Stamens free from corolla or only lightly adherent at base.

Style 1, stigma 1; ovary 4 to 10 (rarely 1, 2 or 3)-celled; anthers commonly opening by a terminal pore, sometimes slit lengthwise; (Rhododendron occidentale has 5 stamens).....ERICACEAE, p. 735.

- Styles 3, united to middle: ovary incompletely 3-celled; thorny desert shrub.  
 FOUQUIERIACEAE, p. 640.  
 Stamens inserted in throat of tubular corolla; root parasite; (stamens 5 to 7).  
 LENNOACEAE, p. 734.

2. COROLLA NEVER TUBULAR OR URN SHAPED, COMMONLY WITH THE PETALS  
 JOINED ONLY AT BASE.

*a. Ovary superior.*

Pistils 4 or 5, distinct; stamens 10.....CRASSULACEAE, p. 449.

Pistil 1.

Corolla irregular; style 1, entire.

Flowers papilionaceous.

Ovary 1-celled; petals 5; fruit a legume; leaves compound, some-  
 times simple.....LEGUMINOSAE, p. 510.

Ovary 2-celled; petals 3; fruit a capsule; leaves simple, entire...  
 POLYGALACEAE, p. 593.

Flowers with the 4 petals in two dissimilar pairs; sepals 2; stamens 6;  
 leaves divided.....FUMARIACEAE, p. 404

Corolla regular.

Stamens 10, united at very base; ovary 5-celled; style 5-lobed; leaves  
 3-foliolate.....OXALIDACEAE, p. 587.

Stamens numerous, monadelphous in a tube; ovary 5 to many-celled;  
 leaves simple, roundish, subentire to palmately divided.....  
 MALVACEAE, p. 626.

*b. Ovary inferior or slightly inferior.*

Petals and stamens numerous; succulent very spiny plants...CACTACEAE, p. 654

Petals 4 to 8, the stamens about twice as many; shrubs...STYRACACEAE, p. 758.

**B. Stamens 5 or less, inserted on the corolla.**

1. OVARY SUPERIOR, THAT IS, FREE FROM THE CALYX.

*a. Corolla regular.*

Pistil 1.

Stamens as many as the lobes of the corolla and opposite them; style 1;  
 fruit a capsule; (stamens 5 to 7 in *Trientalis*).....  
 PRIMULACEAE, p. 753.

Stamens as many as or fewer than the lobes of the corolla and alternate with  
 them.

Corolla colored, not dry-scarious.

Ovary 1, 2 or 3-celled.

Fruit a capsule (sometimes a berry), not opening by a lid.

Style 3-cleft; ovary 3-celled, the flower otherwise with  
 the parts in 5s; capsule 3-valved.....  
 POLEMONIACEAE, p. 781.

Style not 3-cleft; ovary 1 or 2-celled.

Calyx of 5 distinct sepals, or the sepals united only  
 below; corolla 5-lobed; stamens 5; capsule  
 commonly 2-valved.

Erect or diffuse plants; corolla-lobes commonly  
 imbricate in the bud; flowers in coiled  
 racemes or spikes or in heads or soli-  
 tary; corolla-tube often with internal  
 scales; styles 2 and distinct, or 1 and  
 more or less cleft at apex; capsule few  
 to many-seeded; (style 1 and entire in  
*Romanzoffia*) .....

HYDROPHYLLACEAE, p. 809.

Twining or trailing plants; corolla mostly  
 plaited, the plaits twisted in the bud;  
 flowers not in coiled inflorescences;

- corolla-scales none except in *Cuscuta*;  
 styles 1 or 2; capsule 1 to 4-seeded....  
 CONVULVULACEAE, p. 775.
- Calyx 4 or 5-toothed or cleft; style 1, entire.  
 Ovary 2-celled; corolla 5-lobed; stamens 5; fruit  
 a many-seeded capsule or berry; stigma  
 1 (2 in *Datura*); leaves alternate....  
 SOLANACEAE, p. 886.
- Ovary 1-celled; corolla 4 or 5-lobed, commonly  
 withering-persistent; stamens 4 or 5;  
 stigmas 2; fruit a septicidal capsule;  
 leaves opposite..GENTIANACEAE, p. 761.
- Fruit a circumscissile capsule; stamens 2; shrubs.....  
 MENODORA, p. 760.
- Ovary 4-celled, commonly 4-lobed, splitting when ripe into as many  
 nutlets; stamens 5; style 1; flowers in coiled spikes or  
 racemes.....BORAGINACEAE, p. 835.
- Corolla dry-scarious; capsule opening by a lid; ovary 2 or 4-celled;  
 stamens 2 to 4; style 1.....PLANTAGINACEAE, p. 954.
- Pistils 2 (the ovaries distinct but the styles or stigmas united); herbs with  
 milky juice.  
 Stamens and stigmas united, the column bearing hood-like appendages....  
 ASCLEPIADACEAE, p. 769.
- Stamens and stigmas not united; no hoods.....APOCYNACEAE, p. 768.
- b. Corolla from strongly 2-lipped to slightly irregular.*
- Stamens 4 or 2.  
 Fruit a capsule.  
 Ovary 1-celled.  
 Stamens 2; corolla spurred; aquatic plants with finely divided  
 leaves, some bearing bladders..LENTIBULARIACEAE, p. 950.
- Stamens 4.  
 Corolla gibbous; capsule very large, its beak splitting into 2  
 diverging spines; terrestrial trailing plants.....  
 MARTYNIACEAE, p. 950.
- Corolla not gibbous; capsule small, not beaked; root-parasites  
 without green foliage.....OROBANCHACEAE, p. 951.
- Ovary 2-celled.  
 Placentae axile; seeds not winged.  
 Herbs, rarely shrubs; corolla strongly 2-lipped to nearly regu-  
 lar; stamens 4 or 2, a fifth rarely present as a sterile  
 filament or rudiment (or stamens 5 in *Verbascum*);  
 leaves alternate or opposite.....  
 SCROPHULARIACEAE, p. 895.
- Shrubs; stamens 2; calyx with a pair of opposite bractlets  
 at base.....ACANTHACEAE, p. 954.
- Placentae parietal; seeds winged; shrubs...BIGNONIACEAE, p. 949.
- Fruit of 2 to 4 nutlets; leaves opposite.  
 Ovary not lobed, 2 to 4-celled, splitting into as many nutlets; stamens  
 4; style 1, entire.....VERBENACEAE, p. 857.
- Ovary 4-lobed, splitting into as many nutlets; stamens 4 or 2; style 1,  
 cleft at apex; stems square; herbage with the odor of mint..  
 LABIATAE, p. 860.
- Stamens 5, some or all woolly.....VERBASCUM, p. 896.
2. OVARY INFERIOR, THAT IS, ADHERENT TO THE CALYX-TUBE.
1. *Stamens distinct.*
- Leaves alternate; flowers regular; stamens 5; ovary and capsule 2 to 5-celled;  
 herbs.....CAMPANULACEAE, p. 971.
- Leaves opposite or whorled.  
 Stamens 1 to 3; flowers irregular; fruit 1-celled, 1-seeded; herbs.....  
 VALERIANACEAE, p. 970

Stamens 4 or 5, rarely 2.

Ovary 1-celled; flowers in involucre heads or short spikes; fruit an achene; herbs.....DIPSACEAE, p. 969.

Ovary more than 1-celled (except in *Viburnum*).

Ovary in ours 2-celled; flowers regular; fruit berry-like or dry, commonly separating into 2 one-seeded achene-like portions; leaves simple; herbs or shrubs.....RUBIACEAE, p. 957.

Ovary 2 to 5-celled; flowers regular or irregular; fruit a berry, drupe or pod; leaves simple or compound; erect or twining shrubs. CAPRIFOLIACEAE, p. 964.

2. *Stamens united into a tube around the style.*

Flowers not in heads.

Stamens 3; leaves commonly palmate; tendril-bearing herbs.....CUCURBITACEAE, p. 660.

Stamens 5; leaves narrow; annual herbs.....LOBELIACEAE, p. 974.

Flowers collected into a head furnished with a calyx-like involucre, the whole resembling a single flower; stamens 5, rarely 4; fruit an achene.....COMPOSITAE, p. 979.

#### ABBREVIATIONS

*acc.*, according to.

*carp.*, carpel.

*cent.*, central.

*co.*, county; *cos.*, counties.

*e.*, easterly, eastward, east.

*fl.*, flower, flowering.

*fr.*, fruit, fruiting.

*ft.*, foot or feet.

*in.*, inch or inches.

*invol.*, involucre.

*isl.*, island.

*line*,  $\frac{1}{16}$  of an inch, 2 millimeters.

*long.*, longitudinal.

*mt.*, mount, mountain.

*n.*, northerly, northward, north.

*n. comb.*, new combination.

*n. sp.*, new species.

*n. var.*, new variety.

*nat. from*, naturalized from.

*nat. of.*, native of.

*no.*, number.

*pist.*, pistillate.

*s.*, southerly, southward, south.

*sect.*, section.

*stam.*, staminate.

*subsp.*, subspecies.

*var.*, variety.

*w.*, westerly, westward, west.

# MANUAL OF THE FLORA OF CALIFORNIA

## Subkingdom PTERIDOPHYTA. FERN PLANTS

Ours herbs. Sporophyte (or leafy plant) reproducing by means of non-sexual cells or spores borne in sporangia. Spores giving rise to flat plates of tissue or prothallia (gametophyte), these bearing male organs (antheridia) and female organs (archegonia). Archegonia containing an oosphere, this fertilized in the presence of water by a self-motile sperm released from an antheridium, the fertilized cell developing in turn a leafy plant or sporophyte.

### OPHIOGLOSSACEAE. ADDER'S-TONGUE FAMILY

Stem reduced to a short subterranean vertical rootstock, producing one leaf every year. Vernation straight or inclined. Leaf divided into 2 parts, the foliage part (here simply called the leaf) and the spore-bearing part or spike (sporophyll). The spore-bearing spike faces the foliage part, both being branches of the same stalk or petiole. Sporangia large, globose, borne laterally, opening transversely by a slit.

Leaf simple, entire; sporangia borne in an unbranched spike.....1. OPHIOGLOSSUM.  
Leaf pinnate; sporangia borne in a branched spike or panicle.....2. BOTRYCHIUM.

#### 1. OPHIOGLOSSUM L. ADDER'S TONGUE

Rootstock short. Leaf ovate to lanceolate, reticulately veined. Spike flattened, bearing its sporangia in 2 rows. (Greek ophis, snake, and glossa, tongue.)

Leaf ovate to elliptic; basal veins 9 to 13 or more.....1. *O. vulgatum*.  
Leaf lanceolate; basal veins 3 to 7.....2. *O. californicum*.

1. *O. vulgatum* L. Plants 4 to 10 in. high; leaf ovate to elliptic, sometimes oblanceolate, rounded at apex, 1 to 4 in. long, sessile near the middle of the plant; midvein indistinct or none; principal veins forming a loose network, the meshes nearly free from secondary veins; spike  $\frac{3}{4}$  to 2 in. long, long-stalked, exceeding the leaf.—Siskiyou Co.; e. to the Atlantic.

2. *O. californicum* Prantl. Plants 1 to 3 in. high; leaf lanceolate to ovate, acute or obtuse,  $\frac{1}{2}$  to 1 in. long; basal veins 3 to 7, the middle one stronger, the lateral branched; transverse veinlets oblique, forming long narrow areolae with few or no free veinlets; spike 3 to 6 lines long, with about 15 sporangia on either side.—Ione, Amador Co.; San Diego.

#### 2. BOTRYCHIUM Sw. MOONWORT

Rootstock small, tuberous. Leaf uni- to quadri-pinnate, fan-veined. Spike pinnately branched, covered on the surface facing the blade with small coriaceous sporangia. (Greek botrus, a cluster, referring to the sori.)

Leaf arising from above the middle of the plant.....1. *B. lunaria*.  
Leaf arising from near the base of the plant.

Leaf pinnate.....2. *B. simplex*.  
Leaf ternately decomposed.....3. *B. silaifolium*.

1. *B. lunaria* (L.) Swz. Plants fleshy, 6 to 9 ( $2\frac{1}{2}$  to 12) in. high; leaf usually sessile, borne at or above the middle of the plant, pinnate with 2 to 8 pairs of lobes; lobes lunate or fan-shaped, crenate or entire, closely imbricated or somewhat distant; sporophyll bi- or tri-pinnate, 1 to 2 in. long, often exceeding the leaf.—Lytle Creek, San Antonio Mts., 7000 ft.; Whitehorse Lake, Modoc Co., about 5000 ft.; e. to Vt.

2. *B. simplex* E. Hitchc. Plants slender, 2 to 5 in. high; leaf borne near the base of the plant, ovate in outline,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long, pinnately parted (or sometimes ternate with pinnate divisions); segments obovate, obtuse, crenulate or lobed, 3 to 5 lines long; sporophyll a simple or slightly compound spike, sometimes reduced to a few sporangia; spores large, minutely tuberculate.—San Bernardino Mts.; Sierra Nevada from Tulare Co. to Tuolumne Co.; Siskiyou Co.; e. to Nova Scotia.

3. *B. silaifolium* Presl. var. *californicum* (Underw.) Jepson n. comb. CALIFORNIA GRAPE-FERN. Plants stout, 8 to 18 in. high, the common stalk very short, wholly underground; leaves solitary or sometimes 2, broadly triangular or somewhat 5-sided in outline, the 3 main divisions copiously tri-pinnatifid or even quadri-pinnatifid, thick and fleshy, coriaceous in drying, glaucous, 4 to 10 (or 14) in. broad, nearly as long; ultimate segments numerous, ovate or obliquely oval, crenulate, 2 to 3 lines long; leaf-stalk 1 to 4 (or 6) in. long; sporophyll 2 to 5-pinnate, long-stalked, stout, 6 to 10 in. long.—Sierra Nevada from Mariposa Co. to Plumas and Modoc Cos., thence westerly to Humboldt Co. Var. *COULTERI* (Underw.) Jepson n. comb. Similar; leaf-stalk  $\frac{1}{2}$  to 1 in. long; ultimate segments crowded.—In hot springs, Kings Valley, Lassen Peak.

### POLYPODIACEAE. FERN FAMILY

Ours herbs. Leaf-blades (fronds) commonly much lobed or divided, borne on petioles (stalks) arising from creeping rootstocks; vernation circinate. Sporangia borne in clusters (sori) on the backs or margins of the leaves, and provided with a vertical incomplete thickened ring or annulus, dehiscing by a transverse cleft. Sori occurring as dots or collected in lines, commonly covered by a membrane or scale (indusium) derived from the margin or surface of the frond.

Indusium none or obscure, the sori naked.

Leaves powdery or waxy or tomentose beneath; leaves uni- to quadri-pinnate.

Sori elongated, following the veins, often branched or netted...1. *GYMNOGRAMME*.

Sori roundish or oblong, marginal.....2. *NOTHOLAENA*.

Leaves not powdery or waxy or tomentose; sori round or dot-like.

Leaves simply pinnatifid; sori large, on the tips of the veins....3. *POLYPODIUM*.

Leaves thrice pinnatifid; sori small, on the backs of the veins....4. *PHEGopteris*.

Indusium present.

Sori marginal or submarginal, covered by the more or less modified margin of the leaf or indusium.

Sori clearly distinct.....5. *ADIANTUM*.

Sori in a more or less continuous marginal band.

Leaf stalks stout, commonly solitary.....6. *PTERIS*.

Leaf stalks slender, clustered.

Fronds hairy, scaly or viscid (except 1 species)....7. *CHEILANTHES*.

Fronds glabrous.

Sterile and fertile fronds much alike; leaf-stalk dark-colored....

8. *PELLAEA*.

Sterile and fertile fronds very unlike; leaf-stalks light brown or cinnamon.

Fronds bi- or tri-pinnate.....9. *CRYPTOGRAMMA*.

Fronds simply pinnate.....10. *LOMARIA*.

Sori not marginal.

Fruit-bearing veins parallel to the midrib; sori linear, nearer the midrib than the margin; leaves pinnately compound, all alike....11. *WOODWARDIA*.

Fruit-bearing veins not parallel to the midrib.

Sori oblong, seated on oblique veins.

Sori straight; leaves evergreen.....12. *ASPLENIUM*.

Sori curved; leaves herbaceous.....13. *ATHYRIUM*.

Sori round.

Indusium conspicuous.

Indusium peltate; leaves firm or coriaceous....14. *POLYSTICHUM*.

Indusium reniform; leaves membranaceous.....15. *ASPIDIUM*.

Indusium inconspicuous.

Indusium placed beneath the sorus, irregularly lobed or fringed..

16. *WOODSIA*.

Indusium attached at the side, hooded.....17. *CYSTOPTERIS*.

### 1. *GYMNOGRAMME* Desv.

Densely tufted fern. Leaves in ours pinnate, white or golden beneath with a waxy powder. Sori oblong or linear, simple, forked or pinnate, following the course of the veinlets. Indusium none. (Greek *gymnos*, naked, and *gramme*, line, the indusium lacking.)

1. *G. triangularis* Kaulf. GOLD FERN. Fig. 1. Five to 10 in. high; stalks dark brown, polished; fronds pentagonal or deltoid in outline, partly or twice pinnate, 2 to 4 (or 5) in. long; lower pair of pinnae the larger, pinnate; pinnales oblong, nearly entire to pinnately lobed; sori more or less confluent and largely covering the backs of the pinnae.—Damp rock crevices or moist places, 100 to 4500 feet: Coast Ranges; Sierra Nevada; cismontane S. Cal.;

desert ranges; n. to B. C., e. to Ariz. (*Ceropteris triangularis* Underw.). Var. *viscosa* Eat. Upper surface of leaves viscid.—San Diego Co.

## 2. *NOTHOLAENA* R. Br.

Ours small ferns. Leaves small, uni- to quadripinnate, hairy, tomentose or white-waxy beneath. Sori seated on the veins at or near their extremities, roundish or oblong, soon more or less confluent into an irregular marginal band. Indusium none. Veins always free. (Greek *nothos*, spurious, and *laina*, cloak, the woolly hairs forming a false indusial covering to the sorus.)

1. *Gymnogramme triangularis*  
Kaulf.; frond  $\times \frac{1}{2}$ .

Fronds simply pinnate.....1. *N. sinuata*.  
Fronds bipinnate to quadripinnate.

Fronds woolly, especially beneath.

Segments of the fronds with a close felt; stalks commonly with intermixed hairs and shorter gland-tipped hairs, sometimes glabrate; scales of rootstock subulate; cismontane S. Cal.....2. *N. newberryi*.

Segments of fronds coarsely and thickly woolly; stalks woolly or at length more or less glabrate; scales of rootstock lanceolate; deserts....3. *N. parryi*.

Fronds glabrous or nearly so.

Pinnules sessile; fronds colored beneath; basal lower pinnules of lowest pair of pinnae much elongated and again pinnatifid.

Fronds bright yellow or white beneath, the segments without inturned margin or scarcely.....4. *N. candida*.

Fronds brown or dull white beneath, the segments with strongly incurved margin.....5. *N. californica*.

Pinnules stalked; fronds green; lowest pinnules not elongated.....6. *N. jonesii*.

1. *N. sinuata* (Swz.) Kaulf. Plants rigidly erect, 8 to 14 in. high; stalks short, arising from a densely red-scaly rootstock; fronds simply pinnate, the lower surface densely scaly; pinnae numerous, ovate or roundish, 3 to 8 lines long.—Providence Mts.; e. to Tex., s. to Mex.

2. *N. newberryi* Eat. COTTON FERN. Fig. 2. Plants 3 to 8 in. high, densely felt-like, or white-tomentose or silvery, at length rusty on the lower surface of the fronds; rootstocks densely clothed with dark-brown subulate scales; fronds lanceolate-oblong, tri- or quadripinnate, 3 to 4 in. long, as long as the stalks; pinnae oblong-ovate or sometimes narrowly triangular-ovate, mostly (4 or) 6 to 12 lines long, the lower 1 to 3 pairs discrete or distant; pinnules crowded, their segments minute (about  $\frac{1}{2}$  line long), roundish-ovate; hidden by the tomentum; sporangia rather large, blackish, at length emergent from the tomentum.—Among stones or under boulders, very dry places, San Bernardino Mts. to San Diego Co. and L. Cal.

2. *Notholaena newberryi* Eat.; frond  $\times \frac{1}{2}$ , the pinnules hidden by the tomentum.

3. *N. parryi* Eat. PARRY CLOAK FERN. Fig. 3. Plants  $2\frac{1}{2}$  to 8 in. high, the tomentum similar to but coarser than in no. 1; rootstocks short, densely clothed with red-brown lanceolate scales which often have a black midnerve; fronds oblong-lanceolate ( $\frac{3}{4}$  or)  $1\frac{1}{2}$  to 4 in. long, about as long as the stalks, tripinnate, the lower pinnae distant; pinnae 2 to 4 or 5 lines long, commonly so densely tomentose as to look like pellets of wool; ultimate segments oblong-ovate, 1 line long; sporangia blackish, eventually projecting beyond the margin of the segments.—Crevices of cliffs and under boulders: Death Valley; e. Mohave Desert; Colorado Desert; L. Cal., e. to Ariz. and Utah.

4. *N. candida* Hook. var. *accessita* Jepson n. var. PIGMY FERN. Plants 2 to 4 in. high; scales of the rootstock nearly

3. *Notholaena parryi* Eat.; frond  $\times \frac{1}{2}$ , the pinnules hidden by the wool.

black; fronds roundish-cordate or triangular-ovate, pinnate,  $\frac{3}{4}$  to 1 in. long, covered beneath with a white or yellow waxy powder; pinnae oblong-lanceolate from a broad base, obtuse, pinnatifid; pair of lowest pinnules with the basal segment on the lower side greatly elongated and pinnatifid, resembling a supplementary pinnule; lower basal segment greatly elongated and again pinnatifid, the other pairs regularly segmented and gradually decreasing upward; segments elliptic, obtuse.—San Diego Co.: upper Vallecito (Jepson 8031, type); Spring Valley.

5. *N. californica* Eat. Stalks tufted,  $1\frac{3}{4}$  to  $5\frac{1}{2}$  in. high, glabrous; fronds  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, similar to no. 3, but brownish or dull white beneath, segments with strongly incurved margins.—S. Cal. (Deadman Pt., Victorville; San Bernardino; Palm Sprs., Mt. San Jacinto); s. to L. Cal., e. to Ariz.

6. *N. jonesii* Max. Tufted,  $1\frac{1}{2}$  to  $3\frac{3}{4}$  in. high; fronds oblong-ovate, bipinnate, glabrous; pinnae few; pinnules 1 or 2 pairs, mostly short-stalked, distant, roundish or subcordate, entire or crenate, 1 to 2 (or  $2\frac{1}{4}$ ) lines long, the terminal segment similar but often larger; sori in a broad submarginal band.—Desert ranges: San Bernardino Mts. (n. slope); Panamint Mts.; e. to Utah. (*N. tenera* Am. auth.)

4. *Polypodium vulgare* var. *occidentale* Hook.; frond  $\times \frac{1}{4}$ .

### 3. POLYPODIUM L. POLYPODY

Ours small ferns with creeping scaly rootstocks and glabrous herbage. Leaves not tufted, pinnately parted. Sori roundish, arranged in a row either side of the midvein. Indusium none. (Greek *polus*, many, and *pous*, foot, the stipes many in some.)

Sori  $\frac{1}{2}$  to  $1\frac{1}{2}$  lines broad; frond mostly membranous; terminal pinna usually not conspicuous.

Pinnae acuminate, often somewhat falcate; var. *occidentale* of.....1. *P. vulgare*.  
Pinnae acute, not falcate (or obtuse).

Veins forming areolae, with an included veinlet bearing a sorus; lower altitudes, common; var. *intermedium* of.....1. *P. vulgare*.

Veins not forming areolae, free; high montane, rare.....2. *P. virginianum*.

Sori  $1\frac{1}{2}$  to 2 lines broad; fronds coriaceous; terminal pinna conspicuous.....3. *P. scolieri*.

1. *P. vulgare* L. var. *occidentale* Hook. LICORICE FERN. Fig. 4. Stalk slender, 2 to  $5\frac{1}{2}$  in. long; fronds thin-membranous, 6 to 11 in. long, pinnatifid almost to the midrib; pinnae lanceolate or oblong-lanceolate, often somewhat curved, tapering to an acuminate point, 1 to  $2\frac{1}{2}$  in. long; sori about  $\frac{3}{8}$  line broad, distinct.—On trees or in moist soil in the Redwood belt of Humboldt Co.; n. to Wash. Apparently also in Marin Co. Roots roasted as a confection. (*P. occidentale* Max.) Var. *INTERMEDIUM* (H. & A.) Fer. California Polypody. Stalks somewhat slender, 2 to 4 in. long; fronds ovate or ovate-oblong, pinnatifid almost to the midrib,  $3\frac{1}{2}$  to 10 (or 14) in. long; pinnae oblong, tapering to an acute apex, serrulate,  $1\frac{1}{2}$  to 3 in. long; sori 1 to  $1\frac{1}{2}$  lines broad, distinct or confluent.—Mossy banks, crevices of rocks, rarely on trees: Sierra Nevada foothills from Butte Co. to Fresno Co. (1500 to 4000 ft.); near the coast from Humboldt Co. to San Luis Obispo Co. (50 to 1500 ft.); coastal Mts. of S. Cal. (100 to 4000 ft.). Var. *KAULFÜSSII* (Eat.) Fer. Plants smaller (3 to 5 or 7 in. high); pinnae mostly obtuse.—Headland slopes facing the sea, Marin Co., San Francisco and s.

5. *Polypodium scolieri* H. & G.; frond  $\times \frac{1}{4}$ .

2. *P. virginianum* L. GOLDEN POLYPODY. Similar to no. 1; plants 8 to 14 in. high; fronds subcoriaceous; lowest pairs of pinnae more frequently alternate than

in no. 1.—High montane, 5000 to 8000 ft., rare: Yosemite; San Bernardino Mts.; e. to the Atlantic.

3. *P. scouleri* H. & G. LEATHER-LEAF. Fig. 5. Fronds ovate, coriaceous, 4 to 10 in. long, parted to the midrib; stalks stout, 4 to 6 in. high; pinnae oblong, rounded at apex, obscurely serrulate,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long, the terminal pinna distinct, much longer than the upper lateral ones, often the largest of all; sori roundish,  $1\frac{1}{2}$  to 2 lines broad, distinct or eventually more or less confluent.—On trees or rocks: Redwood belt from San Mateo Co. to Del Norte Co.; Santa Barbara Isls.; n. to B. C.

#### 4. PHEGÓPTERIS Fee. BEECH FERN

Rather large ferns. Fronds nearly tripinnate in ours. Sori round, minute, seated on the veins below their apex; indusium none. (Greek phegos, a kind of oak with edible nut, and pteris, fern.)

1. *P. alpestris* Hoppe var. *americana* (Butters) Jepson n. comb. ALPINE BEECH FERN. Fig. 6. Plants  $\frac{2}{3}$  or  $1\frac{1}{2}$  to  $2\frac{1}{2}$  ft. high; fronds oblong-lanceolate, glabrous (6 or) 10 to 20 in. long; pinnae narrowly deltoid-lanceolate, the pinnules oblong-lanceolate, pinnatifid with the segments toothed.—High montane, 7000 to 11,500 ft.: Sierra Nevada from Tulare Co. to Tuolumne and Lassen Cos.; thence nw. to Siskiyou Co.; White Mts. of Inyo Co.; n. to B. C.; Eur.

6. *Phegopteris alpestris* var. *americana* Jepson; pinna x 1.

#### 5. ADIANTUM L.

Delicate ferns with creeping rootstocks. Leaf stalks blackened or purplish brown, commonly highly polished. Pinnules more or less one-sided. Sori borne on the ends of the veinlets at the edge of the pinnules and covered by a reflexed margin or indusium. (Greek a, not, diaino, to wet, the foliage shedding rain.)

Leaf stalks continuous, bearing pinnae along their axes.

Upper margin of fertile pinnules more or less palmately incised or serrulate.....

Upper margin of fertile pinnules rounded, entire save for 1 to 3 very short clefts... 1. *A. capillus-veneris*

2. *A. emarginatum*  
Leaf stalks forked at the summit, each curving fork bearing several pinnae. 3. *A. pedatum*.

7. *Adiantum capillus-veneris* L.; pinna x  $\frac{1}{2}$ .

1. *A. capillus-veneris* L. COMMON MAIDEN-HAIR. Fig. 7. Leaves  $\frac{1}{3}$  to  $1\frac{1}{2}$  (or 2) ft. high; stalks and rachises black, polished; pinnae with about 3 to 10 pinnules; pinnules obovate or roundish, cuneate and entire at base, palmately cleft or serrulate above, 3 to 6 (or 11) lines long; indusia marginal, transversely oblong, separated.—Moist cool and shady cañon walls at low altitudes, widely scattered in the state but relatively rare; cosmop.

2. *A. emarginatum* Hook. CALIFORNIA MAIDEN-HAIR. Fig. 8. Similar to no. 1; stalks stouter; pinnules broadly fan-shaped, reniform to cuneate at the entire base, above serrulate in the sterile pinnules, or with only 1 to 3 very short clefts in the fertile pinnules, 6 to 8 (or 13) lines broad; indusia marginal, transversely elongated, only slightly interrupted around the whole upper portion of the pinnule.—Moist places at low altitudes: cismontane S. Cal.; Coast Ranges; rare in the Sierra foothills (American River).

8. *Adiantum emarginatum* Hook.; pinna x  $\frac{1}{2}$ .

3. *A. pedatum* L. FIVE-FINGER FERN. Fig. 9. Leaves 1 to  $2\frac{1}{2}$  ft. high, the stalks forked at the top, the outwardly curving forks each bearing 3 to 8 pinnae; pinnae long-oblong, 3 to 9 in. long; pinnules oblong, incised on the upper margin, entire below, short-stalked; indusia long-oblong.—Moist cool

9. *Adiantum pedatum* L.;  
pinna  $\times \frac{1}{2}$ .

places throughout the state; N. Am., Asia. Var. *ALEUTICUM* Rupr. Pinnae fewer and more strict; pinnules longer-stalked, more deeply cleft.—Rare, high Sierra Nevada, 7000 to 10,000 ft.; n. to Alas.

#### 6. *PTERIS* L. BRACKEN

Ferns with usually solitary stalks and dark cord-like rootstocks creeping widely underground. Leaves ample, once to thrice pinnate or decompound. Sori marginal, continuous, borne on a marginal vein which connects the ends of the lateral veins. Indusium continuous around the margins of the segments or sometimes interrupted at their apices. (Greek pteris, a wing, the name applied to ferns on account of the feathery fronds.)

1. *P. aquilina* L. var. *lanuginosa* (Bory) Hook. Fig. 10. Plants 1 to 4 ft. high; fronds ternate at the summit of an erect stout stalk, then twice pinnate, tomentulose beneath; pinnules oblong-lanceolate, the upper undivided, the lower more or less pinnatifid.—Common throughout the state in the foothills, ascending in the mountains to the Yellow Pine belt. The young shoots were eaten by the native tribes and the fronds are used by white settlers for thatching summer shelters. (*Pteridium aquilinum* (L.) Kuhn var. *lanuginosum*.)

10. *Pteris aquilina*  
L. var. *lanuginosa*  
Hook.; pinna  
 $\times 1$ .

#### 7. *CHEILANTHES* Sw. LIP FERN

Low ferns with bi- or tri-pinnate leaves. Sterile and fertile leaves nearly alike. Sori roundish, distinct or nearly contiguous, seated on the thickened ends of the free veinlets, covered by a mostly whitish and membranous common indusium derived from the reflexed margins of the pinnule or of its lobes. (Greek cheilos, margin, and anthus, flower, the sori marginal.)

Upper divisions of the rachis with a narrow herbaceous border; herbage glabrous, not viscid or scaly; fronds deltoid; indusia distinct. . . . . 1. *C. californica*.  
Rachis without an herbaceous border; herbage viscid or woolly or scaly; fronds lanceolate or linear to ovate.

Ultimate segments flattish; indusium not continuous all around the margin.

Herbage viscid, not hairy or only obscurely so. . . . . 2. *C. viscida*.

Herbage hairy and more or less glandular. . . . . 3. *C. cooperae*.

Ultimate segments bead-like; indusium continuous all around the margin of the pinnule; fronds bi- to quadri-pinnate.

Fronds tomentose beneath, not scaly.

Stipes and rachises not scaly.

Upper surface of fronds naked or nearly so; indusium prominent, continuous, not concealed. . . . . 4. *C. gracillima*.

Upper surface of fronds with long scattered hairs or glabrate; indusium slightly interrupted, concealed by the dense tomentum of the under surface. . . . . 5. *C. feei*.

Stipes and rachises covered with very narrow scales; upper surface of fronds decidedly pubescent; local about Mt. San Jacinto.

Rachises coarsely fibrous beneath. . . . . 6. *C. fibrillosa*.

Rachises not fibrous beneath. . . . . 7. *C. parishii*.

Fronds densely imbricated beneath with membranous lanceolate scales, not at all tomentose.

Leaves many, closely cespitose; ultimate segments roundish or irregularly oval. . . . . 8. *C. covillei*.

Leaves few, larger, spaced  $2\frac{1}{2}$  to 5 lines apart; ultimate segments mostly subcordate-orbicular. . . . . 9. *C. clevelandii*.

1. *C. californica* Mett. Fig. 11. Plants 6 to 11 in. high, the stalks densely tufted, dark brown, glossy; fronds green, broadly deltoid-ovate, finely quadripinnatifid,  $1\frac{1}{2}$  to  $3\frac{1}{2}$  in. long; upper divisions of the rachis with a narrow herbaceous border; ultimate segments lanceolate, incised, 1 to  $1\frac{1}{2}$  lines long; sori one to each fertile veinlet, the lunate indusia in the sinuses between the teeth of the segments.—Moist shady places or in dry rock crevices in the

foothills; frequent in cismontane S. Cal.; n. in the Coast Ranges to Sonoma Co. and in the Sierra Nevada to Butte Co., but rare.

2. *C. viscida* Davenp. Densely tufted, 3 to 12 in. high; rootstocks densely clothed with red-brown lanceolate scales; herbage minutely glandular or glandular-dotted, especially on the stalks and rachises; fronds lanceolate, bi- or tripinnate; pinnae 3 to 7 lines long; pinnules pinnatifid with the oblong segments incised or toothed.—Desert ranges, 1000 to 4000 ft.: Panamint Range; desert slopes of the mountains bordering the Colorado Desert on the west; L. Cal.

3. *C. coóperae* Eat. COOPER FERN. Fig. 12. Densely tufted, 1 to 4 (or 8) in. high; herbage hairy and more or less

12. *Cheilanthes coóperae* Eat.; a, frond  $\times \frac{1}{2}$ ; b, pinnule  $\times 1\frac{1}{2}$ .

Co.; Sierra Nevada from Mariposa Co. to Lassen Co.

5. *C. feei* Moore. Plants  $1\frac{1}{2}$  to  $5\frac{1}{2}$  in. high, the red-brown stalks densely tufted, sparingly hairy or often glabrous; fronds lance-ovate, tripinnate,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long, densely hairy-tomentose beneath, green and sparingly hairy above or glabrate; pinnae 3 to 6 lines long, the secondary pinnae with crowded pinnules; pinnules elliptic or roundish, about  $\frac{1}{2}$  line long, the margin weakly recurved.—E. Mohave Desert (Providence Mts.); Charleston Mts., Nev.; B. C. to Ill. and Tex.

6. *C. fibrillósa* Davenp. Plants 3 to 6 in. high; stipes 2 to 3 in. long; fronds oblong-lanceolate, tripinnate, loosely tomentose, at length subglabrate, 2 to 3 in. long,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. wide; rachises having the scales mixed with a coarse fibre.—Mt. San Jacinto (w. base near the village of Florida); apparently extinct.

7. *C. parishii* Davenp. Fronds oblong-lanceolate, tri- to quadri-pinnate, both surfaces scantily but coarsely tomentose,

11. *Cheilanthes californica* Mett.; frond  $\times 1$ .

glandular; stalks dark brown; fronds oblong or oblong-lanceolate, bi-pinnate, 2 to 5 in. long; pinnules elliptic, crenate or crenately incised, 2 to 4 lines long.—Crevices of cliffs or rocks in the foothills, infrequent: Sierra Nevada foothills (Eldorado Co.; Calaveras Co.; Duck Bar, Stanislaus River; Wards Ferry, Tuolumne Co.; Hites Cove, Mariposa Co.); Santa Inez Mts.; Slover Mt., San Bernardino; s. to Mex.

4. *C. gracillima* Eat. LACE FERN. Fig. 13. Densely tufted, 2 to 6 (or 8) in. high; stalks glabrous or nearly so, red-brown; fronds linear or lanceolate, bi-pinnate,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long; pinnae 2 to 4 (or 6) lines long; pinnules elliptic or ovate, glabrous above, woolly beneath, 1 to  $1\frac{1}{2}$  lines long, the terminal one often larger, commonly obliquely lobed at base, often once lobed or once cleft above, the margin strongly reflexed.—Among rocks in the higher mountains, 2500 to 4500 or 8000 ft.: North Coast Ranges from Marin Co. to Siskiyou

13. *Cheilanthes gracillima* Eat.; frond  $\times 1$ .

14. *Cheilanthes covillei* Max.; frond  $\times 1$ .

3 to 4 in. long; segments roundish, the terminal largest and 3 lobed.—Andreas Cañon, e. base Mt. San Jacinto.

8. *C. covillei* Max. Fig. 14. Plants 2 to 6 in. high; rootstocks short, ascending; stalks tufted; fronds ovate to ovate-lanceolate, 2 to 4 in. long, green and subglabrous above, the rachises and midribs densely covered beneath with broadly lanceolate scales, these white or soon rusty brown, mostly entire; ultimate bead-like segments numerous, crowded, sometimes suggesting a tessellated pavement, destitute of scales above.—Dry rocky peaks or ridges, 2500 to 6500 ft., both in cismontane S. Cal. and the Colorado Desert, extending n. in the inner Coast Range to Lake Co., in the Sierra Nevada to Eldorado Co., and through the Mohave Desert and thence n. to Inyo Co. and Lassen Co. (*C. fendleri* Cal. auth.). Var. *INTERTÉXTA* Max. Segments bearing a few minute scales above; scales beneath copiously ciliate, entangled, forming a loose tomentum.—Mendocino Co. to the Santa Cruz Mts. and Mt. Hamilton Range.

9. *C. clevelandii* Eat. Plants 6 to 12 in. high; stalks rather scattered or loosely tufted; fronds 4 to 8 in. long, ovate-lanceolate tri- to quadri-pinnate, glabrous and green above, rusty brown beneath with a densely imbricated covering of broad ciliated scales; ultimate segments numerous, crowded, round,  $\frac{1}{4}$  to  $\frac{1}{2}$  line broad, the terminal ones a little larger.—Foothills: San Diego and Riverside Cos.; Santa Barbara Co.

15. *Pellaea bridgesii* Hook.; a, fertile frond; b, sterile frond.  $\times \frac{1}{2}$

#### 8. PELLAEA Link. CLIFF BRAKE

Small rock ferns. Stalks usually dark-colored. Sterile and fertile fronds much alike, 1 to 4-pinnate, generally glabrous and sometimes glaucescent. Sori roundish or oblong, seated near the ends of the veins, often confluent in a submarginal band. Indusium membranous, often broad, continuous round the pinnules and derived from their reflexed margins. (Greek pellos, dusky, referring to the leaf stalks.)

Fronds simply pinnate.

Pinnae entire, coriaceous, the veins usually not visible.....1. *P. bridgesii*.

Pinnae 2-parted or mostly so, thin, the veins clearly visible.....2. *P. breweri*.

Fronds bi- or tri-pinnate.

Fronds bipinnate only; pinnules acute or mucronate.

Fronds linear in outline; secondary rachises very short, the linear-elongated pinnules very closely crowded.....3. *P. brachyptera*.

Fronds lanceolate in outline; secondary rachises mostly  $\frac{3}{4}$  to 1 in. long, the oblong pinnules closely set but not crowded.....4. *P. compacta*.

Fronds bipinnate or partly tripinnate.

Fronds 2 to 5 times as long as broad; common.

Pinnules mucronate, all sessile or nearly so, some of the lower replaced by a cluster of 3 sessile pinnules.....5. *P. ornithopus*.

Pinnules obtuse or emarginate, the lateral sessile or nearly so, the terminal ones with long petiolules.....6. *P. andromedaefolia*.

Fronds roundish in outline, nearly as broad as long; pinnules linear, acute at both ends; rare.....7. *P. densa*.

1. *P. bridgesii* Hook. BRIDGES CLIFF-BRAKE. Fig. 15. Plants 4 to 5 (or 10) in. high; stalks densely tufted, copper-color; fronds pinnate, 2 to  $4\frac{1}{2}$  in. long; pinnules many, roundish-ovate or suborbicular, 2 to  $4\frac{1}{2}$  or 6 lines long, the lower shortly stalked, the upper sessile.—Clefts of dry exposed rocks, 6000 to 11,000 ft.: Sierra Nevada from Tulare Co. to Sierra Co.; n. to Ore.

2. *P. breweri* Eat. SIERRA CLIFF-BRAKE. Fig. 16. Plants very densely tufted, 3 to 6 (or 8) in. high; rootstocks densely dark red-scaly, as if tomentose, the scales attenuate, linear-filiform and very rusty; stalks red-brown;

16. *Pellaea breweri* Eat.;  
frond  $\times \frac{1}{2}$ .

fronds simply pinnate,  $1\frac{1}{2}$  to 4 in. long; pinnae deeply 2-parted, rarely 3-parted, the divisions ovate to oblong-lanceolate, 5 to 7 (or 10) lines long; veins freely forking.—Under rocks, high Sierra Nevada, 7000 to 11,000 ft., from Tulare Co. to Placer Co., thence to Siskiyou Co.; Panamint Mts.; White Mts.; Nev. to Ida.

3. *P. brachyptera* Baker. Fig. 17. Plants loosely tufted, 6 to 9 in. high; rootstocks densely scaly, almost as if rusty tomentose with very slender denticulate red-brown scales; stalks red-brown; fronds linear, 3 to 5 in. long, bipinnate, the 3 to 6 pairs of pinnules densely crowded on the short rachises; pinnules linear, 3 or 4 to 6 lines long, the margins inflexed to the midrib in fertile fronds.—Rocks, montane, 4000 to 8000 ft., from Plumas Co. to Siskiyou Co. and Trinity Co.; n. to Ore.

17. *Pellaea brachyptera*  
Baker;  
pinna  $\times 1$ .

4. *P. compacta* Max. Fig. 18. Tufted, glabrous, 5 to 7 in. high, evergreen; stalks brown; fronds lanceolate, bipinnate, 3 to 5 in. long; pinnae oblong to ovate, 4 or 6 to 12 lines long; pinnules 3 or 6 to 10 pairs, sessile, closely set but not crowded, oblong, mucronate,  $1\frac{1}{2}$  to 2 lines long, spreading at right angles or slightly curved upward, their reflexed or indusial margin strongly inrolled, denticulate.—Dry slopes or flats, montane, 5000 to 6000 ft., Sierra Nevada from Tuolumne Co. southw.; Panamint Mts.; San Gabriel Mts.; San Bernardino Mts.; San Jacinto Mts.

18. *Pellaea compacta*  
Max.; pinna  
 $\times 1$ .

19. *Pellaea ornithopus*  
Hook.; pinna  
 $\times 1$ .

5. *P. ornithopus* Hook. BIRD'S-FOOT FERN. Fig. 19. Plants loosely tufted, 7 to 12 (or 17) in. high, evergreen, dry and brittle; stalks rigidly erect, wiry, mahogany color; fronds bipinnate or partly tripinnate, oblong- or deltoid-lanceolate, bluish or lead-color, 5 to 9 or 14 in. long; pinnae oblong to linear, with about 3 to 5 (or 8) pairs of pinnules; pinnules oblong, mucronate,  $1\frac{1}{4}$  to 2 lines long, sessile or nearly so, spreading at right angles to the rachis, or the lower pairs commonly replaced by secondary pinnae of 3 pinnules, these clusters of 3 resembling the print of a bird's foot.—Driest rocky points and gravelly or bare ledges in the foothills, common, 400 to 4000 (or 5000) ft.: Coast Ranges from Mendocino and Glenn Cos. to San Luis Obispo Co.; Sierra Nevada foothills from Butte Co. to Tulare Co.; Panamint Mts.; w. Mohave Desert; coastal S. Cal.; s. to L. Cal.

Sometimes called Tea Fern; also Poison Fern and Black Fern, since causing death to sheep. (*P. mucronata* Eat.)

6. *P. andrōmedaefolia* Fee. COFFEE FERN. Fig. 20. Plants very loose or open, 10 to 22 in. high, evergreen; stalks straw-color, slightly chaffy; fronds 4 to 7 in. long, bi-pinnate or partially tri-pinnate; pinnae with 3 to 5 pairs of pinnules or the lower one or two pairs replaced by secondary pinnae of 3 pinnules; pinnules oblong, obtuse, 2 to 5 (or 6) lines long, the lateral sessile or nearly so, the terminal one with a long petiolule.—Rocky soil in the foothills, 1000 to 4000 ft.: cismontane S. Cal.; Coast Ranges n. to Mendocino Co.; Sierra Nevada foothills (Tulare Co. to Amador Co.); Marysville Buttes; s. Ore. Also called Sheep Fern, the wiry stalks breaking into needle-like pieces when eaten by sheep and penetrating the intestines, just as in the case of the Black Fern.

20. *Pellaea andrōmedaefolia* Fee;  
pinna  $\times 1$ .

7. *P. dēnsa* Hook. OREGON CLIFF-BRAKE. Fig. 21. Plants loosely tufted, 4 to 6 in. high; stalks subfiliform

21. *Pellaea densa*  
Hook.; frond x 1.

or slender, mahogany color; fronds deltoid- or roundish-ovate, closely tripinnate,  $\frac{3}{4}$  to 2 in. long; pinnules linear, acute at both ends, mucronate, ascending, 3 to  $3\frac{1}{2}$  lines long.—Rare, high Sierra Nevada from Tulare Co. to Nevada Co., 6000 to 8500 ft., sometimes in cool cañons as low as 2000 ft.; nw. Mendocino Co. (Leggett Valley); n. to B. C., e. to Wyo. (*Cryptogramma densa* Diels. *Cheilanthes siliquosa* Max.)

#### 9. CRYPTOGRAMMA R. Br.

Rather small ferns with densely clustered stalks and chaffy rootstocks. Leaves bi- to tri-pinnate, glabrous, of 2 kinds, the fertile taller than the sterile. Sori oblong or roundish, soon confluent. Indusium continuous, formed of the reflexed margins of the pinnule, these meeting at the midrib, at length opening out flat. (Greek cryptos, hidden, and

gramme, line, referring to the concealed sori.)

1. *C. acrostichoides* R. Br. ROCK BRAKE. Fig. 22. Leaves ovate, 2 to 3 (or 5) in. long; sterile leaves with narrowly winged rachises, the pinnules ovate, crenate or slightly incised; fertile leaves with the rachises scarcely winged, the pinnules linear,  $3\frac{1}{2}$  to 5 (or  $8\frac{1}{2}$ ) lines long.—Rocky places, high montane, 6000 to 10,000 ft.: San Bernardino Mts.; Sierra Nevada and n. to Modoc Co.; high North Coast Ranges in Humboldt Co.; n. to Wash. and Unalaska.

22. *Cryptogramma acrostichoides* R. Br.; a, fertile pinna; b, sterile pinna.  
x  $\frac{1}{2}$ .

#### 10. LOMARIA Willd.

Tufted ferns with short thick very chaffy erect rootstocks and simply pinnate or pinnatifid leaves. Leaves of 2 kinds, the sterile with broad foliaceous pinnae, the fertile with very narrow pinnae. Sori in a continuous band, one on each side of and parallel to the midrib of the fertile pinnae (but nearer the margin than the midrib), covered till mature by an elongated marginal or sub-marginal indusium. (Greek loma, a hem or edge, referring to the indusium.)

1. *L. spicant* Desv. DEER FERN. Fig. 23. Leaves erect, glabrous, the sterile ones nearly sessile or on short stalks, lance-linear,  $\frac{1}{2}$  to 2 or 3 ft. high, pinnatifid to the rachis, the pinnae numerous, closely placed, oblong or oblong-linear, acute or obtuse, often upwardly falcate,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; fertile leaves taller than the sterile, more erect, long-stalked, pinnate, the pinnae less crowded, very narrowly linear, sessile by a suddenly dilated base; mature sporangia nearly covering the back of the pinnae.—Redwood belt from Santa Cruz Co. to Del Norte Co.; rare in the Sierra Nevada (Eldorado Co., along alpine streams); n. to Alas.; Eur., Asia. Eaten by deer in the spring.

23. *Lomaria spicant* Desv.  
Segments of sterile (a)  
and fertile (b) fronds.  
x  $\frac{1}{2}$ .

#### 11. WOODWARDIA Sm.

Large ferns with ample pinnate leaves. Rootstocks stout, very densely chaffy with rusty-brown scales. Sori oblong-linear, forming a chain-like row each side of the midribs of the segments. Indusium convex, fixed by its outer margin to the veinlet, free on the inner side. (T. J. Woodward, English botanist.)

1. *W. radicans* Sm. CHAIN FERN. Fig. 24. Leaves long-stalked, standing in a circle, 4 to 6 or 8 ft. high, oblong-ovate in outline; pinnae oblong-lanceolate, deeply pinnatifid, 6 to 11 in. long, their segments lanceolate, slightly falcate, spinulose-serrulate or sometimes pinnatifid.—Springy spots where

24. *Woodwardia radicans* Sm.;  
pinna  $\times \frac{1}{2}$ .

there is all-the-year seepage, foothills and mostly lower altitudes in the mountains, 100 to 4500 (or 8000) ft., almost throughout Cal., but not frequent in the Sierra Nevada (Yosemite, Little Chico Creek); Mex., S. Am., Afr., Asia. (*W. spinulosa* Mart. & Gal.)

## 12. *ASPLENIUM* L. SPLEENWORT

Medium-sized ferns. Fronds in ours once pinnate, the veins free. Sori oblong or linear, straight, obliquely seated (i. e. oblique to midvein), distinct. Indusium fixed lengthwise by one edge to the upper (inner) side of the fertile vein. (Greek *a*, without, and *splen*, spleen, the herbage once used in medicine.)

1. *A. trichomanes* L. var. *vespertinum* (Max.) Jepson n. comb. DWARF SPLEENWORT. Leaves tufted, evergreen, the stalks  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; fronds once pinnate, linear in outline, 2 to  $4\frac{1}{2}$  in. long; pinnae sessile, oblong to ovate, 3 to  $3\frac{1}{2}$  lines long; sori 3 to 7 on each segment.—Under boulders, cismontane S. Cal. (San Bernardino, Millard's Cañon, Pasadena, Pala, Potrero grade, Witch Creek).

## 13. *ATHYRIUM* Roth

Medium-sized ferns. Fronds bi- or tri-pinnate. Sori oblong or linear, often curved, seated obliquely on the midvein. Indusium fixed as in *Asplenium*. (Greek *a*, privative, and *thuri*um, shield, the application uncertain.)

1. *A. filix-foemina* (L.) Roth var. *californicum* Butters. LADY FERN. Fig. 25. Leaves in large clumps, 2 to 4 ft. high; fronds ovate or lance-ovate, 1 to  $2\frac{1}{2}$  ft. long, mostly 6 to 10 in. broad; pinnae oblong-acute or oblong-lanceolate; pinnules oblong, acute, pinnatifid with the lobes toothed at apex, 6 to 14 lines long; sori oblong to oval; indusia toothed or ciliate on the free edge.—Moist usually shady places in the mts., 4000 to 8000 ft. (San Bernardino Mts.; Sierra Nevada and n. to Modoc and Siskiyou Cos.), or along the coast (Santa Barbara Co. to Humboldt Co.); e. to Ida. and Col., s. to Mex.; Eur., Asia. Very variable in leaf form. Var. *angustum* (Willd.) Farwell. Fronds narrow ( $2\frac{1}{2}$  to 3 or 4 in. wide), the pinnae ascending or curved upward.—San Mateo Co.; Lake Co.; Siskiyou Co. Var. *sitchense* Rupr. Swamp Fern. Fronds mostly very large and broad; pinnules narrowly lanceolate, revolute; sori roundish.—Monterey Coast; San Francisco; lower Klamath River; n. to Alas.

25. *Athyrium filix-foemina*  
Roth var. *californicum* Butters; pinna  
 $\times \frac{1}{2}$ .

## 14. *POLYSTICHUM* Roth

Leaves tufted at the end of a stout rootstock, firm or coriaceous, evergreen, pinnate or bipinnate. Stalks and rachises scaly. Pinnae often with a strong lobe at base on the upper side. Sori round. Indusium peltate, that is, fixed centrally. (Greek *polus*, many, and *stichos*, row, the sori in some species many-ranked.)

Large plants; teeth of the pinnae or pinnules spine-tipped.

Fronds simply pinnate.

Fronds scarcely stalked, linear-lanceolate; Nevada Co. to Siskiyou Co. ....

1. *P. lonchitis*.

Fronds long-stalked, lanceolate; throughout the state. .... 2. *P. munitum*.

Fronds bipinnate or bipinnatifid.

Pinnules with many distinct or nearly distinct pinnules or segments; coastal. ....

3. *P. aculeatum*.

Small plants; teeth of the frond segments not spine-tipped; Siskiyou Co. .... 4. *P. scopulinum*.

5. *P. lemmonii*.

1. *P. lonchitis* (L.) Roth. HOLLY FERN. Fig. 26a. Stalks caespitose, very scaly, short ( $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long); fronds evergreen, subcoriaceous, linear or nearly so, acute, pinnate, 6 to 20 in. long,  $1\frac{1}{4}$  to  $2\frac{1}{2}$  in. wide; pinnae numer-

ous, closely set, oblong, falcate, acute, cuspidate-serrulate,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, cuneate at base on the lower side, truncate on the upper with a single strong lobe or auricle; lowest pinnae symmetrically triangular; sori in 2 rows on the pinnae and the auricle; indusium orbicular, attached by the center.—Castle Lake, Nevada Co.; Long Lake, Plumas Co.; Castle Lake, Siskiyou Co.; n. to Alas., e. to Colo. and Nova Scotia; Eur., Asia.

26. a, *Polystichum lonchitis* Roth, pair of pinnae; b, *P. munitum* Presl, pinna, usual form; c, pair of pinnae smaller form.  $\times \frac{1}{2}$ .

or marshy flats in the hills and mountains throughout the state, 100 to 7000 ft., quite common. Var. *NUDATUM* (Eat.) Gilbert. Fronds small (6 to 8 in. long), the stalks scaly only below; pinnae remote, oblong-oval, lobed or slightly auricled on the upper side at base; sori scanty, confined to the ends of the highest pinnae.—Sierra Nevada from Nevada Co. to Mariposa Co. Var. *IMBRICANS* (Eat.) Max. Small; rachis and stalk naked, but the stalk very chaffy at base; pinnae crowded, ascending-imbricated, cuspidate-tipped; sori confined to the upper pinnae.—Mendocino Co.; Plumas Co.; Yosemite.

3. *P. aculeatum* (Swz.) Roth. BRISTLE FERN. Fig. 27 a, b. Tufted ferns 1 to 3 ft. high; stalks densely scaly at base; fronds oblong-lanceolate, bipinnatifid,  $\frac{3}{4}$  to  $2\frac{1}{2}$  ft. long; pinnae closely set, linear- to oblong-lanceolate, pinnatifid nearly or quite to the midrib,  $1\frac{1}{4}$  to 4 in. long, the basal segment or pinnule on the upper side much more pronounced; pinnules rather crowded, ovate, incised, sessile, 5 to 9 lines long, the teeth bristle-tipped; sori 4 to 15 to each segment in 2 rows, distinct or confluent. — Near the coast from the Santa Cruz Mts. to Mendocino Co. Var. *DUDLEYI* (Max.) Jepson n. comb. Pinnules separated, distinctly short-stalked, mostly auricled, slightly incised, the basal one largest and again pinnatifid; under surface chaffy-fibrillose. — Santa Cruz Mts. Var. *CALIFORNICUM* (Eat.) Jepson n. comb. Fig. 27c. Fronds pinnate, the pinnae slightly incised above the middle, more and more deeply cut below, but their segments not distinct, sessile by a broad base.—Santa Cruz Co. to Mendocino Co. and n. to Mt. Eddy.

27. a, *Polystichum aculeatum* Roth, upper fertile pinna; b, lower sterile pinna; c, var. *californicum* Jepson, pinna.  $\times \frac{1}{2}$ .

4. *P. scopulinum* (Eat.) Max. Fig. 28. Similar to no. 3; stalks very short; fronds partially bipinnate, 6 to 10 in. long,  $1\frac{1}{2}$  to 2 in. wide; pinnae ovate or oblong-ovate, rather obtuse, 7 to 9 lines long; upper pinnae spinulose-serrulate, not incised or divided but often with a marked lobe or tooth on the upper side at base; lower pinnae with a pair of distinct pinnules at base, the upper or main part of the pinna incised or serrate.—Montane, 6000 to

6500 ft.: Snow Cañon, San Bernardino Mts.; Nelson Creek, Plumas Co.; Mt. Shasta; also Garberville, Humboldt Co., 1500 ft.: Utah to Wash. & Ida.

5. *P. lemmonii* Underw. SHASTA FERN. Stalks  $1\frac{1}{4}$  to 2 in. long, this and the rachis more or less brown scaly; fronds linear, bipinnatifid, 5 to  $6\frac{1}{2}$  in. long, about 1 in. wide; pinnules ovate, 6 to 7 lines long, pinnatifid, the segments ovate or oval, sparingly incised or crenate, 3 lines long; sori on the upper pinnae; indusia large and often imbricated.—Mt. Shasta and Mt. Eddy; n. to Wash. (*Aspidium mohrioides* Eat.)

28. *Polystichum scopulinum* Max.; pair of lower pinnae showing pair of pinnules at base x 1.

#### 15. *ASPIDIUM* Swz. SHIELD FERN

Mostly large ferns. Leaves membranous, much dissected. Sori round. Indusia orbicular-cordate or reniform, seated on the midvein or along the sinus. Veins free or the lowest united. (Greek aspidion, a small shield, referring to the indusium.)

Fronds pinnate, the pinnae pinnately parted into regular lobes.

Segments or lobes of the pinnae more or less falcate or upcurved.

Lowest pinnae gradually reduced to mere lobes; Sierra Nevada... 1. *A. nevadense*.

Lowest pinnae little shorter than those above; S. Cal. .... 2. *A. patens*.

Segments of the pinnae obtuse or even truncate; San Bernardino Mts. .... 3. *A. filix-mas*.

Fronds bi- or partly tri-pinnate.

Sori in 2 regular rows on the pinnules; margin of indusium glandular... 4. *A. rigidum*.

Sori not in regular rows on the pinnules; indusium not glandular... 5. *A. spinulosum*.

1. *A. nevadense* Eat. SIERRA WATER FERN. Fig. 29. Plants forming tufts, 1 to 2 (or 3) ft. high; stalks short (1 to 2 in.); fronds membranous, lanceolate; pinnae sessile, linear-lanceolate, deeply pinnatifid, 1 to 3 in. long, the lowest pairs distant and much reduced; lobes of the pinnae crowded, oblong-acute, upcurved, lightly resinous-sprinkled beneath, 2 to 3 lines long, the lowest much longer than the others; sori borne on either side the midvein of the lobes but near the margins; indusium minute.—Along streams, mostly higher altitudes, Sierra Nevada from Madera Co. to Plumas Co. and Siskiyou Co.; n. to Ore. (*Dryopteris oregana* C. Chr.)

29. *Aspidium nevadense* Eat.; pinna x 1.

2. *A. patens* Swz. SOUTHERN WOOD FERN. Fig. 30. Plants 1 to 3 ft. high, the rootstock thick, bearing several leaves at the end; leaves 1 to 4 ft. long, the rachis pubescent; fronds thin-coriaceous, pinnate; thinly pubescent beneath; pinnae linear-acuminate, 2 to 6 in. long, regularly incised with upwardly curved acute lobes, the apex caudate-attenuate and merely serrate or entire.—S. Cal. (Santa Barbara; Eaton Cañon, Los Angeles; Tahquitz Cañon, Mt. San Jacinto); L. Cal. to Fla.

3. *A. filix-mas* (L.) Swz. MALE FERN. Plants forming a tuft, 1 to 3 ft. high; fronds membranous, broadly oblong-lanceolate to oblong, pinnate,  $\frac{3}{4}$  to 2 ft. long; pinnae lanceolate-acuminate to oblong-lanceolate, mostly short-stalked, pinnatifid more than half way to the midrib, or the uppermost pinnae merely toothed, 2 to 4 in. long; segments broadly oblong, mostly serrulate at the obtuse or truncate apex, the basal ones symmetrical; sori 1 to 4 on each segment, seated nearer the midvein than the margin.—Known in Cal. only from Holcomb Valley, San Bernardino Mts., 8000 ft.; all continents except Australia.

4. *A. rigidum* Swz. var. *argutum* Eat. CALIFORNIA WOOD FERN. Fig. 31. Plants in tufts, evergreen, about 1 to  $2\frac{3}{4}$  ft.

30. *Aspidium patens* Swz.; pinna x 1.

31. *Aspidium rigidum* var. *argutum* Eat.; pinna  $\times \frac{1}{2}$ .

high, the stalks very chaffy; fronds subcoriaceous, ovato-lanceolate, bipinnate, 10 to 18 in. long (4 or) 6 to 10 in. wide; pinnae lanceolate or oblong-lanceolate, acuminate, 2 to  $4\frac{1}{2}$  in. long, sessile by a narrow or mostly a broad base; pinnules oblong, mostly obtuse, incised or doubly serrate, cuspidate-toothed, 5 to 7 lines long, the lower basal one usually with a semicordate base; sori in 2 rows on the pinnules; indusia orbicular, the margin minutely glandular.—Half-moist stony woods or half-shady slopes in the mountains, 500 to 5000 ft., rather common: San Diego Co. to the San Bernardino Mts. and San Gabriel Mts.; Santa Barbara Isls.; Sierra Nevada; Coast Ranges (most common in the fog belt); n. to B. C.

5. *A. spinulosum* (Mull.) Swz. var. *dilatatum* Hoffm. COMMON WOOD FERN. Fig. 32. Plants 1 to  $1\frac{1}{2}$  or 3 ft. high; scales of stalks large; fronds subcoriaceous, broadly ovate or triangular-ovate, bipinnate or partly tripinnate, about 1 to 2 ft. long, 5 to 15 in. wide; secondary rachises obscurely wing-margined; pinnae lanceolate or linear-lanceolate or the lower pairs triangular; pinnules oblong-ovate, acute, pinnatifid, spinulose-serrulate, 4 to 9 (or 12) lines long; sori small, borne on the back of the free veins; indusium delicate, round-reniform.—Near the coast on fallen logs in the shade of dense woods, from Marin Co. (Bear Valley) to Humboldt Co. (Alton); n. to Alas., e. to N. Eng.

#### 16. *WOODSIA* R. Br.

Small tufted ferns. Sori round, seated on the back of the free veins. Indusium very delicate, sometimes evanescent, fixed to the receptacle under the sorus and in ours concealed by it, stellately and often very deeply divided so as to make irregular lobes or a fringe, or reduced to a few hairs. (Joseph Woods, English botanist.)

Leaves glabrous, bright green.....1. *W. oregana*.  
Leaves finely glandular-puberulent, dull green.....2. *W. scopulina*.

1. *W. oregana* Eat. Leaves glabrous, lance-oblong in outline, pinnate, 5 to 9 in. long, the sterile ones shorter than the fertile; pinnae many, oblong-ovate, 5 to 12 lines long, deeply pinnatifid into toothed lobes; sori submarginal, sometimes covered by the reflexed teeth of the lobes; lobes of the indusium hair-like.—San Bernardino Mts.; n. Sierra Nevada, 4000 to 5000 ft., from Sierra Co. to Lassen Co. and Modoc Co.; n. to Ore.

2. *W. scopulina* Eat. Similar to no. 1; stalks, rachis and lower surface of leaves furnished with scattered slender hairs and stalked glands; leaves lanceolate in outline, finely glandular; lobes of the indusium broader at base.—Exposed rocks, 4000 to 9000 ft., infrequent: Sierra Nevada from Tulare Co. to Sierra Co. (Mt. Silliman; South Fork San Joaquin River; Yosemite; Mono Pass); Providence Mts.; n. to the Modoc lava beds; far n. to B. C., e. to Ariz.

32. *Aspidium spinulosum* var. *dilatatum* Hoffm.; primary pinna  $\times \frac{1}{2}$ .

#### 17. *CYSTOPTERIS* Bernh.

Delicate ferns with small leaves. Leaves bi- or tri-pinnate or bipinnatifid. Sori rather small, seated on the back of the free veins, covered when young with a delicate hood-like indusium attached by a broad base to the veinlet on the inner side, soon thrown back by the ripening of the sporangia and becoming somewhat cleft or jagged. (Greek *kustis*, bladder, and *pteris*, fern, the indusium inflated.)

1. *C. fragilis* (L.) Bernh. BLADDER FERN. Fig. 33. Leaves oblong-lanceolate, bipinnate, 4 to 14 in. long; pinnae ovate-lanceolate, pinnate or pinnat-

33. *Cystopteris fragilis* Bernh.;  
frond x  $\frac{1}{2}$ .

ifid, the pinnules pinnatifid or incised, sessile by a narrow or more commonly a broad base.—Wet rocks or stony stream banks: high mts. of S. Cal. 5000 to 8500 ft.; Sierra Nevada (2000 to 10,000 ft.); Coast Ranges (700 to 6000 ft.) from the Santa Cruz Mts. to Siskiyou Co.; White Mts. (10,300 ft.) of Inyo Co.; n. to Unalaska; cosmop.

#### SALVINIACEAE. SALVINIA FAMILY

Small floating plants with dorsiventral stems, the two rows of leaves borne on the upper side, the roots on the lower. Sporocarps borne 2 or more on a common stalk, each 1-celled and having a central simple or branched receptacle which bears sporangia, some sporocarps containing macrosporangia with solitary macrospores, others containing microsporangia with many microspores.

##### 1. AZÓLLA Lam.

Stems pinnately branched, covered with minute imbricated 2-lobed leaves. Sporocarps borne in pairs on the under side. (Origin of name doubtful.)

1. *A. filiculoides* Lam. DUCKWEED FERN. Moss-like plant, often reddish, the stems 3 to 12 lines long; leaves ovate, about  $\frac{1}{2}$  line long.—Quiet waters, commonly gregarious and often covering considerable surfaces, scattered throughout the state, 500 to 1000 ft.: Willow Creek Valley, Modoc Co.; Greenwood, Mendocino Co.; San Francisco; Lagrange, Stanislaus Co.; Miramonte, Kern Co.; Inyo Co.; San Bernardino; Ramona; Grapevine Spr., e. of Warner Pass, San Diego Co. Also S. Am.

#### MARSILEACEAE. MARSILEA FAMILY

Small perennial herbs with the slender creeping rootstock rooted in mud and with long-petioled leaves. Sporocarps borne on peduncles which arise from the rhizome, and containing both macrospores and microspores.

Leaves with cuneate or fan-shaped leaflets; sporocarps ovoid or bean-shaped. 1. MARSILEA. Leaves filiform; sporocarps globose. . . . . 2. PILULARIA.

##### 1. MARSÍLEA L.

Aquatic. Leaves with 4 leaflets at apex of the long petiole, circinnate when young. Peduncles arising from the rhizome near the base of the petiole, bearing the sporocarps in pairs or solitary. Sporocarps with 2 teeth near the base, its cells arranged in 2 vertical rows; on germination a gelatinous worm-like mass emerges bearing a large number of sporangia somewhat pinnately arranged. (Aloysius Marsigli, early Italian patron of botany.)

1. *M. vestita* H. & G. CLOVER FERN. Leaflets broadly cuneate, entire, usually hairy, 2 to 7 lines long; peduncles short, bearing a solitary sporocarp; upper tooth longest, acute, the lower obtuse.—Eagle Lake; Chico; Yuba Co.; Lemon Cove; Visalia; Ramona; Cuyamaca.

##### 2. PILULÁRIA L.

Aquatic. Leaves needle-like. Peduncles short or almost none, borne in the axils of the leaves. Sporocarps longitudinally 2 to 4-celled, the cells with parietal placentae that bear on the upper portion microsporangia and on the lower portion macrosporangia containing solitary macrospores. (Latin pilula, a little ball, alluding to the shape of the fruits.)

1. *P. americana* A. Br. PILL-WORT. Leaves 1 in. long; sporocarps about 1 line broad, 3-celled, attached by the side to a short peduncle.—Rain pools on the mesas, Santa Barbara to San Diego.

#### EQUISETACEAE. HORSE-TAIL FAMILY

Rush-like often branching plants with running rootstocks. Stems jointed, in ours hollow with solid nodes and sheaths at the joints, the fertile stems terminated by a cone-like spike composed of shield-shaped stalked scales bearing the sporangia beneath. Spores all alike.

1. *EQUISETUM* L. HORSETAIL

Rootstocks perennial, jointed, branched, the roots in whorls from the nodes, annual. Stems usually erect, regularly striated or ridged, the stomata borne in the grooves in rows; internodes with a large central air-passage and with smaller air-passages (vallecular canals) beneath the grooves and smaller ones (carinal canals) beneath the ridges. Leaves much reduced, simple, united into a sheath at the nodes, their tips thinner and prolonged into teeth. (Latin, equus, horse, and seta, bristle.)

Spikes tipped with a rigid but often bluntish point; above-ground stems perennial (evergreen), tall and rigid, usually without whorls of branches; stomata commonly in single rows; teeth of the sheaths short, deciduous, leaving a clean-cut upper border.

Sheaths short-cylindric, appressed, not widened above; stems rough... 1. *E. hyemale*.  
Sheaths widened upwards so as to appear more or less funnel-shaped; stems smooth... 2. *E. laevigatum*.

Spikes rounded or merely acute at apex, without a rigid point.

Above ground stems all alike, green; teeth of the sheaths short.

Fertile stems usually not branched but sometimes with whorls of minute branches; stems very rough with cross bands of silex... 3. *E. funstonii*.

Fertile stems branched, usually with numerous whorls of branches; stems not roughened with cross bands of silex... 4. *E. palustre*.

Above ground stems of two kinds, the sterile ones green and with whorls of numerous branches, the fertile brown and simple, withering after the spores are shed; teeth of the sheaths  $\frac{1}{2}$  to as long as the sheath itself.

Sterile stems 2 to 7 ft. high, the branches several-angled, terete; fertile stem 1 to  $1\frac{1}{2}$  ft. high, robust; spike 2 to 3 in. long, its axis hollow... 5. *E. telmateia*.

Sterile stems mostly 1 to  $1\frac{1}{2}$  ft. high, the branches sharply 3 or 4-angled; fertile stem 4 to 7 in. high; spike 1 to  $1\frac{1}{2}$  in. long, its axis solid... 6. *E. arvense*.

1. *E. hyemale* L. var. *californicum* Milde. COMMON SCOURING-RUSH. Stems stout, stiffish, evergreen, rough, 8 to 34-furrowed, 2 to 4 ft. high, simple or rarely with a few short and occasionally fertile branches; ridges with two indistinct lines of tubercles; grooves with a single row of stomata on each side; sheaths rather long, cylindric, appressed, commonly marked with a black girdle at base and top and separated by an ashy band; leaves with a deep central groove, obscurely 4-carinate; teeth long and flexuous, brown, soon deciduous; spikes narrowly white-bordered.—Uncommon, Berkeley, Sacramento. Var. *robustum* (A. Br.) A. A. Eat. Stems of one kind, unbranched or sometimes with short branches the second year, the ridges with one row of tubercles; sheaths whitish,  $\frac{1}{4}$  to  $\frac{1}{2}$  in. long, with a broad black band below and a narrow or penciled black band above just at the base of the deciduous teeth; leaves usually 3-carinate; spike ovate, about  $\frac{1}{2}$  in. long.—By streams and in marshy places in the hills and mountains: Coast Ranges, 100 to 2500 ft., from Humboldt Co. to S. Cal., 2500 to 5000 ft. (*E. robustum* A. Br.). Var. *intermedium* A. A. Eat. Stems 1 to 4 ft. high, 1 to 4 lines in diameter; sheath segments keeled below the middle, often centrally grooved above.—Mendocino Co. Var. *herbaceum* A. A. Eat. Cespitose, 3 to 10 in. high, the stems  $\frac{1}{2}$  to 1 line in diameter; sheaths elongated and very wide-spreading.—Tulare and Kern Cos.

2. *E. laevigatum* A. Br. Stems slender, 1 to  $1\frac{1}{2}$  ft. high, commonly unbranched, pale green, mostly smooth, 10 to 30-furrowed, the stomata in a single regular row on each side of the ridges; sheaths 4 to 6 lines long, widened upwards, the tips of the teeth deciduous, the persistent base forming a narrow black and white limb to the sheath; spikes 5 to 12 lines long.—Sierra Nevada; n. to B. C., e. to Va.

3. *E. funstonii* A. A. Eat. Stems slender, very rough, 10 to 30-grooved,  $1\frac{1}{2}$  to 6 ft. high, the ridges with many transverse bands of silex; fertile stems with a whorl of small sterile branches at base; sheaths 3 to 5 lines long, the margin with a narrow black band and strongly incurved in age; spikes slender, 6 to 14 lines long.—Damp or dry soil, often in partial shade: the most common species in cismontane S. Cal., 1000 to 7000 ft.; n. to Monterey Co. and Inyo Co. Var. *caespitosum* (A. A. Eat.) Jepson n. comb. Stems 3 to 10 in. high, sometimes 100 in a cluster, very rough; teeth persistent, becoming white; leaves rounded on the back.—San Bernardino; San Diego. Var. *nudum*

(A. A. Eat.) Jepson n. comb. Stems 1 to 2 ft. high, erect, unbranched.—The common form of S. Cal. Var. *RAMOSUM* (A. A. Eat.) Jepson n. comb. Stems 1 to 2 ft. high with whorls of branches developing at time of fruiting.—San Bernardino.

4. *E. palustre* L. MARSH HORSETAIL. Stems slender,  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high, 5 to 10-grooved, the grooves separated by narrow roughish wing-like ridges, the central canal very small; stomata abundant in the grooves; sheaths loose and somewhat dilated, the teeth whitish-margined; branches simple, few in the whorls; spike 1 in. long.—Wet places, San Mateo Co., only known locality in Cal.; distributed around the north temperate zone.

5. *E. telmateia* Ehrh. var. *braunii* Milde. GREAT HORSETAIL. Fertile stems, white, smooth, succulent, 16 to 22-grooved, 1 to  $1\frac{1}{2}$  ft. high,  $\frac{1}{4}$  to  $\frac{1}{2}$  in. in diameter; sheaths loose, whitish below, brownish above, 1 to  $1\frac{3}{4}$  in. long, often longer than the internodes; internodes usually without stomata; spikes 2 to 3 in. long,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. in diameter; sterile stems greenish, 20 to 26 (or 40)-furrowed, 2 to 4 (or 7) ft. high; sheaths  $\frac{1}{4}$  to  $\frac{1}{2}$  in. long, whitish, the teeth brownish; branches numerous, simple, 3 to 6 in. long, the ridges rough.—Rich moist ravines: Coast Ranges; Amador Co. foothills; San Bernardino; San Diego Co.

6. *E. arvense* L. COMMON HORSETAIL. Fertile stems simple, 4 to 7 in. high, internodes with stomata; sheaths 5 to 7 lines long, the teeth almost as long; spikes narrow, 1 to  $1\frac{1}{2}$  in. long; sterile stems green, rather slender, 1 to  $1\frac{1}{2}$  ft. high, 10 to 15-furrowed, the stomata in 2 rows in the furrows, the sheaths loose, scarious, mostly distant, whitish, ending in about 12 brown teeth; branches numerous, long, mostly simple, solid, 4 (or 3)-angled, the sheaths of the branches 4-toothed.—Sandy wet soil or in swamps, 3000 (or 1000) to 5000 ft.: San Bernardino Mts.; Ventura Co.; Sierra Nevada., e. to the Atlantic, n. to the Arctic; Eur., Asia. Var. *BOREALIS* (Bong.) A. A. Eat. Teeth of sheaths acute, black.—Berkeley.

#### LYCOPODIACEAE. CLUB MOSS FAMILY

Low moss-like evergreen perennial herbs. Stems elongated, often much-branched, densely crowded with leaves in 4 to 16 rows. Leaves lanceolate or subulate, 1-nerved. Sporophylls borne at or near the tips of the branches, similar to the leaves, the sterile portions of the stem passing gradually into the fertile portion without any break, or differing from the leaves, the sporophylls then collected into special apical cones. Sporangia all alike, borne singly in or almost in the axils of the sporophylls. Spores of one kind.

##### 1. *LYCOPodium* L. CLUB MOSS

Sporangia coriaceous, flattened, mostly reniform, 1-celled, 2-valved. (Greek lukus, wolf, and pous, foot, from a fancied resemblance to a wolf's foot.)

1. *L. clavatum* L. RUNNING PINE. Stems 1 to 2 ft. long, creeping, with similar ascending branches; leaves subulate, 2 to 3 lines long, ascending or spreading; fertile branches ending in a slender peduncle (2 to 3 in. long), which bears 1 or 2 to 5 spikes; spikes 1 to 2 in. long.—Forming dense masses on trees, Humboldt Co.; n. to Alas., e. to N. Eng. Cosmop. Very rare in Cal., common beyond our borders.

#### SELÁGINELLACEAE. SELAGINELLA FAMILY

Low moss-like herbs. Stems slender, branched, mostly prostrate and creeping. Leaves small and scale-like in 4 or more ranks, mostly imbricated and channeled dorsally, spinulose-ciliate. Fruiting spikes borne at the ends of the branchlets, often quadrangular, the bracts closely aggregated and resembling the leaves. Sporangia solitary in or near the axils of the bracts, minute, some containing 4 macrospores, the others filled with numerous microspores.

##### 1. *SELÁGINELLA* Beauv.

The only genus. (Latin selago, a plant resembling the savin tree, and ella, the diminutive.)

- Plants erect or ascending, with roots only on the lower part; leaves bristle-tipped; Napa Co. to S. Cal. .... 1. *S. bigelovii*.
- Plants trailing or creeping and forming pendent or prostrate spreading masses; stems commonly rooting throughout.
- Stems extensively trailing,  $\frac{1}{2}$  to 2 ft. long; leaves spreading, bristle-tipped, or merely acute; North Coast Ranges. .... 2. *S. struthioloides*.
- Stems creeping, shorter; leaves appressed or spreading in 2 planes.
- Leaves not bristle-tipped.
- Stems not dorsiventral, the leaves not curving toward the upper side; San Diego Co. .... 3. *S. bryoides*.
- Stems dorsiventral, the leaves curving toward upper side of stem.
- Leaves of upper plane oval, obtuse; n. Cal. .... 4. *S. douglasii*.
- Leaves all lanceolate, acute; Colorado desert. .... 5. *S. parishii*.
- Leaves bristle-tipped.
- Bristles white or whitish; common. .... 6. *S. rupestris*.
- Bristles yellowish-green; stems stout, closely branched, 1 to  $2\frac{1}{2}$  in. long; Sierra Nevada. .... 7. *S. watsonii*.

1. *S. bigelovii* Underw. Stems slender, shortly branched, 2 to 8 in. high; leaves narrowly lanceolate, about 6-ranked, appressed-imbricate, 12 to 15-ciliate on either margin, tapering into a white awn; spikes mostly quadrangular, 2 to 8 lines long, at the ends of short lateral branches; bracts ovate, otherwise like the leaves.—Exposed places and rock crevices, Mt. St. Helena to the Santa Lucia Mts. and s. to San Diego Co.

2. *S. struthioloides* (Presl) Underw. Stems slender, widely trailing, the branches and branchlets often coiled like ostrich plumes; leaves linear-lanceolate, shortly 1 to 4-ciliate on either margin; spikes very slender,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; bracts ovate-lanceolate, otherwise similar to the leaves; macrospores lenticular, indistinctly netted on the basal side.—Del Norte Co.; n. to Ore.

3. *S. bryoides* (Nutt.) Underw. Stems with the short branches and branchlets forming a close carpet which is ashen in age; leaves linear-lanceolate, acutish, pale green, loosely imbricated, the margins minutely spinulose-ciliate; spikes short, at the ends of the branches and branchlets, the ovate bracts densely clustered; macrospores honey-combed below with rope-like ridges, papillose above; microspores usually on separate spikes, spinulose.—Dry bare clay hills, San Diego Co. (*S. cinerascens* A. A. Eat.)

4. *S. douglasii* (H. & G.) Spr. Stems 3 to 12 in. long, decumbent, the branches 2 to 6 in. long, bi- or tri-pinnately divided; leaves rigid, in 2 planes, those of the upper plane half as long as those of the lower, shortly pointed; spikes  $\frac{1}{2}$  to 1 in. long, quadrangular, the bracts deltoid-cuspidate, strongly imbricate.—Damp shades, n. Cal.; n. to B. C. (*Lycopodium douglasii* H. & G. *L. ovalifolium* H. & G.)

5. *S. parishii* Underw. Plants prostrate, close-creeping, much-branched, the stems 2 to 4 in. long, the branches short; leaves broadly lanceolate, acute, brownish below, bright green above, conspicuously 6 to 20-ciliate on either margin, coiling over the stems when dry; spikes quadratish, 2 lines long, at the ends of short branches, the bracts similar to the leaves; macrospores yellow, globose, microspores orange-yellow, spherotetrahedral, long remaining united in tetrads.—Colorado Desert; s. to Mex.

6. *S. rupestris* (L.) Spr. var. *bolanderi* (Hier.) Jepson n. comb. Stems prostrate, cespitose, branching, not dorsiventral, scarcely  $2\frac{1}{4}$  in. long; leaves linear-oblong, the margins 8 to 15-ciliate; spikes horizontal, at the ends of the branches, not over  $2\frac{1}{2}$  lines long; bracts ovate-triangular, short acuminate, 10 to 20-ciliate; macrospores with more or less regular net-like thickenings of the membrane.—Mostly on rocks, Auburn, Placer Co. Var. *HANSENII* (Hier.) Jepson n. comb. Stems dorsiventral, prostrate,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long; leaves glaucous, linear-lanceolate, 6 to 12-ciliate on either margin, curving toward the upper side of the stem; spikes terminating the branchlets,  $4\frac{1}{2}$  lines long; bracts ovate-triangular, acuminate, 25 to 30-ciliate on either margin; macrospores tetrahedral or globose with slight crown-shaped rings on the outer surface.—Lower altitudes, Sierra Nevada from Butte Co. to Fresno Co. Var. *FENDLERI* Underw. Stems prostrate, loosely cespitose, rather remotely branched, 3 to 6 in. long; leaves lanceolate, 5 to 7-ciliate on either margin; spikes erect,  $2\frac{1}{2}$  to 9 lines long, at the ends of the branchlets; bracts

ovate-triangular, 12 to 15-ciliate on either side, otherwise similar to the leaves; macrospores reticulate-tuberculate, with short prominent commissural ribs; microspores minutely puncticulate, the commissural side with radiate striae.—Mendocino and Sonoma Cos.; Col. to N. Mex.

7. *S. watsōnii* Underw. Stems stout, creeping,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long, sparingly short-branched; leaves thick, short-lanceolate, deeply channeled dorsally, the margins with 4 to 9 cilia or none, the thickened tips ending abruptly in a short yellowish-green bristle; spikes sharply quadrangular, 6 to 11 lines long; bracts ovate, otherwise similar to the leaves.—High n. Sierra Nevada; e. to Utah.

### ISOETACEAE. QUILLWORT FAMILY

Aquatic or marsh plants, with an extremely short unbranched corm-like stem, crowned with a tuft of rush-like or awl-like leaves. Sporangia of 2 sizes, borne singly in the axils of the leaves, each containing only one kind of spore. Spores of 2 sizes and kinds, macrospores and microspores.

#### 1. ISÔETES L. QUILLWORT

Stem fleshy, very short and depressed, the under side bearing roots, the upper side bearing the leaves. Leaves at base dilated into a sheath with a groove, above rounded or somewhat angular, bearing a bast-bundle in the center and 4 or more in the periphery with 4 air-canals in the intervening area. Sporangia plano-convex, seated in the grooves at the base of the leaf and more or less covered by the velum (formed from the thin edges of the groove). Macrospores with an elevated ridge or equator about the middle, with 3 others (commissures) arising from this and meeting at the top of the upper hemisphere. Microspores obliquely oblong, triangular in section. (Greek isos, ever, and etas, green, the application uncertain.)

Aquatic plants.

Submerged, normally growing under water, only in unusually dry seasons coming above the surface; leaves quadrangular, without peripheral bast-bundles; velum incomplete.

Stomata lacking; sporangia not spotted, covered with a narrow velum.

Leaves 10 to 18, 2 to 3 in. long.....1. *I. lacustris*.

Leaves 5 to 10,  $\frac{1}{2}$  to 1 in. long.....2. *I. pygmaea*.

Stomata few.

Sporangia orbicular to broadly elliptic, spotted,  $\frac{1}{2}$  to  $\frac{3}{4}$  covered by a broad velum.....3. *I. echinospora*.

Sporangia broadly oblong, mostly not spotted, with a narrow velum.....4. *I. bolanderi*.

Amphibious, partly emerged, submerged only in the earlier period of growth or temporarily.

Velum partial; Coast Ranges and Sierra Nevada.....5. *I. howellii*.

Velum complete; San Diego.....6. *I. orcuttii*.

Terrestrial plants, maturing when entirely out of water; stomata abundant.

Velum partial or almost wanting.....7. *I. melanopoda*.

Velum complete.....8. *I. nuttallii*.

1. *I. lacustris* L. var. *paupercula* Engelm. Stem bilobed; leaves obtusely quadrangular, acute but scarcely tapering, dark or olive-green; ligula triangular; macrospores marked with irregular ridges; microspores somewhat granulated.—Castle Lake, Mt. Shasta, 7000 ft. (*I. occidentalis* Henderson).

2. *I. pygmaea* Engelm. One of the smallest species, the stout rigid bright green leaves rapidly tapering to a fine point, and with very short almost square epidermal cells; macrospores marked with minute warts; microspores brown, almost smooth.—Cold running water, e. slope of Mono Pass at 7000 ft.

3. *I. echinospora* Dur. var. *braunii* Engelm. Rather small; leaves 13 to 15, soft, green or reddish-green, erect or spreading, 3 to 6 in. long, tapering, usually with stomata only towards tip; macrospores covered with broad retuse spinules; microspores smooth.—Cal. (acc. Britton); n. to Alas., e. to N. J.

4. *I. bolanderi* Engelm. Small-sized; stem deeply 2-lobed; leaves 5 to 20 (or 25), erect, soft, bright green, 2 to 5 in. long, tapering to a fine point, the stomata few; ligula triangular; macrospores marked with minute points and wrinkles; microspores usually spinulose.—Shallow mountain lakes or lake-

lets, Sierra Nevada, 5000 to 10,000 feet. Var. *SÓNNEI* Henderson. Leaves shorter, more rigid; macrosporangia almost orbicular, spotted with small dark spots; velum wide, covering  $\frac{1}{2}$  to  $\frac{3}{4}$  the sporangium.—Donner Lake.

5. *I. howellii* Engelm. Medium-sized; leaves 10 to 25, bright green, 5 to 8 in. long, with thick dissepiments; stomata always present; sporangia oval, spotted or unspotted,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  lines long,  $\frac{1}{4}$  to  $\frac{1}{2}$  covered by the velum; ligula subulate, equaling sporangium; macrospores rough with prominent rounded single or confluent tubercles.—Borders of ponds, Coast Ranges and Sierra Nevada; n. to Ore.

6. *I. orcuttii* Eat. Stem slightly trilobed, globose, 1 to 2 in. high; leaves 6 to 15, triangular-winged at base; bast-bundles 2, weak; stomata none(?); ligula lunate or semi-circular; macrospores very small, polished, finely pitted and often sparsely mealy; microspores dark brown, spinulose.—Winter pools on mesas, San Diego Co.

7. *I. melanópoda* J. Gay var. *pállida* Engelm. Stem subglobose, deeply bilobed; leaves 15 to 60, slender, stiff, erect, bright green, pale at base, (2 or) 5 to 18 in. long; sporangia oblong, 2 to 5 lines long, spotted,  $\frac{1}{4}$  to  $\frac{1}{2}$  covered by the velum; polygamous; macrospores with depressed tubercles often confluent into worm-like wrinkles, or almost smooth; microspores spinulose.—San Diego; Upland; Monterey; Kaweah River; s. to L. Cal., e. to Ill.

8. *I. nuttállii* A. Br. Stem almost globose, trilobed, slightly grooved; leaves 20 to 60, 3 to 4 in. long, slender, bright green, with only 3 peripheral bast-bundles; sporangium oblong or oval; macrospores variable in size, densely covered with minute but prominent rounded warts or rarely almost smooth; microspores papillose, brown.—Banks of streams, Marin Co.; Ore. to Wash.

## Subkingdom SPERMATÓPHYTA. SEED PLANTS

Plants without distinct alternation of generations, the leafy plant (sporophyte) bearing ovules and stamens in which the gametophyte is extremely reduced or masked. Microspore or pollen grain typically transported through the air to the vicinity of the oosphere (or egg-cell) where it germinates and gives rise to a non-motile sperm. Fertilized oosphere developing into an embryo contained in the resting body or seed.

### CLASS 1. GYMNOSPÉRMAE. CONE-BEARING PLANTS

Cone-bearing trees or shrubs, all of ours evergreen; leaves needle-like, narrowly linear, awl-like or scale-like. Ovules and seeds borne naked on the surface of a scale; stamens and ovules in catkin-like clusters; sperm passing to the oosphere directly through the micropyle; embryo with 2 to 17 cotyledons.

#### PINACEAE. PINE FAMILY

Trees or shrubs. Leaves narrowly linear and alternate, or with bundles of needle-like leaves in the axils of scale-like (primary) leaves. Stamens and ovules in different catkins, usually on separate branches but always on same tree. Staminate catkins with numerous spirally arranged stamens, each bearing two pollen-sacs. Ovulate catkins with spirally arranged scales, each subtended by a distinct bract; ovules naked, 2 at the base of each scale on the upper side, maturing into seeds which commonly bear a wing derived from the surface tissue of the scale. Fruit a woody cone.

Cones pendent or spreading, falling from the tree whole, the scales persistent.

Leaves of 2 kinds, needle-leaves in fascicles of 1 to 5 and scale-leaves; cones maturing the second year, their bracts minute. . . . . 1. *PINUS*.

Leaves of 1 kind, linear; cones maturing in the first year, their bracts obvious.

Bracts shorter than the scales; branchlets roughened by the persistent leaf bases. Leaves petioled, jointed on the woody base which is somewhat decurrent on the branchlet; trunk bark fissured or smoothish, not scaly. . . . . 2. *TAXUS*.

- Leaves sessile, jointed on the woody peg-like base which spreads at right angles to the branchlet; trunk bark marked by scars of deciduous scales..... 3. *PICEA*.  
 Bracts longer than the scales, notched at apex with a spear-like point in the notch; leaf-scars smooth; old bark very rough..... 4. *PSEUDOTSUGA*.  
 Cones erect on branch, maturing the first year, their scales falling separately; leaf-scars smooth..... 5. *ABIES*.

### 1. *PINUS* L. PINE

Trees with two sorts of leaves, the primary leaves thin and scaly or chaff-like, bearing in their axils needle-shaped leaves, in bundles of 1 to 5, which emerge from slender buds whose scarious scales sheathe the base of the cluster. Staminate catkins spreading, crowded in a whorl towards the base of the shoot of the same spring. Ovulate catkins erect, 1 to 5 in a sub-terminal whorl. Cones maturing in the second autumn, reflexed or pendulous, their scales woody, imbricated, the exposed portion (apophysis) often much thickened and bearing centrally an elevated scar or prickly boss (umbo). Cotyledons 4 to 17. (Latin name of the pine.)

**WHITE PINES.**—Cones subterminal, the apophysis of the cone-scale usually thin and unarmed; needles in 5s; wood light-colored, soft; chiefly high montane.

Cones long-stalked, very long and slender when closed.

Needles 1 to  $3\frac{3}{4}$  in. long; cones 6 to 8 in. long..... 1. *P. monticola*.

Needles 2 to  $3\frac{1}{2}$  in. long; cones 13 to 18 in. long..... 2. *P. lambertiana*.

Cones with short stalks or almost none; needles 1 to  $2\frac{1}{2}$  in. long.

Scales very thick at tip, not closely overlapping; cones subglobose, 1 to 3 in. long; subalpine..... 3. *P. albicaulis*.

Scale-tips slightly thickened, rather closely overlapping; cones commonly long-ovate, 2 to 5 in. long; desert mts. chiefly..... 4. *P. flexilis*.

**YELLOW PINES.**—Cones subterminal, sessile or nearly so, the scales with a thick apophysis which is umbonate and armed with a prickle; needles in 5s, 3s, or 2s; wood very pitchy.

Needles in 5s.

Cones oblong-ovate,  $2\frac{1}{2}$  to 5 in. long; scales with minute prickles; needles  $\frac{3}{4}$  to 1 in. long; Mt. Whitney region and high North Coast Ranges..... 5. *P. balfouriana*.

Cones slender ovate, 3 to  $3\frac{1}{2}$  in. long; scales with long slender prickles; needles 1 to  $1\frac{1}{2}$  in. long; desert ranges..... 6. *P. aristata*.

Needles in 3s, 5 to 10 in. long; cones breaking through near base when falling, some scales remaining on branch.

Cones ovate, 3 to 5 in. long; common at middle altitudes..... 7. *P. ponderosa*.

Cones round-oval, 5 to 10 in. long; at higher altitudes..... Var. *jeffreyi*.

Needles in 2s, 1 to  $2\frac{3}{4}$  in. long..... 8. *P. contorta*.

**NUT PINES.**—Cones lateral or subterminal, the scales strongly thickened at tip or prolonged into conspicuous spurs or hooks; seeds large, thick shelled, the wing short or none; needles 1 to 5 in a cluster; arid areas and chiefly low altitudes.

Cones very large, with highly developed spurs, breaking through near base when falling, a few lower scales persisting on the branch; needles in 3s.

Cones ovate, 10 to 13 in. long; needles erect, 5 to 14 in. long; trunk persisting through crown as one main axis; foliage yellowish; South Coast Ranges and Southern California..... 9. *P. coulteri*.

Cones round-oval, 6 to 10 in. long; needles drooping, 7 to  $13\frac{1}{2}$  in. long; trunk branching into several secondary axes; foliage gray; dry interior foothills..... 10. *P. sabiniana*.

Cones with pyramidal apophyses.

Needles in 5s, 8 to 12 in. long; cones triangular-oval, 4 to  $5\frac{1}{2}$  in. long; scales with pyramidal apophyses; local on south coast..... 11. *P. torreyana*.

Needles not in 5s; cones subglobose.

Needles commonly in 4s; cones  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; S. and L. Cal.; var. *parryana* of..... 12. *P. cembroides*.

Needles 1 in a place; cones  $2\frac{1}{2}$  to  $3\frac{1}{2}$  in. long; desert ranges; var. *monophylla* of..... 12. *P. cembroides*.

**CLOSED-CONE PINES.**—Cones lateral, sessile, one-sided, opening tardily, often remaining closed for many years, their scales conspicuously swollen at tip; needles in 3s or 2s, 3 to 6 in. long; lower altitudes, chiefly of coast.

Needles in 2s; cones ovate, 2 to 3 in. long, often developing stout spurs; seashore... 13. *P. muricata*.

Needles in 3s.

Cones broadly ovoid,  $2\frac{1}{2}$  to  $4\frac{1}{2}$  in. long; seashore..... 14. *P. radiata*.

Cones oblong-ovate, 3 to 6 in. long; montane..... 15. *P. tuberculata*.

1. *P. monticola* Don. **SILVER PINE.** Forest tree 50 to 175 ft. high, trunk 1 to 6 ft. in diameter, the bark whitish or reddish, very smooth though slightly checked; needles in 5s, very slender, 2 to  $3\frac{3}{4}$  in. long; cones pendulous, 6 to 8 (or 10) in. long, very slender when closed and usually curved towards the tip, black-purple or green when young,  $2\frac{1}{2}$  to  $3\frac{1}{2}$  in. broad near the base when open and tapering to the apex; scales thin, smooth, rounded

34. *Pinus lambertiana*  
Dougl.; cone  $\times \frac{1}{4}$ .

at apex, umbo scar-like; seeds 3 to 4 lines long, their wings about 3 times as long; cotyledons 5 to 9, mostly 7 or 8.—Sierra Nevada, in the main timber belt from 6000 to 9500 ft.; Mt. Shasta to Marble Mt. and the Siskiyou Mts.; n. to B. C. and nw. Mont. Wood valuable but the species weakly represented.

2. *P. lambertiana* Dougl. SUGAR PINE. Fig. 34. Forest tree 60 to 180 ft. high; trunk 2 to 6 ft. in diameter, its brown or reddish bark 2 to 4 in. thick, roughly fissured longitudinally with the surface breaking down into small deciduous scales; needles in 5s, slender, 2 to  $3\frac{1}{2}$  in. long; cones pendulous, borne on stalks at the ends of the branches, commonly in the very summit of the tree, very long-oblong, 13 to 18 in. long, 4 to 6 in. thick when opened; scale-tips thin, with terminal scar-like umbo; seeds 2 to 5 lines long with broad wings twice as long; cotyledons 13 to 16.—Montane, 2500 to 7000 ft.: Sierra Nevada, in the main timber belt; higher Coast Ranges; high mts. of S. Cal.; n. to Ore. Wood very valuable, white, soft and straight-grained.

3. *P. albicaulis* Engelm. WHITE-BARK PINE. Fig. 35. Usually dwarfish or prostrate, sometimes a tree up to 20 or 40 ft. high; trunk  $\frac{1}{2}$  to 2 ft. in diameter, often with 2 or 3 main stems from the base; bark thin, whitish and smooth; needles in 5s, 1 to  $2\frac{1}{2}$  in. long, densely clothing the tips of the slowly growing branchlets; cones ovoid or subglobose, yellowish-brown, 1 to 3 in. long and nearly as thick; scales

35. *Pinus albicaulis*  
Engelm.; cone  $\times \frac{1}{2}$ .

broad and rounded at apex with a short acute umbo, not overlapping closely but their tips strongly thickened and either projecting freely or presenting very bluntish points; seeds obovate, acute,  $\frac{1}{4}$  to  $\frac{1}{2}$  in. long; wing narrow, usually persistent on the scale; cotyledons 7 to 9.—Subalpine, 8000 to 12,000 ft.: Sierra Nevada; Salmon Mts. and far n.

4. *P. flexilis* James. LIMBER PINE. Tree 10 to 60 ft. high with a short trunk 1 to 3 ft. in diameter; needles in 5s, 1 to  $2\frac{1}{4}$  in. long, often curving, densely clothing the ends of the branchlets and forming a sort of brush; cones buff or olive-buff, globose to long-ovate, 2 to 5 in. long; scales broad with rounded slightly thickened tips and terminal scar-like umbo, overlapping rather closely and leaving only a narrow portion free on the upper side the scale; seeds nearly oval, markedly compressed, 4 to 5 lines long; wing narrow, generally persistent on scale; cotyledons 6 to 9.—Subalpine, desert ranges, 7500 to 11,000 ft.: desert slope of s. Sierra Nevada and high mts. of S. Cal.; White, Inyo and Panamint Ranges; e. to Rocky Mts., n. to Alb.

5. *P. balfouriana* Jeffrey. FOXTAIL PINE. Subalpine tree, 20 to 45 ft. high, with conical trunk 1 to 4 ft. in diameter at the base; trunk bark reddish brown, smoothish but superficially checked; branches stout and rather short with half-drooping branchlets thickly clothed with short needles persisting 10 to 15 years and thus resembling a fox's tail; needles in 5s,  $\frac{3}{4}$  to 1 in. long; cones slender when closed, oblong-ovate when open, terra-cotta color,  $2\frac{1}{2}$  to 5 in. long; tips of the scales thickened or low-pyramidal, with shrunken scar-like umbo; seeds  $3\frac{1}{2}$  to 4 lines long, their wings narrow, 6 to 11 lines long; cotyledons 5.—Timber line tree, 6000 to 11,500 ft., local in

two widely separated areas; inner far North Coast Ranges (Scott Mts. to Yollo Bolly Mts.) and high s Sierra Nevada.

6. *P. aristata* Engelm. HICKORY PINE. Tree 25 to 55 ft. high; leaves 1 to 1½ in. long; young bark milky white; cones slender ovate, 2 to 3 ½ in. long, the scales armed with slender prickles 3 lines long; cotyledons 6 or 7.—High desert ranges of Inyo and Mono Cos. and eastw. to Col. and n. Ariz., 8000 to 11,200 ft.

7. *P. ponderosa* Dougl. YELLOW PINE. Fig. 36. Forest tree 60 to 225 ft. high, the trunk 2 to 8 ft. in diameter; bark 2 to 4 in. thick, tawny or yellow-brown, divided by fissures into large plates, or sometimes closely fissured; needles in 3s, 5 to 10 in. long; cones reddish brown, commonly 3 to 5 in. long, narrowly ovate when closed, roundish ovate or oval when open, after opening breaking through near the base and falling, leaving the basal scales on the limb; scales thickened or low-pyramidal at apex, the umbo with a stout somewhat triangular point or short prickle; seeds ovatish, 3 to 4 lines long, the wing broadest near the middle and tapering to apex, ¾ to 1 in. long, and 4 to 6 lines broad; cotyledons 5 to 10.—Sierra Nevada, main timber belt, the most abundant species; higher Coast Ranges; high mts. of S. Cal.; e. to the Rocky Mts., n. to B. C., s. to Mex. Wood valuable, straight-grained, rather resinous.

36. *Pinus ponderosa* Dougl., cone x ½.

Var. JEFFREYI Vasey. Jeffrey Pine. Tree 60 to 170 ft. high with yellowish or wine-colored trunks, the bark broken into roughish plates; cones larger and denser, 5 to 10 in. long, shaped when open like an old-fashioned straw hive; prickle of the umbo often more slender; seeds often obovate, 5 to 7 lines long with a wing 12 or 13 lines long; cotyledons 7 to 13.—High montane, 6000 to 9000 ft.: Sierra Nevada; Mt. San Jacinto and San Bernardino Mts.; Yollo Bolly Mts. to the Siskiyou Mts.

8. *P. contorta* Dougl. BEACH PINE. Scrub pine 2 to 35 ft. high, commonly with depressed or irregular dark green crown, the trunk mostly ¼ to 1¼ ft. in diameter with dark rough bark; needles in 2s, 1¼ to 2 in. long, clothing the branchlets densely; cones narrowly ovate or sub-cylindric, somewhat oblique, globose when open, 1 to 1½ in. long, falling after 4 or 5 years or remaining on the tree many years; apophysis low pyramidal, bearing a very slender prickle which weathers away in age; seeds 1½ to 2 lines

37. *Pinus contorta* Dougl. var. *murrayana* Engelm.; a, cone; b, seed. x 1.

long, the wing 3 to 6 lines long; cotyledons 4 or 5.—Seacoast, Mendocino Co. (Albion River) to Del Norte Co. and n. to Alas. Var. MURRAYANA Engelm. Tamrac Pine. Fig. 37. Forest tree commonly 50 to 125 ft. high; bark remarkably thin (¼ in. thick), smooth; needles 1½ to 2¾ in. long.—Dry slopes or swampy swales, 6000 to 11,000 ft.: Sierra Nevada; San Bernardino Mts. and San Jacinto Mts.; Mt. Shasta to the Siskiyou Mts.; also far n. and e. Lodge-pole Pine of the northwest. Var. BOLÁNDERI Vasey. Cane-like dwarf 2 to 5 ft. high; cones very small.—Mendocino coastal plain.

9. *P. coulteri* Don. BIG-CONE PINE. Tree 40 to 90 ft. high with usually spreading crown and long lower branches; bark dark, roughly broken; needles in 3s, erect, tipped with a short hard point, 5 to 10 (or 14) in. long; cones long-ovate, 10 to 13 in. long, 5 to 7½ in. thick, when falling breaking through near the base like the cone of the Yellow Pine; scales at tip drawn out into prominent tusk-like points or spurs which towards the base of the cone on the outer side are developed into curving talon-like appendages; seeds 6 to 8 lines long with a wing twice or nearly twice as long; cotyledons 10 to 17.—Dry rocky mountain slopes, 3000 to 6500 ft.: Mt. Diablo (1200 ft.), Mt. Hamilton, San Carlos and Santa Lucia Ranges to the mts. of S. Cal. Timber poor.

10. *P. sabiniana* Dougl. DIGGER PINE. Fig. 38. Tree 40 to 90 ft. high, the trunk in typical trees parting into a cluster of erect branches which form a broom-like top; needles in 3s, drooping, 7 to 13½ in. long; cones on stalks 2 to 2½ in. long, ovate, subglobose when open, 6 to 10 in. long, 5 to 7 in. thick and only slightly unsymmetrical, when falling breaking through near the base and leaving the basal portion on the limb; tips of the scales strongly developed into triangular hooks projecting downwards, about 1 in. long; seeds hard-shelled, oblong, slightly flattened, 9 to 11 lines long, 4 to 5 lines wide, bearing a short wing 3 to 5 lines long and ½ in. broad; cotyledons 11 to 17.—Arid foothills, forming a very thin stand: Sierra foothills; Coast Ranges, mostly toward the interior, reaching the coast only in the Santa Lucia Mts. Timber inferior.

38. *Pinus sabiniana* Dougl.; cone  $\times \frac{1}{4}$ .

11. *P. torreyana* Parry. TORREY PINE. Low crooked or sprawling tree 15 to 35 ft. high, or sometimes straight and 60 ft. high; needles in 5s, 8 to 12 in. long; cones triangular ovate, 4 to 5½ in. long, the scales at apex thickened into heavy pyramids; cotyledons 12 to 14.—Local on the San Diego coast about Del Mar and on Santa Rosa Isl.

12. *P. cembroides* Zucc. var. *parryana* Voss. PARRY PIÑON. Short-trunked low tree 15 to 30 ft. high; needles ¾ to 1½ in. long, usually 4 (sometimes 2, 3 or 5) in a cluster; cones subglobose, ¾ to 1½ in. long; seeds with rudimentary wings; cotyledons 6 to 8.—San Jacinto Range and s. to L. Cal. (*P. parryana* Engelm.) Var. *MONOPHYLLA* Voss. One-leaf Piñon. Low flat-crowned tree 8 to 25 (or 45) ft. high, the trunk very short; needles 1 in a place, cylindric, curving upward, 1½ to 2 in. long; cones subglobose, chocolate-brown or yellow, 2½ to 3½ in. in diameter; scales thick, raised at apex into high broad-based pyramids with slightly umbilicate or flattened summits bearing a minute deciduous prickle; seeds dark brown, oblong in outline, slightly flattened, ¾ in. long, without wings; cotyledons 7 to 10.—Common on desert slopes and ranges; extremely local (4 or 5 stations) on w. slope Sierra Nevada from the Tuolumne River to the Kern River. (*P. monophylla* Torr.)

13. *P. muricata* Don. BISHOP PINE. Tree 40 to 80 ft. high, 1 to 3 ft. in trunk diameter; bark dark, roughly fissured; needles in 2s, 4 to 6 in. long; cones broadly ovate, 2 to 3 in. long, almost as thick, or when open more or less globose, borne on the shoot in circles of 3, 4 or 5, gradually turned downward, developed more strongly on the outside towards the base and in consequence always one-sided; scale-tips rhomboidal, bearing a central

39. *Pinus radiata* Don; cone x  $\frac{1}{2}$ .

prickle with a broad base, or the highly developed scales towards the base on the outside standing out as very stout straightish or upwardly curving spurs; seeds black, sometimes mottled, the thin shell minutely roughened,  $2\frac{1}{2}$  to 3 lines long; wing 5 to 8 lines long; cotyledons 4 to 7.—Low swampy hills or flats or rocky slopes, always near the sea: Luffenholz Creek near Trinidad; Mendocino and Sonoma coasts; Pt. Reyes Peninsula; Monterey; Coon Creek, San Luis Obispo.

14. *P. radiata* Don. MONTEREY PINE.

Fig. 39. Symmetrical tree or in age with flattened or broken top, 30 to 70 or 115 ft. high; trunk 1 to 4 ft. in diameter, the dark hard bark roughly fissured; needles in 3s, or a few in 2s, 3 to 6 in. long; cones tan or cinnamon color, turned downward, sessile and unequally developed, broadly ovoid and bluntly pointed, or globose when

open,  $2\frac{1}{2}$  to  $4\frac{1}{2}$  in. long; scales on the outer side toward the base conspicuously swollen at tip into a hemispherical tubercle or boss and armed with a prickle which usually weathers off; seeds black, minutely roughened on the surface, 3 lines long, bearing a broadly oblong brown wing  $2\frac{1}{2}$  to 3 times as long; cotyledons 5 to 7.—Seacoast, only in a few small scattered colonies: Año Nuevo Pt., Santa Cruz Co.; Monterey; Cambria, San Luis Obispo Co.; Santa Rosa, Santa Cruz and Guadalupe Isls.

15. *P. tuberculata* Gord. KNOB-CONE PINE. Fig. 40. Tree 5 to 30 or 50 ft. high with thin crown and slender trunk; needles in 3s, 3 to 5 in. long; cones strongly deflexed, buff in color, narrowly ovate, oblique, acutely or bluntly pointed and somewhat curved, especially at tip, 3 to 6 in. long; scales moderately thickened at tip, except on the outside towards the base where they are raised into conspicuous rounded or pointed knobs; umbos small and contracted into slender usually deciduous prickles; seeds brownish black, ovate, 3 to 4 lines long, the surface minutely roughened; wings 9 to 12 lines long, 3 to 4 lines broad, broadest near the middle; cotyledons 5 to 8.—Barren or rocky slopes at medium altitudes, the localities few and widely scattered: Santa Lucia Mts.; Santa Cruz Mts.; Moraga Ridge; Mt. St. Helena; n. to Siskiyou Co., thence s. in the Sierra Nevada to Mariposa Co. The cones persist on the trunk and long slender main branches many (15 to 25) years, forming circles from near the base to the summit. The seeds are seldom liberated except when the cones are heated in a forest fire. It is thus very interesting that a burned forest of Knob-cone Pine is promptly resown with its own seed.

2. *TSUGA* Carr. HEMLOCK

Slender trees with nodding leading shoots. Leaves linear; resin canal 1; petioles jointed on a woody base which persists after leaf-fall as a decurrent projection roughening the branchlet. Staminate catkins pendulous, consisting of a subglobose cluster of stamens on a long peduncle arising from an

40. *Pinus tuberculata* Gord.; cone x  $\frac{1}{2}$ .

axillary winter bud. Anthers subglobose, tipped with a short spur or knob, their cells opening transversely. Ovulate catkins erect, from terminal winter buds. Cones maturing in the first autumn, solitary on ends of branchlets, pendent; scales thin, longer than the bracts. Seeds with resin vesicles on the surface; cotyledons 3 to 6.—(*Tsuga*, its Japanese name.)

Leaves in flat sprays; cones  $\frac{1}{2}$  to 1 in. long.....1. *T. heterophylla*.  
Leaves spreading around stem; cones  $1\frac{1}{2}$  to 3 in. long.....2. *T. mertensiana*.

1. *T. heterophylla* (Raf.) Sarg. COAST HEMLOCK. Graceful conifer, 100 to 180 ft. high, with trunk 1 to 4 ft. in diameter, the branches and branchlets slender, forming sprays which droop cascade-wise but not pendulous; trunk bark brown or dark red inside, smoothish or broken into small oblong plates; branchlets finely hairy with the leaves mostly spreading in 2 ranks; leaves linear, flat, 3 to 10 lines long,  $\frac{1}{2}$  to 1 line wide, shortly but distinctly petioled; cones oblong or conical when closed, roundish when open,  $\frac{1}{2}$  to  $\frac{3}{4}$  or 1 in. long; scales longer than broad, roundish at apex, entire; bracts about  $\frac{1}{8}$  the length of the scales, broadly triangular with truncate or obtuse summits; seeds light-brown,  $1\frac{1}{4}$  line long, the wing 3 or 4 lines long and twice the breadth of the seed.—Mountain slopes near the sea from Gualala River, Sonoma Co., to Del Norte Co.; n. to Alas. and w. Mont.

2. *T. mertensiana* (Bong.) Sarg. MOUNTAIN HEMLOCK. Fig. 41. Alpine tree 15 to 90 (rarely 115) ft. high, with conical trunk  $\frac{1}{2}$  to  $2\frac{1}{2}$  ft. in diameter, bearing branches quite to the ground and forming pyramidal bases which are soon narrowed to slender tops; branches slender, horizontal or mostly drooping, the branchlets slender, pubescent and drooping; leaves standing out all around the branchlet, flattish above, strongly ridged below, bearing stomata on both surfaces, bluntish at apex,  $\frac{1}{4}$  to 1 in. long, less than 1 line wide, shortly petioled; cones cylindric and tapering to base and apex,  $1\frac{1}{2}$  to 3 in. long,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. in diameter; opened cones oblong or tapering from base to apex, 1 to  $1\frac{1}{4}$  in. in diameter; scales thin, rounded at apex, in the open cone spreading at right angles to the axis or even recurving, their bracts  $\frac{1}{3}$  to  $\frac{2}{3}$  as long, rounded above and tipped with a short point; seeds  $2\frac{1}{2}$  lines long, the wing 4 or 5 lines long.—Timberline tree, 6000 to 11,000 ft.: Sierra Nevada from Bubbs Creek, Fresno Co., to Mt. Shasta, thence w. to the Salmon and Siskiyou mountains; n. to Alas. and w. Mont.

41. *Tsuga mertensiana* Sarg.; fr. branchlet  $\times \frac{1}{2}$ .

Sierra Nevada from Bubbs Creek, Fresno Co., to Mt. Shasta, thence w. to the Salmon and Siskiyou mountains; n. to Alas. and w. Mont.

### 3. *PICEA* Link. SPRUCE

Trees with tall tapering trunks and thin scaly bark. Leaves narrowly linear, spreading on all sides, jointed near the stem on a woody base which persists after leaf-fall as a prominent spreading "peg"; resin canals in ours 2. Staminate catkins from terminal or axillary winter buds, erect or nodding; anthers with nearly circular toothed crests, opening longitudinally. Ovule-bearing catkins erect. Cones maturing in the first autumn, pendent, usually scattered over the upper half of the tree; scales very thin, the bracts

shorter than the scales. Seeds without resin vesicles; cotyledons 4 to 15. (*Picea*, ancient Latin name, from *pix*, pitch.)

Scales of cones thin, serrulate; leaves prickly pointed or cuspidate.

Bracts  $\frac{1}{2}$  to  $\frac{2}{3}$  as long as the scale; coastal.....1. *P. sitchensis*.  
 Bracts  $\frac{1}{2}$  to  $\frac{3}{4}$  as long as the scale; montane.....2. *P. engelmannii*.  
 Scales of cone thickish, entire; leaves merely acute; high montane.....3. *P. breweriana*.

1. *P. sitchensis* (Bong.) Carr. TIDELAND SPRUCE. Fig. 42. Forest tree 80 to 190 ft. high, with trunk 3 to 20 ft. in diameter, wide spreading rigid branches, and drooping branchlets; trunk bark reddish brown, developing roughish and ill-defined deciduous scales; leaves linear,  $\frac{1}{2}$  to 1 in. long,  $\frac{2}{3}$  to 1 line wide, whitened and flat above but with a median ridge, convex or strongly ridged below, very stiff and usually tapering to a prickly point or the upper leaves less sharp or bluntly pointed; cones dull brown, long oblong, 2 to 4 in. long and when open  $1\frac{1}{4}$  to  $1\frac{1}{2}$  in. in diameter; scales narrow, finely and irregularly toothed, with ovate-lanceolate bracts,  $\frac{1}{2}$  to  $\frac{2}{3}$  as long; seeds  $1\frac{1}{2}$  lines long, the wing 3 to 4 lines long and  $1\frac{1}{2}$  to 2 lines broad.—Lowlands facing the ocean, Mendocino Co. to Del Norte Co.; n. to Alas. Extensively lumbered. In cultivation called Sitka Spruce.

2. *P. engelmannii* Engelm. ENGELMANN SPRUCE. Tree 20 to 50 (or 100) ft. high; branchlets (in ours) glabrous; leaves strongly ridged above and below, cuspidate, 8 to 11 lines long, resin-ducts often 1 or 2; cones oblong, 2 to  $2\frac{1}{2}$  in. long,  $1\frac{1}{2}$  in. in diameter when open; scales rounded or a little contracted at apex; bract  $\frac{1}{2}$  to  $\frac{1}{4}$  as long as the scale.—Clark Creek, Shasta Co. (only known locality in Cal.); Ashland Butte, s. Ore.; n. to B. C., e. to Rocky Mts.

42. *Picea sitchensis* Carr.; fr. branchlet x  $\frac{1}{2}$ .

3. *P. br  weriana* Wats. WEEPING SPRUCE. Tree 20 to 95 ft. high; branches clothing the trunk to the ground, few and mainly horizontal, ornamented with cord-like branchlets hanging straight down; trunk  $\frac{1}{2}$  to  $3\frac{1}{2}$  ft. in diameter, its bark thin, whitish and smoothish, the deciduous scales making irregular but sharply defined scars; leaves roundish and green below, whitish above on either side the conspicuous median ridge, obtuse at apex,  $\frac{1}{2}$  to 1 in. long; cones narrowly cylindric,  $3\frac{1}{2}$  to  $4\frac{1}{4}$  in. long,  $1\frac{1}{4}$  to  $1\frac{1}{2}$  in. in diameter; scales rounded at apex, very thick for a spruce and with smooth entire edges; bracts oblong, acute,  $\frac{1}{2}$  to  $\frac{1}{4}$  as long as the scales; seeds  $1\frac{1}{2}$  lines long, the wing 4 lines long.—High cold hollows or north slopes, 6000 to 7000 ft.: Trinity Mts. to the Siskiyou Mts.; also sw. Ore.

#### 4. *PSEUDOTSUGA* Carr.

Large trees with flat short-petioled leaves spreading around the stem or on horizontal branches often somewhat 2-ranked. Staminate catkins axillary, the pollen-sacs tipped with a spur and opening obliquely. Ovulate catkins erect, terminal or axillary. Cones pendent, maturing in the first autumn, borne all over crown; scales thin, rounded, shorter than the slender acutely

2-lobed bracts which bear a spear-like point in the notch. Seeds without resin vesicles; cotyledons 5 to 12.—In botanical relationship it stands in an intermediate position among the Spruces, Hemlocks and Firs. Its peculiar cone bracts, signally different from those of any other conifer, and the obliquely dehiscing pollen-sacs are the chief marks of the distinctive genus *Pseudotsuga*. (Greek *pseudos*, false, and Japanese *tsuga*, hemlock.)

Cones  $1\frac{1}{2}$  to  $3\frac{1}{2}$  in. long; bracts conspicuously exserted; Sierra Nevada and Coast Ranges.....1. *P. taxifolia*.

Cones 4 to  $7\frac{1}{2}$  in. long; bracts protruding little; S. Cal. only.....2. *P. macrocarpa*.

1. *P. taxifolia* (Lamb.) Britt. DOUGLAS FIR. DOUGLAS SPRUCE. Fig. 43. Magnificent forest tree, 70 to 250 ft. high, the trunk 1 to 8 ft. in diameter; bark on old trees very thick, soft and putty-like, broken into broad heavy furrows; branchlets with the leaves spreading all around the stem or on horizontal branchlets turned more or less to right and left but not in truly

43. *Pseudotsuga taxifolia* Britt.; a, fr. branchlet  $\times \frac{1}{2}$ ; b, bract and scale  $\times \frac{1}{2}$ .

flat sprays; leaves linear, blunt at apex, flat with a median groove above and a ridge below, green, with two pale longitudinal bands on the under surface, very short-petioled,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long,  $\frac{1}{2}$  to 1 line wide; cones cinnamon or red-brown, long-oval and more or less pointed,  $1\frac{3}{4}$  to  $3\frac{1}{2}$  in. long, when open  $1\frac{1}{4}$  to  $1\frac{3}{4}$  in. thick; scales broad and rounded at apex; bracts conspicuously exserted, broadly linear and bearing in the deep notch at apex a spear-like point; seeds 3 lines long, almost as long as the wings; cotyledons 5 to 8.—Moist mountain slopes: Coast Ranges, especially toward the coast, from the Santa Lucia Mts. to Siskiyou Co.; Sierra Nevada from Fresno Co. to Shasta Co.; n. to B. C. Valuable timber tree; known to woodsmen as Red Fir or Yellow Fir, but when manufactured into lumber the product is sold under the trade name "Oregon Pine."

2. *P. macrocarpa* Mayr. BIG-CONE SPRUCE. Tree 30 to 60 or occasionally 80 ft. tall, with very long lower branches, the foliage and cones very similar to no. 1; bark dark or black; leaves slightly curved; cones 4 to  $7\frac{1}{2}$  in. long, 2 to 3 in. in diameter when open; bracts protruding little or not at all beyond the scales, except the lowest, the tails of which are often as much as  $\frac{3}{4}$  in. long; cotyledons 6 or 7.—Cañons and north slopes: San Emigdio Mts. westw. to the San Rafael and Santa Inez ranges, southw. to the San Gabriel, San Bernardino, Palomar and Cuyamaca mountains, 2500 to 8000 ft.

## 5. *ABIES* Link. FIR

Highly symmetrical trees of lofty stature, the branches in regular whorls and ramifying laterally, forming flat sprays. Leaves linear, flat, thickened or 4-angled, whitened beneath, spreading in 2 opposite directions or even 2-ranked, or more often curving upwards, leaving a smooth circular scar when they fall. Catkins from axillary winter buds. Staminate catkins borne on the under side of the branches, mostly in the upper half of the tree. Ovulate catkins erect, on the upper side of the topmost spreading branches. Cones erect, maturing in the first autumn, falling to pieces on the tree; scales thin, incurved at the broadened apex; bracts often exserted. Seeds with resin vesicles; cotyledons 4 to 10. (The Latin name.)

Leaves of lower and uppermost branches slightly different; bracts not bristle-like.

Cones 2 to  $5\frac{1}{2}$  in. long; bracts not exserted.

Leaves glaucous or dull green with stomata above, flat or on cone-bearing branches keeled above, acute or rarely notched at apex, spreading in two ranks or curving upwards, with a twist in the short petiole; old bark drab or grayish; high montane.....1. *A. concolor*.

Leaves dark lustrous green, no stomata above, white beneath, notched at apex, usually spreading in two ranks, on cone-bearing branches often blunt, curving upwards; bark white; north coast only. . . . . 2. *A. grandis*.  
 Cones 4 to 8 in. long, the bracts concealed or exserted; leaves ridged above and below so as to be 4-sided, somewhat compressed, thicker on the uppermost branches, curving upwards but not twisted, sessile; old bark reddish brown; high montane. . . . . 3. *A. magnifica*.  
 Leaves alike all over tree; cones with conspicuous bracts, the exserted portion long and bristle-like; bark light brown, smoothish; Santa Lucia Mts. only. . . . . 4. *A. venusta*.

1. *A. concolor* Lindl. & Gord. WHITE FIR. Fig. 44. Forest tree 60 to 150 or 200 ft. high, with a narrow crown and a trunk 1 to 6 ft. in diameter; bark smooth, silvery or whitish in young trees, becoming thick and heavily

44. *Abies concolor* Lindl. & Gord.; fr. branchlet  $\times \frac{1}{2}$ .

fissured into rounded ridges on old trunks and gray or drab-brown in color, in section showing dull brown areas separated by a coarse light-colored mesh; leaves  $\frac{1}{2}$  to  $2\frac{1}{2}$  in. long, flat, often with a median channel on upper side, or on the uppermost branches keeled, a prominent midrib beneath with a broad depressed stomatal band on either side, acutish, obtuse or slightly notched at summit, contracted at base into a very short petiole, spreading in two ranks or more or less erect by a twist in the very short petiole; cones brown, oblong, rounded at summit and base, 2 to  $5\frac{1}{2}$  in. long, 1 to  $1\frac{3}{4}$  in. in diameter; bracts about  $\frac{1}{2}$  as long as the scales, roundish and finely toothed, often with a notch

at top and usually terminating in a short slender point; seeds 5 lines long, the wing 6 or 7 lines long.—Mountain slopes, 3000 to 7000 or 10,000 ft.: Sierra Nevada; high North Coast Ranges; high mts. of S. Cal.; e. to the Rocky Mts. Makes a second-grade saw-timber. Also, but wrongly, called Silver Fir.

2. *A. grandis* Lindl. LOWLAND FIR. Forest tree 40 to 160 ft. high, the trunk  $1\frac{1}{2}$  to 4 ft. in diameter; leaves flat, 1 to 2 in. long, notched at apex, dark lustrous green above and with a median channel, below with two white bands separated by a ridge; cones long-oblong in outline,  $2\frac{1}{2}$  to 4 in. long,  $1\frac{1}{2}$  to  $1\frac{3}{4}$  in. thick; bracts small, with a short awl-like point set on the roundish apex,  $\frac{1}{2}$  as long as the scales; seeds drab-color,  $4\frac{1}{2}$  lines long with a wing somewhat longer and twice as broad as the seed; cotyledons 6.—Low hills or valleys near the sea: n. Sonoma Co. to Del Norte Co.; n. to B. C.

45. *Abies magnifica* Murr. var. *shastensis* Lem.; fr. branchlet  $\times \frac{1}{4}$ .

3. *A. magnifica* Murr. RED FIR. Superb forest tree 60 to 175 or even 200 ft. high, with a trunk 1 to 5 ft. in diameter and a very narrow crown composed of numerous horizontal strata of fan-shaped sprays; bark on young trees whitish or silvery, on old trunks dark red, very deeply and roughly fissured; leaves  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, ridged above and below so as to be equally 4-sided, although more or less compressed, acutish at

apex, those on the under side of the branches spreading right and left, in the top of the tree more thickened, erect, incurved and hiding the upper side of the branch; cones brown, 4 to 8 in. long,  $2\frac{1}{2}$  to  $3\frac{1}{2}$  in. in diameter, broadly oval in outline, the broad scales with upturned edges; bracts oblong, acute, not exserted; seeds 7 lines long with a semi-fanshaped wing 8 lines long; cotyledons 9 to 13.—Mountain slopes and ridges, 5000 to 8500 ft.: Sierra Nevada; high North Coast Ranges from n. Lake Co. to Siskiyou Co. Wood straight- and fine-grained, heavy and very durable. Var. *SHASTENSIS* Lem. Shasta Fir. Fig. 45. Bracts enlarged or spatulate at apex, mucronate, exserted.—Sierra Nevada and n. to Mt. Shasta and s. Ore.

4. *A. venusta* (Dougl.) Koch. SANTA LUCIA FIR. Singular montane tree 30 to 75 or 100 ft. high with a narrow crown abruptly tapering above into a steeple-like top; trunk  $\frac{1}{2}$  to  $2\frac{1}{2}$  ft. in diameter, vested in light reddish brown bark, and bearing short slender declined or drooping branches nearly or quite to the ground; leaves stiff, sharp-pointed, dark green and nearly flat above, below with a white band on either side of the strong median ridge,  $1\frac{1}{4}$  or mostly  $1\frac{3}{4}$  to  $2\frac{1}{4}$  in. long, 1 to  $1\frac{1}{2}$  lines wide, mostly 2-ranked; cones elliptic-oblong,  $2\frac{1}{2}$  to 4 in. long,  $1\frac{1}{2}$  to 2 in. thick, borne on peduncles  $\frac{1}{2}$  in. long; bracts wedge-shaped, truncate or notched at summit, the mid-ribs prolonged into a long-exserted bristle  $\frac{1}{2}$  to  $1\frac{3}{4}$  in. long and  $\frac{1}{2}$  line wide; seeds reddish brown,  $3\frac{1}{2}$  lines long with a broad wing 4 to 5 lines long and rounded at apex; cotyledons 7.—Rocky mountain peaks and deep cañons, Santa Lucia Mts.

### TAXODIACEAE. REDWOOD FAMILY

Trees with linear or awl-shaped alternate leaves. Staminate and ovulate catkins on the same tree. Staminate catkins small. Scales of the ovulate catkins spirally arranged, more or less blended with the bract, often spreading horizontally from the axis of the cone and developed into broad flattish summits. Ovules to each scale 2 to 9. Seeds not winged or merely margined

#### 1. *SEQUOIA* Endl. REDWOOD

Tall trees with thick, red, fibrous bark and linear, awl-shaped, or scale-like leaves. Staminate catkins terminal on the branchlets or on short lateral branchlets, with many spirally disposed stamens, each bearing 2 to 5 pollen-sacs. Ovulate catkins terminal, composed of many spirally arranged scales, each with 5 to 7 ovules at base. Cone woody, its scales divergent at right angles to the axis, widening upward and forming a broad rhomboidal wrinkled summit with a depressed center. Seeds flattened; cotyledons 2 to 6. (The Cherokee Indian, Sequoyah, who invented an alphabet for his tribe.)

Leaves awl-shaped, ascending all around stem; cones 2 to  $3\frac{3}{4}$  in. long; Sierra Nevada only.....1. *S. gigantea*.

Leaves linear, petioled, spreading in 2 ranks and forming a flat spray; cones  $\frac{3}{8}$  to  $1\frac{1}{4}$  in. long; Coast Ranges only.....2. *S. sempervirens*.

1. *S. gigantea* (Lindl.) Dec. BIG TREE. Fig. 46. Giant tree 100 to 325 ft. high with columns 80 to 225 ft. to the first limb and 5 to 30 ft. in diameter at 6 ft. above the ground; crown rounded at summit or much broken in age; bark red, deeply furrowed or fluted,  $\frac{1}{2}$  to 2 ft. thick; leaves awl-like, 1 to 6 lines long, only the tips free, adherent below

46. *Sequoia gigantea* Dec.; fr. branchlet x  $\frac{1}{2}$ .

to the stem which they thickly clothe; cones maturing in the second autumn, red-brown, ovoid,  $1\frac{3}{4}$  to  $2\frac{3}{4}$  in. long, composed of 35 to 40 scales; scales with transversely rhomboidal summits and a centrally depressed umbo; seeds numerous, flattened, margined all around with a border, ovate or oblong in outline,  $2\frac{1}{2}$  to 3 lines long.—Western slope of the Sierra Nevada, 5000 to 8000 ft., from Placer Co. to Tulare Co., a longitudinal range of 250 miles but occurring in more or less widely disconnected and limited areas called "groves," 32 in number. The trees have been extensively lumbered and the product marketed as Redwood. The wood is similar to Redwood but more brittle.

2. *S. sempervirens* (Lamb.) Endl. REDWOOD. Fig. 47. Tall and massive tree 100 to 340 ft. high, the trunk 2 to 16 ft. in diameter; bark  $\frac{1}{4}$  to 1 ft. thick; foliage reddish brown; leaves linear, spreading right and left so as to form flat sprays,  $\frac{1}{4}$  to  $1\frac{1}{4}$  (mostly  $\frac{1}{2}$  to  $\frac{3}{4}$ ) in. long and 1 to  $1\frac{1}{4}$  lines wide, or in the top of adult trees with short linear acuminate leaves 3 to 5 lines long, such branchlets strikingly suggestive of those of the Big Tree; cones oval, reddish brown,  $\frac{5}{8}$  to  $1\frac{1}{8}$  in. long, maturing in first autumn; scales 14 to 24; seeds narrowly margined, elliptic in outline, 2 lines long.—This forms a narrow belt along the coast from the Santa Lucia Mts. to the Oregon line, never ranging inland beyond the influence

47. *Sequoia sempervirens* Endl.; fr. branchlet  $\times \frac{1}{2}$ .

of the sea-fogs, reaching its greatest development in Humboldt Co. It is the tallest tree on the American continent. The wood is light, non-resinous, very straight-grained and exceedingly durable. No other tree has been so important to the development of civilization in California, since the wood, abundant and cheap, is highly useful for all sorts of building and industrial purposes and in manufactures and the arts.

#### CUPRESSACEAE. CYPRESS FAMILY

Trees or shrubs with opposite or whorled scale-like (or rarely linear) leaves thickly clothing the ultimate branchlets. Stamens and ovules in separate catkins terminal on the branchlets. Staminate catkins small, with shield-like stamens bearing 2 to 6 pollen-sacs. Ovulate catkins consisting of several opposite or whorled scales which bear at base 1 to several erect ovules. Cones dry or berry-like, of few scales; scales consisting (morphologically) of a completely blended scale and bract.

Fruit a woody cone; stamens and ovules on same tree.

Branchlets flattened, disposed in flat sprays; leaves opposite, in 4 rows, the successive pairs unlike; cones maturing in first autumn; seeds 2 to each scale.

Scales of cones imbricated.

Cones pendent, scales 4 to 7, only the middle pair seed-bearing; seeds unequally 2-winged.....1. *LIBOCEDRUS*.

Cones reflexed, scales 8 to 12, the 2 or 3 middle pair seed-bearing; seeds equally winged.....2. *THUJA*.

Scales of cones peltate; seeds narrowly winged.....3. *CHAMAECYPARIS*.

Branchlets cord-like, not in flat sprays; leaves opposite, in 4 rows, alike; cones maturing in second autumn; seeds acutely margined, many to each scale...

4. CUPRESSUS.  
Fruit a berry; seeds 1 to 3 to each fruit; stamens and ovules on different trees; branchlets cord-like; leaves in whorls of 3 or opposite.....5. JUNIPERUS.

### 1. *LIBOCÈDRUS* Endl. INCENSE CEDAR

Aromatic trees with flattened branchlets disposed in one plane. Leaves scale-like, opposite, imbricated in 4 rows, the successive pairs unlike. Staminate and ovulate catkins terminal on separate branchlets. Staminate catkins with 12 to 16 decussately opposite stamens, each bearing 4 to 6 pollen-sacs. Ovulate catkins consisting of 4 to 8 scales, only one pair ovule-bearing, each scale of this pair with 2 ovules at base. Cone maturing in one season, oblong, composed of 6 imbricated oblong scales. Seeds unequally 2-winged;

cotyledons 2. (Greek libas, referring to the trickling of resin, and kedros, cedar.)

48. *Libocedrus decurrens* Torr.; fr. branchlet  $\times \frac{1}{2}$ .

1. *L. decurrens* Torr. INCENSE CEDAR. Fig. 48. Forest tree 50 to 125 ft. high with conical trunk 2 to 7 ft. in diameter; bark cinnamon, loose or fibrous in age; leaves minute, 1 to 3 lines long, coherent, also adherent to the stem, free only at the tips, those above and below obtuse but minutely pointed and forming a pair overlapped by the keel-shaped lateral pair; cones red-brown, oblong-ovate when closed,  $\frac{3}{4}$  to 1 in. long, consisting of 2 seed-bearing scales with one septal scale between them and often with 2 small scales at base; scales with a small triangular umbo at tip; seeds 4 lines long, margined on each side from near the base to the apex by two very unequal wings; larger wing ovate, about 6 lines

long.—Mountain slopes, 2000 to 7000 ft.: common in the Sierra Nevada; higher Coast Ranges; mts. of S. Cal.; s. to L. Cal., n. to Ore. Wood soft, fine and straight-grained, highly durable.

### 2. *THUJA* L. ARBOR-VITAE

Aromatic trees with scattered branches, the flattened branchlets disposed in one plane. Leaves scale-like, opposite, and imbricated in 4 rows, the successive pairs unlike, adnate with free tips. Catkins terminal. Staminate catkins with 4 to 6 stamens, each with 3 or 4 anther-cells under the subpelate crests. Ovulate catkins with 8 to 12 erect scales, each with 2 erect ovules at base. Cones small, maturing the first autumn, reflexed; scales 8 to 12, thin-leathery, the lowest and uppermost pairs sterile. Seeds bordered by nearly equal lateral wings so as to be nearly round, their coats with minute resin-cells; cotyledons 2. (Ancient Greek name for a resinous tree.)

1. *T. plicata* Don. CANOE CEDAR. Giant tree 80 to 190 ft. high, of pyramidal outline, slender branches, drooping sprays and whip-like often nodding leader; trunk 3 to 16 ft. in diameter at the ground but tapering rapidly above; bark cinnamon-red; branchlets repeatedly 2-ranked, forming flat

sprays, thickly clothed with leaves; leaves minute, those on the margin of the flat sprays keeled and acute at tip, those above and below flattish and triangular at apex; cones borne on short lateral branchlets, on opening turned downward beneath the spray, cinnamon color, oblong when closed,  $1\frac{1}{2}$  in. long; scales 9; seeds winged all around and with a narrow notch at apex, the whole structure 3 lines long.—Along the coast from Humboldt Co. (Bear River Mts.) to Wash. and se. Alas.; inland to Mont. Wood aromatic, light, soft, remarkably durable, extensively manufactured into shingles.

### 3. CHAMAECYPARIS Spach

Trees or shrubs; leading shoot nodding; branchlets more or less flattened and in flat sprays; leaves scale-like, adpressed, thickly clothing the branchlets, opposite, in 4 rows, the successive pairs in ours unlike. Catkins and cones very similar to Cupressus. Stamens with usually 2 pollen-sacs. Ovules 2 to 5 at the base of each scale. Cones maturing in the first autumn. Seeds winged. Cotyledons 2. (Greek chamai, dwarf, and kuparissos, cypress.)

1. *C. lawsoniana* Parl. PORT ORFORD CEDAR. LAWSON CYPRESS. Forest tree 80 to 175 ft. high, with straight shafts and narrow pyramidal crown of drooping branches ending in broad flat drooping fern-like sprays; bark reddish brown, smooth or later longitudinally furrowed; foliage fragrant; leaves above and below rhomboidal, glandular-pitted, and overlapped by the keel-shaped ones on the margin; cones globose, consisting of about 7 scales, 3 to 4 lines long; seeds  $1\frac{1}{2}$  to 2 lines long, narrowly wing-margined on each edge, the whole structure orbicular.—Moist hillsides or cañon bottoms, nw. Cal. from w. Shasta Co. and n. Humboldt Co. to Siskiyou and Del Norte Cos.; sw. Ore.

### 4. CUPRESSUS L. CYPRESS

Trees or shrubs with the leaves small and appressed, scale-shaped and closely imbricated in 4 ranks on the ultimate branchlets, or awl-shaped on vigorous shoots. Staminate catkins terminal on the branchlets, with 3 to 5 pollen-sacs to each stamen. Ovulate catkins upon short lateral branchlets, the ovules numerous, erect, in several rows at the base of the scales. Cones globose to oblong, maturing in the second year, the shield-shaped scales fitting closely together by their margins, not overlapping, separating at maturity, their broad summits with a central boss or short point. Seeds acutely angled or with a narrow hard wing; cotyledons 2 to 5. (Classical name of the Cypress.)

Our species are of very localized occurrence, that is they appear as small "islands" at rather widely separated stations, in the case of nos. 1 and 2 being known only at 1 or 2 approximate stations. The species depend for their separation on characters that are too vague and it might be better to receive a less number of them. Their history is as yet little known and new stations are still being discovered.

Umbos more or less upwardly impressed and more or less crescent-shaped.

Bark of mature trunks dark brown, roughish and more or less fissured.

Glands on leaves none or rare; maritime or coastal species.

Crown with "finger-pointed" branchlets.

Seeds brown or commonly so; umbos prominent; Monterey coast. . . . .

1. *C. macrocarpa*.

Seeds black; umbos small; Mendocino coast. . . . .

2. *C. pygmaea*.

Crown compact or smooth; cones with low umbos; Monterey. . . . .

3. *C. goveniana*.

Glands more or less present as a closed dorsal pit; montane species. . . . .

4. *C. sargentii*.

Bark of mature trunks red, smoothish, shining; San Diego Co. . . . .

5. *C. forbesii*.

Umbos more or less conical or peak-shaped; leaves with conspicuous dorsal resin pits.

Umbos all straightish; Piute Mt., Kern Co. . . . .

6. *C. nevadensis*.

Two uppermost umbos horn-like and incurved; n. Cal. . . . .

7. *C. macnabiana*.

1. *C. macrocarpa* Hartw. MONTEREY CYPRESS. Fig. 49. Tree 15 to 80 ft.

high with broadly conical crown, the spreading branches with the terminal

divisions strict and therefore "finger-pointed"; bark strands spirally twisted

to the left or straight; leaves not resin-pitted; cones broadly short-cylindric

49. *Cupressus macrocarpa* Hartw.:  
fr. branchlet  $\times \frac{3}{4}$ .

or oblong, the scales with a central curved thin-edged ridge or umbo, or the umbo sometimes subconical; seeds brown.—Headlands at mouth of Carmel River, Monterey coast.

2. *C. pygmaea* Sarg. MENDOCINO CYPRESS. Tree 25 to 75 ft. high, the crown with finger-pointed branchlets, or sometimes a low shrub or reduced to a dwarf cane; leaves not resin-pitted; cones 5 to 9 lines long, the umbos small and low; seeds black.—Mendocino coastal plain. Said to become 100 ft. high.

3. *C. gōveniāna* Gord. GOWEN CYPRESS. Shrub 1 to 5 ft. high, its outline compact or smooth; branchlets slender, squarish; leaves without dorsal pits; cones subglobose or oval, 6 to 8 lines long; seeds commonly black.—Monterey.

4. *C. sargéntii* Jepson. Shrub 5 to 10 ft. high; branchlets thickish, obscurely squarish; leaves or many of them with closed dorsal pits; cones 8 to 10 lines long; seeds brown.—On or near serpentine rocks: Santa

Cruz Mts. to Mt. Tamalpais, Hoods Peak Range and Mendocino Co. Var. DUTTONI Jepson n. var. Symmetrical tree 40 to 72 ft. high, the branchlets more or less divaricate; bark strands spirally twisted to right or straight, fissuring into narrow laced ribbons; leaves triangular-ovate, very short, the dorsal pits none or few; cones globose, 8 to 12 lines long, the umbos peak-shaped or tending to be so; seeds brown.—Cedar Mt., Alameda Co., occupying a colony about  $1\frac{1}{2}$  by  $\frac{3}{4}$  mile in area (Jepson 7741, type).

5. *C. fōrbesii* Jepson. Slender tree 15 to 20 ft. high; bark very smooth, shining, red-brown or even dark cherry red; branchlets squarish; foliage bright green; dorsal pits of leaves minute or commonly wanting; cones globose,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; seed red-brown.—Mts. of San Diego Co.: Cedar Cañon betw. El Nido and Dulzura; Mt. Tecate; near Pala.

6. *C. nevadēnsis* Abrams. Tree 20 to 50 ft. high; branchlets slender, 4-angled; leaves light green with conspicuous dorsal resin pit; cones oblong to subglobose, 10 to 12 lines long; upper umbos pointed; seeds light brown.—Local on Piute Mt., Kern Co.

7. *C. macnabiāna* Murr. McNAB CYPRESS. Fig. 50 a, b. Tree 15 to 40 ft. high, often somewhat bushy, sometimes a low shrub; foliage blue-green, pungently aromatic; branchlets very slender; leaves with a conspicuous dorsal resin pit or white gland, often slightly glaucous; cones globose, 5 to 8 lines in diameter, reddish or grayish brown; umbos conical, the uppermost pair very prominent or horn-like and incurved; seeds brown.—Dry hills and flats, Napa Co. to Shasta Co., thence easterly to the n. Sierra foothills as far south as Yuba Co. Var. BAKERI Jepson n. comb. Baker Cypress. Fig. 50c. Slender tree; cones silvery or glaucous; umbos short-conical.—Modoc lava beds. (*C. bakeri* Jepson.)

##### 5. JUNÍPERUS L. JUNIPER

Trees or shrubs. Leaves in whorls of 3 or opposite, scale-like, imbricated, closely appressed and adnate to the branchlets or linear-subulate and spreading. Stamens and ovules on separate trees. Staminate catkins with

50. a, *Cupressus macnabiana* Murr.:  
foliage branchlet  $\times 6$ ; b, cone  $\times 1$ ;  
c, var. *bakeri* Jepson. cone  $\times 1$ .

many stamens, each with 2 to 6 anther cells. Ovulate catkins of 3 to 6 succulent coalescent scales, each bearing 1 or 2 ovules. Cones fleshy and berry-like, ripening the second year, in ours 1 to 3-seeded; cotyledons 2 to 6.

Catkins axillary; leaves linear or lanceolate, acute, cuspidate, spreading, white-glaucous above, 3 to 6 lines long; subalpine shrub.....1. *J. communis*.  
Catkins terminal on short branchlets; leaves ovate, scale-like,  $\frac{1}{2}$  to 1 line long, closely appressed to the branchlets in whorls of 3, with a more or less distinct dorsal gland or pit.

Berries reddish brown, oblong; cotyledons 4 to 6; medium altitudes...2. *J. californica*.

Berries blue-black, globose or subglobose; cotyledons 2; high montane.....3. *J. occidentalis*.

1. *J. communis* L. var. *montana* Ait. DWARF JUNIPER. Low or prostrate alpine shrub, 1 ft. high or less, forming patches a few feet in diameter; leaves rigid, 3 (rarely 2) at a node with very short internodes; berries globose, blue, covered with white bloom,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  lines long.—Sierra Nevada, 8000 to 9500 ft., from Mono Pass to Mt. Shasta, thence w. to Del Norte Co.; n. to Arctic regions; rare in Cal.

2. *J. californica* Carr. CALIFORNIA JUNIPER. Shrub, much-branched from the base, 2 to 15 ft. high, or occasionally a tree up to 40 ft. in height; bark brown or ashen gray, shreddy; berries subglobose or oblong, reddish or brownish, covered with a dense white bloom, 4 to 8 lines long, with dry fibrous sweet flesh and 1 to 3 seeds; seeds ovate, acute, brown, with a thick smooth but angled or ridged polished bony shell, 3 to  $5\frac{1}{2}$  lines long.—Western Mohave Desert, s. to L. Cal., n. in the Sierra Nevada foothills to Kern Co. and in the inner Coast Ranges to Mt. Diablo; local near Coulterville and in the mts. n. and w. of Clear Lake. Var. *UTAHENSIS* Engelm. Desert Juniper. Shrub 3 to 10 ft. high or a tree to 20 ft. high; branches more slender; leaves usually glandless; berries usually globose, blue-black with a bloom, 4 to 5 lines long.—Desert ranges, Inyo Co.; e. to Utah. (*J. utahensis* Lem.)

3. *J. occidentalis* Hook. SIERRA JUNIPER. Subalpine tree 10 to 25 or even 65 ft. high; trunk 1 to 5 ft. in diameter; bark dull red, shreddy; berries globose to ovoid, blue-black with a whitish bloom, 3 to 5 lines long, with resinous juicy flesh and 2 seeds (rarely 1 or 3); seeds flat on the face, the convex back with 3 to 5 resinous-glandular pits.—Granite ridges and cirques, 7000 to 10,500 ft.: common in the Sierra Nevada, rare in the San Bernardino, Panamint and Yollo Bolly mountains; n. to Wash.

#### TAXACEAE. YEW FAMILY

Trees or shrubs with linear leaves 2-ranked by a twist in their petioles. Stamens and ovules borne on different trees. Stamens united by their filaments into a column with 4 to 8 pollen-sacs pendent from each filament. Ovule solitary, terminal on a short axillary branch. Seeds set loosely in a fleshy cup, or quite enveloped by it and thus appearing drupe-like, ripe in first autumn; cotyledons 2.

Fruit red, berry-like; leaves  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long, acute.....1. *TAXUS*.  
Fruit green or purplish, plum-like; leaves  $1\frac{1}{4}$  to  $2\frac{1}{2}$  in. long, stiffish, bristle-pointed....

2. *TORREYA*.

##### 1. *TAXUS* L. YEW

Trees or shrubs, the leaves bluntish or merely acute. Stamens 7 to 12 in a cluster, the 4 to 9 pollen-sacs borne under a shield-like crest. Ovule seated upon a circular disk which in fruit becomes cup-shaped, fleshy, and red, surrounding the bony seed, the whole berry-like. (Ancient Latin name of the yew, probably from Greek toxon, a bow, the wood used for bows.)

1. *T. brevifolia* Nutt. WESTERN YEW. Fig. 51. Small tree 10 to 30 ft. high, the crown irregular with the branches of unequal length and standing at various angles but tending to droop; bark thin, red-brown, shreddy; leaves linear, acute at apex, shortly petioled, flat, with midrib in relief above and below, 3 or mostly 6 to 8 lines long, 1 line wide, spreading right and left in flat sprays; seeds borne on the under side of the sprays and when mature set in a fleshy scarlet cup, the whole looking like a brilliantly colored

51. *Taxus brevifolia* Nutt.; a, fr. branchlet  $\times \frac{1}{2}$ ; b, long. sect. fr.  $\times \frac{1}{4}$ .

with two longitudinal glaucous grooves, linear or tapering above middle, bristle-tipped, twisted on their short petioles so as to form a 2-ranked flat spray; fruit elliptical, green in color or when ripe streaked with purple,  $1\frac{1}{8}$  to  $1\frac{3}{4}$  in. long; flesh thin and resinous; endosperm copious, with irregular incisions filled by the inner coat, giving it a marbled appearance so that in cross-section the seed resembles the true nutmeg of commerce.—Cool, shady cañons: Santa Cruz Mts. to Mendocino Co.; Sierra Nevada. A forestally rare tree.

#### GNETACEAE. GNETUM FAMILY

Woody plants without resin. Catkins unisexual. Embryo axile in the endosperm; cotyledons always 2.

##### 1. *ÉPHEDRA* L. MEXICAN TEA. JOINT PINE

Equisetum-like shrubs with slender long-jointed stems, opposite or fascicled branches and opposite scale-like leaves. Scales more or less connate, sheathing the stem, at length splitting to the base. Staminate and ovulate catkins very small, on different shrubs. Staminate catkins with 2 to 8 stamens united into a column and a perianth of 2 segments. Ovulate catkins 1, 2, or usually 3 at each node, each 1 or 2-ovulate, with several subtending bracts. Ovule produced at apex into a style-like process (the micropyle) which is exerted through the opening in the urn-shaped perianth. Seed nut-like, enveloped by the indurated perianth, and partly or wholly enclosed by the bracts. (Greek ephedra, the name used by Pliny for the horse-tails.)

berry.—Deep, shady cañons: Santa Cruz Mts. to Mendocino Co. and northw. to Mt. Shasta, thence s. through the Sierra Nevada. Localities few and scattered, and the individuals not numerous. Wood fine- and close-grained, hard, heavy and durable.

##### 2. *TÓRREYA* Arn. STINKING YEW

Trees with rigid sharp-pointed leaves in 2 ranks. Stamen clusters solitary in the adjacent leaf axils, made up of 6 to 8 whorls of stamens, 4 stamens in a whorl, each filament with 4 pollen-sacs without crests. Ovule completely covered by a fleshy aril-like coat, the whole becoming drupe-like in fruit. Seed with thick, woody outer coat, its inner layer irregularly folded into the white endosperm; embryo minute. (John Torrey, Professor of Botany in Columbia College, long-time a student of western botany, who traveled in California before the days of the Overland Railroad.)

1. *T. californica* Torr. CALIFORNIA NUTMEG. Fig. 52. Handsome tree 15 to 50 ft. high, the trunk  $\frac{1}{2}$  to 3 ft. in diameter; leaves rigid,  $1\frac{1}{4}$  to  $2\frac{1}{2}$  in. long,  $1\frac{1}{2}$  lines wide, flat, dark green above, yellowish green beneath and

52. *Torreya californica* Torr.; fr. branchlet  $\times \frac{1}{4}$ .

Scales and bracts in 2s; bracts connate at base; ovulate catkins (and sometimes the staminate) on peduncles  $\frac{1}{2}$  to 4 lines long.

Branches bright or yellowish green, erect and broom-like. .... 1. *E. viridis*.

Branches pale or glaucous, divergent. .... 2. *E. nevadensis*.  
Scales and bracts in 3s; bracts distinct; ovulate catkins sessile or nearly so; branches clustered, erect.

Fruiting catkin subglobose, 3 to 4 lines long. .... 3. *E. californica*.

Fruiting catkin slender-ovate, 5 to 6 lines long. .... 4. *E. trifurca*.

1. *E. viridis* Cov. Erect green shrub  $1\frac{1}{2}$  to 3 ft. high, with numerous broom-like muriculate branches; fruiting bracts green, firm, with narrow scarious edge; fruits 1 or usually 2 in a catkin, with flat faces and strongly convex or carinate backs,  $3\frac{1}{2}$  to 4 lines long.—Desert ranges, 5000 to 7000 ft.: Mohave Desert; Inyo Co.; e. to Ariz. and Utah.

2. *E. nevadensis* Wats. Erect olive-colored shrub  $\frac{1}{2}$  to 2 ft. high; branches somewhat scabrous, divergent; scales sheathing, at length mostly deciduous; fruiting bracts ovate or round ovate, firm, scarious on edges, 4 to 6 pairs; fruit one in a catkin, exserted, 3 or 4 lines long, 3-ridged or trigonous, or, when 2 in a catkin, with more or less flat faces and strongly convex or carinate backs.—Desert valleys: Honey Lake Valley s. to the Mohave and Colorado deserts; e. to Utah, s. to Mex.

3. *E. californica* Wats. Fig. 53. Light green shrub,  $1\frac{1}{2}$  to 3 ft. high; fruiting bracts reddish or brownish, submembranous, in 4 or 5 whorls, reniform-orbicular, entire, with a short broad claw; fruit one in a catkin, ovate, included, 4-angled,  $2\frac{1}{2}$  to 3 lines long.—Mohave and Colorado deserts, n. to western Fresno Co., w. to San Diego, s. to L. Cal.

4. *E. trifurca* Torr. Erect light- or yellowish-green shrub  $1\frac{1}{2}$  to 5 ft. high, with spinosely tipped straight branches; scales conspicuously sheathing, 3 to 6 lines long, finally weathering fibrous; ovulate catkins nearly sessile, of 8 to 10 pairs of bracts; fruiting bracts large, very thin, scarious, round-cordate, clawed, with reddish centers; fruit one in a catkin, slender, 4-sided, included, 6 lines long.—Mohave River at Daggett; Superstition Mts., Colorado Desert; e. to Ariz., s. to Mex.

## CLASS 2. ANGIOSPERMAE. FLOWERING PLANTS

Ovules enclosed in a sac or ovary, which becomes the fruit and encloses the seed. Plants with true flowers, typically with an abbreviated stem (receptacle) bearing regular whorls of floral envelopes and stamens and pistils.

### MONOCOTYLEDONS

Leaves parallel-veined. Stem with vascular bundles scattered irregularly through the pith. Flowers with the parts usually in 3s. Embryo with one cotyledon.

#### TYPHACEAE. CAT-TAIL FAMILY

Marsh or aquatic perennial herbs, the solid cylindric jointless stems from creeping rootstocks and bearing long linear alternate leaves. Flowers monoecious, crowded in dense cylindrical spikes, without perianth. Ovary 1-celled, 1-ovuled; style slender. Fruit a seed-like nutlet.

##### 1. *TYPHA* L. CAT-TAIL

Stems tall, simple, ending above in a long spike, the pistillate portion below, the staminate portion above. Stamens seated directly on the axis, intermixed with long bristle-like hairs. Ovaries minute, pedicellate; pedicels bearing clavate bristles which envelop the very small nutlets in a copious down. (Ancient Greek name of the Cat-tail.)

Staminate and pistillate portions of spikes contiguous, rarely separated; pistillate flowers without bractlets. .... 1. *T. latifolia*.

Staminate and pistillate portions of spikes usually separated by a small interval; pistillate flowers with bractlets. .... 2. *T. angustifolia*.

1. *T. latifolia* L. COMMON CAT-TAIL. Stout,  $3\frac{1}{2}$  to 6 ft. high; leaves very long, flat, sheathing at the base,  $\frac{1}{4}$  to 1 in. broad; spike 7 to 13 in. long; pistillate portion of spike without bractlets; stigma rhombic-lanceolate; pollen-grains in 4s; fruiting spike dark brown or blackish, 10 to 12 lines thick.—Common in marshy places; north temperate regions.

53. *Ephedra californica* Wats.; ovulate branchlet x 1.

2. *T. angustifolia* L. Stems slender, 3 to 8 ft. high; leaves 3 to 6 lines broad, somewhat convex on the back; pistillate flowers with a hair-like bractlet dilated at apex and a linear stigma; pollen-grains simple; fruiting spikes light or dark brown, 5 to 6 lines thick.—Marshes: Inyo Co. s. to cismontane S. Cal.; Atlantic coast; S. Am., Eur., Asia, n. Afr.

### SPARGANIACEAE. BUR-REED FAMILY

Marsh or aquatic plants with terete stems from creeping rootstocks, alternate long-linear 2-ranked leaves and monoecious flowers in globose heads. Ovary 1 or 2-celled. Fruit consisting of obovoid or spindle-shaped nutlets, 1 to 2-seeded.

#### 1. SPARGANIUM L. BUR-REED

Perennials with fibrous roots and horizontal rootstocks. Heads scattered along the upper portion of the simple or sparingly branched stem; lower heads pistillate, with leaf-like bracts; upper heads staminate. Stamens with minute scales interposed, their filaments slender and elongated. Ovaries surrounded by 3 to 6 linear-subulate scales forming a sort of calyx. (Sparganion, the Greek name, diminutive of sparganon, a swaddling-band, on account of the ribbon-like leaves.)

Inflorescence compound; pistillate flowers sessile; nutlets obovoid, with truncate or rounded summit; fruiting heads 10 to 15 lines in diameter.....1. *S. eurycarpum*.  
Inflorescence simple; pistillate flowers pediceled; nutlets spindle-shaped, with tapering summit; fruiting heads 7 to 10 lines in diameter.

Leaves ( $2\frac{1}{2}$  to 5 lines wide) and bracts conspicuously scarious-margined.....

2. *S. simplex*.

3. *S. angustifolium*.

Leaves ( $1\frac{1}{2}$  to 2 lines wide) and bracts not conspicuously scarious-margined.....

54. *Sparganium eurycarpum* Engelm.; a, infl.  $\times \frac{1}{4}$ ; b, achene with sepals  $\times 2$ ; c, head of achenes  $\times \frac{1}{4}$ .

1. *S. eurycarpum* Engelm. Fig. 54. Erect, rather slender, 3 to 8 ft. high, with branching inflorescence; leaves flat and thin, slightly keeled beneath; staminate heads 5 to 13; pistillate heads 2 to 4 on the stem or branch, sessile or more commonly peduncled; fruiting heads  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. in diameter; nutlets sessile, obovoid, several-angled, with a truncate or depressed summit, tipped with the short style, 3 (or nearly 3) lines broad, 4 lines long, including the style.—Los Angeles River to the San Joaquin Valley; n. to B. C., e. to the Atlantic. Var. *GREENEI* Graebner. Branches of the inflorescence more erect; achenes rounded at summit.—San Francisco Bay region, s. to L. Cal., n. to B. C.

2. *S. simplex* Huds. Fig. 55. Stems erect, 1 to 3 ft. high, or sometimes floating; leaves 2 to 6 lines broad, slightly carinate; inflorescence usually simple; staminate heads 3 to 5, congested or confluent, but distant from the pistillate; pistillate heads 2 to 6, the lowest peduncled, some supra-axillary, 8 or 9 lines in diameter in fruit; nutlets narrow, 2 to  $2\frac{1}{2}$  lines long, 1 to  $1\frac{1}{2}$  lines thick on the lower third, at apex gradually attenuate into the long style, long-pedicelled, often 2-celled.—Sierra Nevada, 6000 to 7000 ft., from Tulare Co. to Modoc Co.; n. to B. C., e. to N. Eng.

3. *S. angustifolium* Michx. Stems 1 to 4 ft. high; leaves exceedingly long and narrow, 1 to  $2\frac{1}{2}$  lines

55. *Sparganium simplex* Huds.; a, fr. branch  $\times \frac{1}{2}$ ; b, achene  $\times 2$ .

broad, floating or erect; inflorescence simple; staminate heads 2 to 6, sometimes blended but distant from the pistillate; pistillate heads sessile in the axils, often a little supra-axillary, rarely peduncled; nutlets  $2\frac{1}{2}$  lines long, brownish, constricted at or above the middle, abruptly contracted at apex into the long style or beak, pediceled.—Lakelets and slow streams, 8000 to 9000 ft., very rare: San Bernardino Mts.; Sierra Nevada; B. C. to the Atlantic.

### NAIADACEAE. PONDWEED FAMILY

Water plants entirely submerged or with floating leaves. Leaves thread-like or grass-like or some with broad floating blades, commonly sheathing at base or with sheathing stipules. Flowers inconspicuous, naked or with a very small calyx, commonly borne on a short spike or spadix. Ovaries 1 to 4, distinct, free from the calyx if that be present, 1-celled, 1-ovuled, ripening into nutlet-like fruits.

Flowers perfect, in spikes or clusters.

Calyx of 4 distinct sepals.....1. POTAMOGETON.

Calyx none.....2. RUPPIA.

Flowers unisexual; calyx none.

Leaves entire.

Pistils about 4, borne in a cup-shaped involucre; fresh water ponds or streams.. 3. ZANNICHELLIA.

Pistils many, borne on the side of a linear spadix; maritime.

Flowers monoecious; nutlet ovoid; leaves 2 to 4 lines broad....4. ZOSTERA.

Flowers dioecious; nutlet sagittate-cordate; leaves  $\frac{1}{2}$  to 2 lines broad.... 5. PHYLLOSPADIX.

Leaves with spiny-toothed margins; pistil solitary and naked.....6. NATAS.

#### 1. PÓTAMOGÈTON L. PONDWEED

Perennial herbs, commonly growing in the still waters of creeks and in fresh or brackish ponds, the stems arising from rootstocks. Leaves alternate, or the uppermost opposite, frequently of two kinds, the floating ones broad, the submerged narrower and often thread-like or linear; stipules present, often sheathing the stem. Flowers in spikes or heads on axillary peduncles and enclosed in the bud by stipular sheaths. Sepals 4, with short claws. Stamens 4, inserted on the base of sepals. Ovaries 4. (Greek potamos, a river, and geiton, a neighbor, on account of the aquatic habit.)

##### A. Stipules axillary and free from the leaf.

Plants with both submerged and floating leaves; petioles of floating leaves present, often long, short or none in no. 4.

Submerged leaves linear or thread-like, consisting of petioles only.

Floating leaves elliptical, subcordate at base.....1. *P. natans*.

Floating leaves narrowly oblong, attenuate into the petiole.....2. *P. epiphydus*.

Submerged leaves linear or lanceolate, bearing true blades.

Flowers capitate; peduncles 1 to 3 lines long; floating leaves less than 1 in. long.

3. *P. dimorphus*.

Flowers spicate; peduncles 2 in. long or more; floating leaves 2 to 4 in. long.

Plants reddish; nutlet with a distinct pit on each side.....4. *P. alpinus*.

Plants green; nutlet not pitted.

Nutlet distinctly 3-keeled; low altitudes.....5. *P. americanus*.

Nutlet indistinctly 3-keeled; high montane.....6. *P. heterophyllus*.

Submerged leaves, or some of them, broader and falcate.....7. *P. amplifolius*.

Plants with the leaves all submerged; petioles short or none.

Leaves with broad blades, ovate, orbicular or lanceolate, never linear.

Stipules greenish; leaves with a short petiole or subsessile.....8. *P. lucens*.

Stipules white, with numerous fibrous nerves.

Leaves clasping, hooded at apex; peduncles often 8 in. long or more.....

9. *P. praelongus*.

Leaves cordate-clasping, not hooded, the lobes at base often touching around the stem.....10. *P. perfoliatus*.

Leaves linear, thread-like, or setaceous.

Without propagating buds or glands.....11. *P. foliosus*.

With both propagating buds and glands.

Leaves capillary; stem slender, not flattened.....12. *P. pusillus*.

Leaves linear, 1 to 2 lines wide; stem much flattened....13. *P. compressus*.

##### B. Stipules adnate to the leaf or petiole.

Plants with submerged leaves only.

Leaves capillary.....14. *P. pectinatus*.

Leaves flat,  $\frac{1}{2}$  to  $1\frac{1}{2}$  lines broad.

Leaves in terminal clusters.....15. *P. latifolius*.

Leaves 2-ranked.....16. *P. robbinsii*.

1. *P. nātans* L. BROAD PONDWEED. Stem thick, little if at all branched; floating leaves elliptical, subcordate at base,  $1\frac{1}{2}$  to 3 in. long, 1 to 2 in. broad, on petioles longer than the blade; stipules linear-lanceolate, membranaceous, 2 to 4 in. long; submerged leaves consisting of petioles without blades, 2 to 9 in. long or more and 1 line wide, usually perishing early, their tips sometimes reaching the surface of the water and forming miniature blades; spikes dense, 1 or 2 in. long, on longer peduncles; nutlet evidently keeled along the back, 2 lines long.—Montane region at 5000 to 7000 ft. alt.: Bear Valley, San Bernardino Mts.; Sierra Nevada; Mt. Shasta; n. to B. C., e. to the Atlantic; Eur., Asia.

2. *P. epihȳdrus* Raf. Stems slender ( $\frac{1}{2}$  line broad), compressed, mostly simple, 1 to 2 ft. long; floating leaves narrowly oblong,  $1\frac{3}{4}$  to 2 in. long, gradually narrowed into petioles about  $\frac{1}{2}$  as long; submerged leaves thin, grass-like, 2 to 3 in. long, 2 to 3 lines wide, the petiole-like base very short; spikes dense,  $\frac{1}{2}$  in. long, on peduncles  $1\frac{1}{4}$  to  $1\frac{1}{2}$  in. long; nutlet flattish, 3-keeled, the seed impressed on the sides.—Yosemite Valley; n. to B. C., e. to the Atlantic.

3. *P. dimȳrphus* Raf. Stems simple,  $1\frac{1}{2}$  ft. long; floating leaves in 2 or 3 opposite pairs, oblong, tapering to each end, impressed beneath with 7 to 9 nerves, 3 to 4 lines wide and 7 to 10 lines long, passing rather definitely at base into the somewhat shorter (or sometimes longer) petiole; submerged leaves  $\frac{1}{4}$  to  $\frac{3}{4}$  line wide, 1 or 2 in. long, acute at tip but not setaceous, stipules 1 to 5 lines long, adnate for about  $\frac{1}{2}$  their length; flowers in a few-flowered head (or the emersed in a very short spike), the peduncles 1 to 3 lines long, shorter than the submersed spike; nutlet less than 1 line long, keeled on the back, the keel winged and sometimes denticulate; embryo coiled  $1\frac{1}{2}$  times; pericarp very thin and fleshless, revealing clearly the coiled embryo, the whole suggestive of a snail shell.—San Jacinto Mts.; n. to the Great Valley; e. to Va.

4. *P. alpinus* Balbis. ALPINE PONDWEED. Whole plant of a reddish tinge; stems simple, 1 or 2 ft. long; floating leaves narrowly oblong, tapering at both ends, 2 to 4 in. long,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. wide, submerged leaves 2 to 7 in. long,  $\frac{1}{4}$  to  $\frac{1}{2}$  in. wide, all sessile or narrowed to a short petiole; stipules broad,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; spikes  $\frac{3}{8}$  to  $1\frac{1}{8}$  in. long, on peduncles about 2 in. long; nutlet with a distinct pit on each side.—Ponds, montane, 6000 to 7000 ft.: Sierra Nevada, from Fresno Co. to Alpine Co.; n. to Alas. and Canada, e. to Fla.; Eur., Asia.

5. *P. americanus* C. & S. Stems terete, much branched, 3 to 6 ft. long; floating leaves coriaceous, elliptical, 2 to 4 in. long,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. wide, the petiole often longer than the blade, submerged leaves very thin, lanceolate, 4 to 12 in. long, 4 to 6 lines broad, rounded at base, or tapering into a petiole 1 to 4 in. long; stipules 1 to 4 in. long; peduncles 2 to 3 in. long; spikes 1 to 2 in. long, densely fruited; nutlet obliquely obovate,  $1\frac{1}{2}$  to 2 lines long, the back 3-keeled, with the middle keel prominent.—Ponds or slow creeks in the valleys or hills at low altitudes: Los Angeles Co.; Great Valley; Coast Ranges; n. to B. C., e. to the Atlantic; Eur., Asia, n. Afr.

6. *P. hȳterophȳllus* Schreb. Stems slender, compressed, branched, 1 to 2 ft. long; floating leaves oval to oblong-elliptical, 1 or 2 in. long, 4 to 9 lines wide; petioles 1 to 4 in. long; stipules 1 in. long or less; submerged leaves linear-lanceolate, narrowed at base, sessile, 1 to 2 in. long, 1 to 3 lines wide; spikes 1 in. long; peduncles 1 to 4 in. long; nutlet roundish,  $\frac{3}{4}$  to  $1\frac{1}{2}$  lines long, indistinctly 3-keeled.—High montane, 8000 to 9000 ft.: Sierra Nevada from Tulare Co. to Modoc Co.; n. to Wash., e. to the Atlantic; Eur., Asia.

7. *P. amplifȳllus* Tuckerm. Stems mostly simple, 2 to 4 ft. long; floating leaves oblong-ovate or oval, mucronate,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. broad, 2 to 3 in. long, the petioles of about the same length; submerged leaves with the sides folding together and assuming a falcate shape, the uppermost large, elliptical or ovate,  $2\frac{1}{2}$  to 4 in. long, the lower lanceolate and often as much as 8 in. long and 2 in. wide; spikes  $\frac{1}{2}$  to 2 in. long; peduncles thickening upwards.

2 to 3 in. long; nutlet 3-keeled, the middle keel prominent.—Sierra Nevada (Red Lake on the San Joaquin River); Ore. and B. C. to the Atlantic.

8. *P. lucens* L. Stem thick, branching below and bearing masses of very leafy branches at summit; leaves all submerged, thin, elliptical to lanceolate or oblanceolate or the uppermost oval, acute or acuminate, often undulate-serrate, narrowed at base to a short petiole or sessile, 2 to 7 in. long and  $\frac{3}{4}$  to  $1\frac{3}{4}$  in. wide; stipules greenish, 1 to 2 in. long, loose and spreading, sometimes very broad; peduncles 3 to 6 in. long; spikes 2 to  $2\frac{1}{2}$  in. long, thick cylindrical; nutlet  $1\frac{1}{2}$  lines long, nearly as broad, with 3 distinct ribs on back.—Small lakes and ponds: San Diego Co.; San Francisco; n. to B. C., e. to Nova Scotia.

9. *P. praelongus* Wulf. Stems whitish, zigzag, 3 to 8 ft. long, branching; leaves all submerged, bright green, oblong-lanceolate, undulate, "cucullate at apex," sessile by a clasping base, 4 to 9 in. long, and  $\frac{1}{2}$  to 1 in. wide; stipules white, the uppermost obtuse, many-nerved, usually hugging the stem,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; spikes 1 to 2 in. long, borne on peduncles 4 to 10 in. long (or even longer), erect and straight and often numerous; nutlet 2 to  $2\frac{1}{2}$  lines long.—Deep water of ponds: Sierra Co.; Ore. to B. C. and N. J.; Eur.

10. *P. perfoliatus* L. var. *richardsonii* Benn. Stems straight, simple or branching; leaves long-lanceolate and acute, wavy, cordate at base and clasping, 1 to 4 in. long; stipules  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long, many nerved, often becoming much frayed; spikes 8 to 11 lines long; peduncles  $1\frac{1}{4}$  in. long; nutlet  $1\frac{3}{4}$  lines long.—Siskiyou Co.; Ore. to B. C. and N. J.

11. *P. foliosus* Raf. LEAFY PONDWEED. Stem flattened, much branched, 1 to  $2\frac{1}{2}$  ft. high; leaves rather thickly clothing the stem, 1 to  $1\frac{1}{2}$  in. long,  $\frac{1}{2}$  to 1 line wide, abruptly acute; stipules white, transparent, 6 to 9 lines long; flowers few in a head on a peduncle 2 to 6 lines long; nutlet nearly 1 line long, 3-keeled on the back, the central keel with narrow rough-edged wing.—Ponds, Coast Ranges and Sierra foothills; n. to Ore., e. to the Atlantic. Var. *CALIFORNICUS* Morong. Bushy in its habit; stem thick.—Coastal S. Cal. Var. *NIAGARÉNSIS* Gray. Large-sized; leaves often 3 in. long or more; stipules longer than in the species.—Visalia; e. U. S.

12. *P. pusillus* L. SLENDER PONDWEED. Stems filiform, branching,  $\frac{1}{2}$  to 1 ft. long; leaves narrowly linear, acute, with a crater-like gland on each side of the stem at base of the petiole or rarely glandless, 1 to 3 in. long,  $\frac{1}{4}$  to  $\frac{3}{4}$  line wide, sessile; stipules short, obtuse, becoming setose; peduncles flattened, slender,  $\frac{1}{2}$  to 3 in. long; spikes interrupted or capitate; nutlet obliquely elliptical,  $\frac{3}{4}$  to 1 line long, with a groove on each side of the rounded back, or sometimes with 3 distinct keels, beaked by a short style.—Coast Ranges; Sierra Nevada; n. to B. C., e. to the Atlantic, s. to Mex.; Eur., Asia. Var. *TENUISSIMUS* Mert. & Koch. Leaves setaceous.—Soda Sprs., Tuolumne Mdns.

13. *P. compressus* L. EEL-GRASS PONDWEED. Stem very much flattened; foliage bright green and shining; leaves fascicled at summit of the branches, with numerous fine nerves, 2 to 6 in. long,  $1\frac{1}{4}$  to 2 lines wide, abruptly acute, mucronate, sessile; stipules scarious, soon perishing; spikes  $\frac{1}{2}$  to 1 in. long, on peduncles 1 to 4 in. long; nutlet nearly or quite 2 lines long, 3-keeled on back.—Honey Lake Valley, Lassen Co.; Ore. to B. C. and N. J.; Eur.

14. *P. pectinatus* L. FENNEL PONDWEED. SAGO PONDWEED. Fig. 56. Stems  $\frac{1}{2}$  or 2 to 6 or 8 ft. long, from a running rootstock, repeatedly forking above, then very leafy and forming broom-like clusters; leaves very slender, setaceous, 1 to 3 in. long exclusive of the sheaths which are  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long or on the lower leaves even 2 in. long; scarious margin of the sheaths very narrow; spikes  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, the flowers in distinctly separated whorls; peduncles 1 to 3 or more in. long; nutlet  $1\frac{1}{2}$  to 2 lines long, with an obscure ridge on each side of the back.—The most common species throughout the state from sea-level to 7000 ft.; of world-wide distribution. The rootstocks bear tubers about the size of a pea, which are fed upon by the Canvas-back and Broad-bill.

56. *Potamogeton pectinatus* L.; a, fruiting branch; b, rootstocks with ascending stems producing tubers on branches from the nodes; c, d, tubers with young shoots.  $\times \frac{1}{4}$ .

15. *P. latifolius* Morong. Near the preceding; stems stoutish, white, branching; leaves numerous, fasciated terminally,  $\frac{1}{2}$  to  $1\frac{1}{2}$  lines broad; adnate portion of stipule  $\frac{1}{4}$  to 1 in. long, broad on the uppermost leaves, scarious-margined, the free portion shorter.—Brackish water; n. Sierra Nevada from Lassen Co. to Modoc Co.; nw. Nev.

16. *P. robbinsii* Oakes. Stems stout; rootstocks running, sometimes nearly 1 ft. long; leaves crowded in 2 ranks,  $1\frac{1}{2}$  to 4 in. long,  $1\frac{1}{2}$  to 2 lines wide, obtuse, mucronate, auriculate at junction of free portion of stipule; adnate portion of stipules about  $\frac{1}{2}$  in. long, the free portion as long or longer.—Mariposa Co.; Honey Lake Valley, Lassen Co.; Ore. to B. C. and Del.

## 2. RÚPPIA L.

Immersed aquatic herbs with long filiform forking stems. Leaves almost capillary, with a broad membranous sheathing base. Peduncles slender, axillary, at first very short and enclosed in the spathe-like base of the leaf, each bearing two flowers disposed near together and rising to the surface in the period of anthesis, afterwards coiling and drawing the

fruits beneath the surface. Flowers perfect, entirely destitute of perianth. Stamens 2, sessile, each anther consisting of 2 large and separate anther-cells. Pistils 4, after flowering becoming stalked and ripening into hard ovoid nutlets; stigmas depressed, sessile. (H. B. Ruppius, a German botanist of the 18th century.)

1. *R. maritima* L. DITCH-GRASS. Plants 2 to 3 ft. long; leaves 2 to 3 in. long; nutlets  $\frac{3}{4}$  to  $1\frac{1}{4}$  lines long, raised on stipes 1 to 12 lines long; fruiting peduncle 3 to 6 lines long.—Alkaline or brackish waters: throughout the state; cosmopolitan.

## 3. ZANNICHÉLLIA Mich.

Immersed aquatic plants, flowering and fruiting under water, the thread-like stems from a creeping rootstock. Leaves opposite or in whorls. Flowers monoecious, without perianth, sessile, both kinds in the same axil: staminate flowers consisting of an anther on a pedicel-like filament; pistillate flowers 2 to 6 (usually 4) in a cluster and surrounded by a hyaline cup-shaped involucre shorter than the pistils, each flower consisting of a single pistil with a thin peltate stigma on the summit of the short style. Fruit an oblong somewhat flattened, beaked nutlet. (G. G. Zannichelli, 1662-1729, a botanist of Venice.)

1. *Z. palustris* L. HORNED PONDWEED. Stems sparingly branched, 1 to  $1\frac{1}{2}$  ft. long; leaves 1 to 2 in. long, filiform but flat; nutlet slightly incurved, becoming stipitate, 1 to  $1\frac{1}{2}$  lines long, often roughened or toothed on the back.—Pools and still waters of streams: Los Angeles and Santa Barbara, n. to Alameda Co. and the Sacramento Valley; cosmopolitan.

## 4. ZOSTÉRA L. GRASS-WRACK

Submerged maritime herbs with elongated and very narrow grass-like radical leaves and inflorescences raised on peduncle-like stems. Flowers monoe-

cious, borne in 2 rows on the face of a flattened spadix with or without small lateral appendages covering them in the bud and closely invested by a protecting leaf-like spathe until anthesis. Staminate flower of 1 stamen. Pistillate flower of 1 pistil. Nutlet ovoid. (Greek zoster, a girdle or band, on account of the ribbon-like leaves.)

1. **Z. marina** L. EEL-GRASS. Leaves with long sheathing bases, 3 to 7-nerved. 1 to 4 ft. long, 1 to 4 lines broad; spathes jointed at base, ending above in a more or less elongated leaf-like summit; spadix 2 to 4 in. long, 10 to 20-fruited; fruits  $1\frac{1}{2}$  lines long, the ribs of the seed showing clearly on the pericarp.—Shoal waters of bays, San Pedro to San Francisco Bay and n. to Alas. Var. **LATIFOLIA** Morong. Stem stout, sometimes 8 or 10 ft. long; leaves 3 to 6 lines wide; nutlet with a distinct stipe, the pericarp splitting along the face; seed without ribs.—Santa Barbara to Bolinas Bay and n. to Puget Sound.

#### 5. **PHYLLÓSPADIX** Hook.

Aquatic plants of rocky ocean shores, closely related to *Zostera*, with elongated narrowly linear basal leaves from much branched creeping rootstocks. Flowers dioecious, borne in 2 rows on the side of a flattened spadix, with a lateral chartaceous appendage covering each flower in the bud, the whole inflorescence enclosed by a spathe which is produced beyond the spadix as a foliaceous prolongation. Staminate spadices with sessile anthers; pistils or rudiments none. Pistillate spadices with rudimentary anthers alternating with the pistils; pistils simple, with 2 stigmas; ovary sagittate-cordate, i. e., with two downwardly-produced horns at base, which in fruit are strongly developed and bear on the inside deflexed bristles serving to attach the floating nutlets to other plants on the beaches. (Greek phullon, leaf, and spadix, a kind of inflorescence.)

Flowering stems 1 ft. long or more, bearing 2 to 5 pistillate spadices. . . . . 1. *P. torreyi*.  
Flowering stems 2 or 3 in. long, bearing 1 pistillate spadix or rarely 2. . . . . 2. *P. scouleri*.

1. **P. torreyi** Wats. Rootstocks brittle; leaves  $1\frac{1}{2}$  to 2 ft. long,  $\frac{1}{2}$  to 1 line broad; pistillate spadices 1 to  $1\frac{3}{4}$  in. long; staminate spadices shorter and with shorter peduncles; nutlet  $2\frac{1}{2}$  lines long.—Low tide limits to two fathoms below: Russian River to San Diego; s. to L. Cal.; usually in more quiet waters than the next.

2. **P. scouleri** Hook. Very similar to the preceding but the leaves rather broader.  $\frac{3}{4}$  to 2 lines wide, and more obviously 3-nerved; nutlet larger.—Santa Barbara to Sonoma Co.; n. to Vancouver Isl.; Japan.

#### 6. **NAIAS** L. NAIAD

Slender branching submerged fresh-water plants with linear opposite spiny-toothed leaves, which are seemingly whorled on account of the ones crowded in the axils. Flowers monoecious or dioecious, solitary in the axils. Staminate flower consisting of a single stamen enclosed by two perianth-like envelopes. Pistillate flower naked, consisting of a single ovary bearing a style with 2 to 4 stigmas. Fruit a seed-like nutlet, tipped with the persistent style. (Greek Naias, a water-nymph.)

Leaves coarsely toothed, the sheathing base entire or with 1 or 2 teeth on each side; stems and back of the leaves often spiny; flowers dioecious. . . . . 1. *N. marina*.  
Leaves very minutely serrulate; flowers monoecious; stems unarmed.

Nutlet shining, smooth; sheathing base of leaves with many minute teeth on its upper portion. . . . . 2. *N. flexilis*.

Nutlet dull, reticulated; sheathing base of leaves commonly narrow and with few teeth or sometimes entire. . . . . 3. *N. guadalupensis*.

1. **N. marina** L. HOLLY-LEAVED NAIAD. Stems stout, often armed with prickles twice as long as their breadth; leaves linear,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, 1 to  $1\frac{1}{2}$  lines broad, coarsely saw-toothed, with the teeth spinulose-tipped and the broad sheathing base entire or with 1 or 2 teeth on each side; nutlet 2 to  $2\frac{1}{2}$  lines long, reticulated.—Clear Lake; L. Cal.; e. to the Atlantic. Rare in Am.; Eur., Asia, Australia. Var. **CALIFORNICA** Rendle. Internodes sparingly spinose; leaves very coarsely toothed and with 4 to 6 dorsal spines.—S. Cal.

2. *N. flexilis* R. & S. SLENDER NAIAD. Stems slender; leaves narrowly linear, very minutely toothed, mostly acuminate,  $\frac{1}{2}$  to 1 in. long,  $\frac{1}{4}$  to  $\frac{1}{2}$  line wide; nutlet oblong-ovoid, 1 to 2 lines long, nearly smooth, shining.—Santa Monica; San Francisco; Wash. to the Atlantic; Eur.

3. *N. guadalupensis* (Spreng.) Morong. Stems thread-like, 1 to 2 ft. long; leaves 6 to 9 lines long,  $\frac{1}{2}$  line wide or something less, abruptly acute; nutlet cylindrical, 1 to  $1\frac{1}{2}$  lines long, dull but distinctly marked with numerous rows of squarish reticulations.—Ore. to San Francisco and se. to the Atlantic; tropical Am.

### JUNCAGINACEAE. ARROW-GRASS FAMILY

Marsh or sub-aquatic herbs with mostly basal rush-like or grass-like leaves, and small flowers in racemes or spikes, or solitary. Calyx 6 or 3-parted, or none. Stamens in ours 6 or 1. Ovaries 1, or 3 to 6 and united. Embryo straight.

Flowers perfect, in a raceme; perianth present; stamens 6 or 3.

Leaves all basal; flowers greenish, numerous in bractless spike-like racemes.....

1. TRIGLOCHIN.

Leaves both basal and cauline; flowers white, few in a loose bracted raceme.....

2. SCHEUCHZERIA.

Flowers polygamous, in a spike, also with some solitary; perianth none; stamen 1.....

3. LILAEA.

#### 1. TRIGLOCHIN L.

Perennial by means of short rootstocks. Leaves fleshy with membranous sheaths. Flowers small, in a spike-like bractless raceme raised on a scape. Sepals 6 or 3, greenish, deciduous, the 3 inner inserted higher. Stamens 6 or 3; anthers sessile or nearly so. Carpels 6 or 3, united around a central axis (carpophore), separating when ripe from the base upward, and leaving the persistent axis. Stigmas as many as the carpels, plumose. Carpels 1-seeded, dehiscent by the ventral suture. (Greek tri, three, and glochis, a point, referring to the fruit of the 3-carpeled species.)

Sepals 6, the 3 inner inserted higher; carpels 6, strongly 2-ridged, with an obscure or obvious ridge in the furrow; carpophore slender, not winged.....

1. *T. maritima*.

Sepals 3; carpels 3, 3-ridged, the median ridge much stronger than the lateral; carpophore 3-winged.....

2. *T. striata*.

1. *T. maritima* L. COMMON ARROW-GRASS. Scapes stout, 1 ft. long or somewhat more, bearing a raceme 10 to 15 in. long, the whole surpassing the (2 to 3 lines wide) leaves; flowers 1 line long, longer than the pedicels, these in fruit conspicuously decurrent; carpels 3-angled, with the dorsal angles winged, making a broad longitudinally-striate groove on the back,  $2\frac{1}{2}$  lines long.—Marshy shores along the coast, rarely in the interior. Var. *DEBILIS* Jones. Slender Arrow-grass. Scapes very slender and racemes looser, 7 to 13 in. high; leaves usually less than 1 line wide; flowers about  $\frac{1}{2}$  line long; carpels rather less than 2 lines long; fruiting pedicels less obviously decurrent.—With the species.

2. *T. striata* R. & P. Scapes 1 to several in a tuft, 2 to 7 in. high, mostly exceeded by the leaves; leaves 1 line wide; sepals 3; stamens 3; fruit about  $\frac{3}{4}$  line long; carpels 3-ridged on the back.—Salt-marshes, Coast Ranges from Monterey Co. to Mendocino Co.; N. and S. Am.

#### 2. SCHEUCHZERIA L.

Rush-like perennials with creeping rootstocks, erect leafy zig-zag stems, and small flowers in a loose terminal raceme. Leaves grass-like, flat above, semi-terete below, tubular at apex, sheathing the stem at base, reduced to bracts above. Flowers white, few in a lax raceme. Calyx 6-parted, persistent, its segments nearly alike, the inner narrower. Stamens 6, inserted on the base of the perianth segments. Ovaries 3, nearly distinct, 1 to 3-ovuled, bearing flat sessile stigmas, becoming in fruit divergent inflated coriaceous follicles dehiscent along the inside. (The brothers J. and J. J. Scheuchzer, Swiss botanists, early in 18th century.)

1. *S. palustris* L. Stems solitary or several, 4 to 10 in. high; leaves 4 to 12 in. long; pedicels 3 to 10 lines long, spreading in fruit; perianth segments

membranous, 1-nerved,  $1\frac{1}{2}$  lines long; follicles 2 to 4 lines long.—Bogs: Sierra Co.: n. to Alas., e. to Penn.; Eur., Asia.

### 3. *LILAËA* H. & B.

Sub-aquatic annual with fibrous roots and basal rush-like leaves sheathing at base. Flowers in spikes raised on scapes and also with solitary pistillate flowers in the axils of the basal leaves. Spikes unisexual or with perfect flowers in the middle, pistillate below and staminate above, all in the axils of bracts except the pistillate. Staminate flowers consisting of a single stamen. Perfect flowers made up of a stamen and a pistil. Pistillate flowers consisting of a single pistil with short style, those in the axils of the basal leaves with extraordinarily long styles. Fruits coriaceous, flattish, oblong-ovate, winged, longitudinally ribbed, 1-seeded, indehiscent, those in the axils of the basal leaves less compressed and wingless. (A. R. Delile, French botanist, 1778-1850, author of a Flora of Egypt.)

1. *L. subulata* H. & B. Leaves cylindrical, 6 to 8 in. long, 1 to 2 lines in diameter, tapering to a point; spikes dense,  $\frac{1}{2}$  in. long or less; basal pistillate flowers often with a style 1 to 3 in. long, their fruits larger than those of the spike,  $2\frac{1}{2}$  to 3 lines long.—In water or mud of shallow vernal pools, Great Valley and Coast Ranges, s. to S. Cal.; n. to B. C.; also Mex. and S. Am.

## ALISMACEAE. WATER PLANTAIN FAMILY

Marsh or aquatic herbs with basal leaves, scape-like flower stems and perfect or unisexual flowers. Perianth of 3 outer herbaceous persistent sepals and 3 inner white delicate deciduous petals. Stamens 6 to many or numerous. Ovaries numerous, distinct, 1-celled, 1-ovuled, becoming achenes in fruit. Endosperm none; embryo strongly recurved or folded.

Achenes verticillate in a single whorl; stamens 6.

Petals entire; style lateral; achenes minutely beaked.....1. *ALISMA*.

Petals incised; style apical; achenes long-beaked.....2. *DAMASCONIUM*.

Achenes numerous, crowded on a globose or elevated receptacle; stamens 9 to many.

Leaves entire; achenes turgid; flowers all perfect.....3. *ECHINODORUS*.

Leaves typically sagittate; achenes strongly flattened; flowers not all perfect.

Flowers polygamous, the lower perfect, the upper staminate...4. *LOPHOTOCARPUS*.

Flowers unisexual, the lower pistillate, the upper staminate.....5. *SAGITTARIA*.

### 1. *ALISMA* L.

Erect perennial herbs of shallow water or mud. Inflorescence a panicle of whorled branches each bearing a simple or compound umbel of perfect flowers. Petals small, scarcely exceeding the sepals. Stamens 6, with short filaments. Ovaries distinct, on a disk-like receptacle. Achenes numerous, channeled on the back, crowded in a whorl. (*Alisma*, the Greek name.)

1. *A. plantago* L. WATER PLANTAIN. Fig. 57. Plants 2 to 4 (or 6) ft. high; rootstock becoming almost bulbous by the sheathing bases of the petioles; leaf-blades ovate to oblong, abruptly acute, the larger often subcordate at base, 2 to 6 (or 9) in. long, usually on long petioles; whorled branches of flowering stems unequal in length, forming a loose pyramidal panicle; pedicels 1 in. long or less;

57. *Alisma plantago* L.; a, fr. plant  $\times \frac{1}{4}$ ; b, fr. head  $\times 3$ ; c, achene  $\times 3$ .

petals white, 1 line long; achenes very strongly flattened, oblong, 1 line long.—Common along the margins of ponds, rivers, and marshy shores of lakes: Coast Ranges; Great Valley; Sierra Nevada to 5000 ft. Widely distributed as a polymorphic species, through the north temperate zone and in n. Afr. and Australia.

## 2. DAMASONIUM Juss.

Annual or perennial herbs. Flowers perfect, in a terminal umbel, or the umbel proliferous and forming a succession of 2 or 3 umbels. Petals delicate, spreading, erose or incised, soon marcescent. Stamens 6, in pairs opposite each sepal. Ovaries 6 to 10, 1 to several-ovuled, attached by their short ventral side to the conical receptacle. Achenes with long erect beak, radiately whorled and divergent. (Name of uncertain origin.)

58. *Damasonium californicum* Torr.; a, fr. infl.  $\times \frac{1}{2}$ ; b, leaf  $\times \frac{1}{2}$ ; c, achene  $\times 2\frac{1}{2}$ .

1. *D. californicum* Torr. Fig. 58. Stems erect, slender, 8 to 16 in. high, arising from tuberous perennial rootstocks; leaf-blades ovate to lanceolate, 3 to 5-nerved, 1 to  $1\frac{1}{2}$  in. long, long-petioled; petals almost orbicular, 4 to 5 lines long, larger than the sepals; ovaries 1-ovuled; achenes ribbed on back,  $3\frac{1}{2}$  lines long, their beaks long-subulate.—Pools and shallow shores: Petaluma; College City; Sutter Co.; n. Sierra Nevada from Amador Co. to Modoc Co.

## 3. ECHINÓDORUS Rich.

Annual or perennial herbs with the habit of *Sagittaria*. Stem scapose, with the perfect flowers on short pedicels in umbel-like whorls. Stamens 6 to 12 or more. Ovaries 1-ovuled, many to numerous, crowded on a globose receptacle, attenuate into the terminal style. Achenes sharply ribbed. (Greek echinos, hedgehog, and doros, utricle, or leather bottle, in reference to the prickly fruit.)

1. *E. cordifolius* (L.) Griseb. Fig. 59. Annual; leaf-blades ovate, 5 to 9-nerved, obtuse, truncate or cordate at base,  $1\frac{1}{2}$  to 6 (or 8) in. long, long-petioled; scapes erect,  $1\frac{1}{4}$  to 2 ft. high; umbels distant, 3 to 12-flowered, proliferous and forming a sparingly branched panicle; corolla 6 to 14 lines broad; stamens 12; fruiting heads globose-ovate, 3 lines long; achenes 1 line long, strongly several-ribbed, with a conspicuous erect straight beak.—Borders of pools and streams: San Joaquin Co.; cismontane S. Cal.; Palo Verde Valley; e. to Fla.; s. to Mex.

## 4. LÓPHOTOCÁRPUS T. Dur.

Closely allied to *Sagittaria*. Leaves sagittate, sometimes with entire blades or reduced to phyllodes. Flowers polygamous (perfect and staminate). Sepals accrescent, erect and appressed in fruit. Stamens 9 to 21. Fruiting pedicels recurved. (Greek lophos, crest, and karpos, fruit.)

1. *L. calycinus* (Engelm.) J. G. Sm. Aquatic; leaves submerged, floating or erect; scapes simple, bearing 3 to 5 whorls of flowers.—Stockton; Los Angeles Co.; e. to the Atlantic.

59. *Echinodorus cordifolius* Griseb.; a, habit  $\times \frac{1}{2}$ ; b, leaf  $\times \frac{1}{2}$ ; c, fl.  $\times \frac{1}{2}$ ; d, achene  $\times 4$ .

5. *SAGITTARIA* L. ARROW-HEAD

Marsh or aquatic perennial herbs with thickened or tuberous rootstocks, fibrous roots and milky juice. Leaves sheathing the stem at base; earlier leaves (phyllodia) destitute of blades, later producing small entire blades or most commonly sagittate blades. Flowers pediceled, borne in whorls of 3 on the upper part of the stem, with membranous bracts. Flowers monoecious (rarely dioecious), the staminate above. Petals longer than the sepals. Stamens numerous, inserted above the receptacle. Ovaries indefinitely numerous, crowded on a globose receptacle. Achenes flat, winged or margined, beaked by the short style. (Latin *sagitta*, an arrow, referring to the shape of the leaves.)

Sepals of pistillate flowers reflexed or spreading, not accrescent.

Pedicels of pistillate flowers slender, ascending; leaves (or some of them) with sagittate lobes.

Basal lobes equalling or shorter than the terminal one; achenes without wings or crests on sides.

Achenes with prominent horizontally oblique beak.....1. *S. latifolia*.

Achenes with minute erect beak.....2. *S. arifolia*.

Basal lobes longer than terminal one; achenes almost beakless, the sides with a prominent wing-margined depression.....3. *S. greggii*.

Pedicels of pistillate flowers much thickened, reflexed in fruit; leaves not sagittate...

4. *S. sanfordii*.

Sepals of the pistillate flowers erect and accrescent.....5. *S. montevidensis*.

1. *S. latifolia* Willd. TULE POTATO. Leaf-blades sagittate, very variable in outline and size, 2 to 12 in. long; basal lobes lanceolate to broadly ovate, acuminate, commonly divaricate,  $\frac{1}{2}$  to as long as the terminal lobe; scape simple or branched,  $\frac{1}{4}$  to 3 ft. high; flowers monoecious or dioecious; stamens 20 to 25; achene  $1\frac{1}{2}$  lines long, with somewhat swollen dorsal wing and long horizontally oblique beak.—Rivers and deltas of the Sacramento and San Joaquin valleys, especially abundant on the river islands; swamps and meadows in the Sierra Nevada to 6000 ft.; s. to Los Angeles. Almost throughout N. Am. The edible tubers are used by the Chinese of the lower Sacramento.

2. *S. arifolia* Nutt. Very near the preceding; leaf-blades sagittate,  $2\frac{1}{2}$  to 7 in. long; terminal lobe ovate to lanceolate or nearly linear; basal lobes narrower than the terminal; scapes as long as the leaves or commonly shorter; achenes obovate, 1 to  $1\frac{1}{2}$  lines long, winged all around, bearing a minute erect beak.—San Bernardino Mts.; n. through the Sierra Nevada to Lassen Co.; n. to B. C., e. to Nova Scotia.

3. *S. greggii* J. G. Sm. Plants 2 to 4 ft. high; leaf-blades 8 to 16 in. long, on long petioles; basal lobes lanceolate, acuminate, widely divergent, longer than the lanceolate or ovate, acuminate terminal one; submersed leaves with an entire lanceolate blade  $1\frac{1}{2}$  or 2 in. long, or the blade wholly obsolete; whorls numerous; pedicels 4 to 12 lines long; petals orbicular with truncatish or broadly subcordate base, 7 to 10 lines broad, broader than long; stamens 22 to 30, the filaments about as long as the anthers, dilated at base; achenes with acute margins, the sides with an ear-shaped depression margined by a narrow wing and with one or two tube-like passages in the spongy pericarp near the ventral angle.—Lower San Joaquin River islands and shores.

4. *S. sanfordii* Greene. Leaves 2 to 3 ft. long; petioles obtusely triquetrous,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. thick at the base; blades linear- to oblong-lanceolate, 4 or 5 in. long, tapering into the spongy petiole, or almost obsolete in submersed plants; scapes stout,  $1\frac{1}{2}$  ft. high or more; whorls of flowers usually few; sepals ovate, 2 to 3 lines long; achenes 1 line long, winged on both the inner and outer margins, the sides reticulated; beak nearly erect, short, triangular.—Sloughs and pools, lower San Joaquin River.

5. *S. montevidensis* C. & S. Stout; leaves sagittate, strongly many-ribbed; flowers 1 to  $1\frac{1}{4}$  in. broad; petals white, with a brownish purple spot at base; fruiting heads of achenes very large,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. in diameter.—Introduced at Stockton and Penryn; native of Argentina.

**HYDROCHARITACEAE. FROG'S BIT FAMILY**

Aquatic herbs with dioecious or polygamous regular flowers from a spathe. Stamens 3 to 12. Ovary 1 to 3-celled, inferior; stigmas 3 or 6. Fruit maturing under water, many-seeded, indehiscent.

**1. ELODËA Michx.**

Perennial herbs. Leaves opposite or whorled, crowded, sessile, pellucid. Flowers polygamo-dioecious, solitary and sessile, arising from a tubular 2-cleft axillary spathe. Staminate flowers minute, with 6-parted perianth (3 sepals, 3 petals), and 9 short stamens. Pistillate flowers with 3 calyx-lobes and 3 petals, its long calyx-tube at base coherent with the ovary; ovary 1-celled, with 3 parietal placentae; style capillary, coherent with calyx tube; stigmas 3; stamens 3 (sometimes rudimentary) or 6. (Greek elodes, marshy.)

1. *E. canadensis* Michx. WATER-WEED. Stems slender, elongated, submerged,  $\frac{1}{4}$  to 2 ft. long, varying according to depth of the water; leaves lanceolate to ovate or linear, 1 to 3 lines long; staminate flowers breaking off in anthesis, rising to the surface and shedding their pollen around the pistillate ones; pistillate flowers rising to and expanding on the surface by means of the elongated (2 to 10 in. long) calyx tube.—Rare in Cal.: Mendocino Co.; Truckee; Egg Lake, Modoc Co. Nearly throughout N. Am.

**GRAMINEAE. GRASS FAMILY<sup>1</sup>**

By A. S. HITCHCOCK, Systematic Agrostologist, U. S. Department of Agriculture; revised in 1921 by AGNES CHASE, Assistant Agrostologist.

Herbs with usually hollow stems (culms) closed at the nodes, and 2-ranked parallel-veined leaves consisting of two parts, the sheath and the blade, the sheath enveloping the culm, the blade usually narrowly linear; at the junction of the sheath and blade on the inside, a membranaceous or hairy appendage, the ligule. Flowers minute, usually perfect, without a distinct perianth, arranged in spikelets consisting of a shortened axis (rachilla) and 2 to many 2-ranked bracts, the lowest pair (glumes) empty, each succeeding bract (lemma) including a single flower and, with its back to the rachilla, a 2-nerved bract (palea), the flower, lemma and palea together termed the floret. Spikelets arranged in panicles, racemes or spikes. Stamens usually 3, with delicate filaments and 2-celled anthers. Pistil 1, with a 1-celled 1-ovuled ovary, usually 2 styles and plumose stigmas. Fruit a caryopsis with starchy endosperm and a small embryo at the base, on the side opposite the hilum. Grain usually inclosed at maturity in the lemma and palea, free or adnate to the palea.

The stems are woody in bamboos (cultivated in California for ornament) and in a few other groups, and are solid in corn, sorghum and some other large grasses. The sheath is sometimes grown together at the margins, as in *Melica* and *Glyceria*. The plants may be monoecious as in the cultivated corn, or dioecious, as in *Distichlis* and *Monanthochloë*. One or both of the glumes may be wanting, as in *Paspalum*. The lemma may be sterile, that is, it may contain only stamens, or only the palea, or the latter may be suppressed, or the lemma itself may be variously modified as in the upper florets of *Melica*, or *Bouteloua*. The perianth is represented by 2 minute hyaline scales (lodicules) at the base of the flower, inside the palea. The stamens are rarely 1, 2, or 6, and the styles are rarely 1 or 3. The seed is free from the thin pericarp in *Sporobolus*, *Eleusine* and *Crypsis*.

**SUBFAMILY 1. Poëtæ**

Spikelets 1 to many-flowered, the reduced florets, if any, above the perfect florets (except in *Phalarideæ*); articulation usually above the glumes; spikelets usually more or less laterally compressed.

<sup>1</sup> Twenty-six of the drawings in illustration of this family are original; forty-six were generously loaned by the U. S. Department of Agriculture. The ranges for California were written by W. L. Jepson, chiefly on the basis of specimens determined by Dr. Hitchcock and Mrs. Chase.

- Spikelets without sterile lemmas below the perfect floret (or these rarely present and like the fertile ones).
- Spikelets not in deciduous groups of 3.
- Spikelets pedicellate in open or contracted, sometimes spike-like panicles.
- Spikelets 2 to many-flowered.
- Glumes shorter than the first floret (except in *Dissanthelium* with long rachilla joints); lemmas awnless or awned from the tip or from a bifid apex. . . . . Tribe 1. FESTUCEAE.
- Glumes as long as the lowest floret, usually as long as the spikelet; lemmas awned from the back (spikelets awnless in *Koeleria* and *Sphenopholis*). . . . . Tribe 3. AVENEAE.
- Spikelets 1-flowered. . . . . Tribe 4. AGROSTIDEAE.
- Spikelets sessile on a usually continuous rachis (short-pedicellate in *Leptochloa*; the rachis disarticulating in *Lepturus*, *Pholiurus*, *Hordeum*, *Sitanion*, and a few species of allied genera).
- Spikelets on opposite sides of the rachis; spike terminal, single. . . . . Tribe 2. HORDEAE.
- Spikelets on one side of the rachis; spikes usually more than 1, digitate or racemose. . . . . Tribe 6. CHLORIDEAE.
- Spikelets in groups of 3, 1 perfect, 1-flowered, 2 staminate, 2-flowered, sessile on the main axis, the groups falling entire. . . . . Tribe 5. NAZIEAE.
- Spikelets with 2 staminate, neuter, or rudimentary lemmas unlike and below the fertile lemma; no sterile or rudimentary florets above. . . . . Tribe 7. PHALARIDEAE.

## SUBFAMILY 2. Panicatae

Spikelets with one perfect terminal floret (disregarding those of the few monoecious genera and the staminate and neuter spikelets) and a sterile or staminate floret below, usually represented by a sterile lemma only, one glume sometimes (rarely both glumes) wanting; articulation below the spikelets, either in the pedicel, in the rachis, or at the base of a cluster of spikelets, the spikelets falling entire, singly, in groups, or together with joints of the rachis; spikelets, or at least the fruits, more or less dorsally compressed.

- Spikelets all alike; glumes and sterile lemma membranaceous, fertile lemma and palea indurate. . . . . Tribe 8. PANICEAE.
- Spikelets in pairs, one sessile and perfect, the other pedicellate and staminate or neuter (the pedicellate one sometimes obsolete, rarely both pedicellate); glumes firm, lemmas hyaline. . . . . Tribe 9. ANDROPOGONEAE.

## TRIBE 1. Festuceae. FESCUE TRIBE

Spikelets 2 to several-flowered, in open or contracted panicles (racemose in nos. 4 and 19); lemmas awnless or awned from the tip or from just below it; rachilla disarticulating above the glumes, these remaining after the fall of the florets.

- Lemmas divided at the summit into 5 to several awns or awn-like lobes; inflorescence a simple erect raceme. . . . . 19. ORCUTIA.
- Lemmas awnless, with a single awn, or, if 3, the lateral awns minute.
- Tall stout reeds with large plume-like panicles; lemmas or rachilla with long silky hairs as long as lemmas.
- Lemmas hairy; rachilla naked. . . . . 12. ARUNDO.
- Lemmas naked; rachilla hairy. . . . . 13. PHRAGMITES.
- Low or rather tall grasses, rarely over 1.5 m. tall.
- Plants dioecious, perennial; lemmas glabrous; grasses of salt or alkaline soils.
- Plants low and creeping; spikelets obscure, scarcely differentiated from the short crowded rigid leaves. . . . . 10. MONANTHOCLOE.
- Plants erect from creeping rhizomes; spikelets in a narrow simple exserted panicle. . . . . 11. DISTICHLIS.
- Plants not dioecious (except in a few species of *Poa* with villous lemmas and in *Eragrostis hypnoides*).
- Spikelets of two forms, sterile and fertile intermixed; panicle dense, somewhat one-sided. . . . . 15. LAMARCKIA.
- Spikelets all alike in the same inflorescence.
- Lemmas strongly 3-nerved.
- Nerves of lemma conspicuously pilose below. . . . . 18. TRIODIA.
- Nerves of lemma not pilose.
- Glumes longer than the lemma; lateral nerves of lemma close to the margin, the internerves pubescent. . . . . 9. DISSANTHELIUM.
- Glumes shorter than the lemmas; lateral nerves of lemma not close to the margin, the internerves glabrous. . . . . 8. ERAGROSTIS.
- Lemmas 5 to many-nerved, the nerves sometimes obscure.
- Glumes wanting, lemmas broad, flabellate; panicle dense, cylindric. . . . . 17. ANTHOCHLOA.
- Glumes developed; lemmas not flabellate; panicle not cylindric.

- Palea winged on the lower half of the keels; spikelets linear, in a loose raceme.....4. *PLEUROPOGON*.  
 Palea not winged on the lower half of the keels; inflorescence paniculate.  
 Lemmas as broad as long, the margins outspread; florets closely imbricate, horizontally spreading.....7. *BRIZA*.  
 Lemmas longer than broad, the margins clasping the palea; florets not horizontally spreading.  
 Lemmas keeled on the back (somewhat rounded in *Poa scabrella* and its allies).  
 Spikelets strongly compressed, crowded in one-sided clusters at the ends of the stiff naked panicle branches.14. *DACTYLIS*.  
 Spikelets not strongly compressed, not crowded in one-sided clusters.  
 Lemmas awned from a minutely bifid apex (awnless or nearly so in *Bromus unioloides* and *B. brizaeformis*); spikelets large.....1. *BROMUS*.  
 Lemmas awnless; spikelets small..6. *POA*.  
 Lemmas rounded on the back (slightly keeled toward the summit in *Festuca* and *Bromus*).  
 Glumes papery; lemmas firm, strongly nerved, scarious-margined; upper florets sterile, often reduced to a club-shaped rudiment infolded by the broad upper lemmas; spikelets tawny or purplish, usually not green.....16. *MELICA*.  
 Glumes not papery; upper florets not unlike the others.  
 Nerves of the lemma parallel, not converging at the summit or but slightly so; lemmas awnless mostly obtuse.  
 Nerves prominent; plants usually rather tall, growing in woods or fresh-water marshes.....3. *GLYXERIA*.  
 Nerves faint; plants low, growing in saline soil.5. *PUCCINELLIA*.  
 Nerves of the lemma converging at the summit; lemmas awned or pointed (upper florets only minutely awn-tipped in *Bromus brizaeformis*).  
 Lemmas entire, awned from the tip or pointed (minutely toothed in *Festuca elmeri*).2. *FESTUCA*.  
 Lemmas awned or awn-tipped from a minutely bifid apex.....1. *BROMUS*.

## TRIBE 2. *Hórdeae*. BARLEY TRIBE

Spikelets 1 to several-flowered, the rachilla usually disarticulating above the glumes and between the florets, sessile on opposite sides of a jointed or continuous axis, forming symmetrical (not one-sided) spikes. (Wheat, rye, and barley belong to this tribe.)

Spikelets solitary at each node of the rachis (rarely 2 in species of *Agropyron*, but never throughout).

Spikelets 1-flowered, sunken in hollows in the rachis; spikes slender, cylindric; low annuals.

Lemmas awned; florets lateral to the rachis.....21. *SORIBNERIA*.

Lemmas awnless; florets dorsiventral to the rachis.

First glume wanting.....27. *LEPTURUS*.

First glume present, the pair standing in front of the spikelet.....28. *PHOLIURUS*.

Spikelets 2 to several-flowered, not sunken in the rachis.

Spikelets placed edgewise to the rachis; first glume wanting except in the terminal spikelet.....26. *LOLIUM*.

Spikelets placed flatwise to the rachis.....20. *AGROPYRON*.

Spikelets more than 1 at each node of the rachis.

Spikelets 3 at each node of the rachis, 1-flowered, the lateral pair pediceled, usually reduced to awns.....25. *HORDEUM*.

Spikelets 2 at each node of the rachis, alike, 2 to 6-flowered.

Glumes wanting or reduced to 2 short bristles; spikelets horizontally spreading at maturity; spikes very loose.....24. *HYSTRIX*.

Glumes usually equaling the florets; spikelets appressed or ascending.

Rachis continuous; glumes broad or narrow, entire.....22. *ELYMUS*.

Rachis disarticulating at maturity; glumes subulate, extending into long awns, these and the awns of the lemmas making the spike very bristly.....23. *SITANION*.

TRIBE 3. *Avènææ*. OAT TRIBE

Spikelets 2 to several-flowered, in open or contracted panicles (rarely in racemes, solitary in *Danthonia unispicata*); rachilla usually disarticulating above the glumes and between the florets; glumes usually as long as or longer than the first lemma, commonly longer than all the florets; lemmas usually awned from the back or from between the teeth of a bifid apex, the awn bent, often twisted, the callus and rachilla joints usually villous.

- Spikelets awnless or the upper lemma mucronate (minutely awned in *Koeleria phleoides*).  
 Articulation below the glumes; glumes distinctly different in shape, the second widened above.....31. SPHENOPHOLIS.  
 Articulation above the glumes; glumes similar in shape.....29. KOELERIA.  
 Spikelets awned (commonly awnless in *Trisetum woldii*).  
 Florets 2, one perfect, the other staminate.....35. NOTHOLCUS.  
 Florets 2 or more, all alike except the reduced upper ones.  
 Awn arising from between the teeth of a bifid apex, flattened, twisted; inflorescence a simple panicle or reduced to a raceme or even to a single spikelet.....36. DANTHONIA.  
 Awn dorsal, not flattened; lemma often bifid at apex.  
 Spikelets large, the glumes over 1 cm. long.....32. AVENA.  
 Spikelets less than 1 cm. long.  
 Lemmas keeled, bidentate; awn arising from above the middle.....30. TRisetum.  
 Lemmas convex; awn from below the middle.  
 Rachilla prolonged behind the upper floret; lemmas truncate and erose-dentate at summit.....33. AIRA.  
 Rachilla not prolonged; lemmas tapering into 2 slender teeth....34. ASPRIS.

TRIBE 4. *Agrostideæ*. TIMOTHY TRIBE

Spikelets 1-flowered, usually perfect, in open, contracted, or spike-like panicles.

- Rachilla articulate below the glumes, the spikelets falling entire.  
 Panicle open, drooping.....40. CINNA.  
 Panicle contracted or spike-like.  
 Glumes awnless.....41. ALOPECURUS.  
 Glumes long-awned.....42. POLYPOGON.  
 Rachilla articulate above the glumes, these persistent after the fall of the florets.  
 Fruit indurate, terete, awned, the nerves obscure; callus well-developed, bearded.  
 Awn trifid, the lateral divisions sometimes short, rarely obsolete (when obsolete no line of demarcation between awn and lemma as in the next)....52. ARISTIDA.  
 Awn simple, a line of demarcation between the awn and the lemma.  
 Awn persistent, twisted and bent, several to many times longer than the slender fruit; callus sharp-pointed.....51. STIPA.  
 Awn deciduous, not twisted, sometimes bent, rarely more than 3 or 4 times as long as the plump fruit; callus short, usually obtuse.....50. ORYZOPSIS.  
 Fruit thin or firm, but scarcely indurate, if firm, the nerves prominent or evident; callus not well developed.  
 Glumes longer than the lemma (lemma equaling the glumes in *Agrostis thurberiana*).  
 Panicle feathery, capitate, nearly as broad as long; spikelets woolly.....45. LAGURUS.  
 Panicle not feathery; spikelets not woolly.  
 Glumes compressed-carinate, abruptly mucronate, stiffly ciliate on the keels; panicle dense, cylindric or ellipsoid.....43. PHEUM.  
 Glumes not compressed-carinate, not ciliate.  
 Glumes saccate at base; lemma long-awned; inflorescence contracted, shining.....44. GASTRIDIMUM.  
 Glumes not saccate at base; lemma awned or awnless; panicles open or contracted.  
 Florets bearing a tuft of hairs at the base from the short callus, the hairs at least half as long as the lemma; palea present.....37. CALAMAGROSTIS.  
 Florets without hairs at base or with short hairs rarely as much as half the length of the lemma (*A. hallii*); palea usually small or wanting.....39. AGROSTIS.  
 Glumes not or scarcely longer than the lemma, usually shorter (the awn tips longer in *Muhlenbergia racemosa*).  
 Lemma awned from the tip or mucronate, 3 to 5-nerved (lateral nerves obsolete in *M. repens*).....47. MUHLENBERGIA.  
 Lemma awnless or awned from the back.  
 Florets bearing a tuft of hairs at the base from the short callus; lemma and palea chartaceous, awnless.....38. AMMOPHILA.  
 Florets without hairs at base.  
 Caryopsis at maturity falling from the lemma and palea; seed loose in the pericarp, this usually opening when ripe; lemma 1-nerved.  
 Inflorescence capitate in the axils of broad bracts.....49. CRYPSIS.

Inflorescence an open or contracted panicle. 48. *SPOROBOLUS*.  
 Caryopsis not falling from the lemma and palea, remaining permanently inclosed in them; seed adnate to the pericarp; panicle elongate.....46. *EPICAMPES*.

#### TRIBE 5. *Nazlaeae*. CURLY-MESQUITE TRIBE

Spikelets sessile in groups of 3, the group falling entire from the continuous axis, the perfect spikelet 1-flowered, the staminate 2-flowered; glumes usually firmer than the lemma and palea, sometimes awned, the lemma awnless.

Only one genus in California.....53. *HILARIA*.

#### TRIBE 6. *Chlorideae*. GRAMA TRIBE

Spikelets 2 to several-flowered, sessile or short-pedicelled, approximate or somewhat distant along one side of a slender rachis, the rachilla disarticulating above the glumes and between the florets; glumes unequal or nearly equal, awnless or mucronate, 1-nerved, usually shorter than the first lemma; lemmas obtuse or acute, sometimes 2-toothed and mucronate or short-awned from between the teeth, 3-nerved, the nerves sometimes pubescent.

Spikelets with few to several perfect florets.....54. *LEPTOCHLOA*.

Spikelets with 1 perfect floret, with or without additional imperfect florets above.

Spikelets without additional modified florets, the rachilla sometimes prolonged.

Spikes digitate, rachilla articulate above the glumes.....55. *CYNODON*.

Spikes racemose, erect or nearly so; rachilla articulate below the glumes, the spikelets falling entire.

Glumes equal, broad and boat shaped.....56. *BECKMANNIA*.

Glumes unequal, narrow.....57. *SPARTINA*.

Spikelets with 1 or more modified florets above the perfect one.

Spikes digitate or nearly so.....58. *CHLORIS*.

Spikes racemose along the main axis.....59. *BOUTELOUA*.

#### TRIBE 7. *Phalarideae*. CANARY GRASS TRIBE

Spikelets with one perfect terminal floret and, below this, a pair of staminate or neuter florets, the rachilla disarticulating above the glumes, the sterile florets falling attached to the fertile one.

Lateral florets staminate; spikelets brown and shining.....60. *TORRESIA*.

Lateral florets neuter; spikelets green or yellowish.

Lateral florets consisting of awned hairy sterile lemmas exceeding the fertile floret; spikelet terete.....61. *ANTHOXANTHUM*.

Lateral florets reduced to small awnless scale-like lemmas; spikelets much compressed laterally.....62. *PHALARIS*.

#### TRIBE 8. *Panicaceae*. MILLET TRIBE

Spikelets with one perfect terminal floret and below this a sterile floret and two glumes; fertile lemma and palea indurate, or at least firmer than the glumes and sterile lemma; articulation below the spikelet.

Spikelet subtended or surrounded by 1 to many distinct or more or less connate bristles, forming an involucre.

Bristles persistent, the spikelets deciduous.....68. *CHAETOCHELOA*.

Bristles falling with the spikelets at maturity.

Bristles not united except at base, slender, plumose.....69. *PENNISSETUM*.

Bristles united into a bur-like involucre, retrorsely barbed.....70. *CENCHRUS*.

Spikelets not subtended by bristles.

Glumes or sterile lemma awned (awn reduced to a point in *E. colonum*).....67. *ECHINOCHLOA*.

Glumes and sterile lemma awnless.

Spikelets subsessile in slender racemes.

Fruit cartilaginous-indurate, flexible, usually dark colored, the lemma with more or less prominent white hyaline margins, these not inrolled; racemes digitate.....63. *SYNTHESISMA*.

Fruit chartaceous-indurate, the firm margins inrolled; racemes paired or racemose.

First glume and the rachilla-joint forming a swollen ring-like callus at the base of the spikelet.....64. *EBIOCHLOA*.

First glume wanting (developed in occasional spikelets); spikelets plano-convex.....65. *PASPALUM*.

Spikelets pedicellate in open panicles.....66. *PANICUM*.

#### TRIBE 9. *Andropogoneae*. SORGHUM TRIBE

Spikelets in pairs along a rachis, the usual arrangement being one of the pair sessile and fertile, the other pedicellate and staminate or neuter, or rarely wanting, only the pedicel present; fertile spikelet consisting of one perfect terminal floret and, below this, a staminate or neuter floret, the lemmas thin or hyaline, and two awnless glumes, usually one or both firm or indurate.

Spikelets all perfect, surrounded by a copious tuft of soft hairs; racemes in a narrow spike-like panicle; spikelets awnless.....71. *IMPERATA*.

Spikelets unlike, the sessile perfect, the pedicellate sterile.

- Racemes of several to many joints, solitary, digitate, or aggregate in a flabellate panicle.....72. ANDROPOGON.  
 Racemes reduced to one or few joints, these mostly peduncled in a subsimple or compound panicle.....73. HOLCUS.

### TRIBE 1. Festuceae. FESCUE TRIBE

Spikelets 2 to several-flowered, in open or contracted panicles (racemose in 2 genera): lemmas awnless or awned from the tip or from just below it; rachilla disarticulating above the glumes, these remaining after the fall of the florets.

#### 1. *BROMUS* L. BROME GRASS

Annuals or perennials, with closed sheaths, flat blades, and open or contracted panicles of large spikelets. Spikelets several to many-flowered. Glumes unequal, acute, the first 1 to 3-nerved, the second usually 3 to 5-nerved. Lemmas convex or keeled, 5 to 9-nerved, 2-toothed at the apex, awnless or usually awned from between the teeth. Palea usually shorter than the lemma. (Ancient Greek name for the oat.)

Plants annual; introduced weeds (except no. 1).

Lemmas narrow, gradually acuminate, the awn as long as the body of the lemma or longer.

Awn twisted, geniculate; apex of lemma produced into 2 aristate teeth.....1. *B. tritici*.

Awn not twisted nor geniculate; apex of lemma not aristate.

Panicle drooping; pedicels capillary; second glume not over 10 mm. long.. 2. *B. tectorum*.

Panicle erect or nodding; pedicels stiff; second glume over 12 mm. long, or if only 10 mm. the panicle erect and compact; glumes narrow, acuminate, the first 1-nerved, the second 3-nerved.

Panicle erect, compact or dense.

Panicle compact; pedicels mostly less than 5 mm. long; culms pubescent at summit.....3. *B. rubens*.

Panicle relatively loose, some of the pedicels at least 10 mm. long; culms glabrous.....4. *B. madritensis*.

Panicle more or less nodding, loose and open.

Lemma and awn together 6 to 8 cm. long; first glume about 15 mm. long.....5. *B. rigidus*.

Lemma and awn together not over 4 cm. long; first glume about 8 mm. long.....6. *B. sterilis*.

Lemmas broad, abruptly narrowed above, the awn mostly shorter than the body.

Lemmas awnless, obtuse, inflated.....7. *B. brizaeformis*.

Lemmas awned, not inflated.

Panicle contracted, usually dense, erect or nearly so.

Lemmas pubescent; sheaths velvety.....8. *B. hordeaceus*.

Lemmas glabrous or scabrous.

Awn erect or nearly so, inserted just below the summit of lemma.. 9. *B. racemosus*.

Awn divergent, inserted  $\frac{1}{4}$  to  $\frac{1}{3}$  below the summit of lemma.... 10. *B. scoparius*

Panicle loose, nodding or drooping.

Sheaths and lemmas glabrous; margin of lemma inrolled toward the base at maturity, the rachilla partly visible..11. *B. secalinus*.

Sheaths pubescent; lemmas pubescent or glabrous, the margins not or rarely inrolled.

Panicles nodding, the branches and pedicels not elongate and flexuous; awns usually not over  $\frac{2}{3}$  as long as the broad glabrous or scaberulous lemma....12. *B. commutatus*.

Panicles drooping, the branches and pedicels flexuous; awns mostly as long as the body of the narrower lemma or longer.

Awns becoming divergent.....13. *B. japonicus*.

Awns not becoming divergent.....14. *B. arenarius*.

Plants perennial (no. 15 often flowering the first year), mostly natives.

Spikelets strongly flattened, the lemmas strongly keeled toward the summit.

Spikelets awnless or nearly so.....15. *B. unioloides*.

Spikelets awned.

Blades canescent and densely pilose, narrow or involute..16. *B. subvelutinus*.

Blades not canescent, glabrous or somewhat pilose, broader, flat.

Panicle narrow, the branches short and erect.....18. *B. maritimus*.

Panicle open, the branches spreading or drooping.

Awn less than 7 mm. long; blades rather broad..17. *B. marginatus*.

Awn more than 7 mm. long; blades usually narrow.....19. *B. carinatus*.

Spikelets not strongly flattened, the lemmas not keeled.

Panicle narrow.

Panicle stiff, the branches suberect.....20. *B. suksdorfii*.

Panicle lax, the branches drooping.....21. *B. porteri*.

Panicle open, the branches spreading.

Branches of panicle stiffly divaricate; blades short.....22. *B. orcuttianus*.

Branches drooping; blades elongate.

Lemmas pubescent throughout.....23. *B. grandis*.

Lemmas pubescent at margins or base only, or nearly glabrous.

Lemmas sparsely pubescent on back, ciliate on margins or nearly glabrous; first glume 1-nerved.....24. *B. vulgaris*.

Lemmas densely pubescent at base and margins; first glume 3-nerved.....25. *B. laevipes*.

1. *B. trinitii* Desv. Culms erect, 3 to 6 dm. high; sheaths pilose or nearly smooth; blades usually pilose; panicle narrow, 10 to 20 cm. long, rather dense; spikelets 5 to 7-flowered, 1.5 to 2 cm. long; glumes acuminate, smooth, the first mostly 1-nerved, the second mostly 3-nerved; lemmas coarsely and sparsely pubescent, 5-nerved, 13 to 15 mm. long, the teeth 2 mm. long; awn 1.5 to 2 cm. long, twisted below, bent and strongly divaricate when old.—Dry plains and rocky or wooded slopes, Siskiyou Co. and southw., especially in desert regions; e. to Colo. and s. to Mex.; also Chile. Var. *EXCELSUS* Shear. Lemmas 7-nerved; awn scarcely twisted or bent.—Panamint Mts.

2. *B. tectorum* L. DOWNY BROME. Culms tufted, 3 to 6.5 dm. high, the whole plant softly pubescent; panicle many-flowered, loose, drooping, commonly  $\frac{1}{2}$  the entire height of the plant; spikelets 1.5 to 2 cm. long, nodding; lemmas pubescent; awn 1.2 to 1.5 cm. long.—Waste places, throughout U. S.; nat. from Mediterranean region. Var. *NUDUS* Klett & Richt. Spikelets glabrous; the common form in Cal.

3. *B. rubens* L. RED BROME. Culms 1.5 to 3.8 dm. high, puberulent below the panicle; sheaths and blades pubescent; panicle erect, compact, ovoid, usually purplish, 4 to 8 cm. long; spikelets 7 to 11-flowered, about 2 cm. long; lemmas 5-nerved, pubescent or smooth, 1.2 to 1.5 cm. long, the apex deeply cleft into 2 long-acuminate hyaline teeth; awn about 2 cm. long.—Dry hills and in waste or cultivated ground; common especially in middle and S. Cal.; n. to Wash.; nat. from s. Eur.

4. *B. madritensis* L. Culms tufted, 3 to 6 dm. high; sheaths smooth or the lower slightly pubescent; blades puberulent or nearly smooth; panicle erect, 4 to 8 cm. long, oblong-ovoid in outline, contracted, rather dense; lemmas 1.5 to 1.8 cm. long, usually glabrous or scabrous only, somewhat curved outward when old, distinctly 3 or faintly 5 to 7-nerved, with 2 acute hyaline teeth; awn rather stout, tapering, somewhat curved, 1.6 to 2.2 cm. long.—Open ground and waste places; nat. from Eur.

5. *B. rigidus* Roth. "RIPGUT" GRASS. Culms 4.5 to 7.5 dm. high; sheaths and blades pilose; panicle open, rather few-flowered, 6 to 10 cm. long; spikelets usually 5 to 7-flowered 3.5 to 5 cm. long; lemmas 5-nerved, scabrous or puberulent, 2-toothed; awn stout, 3.5 to 5 cm. long.—Weed in open ground and waste places, nat. from Mediterranean region. Var. *GUSSONEI* (Parl.) Coss. & Dur. (*B. villòsus* Forsk.). Differs in having a more open panicle, and longer flexuous branches and pedicels, the lower branches as much as 10 to 12 cm. long.—More common than the species in mid. and n. Cal.; nat. from s. Eur. At maturity nos. 3 to 6 are injurious to grazing animals; the disjointed sharp-pointed florets with their long rough awns penetrate the eyes, nose and mouth parts, causing sores and blindness.

6. *B. stérilis* L. Similar to no. 5 but with smaller spikelets, the lemma including awn not over 4 cm. long; first glume about 8 mm. long.—Waste places; nat. from Mediterranean region.

7. *B. brizaefórmis* F. & M. Culms 3 to 6 dm. high; sheaths and blades pilose; panicle 5 to 15 cm. long, lax, nodding; spikelets oblong-ovate, laterally much compressed, 1.5 to 2.3 cm. long; glumes broad, obtuse, the first 3 to 5-nerved, about  $\frac{1}{2}$  the length of the broader 5 to 9-nerved second; lemma 1.1 cm. long, very broad, inflated, obtuse, smooth, with a broad scarious margin.—Sandy fields and waste ground, occasional; nat. from Eur.

8. *B. hordeaceus* L. SOFT CHEAT. Culms 2 to 7.5 dm. high; sheaths retrorsely softly pilose; blades usually pubescent; panicle contracted, erect, 5 to 10 cm. long, or in depauperate plants reduced to a few spikelets; glumes broad, obtuse, coarsely pilose or scabrous-pubescent, the first 3 to 5-nerved,

the second 5 to 7-nerved; lemmas obtuse, 7-nerved, coarsely pilose or scabrous-pubescent, rather deeply bidentate, 8 to 9 mm. long, the margin and apex hyaline; awn rather stout, 6 to 9 mm. long.—Weed in waste places and cultivated soil, abundant; nat. from Eur.

9. *B. racemösus* L. Similar to no. 8, the panicle more open, the lemmas glabrous or scabrous.—Weed in waste places; nat. from Eur. (*B. hordeaceus* var. *leptostachys* Beck.)

10. *B. scoparius* L. Culms 2 to 3 dm. high; sheaths and blades more or less pilose; panicle oblong or ovate, obtuse, 3 to 7 cm. long; spikelets short-pedicelled, 5 to 11-flowered, 1 to 1.8 cm. long; glumes glabrous, the first 1 to 3-nerved, the second 3-nerved; lemmas 5-nerved, 7 to 8 mm. long; bidentate; awn somewhat divaricate, 7 to 8 mm. long.—Rare, Mariposa, Santa Barbara; nat. from Eur.

11. *B. secalinus* L. CHEAT. CHESS. Culms erect, 3 to 6 dm. high; sheaths smooth; panicle pyramidal, drooping, 8 to 15 cm. long, open, the lower branches 3 to 5, unequal; spikelets ovoid-lanceolate, becoming somewhat turgid in fruit, 1.2 to 1.5 cm. long; glumes obtuse, the first 3 to 5-nerved, the second 7-nerved; lemmas 7-nerved, 6 to 8 mm. long, elliptic, obtuse, smooth or scabrous, the margin strongly involute in fruit, apex shortly bidentate, the undulate awn usually 3 to 6 mm. long. In fruit the turgid florets are somewhat distant so that, viewing the spikelet sideways, the light passes through the small openings at the base of each floret.—Weed in grain fields and waste places; nat. from Eur.

12. *B. commutatus* Schrad. Resembling no. 11; sheaths retrorsely pubescent; blades commonly pubescent; lemmas with an obtuse angle on the margin just above the middle, the margin not as strongly inrolled in fruit as in no. 11, the awn straight and rather longer than in no. 11.—Weed in fields and waste places; nat. from Eur.

13. *B. japonicus* Thunb. Culms erect or geniculate at base, 4.5 to 7.5 dm. high; sheaths and blades soft-pubescent; panicle 12 to 20 cm. long, broadly pyramidal, diffuse, the lower branches 3 to 5; glumes rather broad, the first narrower, acute, 3-nerved, the second obtuse, 5-nerved; lemmas broad, obtuse, smooth, 9-nerved, the marginal pair faint, 7 to 9 mm. long, the hyaline margin obtusely angled above the middle, the apex emarginate; awns about 1 cm. long, somewhat twisted and strongly divaricate at maturity, those of the lower florets shorter than the upper; palea conspicuously shorter than the lemma.—Weed in waste places; nat. from Eur. and the Orient.

14. *B. arenarius* Labill. Culms 1.5 to 4.5 dm. high; sheaths and blades pilose; panicle pyramidal, open, the spreading branches and slender pedicels sinuously curved; spikelets 1.5 to 1.8 cm. long, densely pilose; glumes acute, scarious-margined, the first narrower, 3-nerved, the second 7-nerved; lemmas 7-nerved, 2-toothed; awn 1 to 1.5 cm. long.—Sandy roadsides, gravelly or sterile hills; cent. to S. Cal.; nat. from Australia.

15. *B. unioides* (Willd.) H. B. K. RESCUE GRASS. Culms 6 to 9 dm. high; sheaths pilose; blades narrow, very scabrous; panicle open; spikelets 2 to 2.5 cm. long; glumes smooth, the first 5-nerved, 7 to 10 mm. long, the second 7-nerved, 10 to 12 mm. long; lemmas acute, subcoriaceous, glabrous or scabrous, 12 to 15 mm. long; awn not over 2 mm. long; palea  $\frac{1}{2}$  to  $\frac{3}{4}$  as long as lemma.—Introd.; native country probably the Andes, now distributed from Chile to s. U. S. Cult. as meadow grass in Southern States.

16. *B. subvelutinus* Shear. Culms 3 to 6 dm. high; sheaths canescent; blades narrow, rather rigid, becoming involute, canescent and also pilose; panicle 3 to 15 cm. long, narrow, stiff, the branches short, erect; spikelets about 25 cm. long; glumes puberulent, the first 3 to 5-nerved, the second 7-nerved; lemmas appressed-puberulent, 12 to 14 mm. long; awn 3 to 4 mm. long.—Dry wooded hills and meadows; n. to Ore., e. to Wyo.

17. *B. marginatus* Nees. Short-lived perennial; culms rather stout, 6 to 12 dm. high; sheaths pilose; blades broad, flat, more or less pilose; panicle erect, rather narrow, 10 to 20 cm. long, the lower branches somewhat spread-

ing; spikelets 7 or 8-flowered, 2.5 to 3.5 cm. long; glumes broad, scabrous, or scabrous-pubescent, the first subacute, 3 to 5-nerved, the second obtuse, 5 to 7-nerved; lemmas subcoriaceous, coarsely pubescent, ovate-lanceolate, acute, 12 to 14 mm. long; awn 4 to 7 mm. long.—Open ground, open woods, roadsides and waste places; n. to B. C. and Alb., e. to Ariz. Var. *SEMINUDUS* Shear. Sheaths glabrous; plant often tall and stout with large spreading panicle.—Woods or near streams, at higher altitudes; n. to B. C. and Assin., e. to Col.

18. *B. maritimus* (Piper) Hitchc. Differs from no. 17 in having smooth sheaths, scabrous but not pilose blades, and narrow strict panicle, the branches short and erect.—Near the coast from Sonoma Co. to Monterey Co.

19. *B. carinatus* H. & A. CALIFORNIA BROME GRASS. Fig. 60. Culms 6 to 9 dm. high; sheaths pilose; blades narrow, flat, more or less pilose; panicle pyramidal, rather lax, the lower branches spreading or drooping; spikelets about 2.5 cm. long, 6 mm. wide, 5 to 9-flowered; glumes lanceolate, acute,

60. *Bromus carinatus* H. & A.; a, habit  $\times \frac{1}{4}$ ; b, spikelet  $\times 1\frac{1}{2}$ ; c, floret (dorsal view)  $\times 1\frac{1}{2}$ .

glabrous or slightly scabrous-pubescent, the first 3-nerved, the second 5-nerved; lemmas lanceolate, puberulent or short-pubescent, 12 to 16 mm. long; awn 7 to 10 mm. long.—Open ground, open woods, roadsides and waste places, throughout the state; n. to Wash. Var. *CALIFORNICUS* Shear. Sheaths smooth; spikelets narrower than in the species.—Common in the Coast Ranges; infrequent in the Sierra Nevada and San Bernardino Mts. Var. *HOOKERIANUS* Shear. Sheaths smooth; spikelets as broad as in the species.—Range about as in the last, less common. Var. *LINEARIS* Shear. Sheaths pubescent; blades less than 2 mm. wide; panicle narrow, few-flowered.—Berkeley Hills; Mt. Lyell, above timber-line; known only from Cal.

20. *B. suksdorfii* Vasey. Culms 6 to 9 dm. high; sheaths and blades smooth, scattered; panicle narrow, erect, rather dense, 8 to 13 cm. long, the branches erect or ascending; spikelets about 2.5 cm. long, the pedicels shorter; glumes glabrous, the first 1-nerved, the second 3-nerved; lemmas 1.2 to 1.4 cm. long, appressed-pubescent near margin and on the lower part of the midnerve.—Rocky woods and slopes, 6000 to 8500 ft., Sierra Nevada from Tulare Co. to Nevada Co.; n. to Wash.

21. *B. porterii* (Coul.) Nash. Culms 4.5 to 7.5 dm. high; sheaths more or less pubescent; blades 2 to 4 mm. wide; panicles rather few-flowered, the branches subcapillary; spikelets 2 to 2.5 cm. long, conspicuously pubescent throughout.—Dry woods, rare; e. to the Rocky Mts.

22. *B. orcuttianus* Vasey. Culms erect, leafy below, nearly naked above, 7.5 to 10.5 dm. high; pubescent at and below the nodes; sheaths pilose or more or less velvety; blades glabrous, rather short and erect; panicle narrow-pyramidal, erect 10 to 15 cm. long, branches few, divaricate and rather rigid in fruit; spikelets 20 to 25 mm. long, subterete, on short stout pedicels; glumes narrow, smooth or scabrous, the first acute, 1-nerved, or sometimes with a faint lateral pair, the second broader, obtuse, 3-nerved; lemmas 10 to 12 mm. long, narrow, scabrous or scabrous-pubescent over the back, the awn 5 to 7 mm. long.—Open woods, mostly in the higher mountains; n. to Wash. Var. *HALLII* Hitchc. Blades soft-pubescent on both surfaces; glumes and lemmas pubescent.—Dry mostly wooded ridges and slopes, 5000 to 9000 ft., Sierra Nevada and mts. of S. Cal.

23. *B. grândis* (Shear) Hitchc. Culms 9 to 15 dm. high; sheaths pubescent; blades pubescent, elongated, spreading, rather lax; panicle broad, open, the branches slender, drooping, naked below, the lower usually in pairs, as much as 15 cm. long; first glume usually distinctly 3-nerved; lemmas densely

pubescent over the back; awns 5 to 8 mm. long.—Dry hillsides at moderate altitudes, S. Cal. and South Coast Ranges; n. to Wash. Resembles *B. orcutianus* var. *hallii*, from which it differs in the open drooping panicle and the more distinctly 3-nerved first glume.

24. *B. vulgaris* (Hook.) Shear. Culms 9 to 12 dm. high; nodes pubescent; sheaths pilose; blades scattered, more or less pilose; panicle open, 10 to 18 cm. long, the branches slender, drooping; spikelets slender, about 2.5 cm. long; glumes narrow, sparsely pubescent, the first 1-nerved, acute, the second 3-nerved, broader and longer than the first, obtuse or acutish; lemmas 8 to 10 mm. long, sparsely pubescent over back, pubescent or ciliate near the margins or nearly glabrous; awn 6 to 8 mm. long.—Rocky woods and shady ravines, 100 to 7000 ft.; n. to B. C. and Mont. Var. *EXIMIUS* Shear. Sheaths glabrous.—Moist mt. sides, n. Cal.; n. to B. C.

25. *B. laevipes* Shear. Culms  $7\frac{1}{2}$  to 9 dm. high, the base often decumbent and rooting; sheaths and blades glabrous; panicle broad, lax, drooping, 15 to 20 cm. long; spikelets 2.5 to 3 cm. long; glumes smooth, the first 3-nerved, the second 5-nerved; lemmas obtuse, 7-nerved, 12 to 14 mm. long, densely pubescent on the margin nearly to the apex and on the back at the base; awn 3 to 6 mm. long.—Moist woods and shady banks; n. to Wash.

## 2. FESTUCA L. FESCUE

Annuals or perennials. Spikelets few to several-flowered. Glumes narrow, acute, unequal, the first sometimes very small. Lemmas rounded on the back, membranaceous or somewhat indurate, 5-nerved, the nerves often obscure, acute or rarely obtuse, awned from the tip or rarely from a minutely bifid apex. (Ancient name for some grass.)

Plants annual; florets narrowly lanceolate; stamens usually 1.—Subgenus *VULPIA*.

Spikelets densely 5 to 13-flowered; lemmas without scarious margin...1. *F. octoflora*

Spikelets loosely 1 to 5-flowered; lemmas with narrow scarious margin; first glume 1-nerved, the second 3-nerved.

Branches of the short panicle normally divergent, a pulvillus at the base of at least 1 of them.

Florets mostly 3 to 5; only the principal panicle branches divergent.

Lemmas glabrous.

Glumes glabrous.....2. *F. pacifica*

Glumes hirsute.....3. *F. confusa*

Lemmas hirsute.

Glumes glabrous.....4. *F. arida.*

Glumes hirsute.....5. *F. grayi.*

Florets mostly 1 to 3; all the spikelets divergent.

Lemmas glabrous.....6. *F. reflexa.*

Lemmas pubescent.

Glumes glabrous.....7. *F. microstachys.*

Glumes pubescent.....8. *F. eastwoodae.*

Branches of the narrow panicle erect or appressed.

Lower glume  $\frac{2}{3}$  to  $\frac{3}{4}$  as long as the upper.....11. *F. bromoides.*

Lower glume not more than  $\frac{1}{2}$  as long as upper.

Lemma ciliate.....9. *F. megalura.*

Lemma not ciliate.....10. *F. myuros.*

Plants perennial.

Rhizomes developed; blades flat; lemma acuminate, unawned.—Subgenus *HESPERO-*

*CHLOA*.....24. *F. confinis.*

Rhizomes wanting (base of culm decumbent in *F. rubra*).—Subgenus *EUFESTUCA*.

Blades flat, rather soft and lax.

Lemmas awnless, indurated, not keeled.....20. *F. elatior.*

Lemmas awned, membranaceous, more or less keeled.

Florets long-stipitate.....21. *F. subuliflora.*

Florets sessile.

Awn terminal.....23. *F. subulata.*

Awn folded or involute, narrow or capillary.....22. *F. elmeri.*

Blades usually folded or involute, narrow or capillary.

Collar and auricles tomentose or bristly.....19. *F. californica.*

Collar and auricles not conspicuously tomentose or bristly.

Lemmas acute, awnless or only awn-pointed.....18. *F. viridula.*

Lemmas awned.

Tufts loose, the bases of the culms decumbent; blades usually

smooth to the touch.....12. *F. rubra.*

Tufts compact; culms erect.

Panicle open, the branches long and spreading; awn longer than body of lemma.....14. *F. occidentalis.*

Panicle narrow, the branches ascending.

Blades scabrous, usually elongate. . . . . 15. *F. idahoensis*.

Blades smooth.

Plants about 12 dm. tall. . . . . 13. *F. howellii*.

Plants low, usually less than 1.5 dm. tall.

Blades hard, involute, shining, not angled. . . . .

17. *F. supina*.

Blades soft, angled in drying, the tissue soft between the angles. . . . .

16. *F. brachyphylla*.

1. *F. octoflora* Walt. Culms slender, erect, usually 1.5 to 3 dm. high; blades narrow, involute; panicle narrow, the short branches mostly appressed; spikelets 6 to 8 mm. long; glumes subulate-lanceolate; lemmas firm, convex, glabrous or scabrous, 4 to 5 mm. long, attenuate into a scabrous awn 2 to 4 mm. long.—Open ground throughout the U. S. Var. *HIRTÉLLA* Piper. Lower, more densely tufted; foliage usually pubescent; lemmas hirtellous or pubescent.—Arid ground; more frequent than the species, cent. Cal. to Ariz. and Mex.

2. *F. pacifica* Piper. Culms slender, erect, 1.5 to 3 dm. high; blades soft, glabrous, loosely involute; panicle 2.5 to 6 cm. long, the lower branches solitary, divaricate; spikelets 3 to 6-flowered; glumes glabrous, the first subulate-lanceolate, the second lanceolate-acuminate; lemmas scabrous, except in the lowermost floret (this smooth), 6 to 7 mm. long, attenuate into a scabrous awn 10 to 15 mm. long.—Open ground, hill slopes and open woods in the mts. throughout the state; B. C. to Ariz. and L. Cal.

3. *F. confusa* Piper. Differs from no. 2 in having hirsute glumes; plants small, slender; sheaths and blades pubescent; spikelets 2 to 3-flowered.—Dry hillsides; middle Cal.; n. to Wash.

4. *F. árida* Elmer. Culms 1 to 3.8 dm. high; sheaths glabrous or pubescent; blades soft, loosely involute, usually glabrous; panicle 2.5 to 7 cm. long, the solitary rays at length divaricate; glumes lanceolate, glabrous; lemmas densely villous, 6 to 7 mm. long, attenuate into a scabrous awn nearly as long.—Sandy ground, n. Cal.; Nev. (*F. eriólepis* of authors.)

5. *F. grayi* (Abrams) Piper. Habit of no. 2, but somewhat stouter; sheaths and sometimes blades pubescent; glumes and lemmas hirsute throughout.—Open ground and rocky slopes; n. to Ore., e. to Ariz.

6. *F. refléxa* Buckl. Culms 2 to 4.5 dm. high; sheaths smooth or pubescent; blades narrowly linear, flat, or loosely involute; panicle 5 to 12 cm. long, the solitary rays and the spikelets all at length divaricate; spikelets 1 to 3-flowered, 5 to 7 mm. long; glumes glabrous; lemmas glabrous or somewhat scabrous, 5 to 6 mm. long, attenuate into a scabrous awn, usually 5 to 8 mm. long.—Mesas, rocky slopes and wooded hills; n. to Vancouver Isl., e. to Utah.

7. *F. micróstachys* Nutt. Habit of no. 6; differs in having pubescent lemmas.—Banks, hillsides and open ground; n. to Ore. Less frequent than no. 6.

8. *F. eastwoodae* Piper. Differs from no. 6 in having pubescent glumes and lemmas.—Open pine forests; cent. Cal.

9. *F. megalúra* Nutt. Culms 2 to 6 dm. high; sheaths and blades smooth; panicle narrow, somewhat 1-sided, 8 to 20 cm. long; spikelets 4 or 5-flowered; glumes glabrous, the first about half the length of the second; lemmas scabrous above, attenuate into an awn about twice its length. The cilia on the lemmas, characteristic of this species, are sometimes hidden by the incurved edges of the lemma at maturity.—Cultivated or open ground, sandy soil, and waste places; n. to B. C. and Ida., s. to L. Cal.

10. *F. myúros* L. RAT'S-TAIL FESCUE. Similar to no. 9 but lemmas not ciliate.—Rare in waste grounds; nat. from Eur.

11. *F. bromoides* L. Similar to no. 9; culms 1 to 3 dm. high; panicle dense, 5 to 10 cm. long; lemma 7 to 8 mm. long, the awn 10 to 12 mm. long.—Dry hills and meadows; nat. from Eur.

12. *F. rubra* L. RED FESCUE. Fig. 61. Culms erect from a decumbent base, smooth, 4.5 to 9 dm. high; sheaths smooth, the lowermost usually purple; blades smooth, soft, usually folded or involute; panicle 5 to 18 cm. long,

61. *Festuca rubra* L.; a, habit x  $\frac{1}{4}$ ; b, c, glumes x 3; d, florets x 3.

usually contracted, the branches erect except at anthesis; spikelets 4 to 6-flowered, 7 to 10 mm. long, pale green or glaucous, often purpletinged; lemmas 5 to 7 mm. long, smooth, or scabrous toward apex, the awn usually about  $\frac{1}{2}$  as long.—Meadows and hills in the mts. or near the coast; distributed throughout the cooler parts of the n. hemisphere.

13. *F. howellii* Hack. Resembling no. 12 but stouter and 9 to 12 dm. high; culms numerous, erect at base, in a close tuft; blades 3 dm. or more long, folded, smooth; panicles smaller; spikelets 8 to 12 mm. long; lemmas about 7 mm. long, awned.—Rocky woods, Sonoma Co.; n. to Ore.

14. *F. occidentalis* Hook. Culms densely tufted, slender, erect, 4.5 to 7.5 dm. high; leaves numerous, mostly basal; sheaths smooth; blades filiform-involute, bright green, soft, 5 to 20 cm. long; panicle loose, subsecund, 7 to 20 cm. long, nodding, the branches solitary or the lowest in pairs; spikelets loosely 3 to 5-flowered, 6 to 10 mm. long, mostly on slender pedicels, pale green; lemmas rather thin, 5 to 6 mm. long, scaberulous toward the apex, attenuate into a slender awn somewhat longer than the body.—Dry rocky wooded slopes and banks: Sequoia Park; San Mateo Co.; n. to B. C., e. to Wyo. and n. Mich.

15. *F. idahoensis* Elmer. BLUE BUNCH GRASS. Culms densely tufted, smooth or somewhat scabrous above, 3 to 9 dm. high; blades numerous, mostly basal, rather stiff and firm, more or less flexuous, scabrous, 1.5 to 3 dm. long, sometimes shorter; panicle narrow, 10 to 20 cm. long, the branches appressed or ascending, very scabrous; spikelets 8 to 10 mm. long; lemmas firm, the awn 2 to 4 mm. long.—Open woods and rocky slopes, 1000 to 2500 ft., cent. and n. Cal.; n. to B. C. and Alb., e. to Col.

16. *F. brachyphylla* Schult. Culms erect, tufted, 1 to 1.5 dm. high; blades about  $\frac{1}{2}$  as long as the culms, filiform, soft, angled in drying, the tissue soft between the angles; panicle narrow, 2.5 to 5 cm. long, few-flowered; glumes and lemmas broad, rather soft; awn about 1 mm. long.—Mt. Dana; Blue Mts. of Ore. and Rocky Mts., n. to arctic Am.

17. *F. supina* Schur. Culms erect, densely tufted, 0.8 to 1.5 dm. high; blades numerous, usually less than  $\frac{1}{2}$  the length of the culm, involute, smooth, firm and hard, scarcely angled in drying; inflorescence as in no. 16; lemmas firmer, narrower, involute, more scabrous, the florets looser, more numerous and the awn longer.—High montane, 9500 to 12,000 ft.: San Bernardino Mts.; Sierra Nevada from Tulare Co. to Mariposa Co.; White Mts.; n. to arctic Am.

18. *F. viridula* Vasey. MOUNTAIN BUNCH GRASS. Culms rather loosely tufted, erect, smooth, 6 to 9 dm. high; sheaths smooth; blades erect, 2 mm. wide or less, soft, scaberulous above, often more or less involute; panicle loose and open, 10 to 15 cm. long, the branches ascending; spikelets 3 to 6-flowered, 10 to 12 mm. long; glumes membranaceous, smooth; lemmas firm, membranaceous, keeled toward the apex, acute or somewhat mucronate, 6 to 7 mm. long.—Subalpine meadows in the Sierra Nevada from Eldorado Co. to Sierra Co.; Coast Ranges in Sonoma Co.; n. to Wash. and Ida.

19. *F. californica* Vasey. CALIFORNIA FESCUE. Culms tufted, stout, coarse, usually 9 to 15 dm. high, scabrous; sheaths somewhat scabrous, the collar and auricles pilose; blades flat or becoming involute, hard, firm, scabrous,

the lower elongate; panicle large, usually loose and open, the few long slender branches naked below, bearing a few spikelets toward the ends; spikelets compressed, about 5-flowered, 10 to 18 mm. long; glumes oblong-lanceolate, firm, smooth, except the scabrous keel; lemmas 8 to 10 mm. long, lanceolate, firm, scabrous, acuminate or short-awned.—Meadows, shady banks and wood borders; Coast Ranges from Monterey Co. to Siskiyou Co., n. to western Ore. Var. *PARISHII* (Piper) Hitchc. Plant more slender; culms about 4.5 to 6 dm. tall; sheaths puberulent; blades 1.5 to 2.5 dm. long, closely involute, smooth below or nearly so; panicle 10 to 12 cm. long; awn 3 to 4 mm. long.—San Bernardino Mts.

20. *F. elatior* L. MEADOW FESCUE. Culms smooth, 2½ to 4 ft. high; sheaths smooth; blades flat, 4 to 8 mm. wide, scabrous above; panicle erect, or nodding at summit, 5 to 10 cm. long, contracted after flowering, the branches spikelet-bearing nearly to base; spikelets usually 6 to 8-flowered, 8 to 12 mm. long; glumes 3 to 4 mm. long, lanceolate; lemmas oblong-lanceolate, coriaceous, 5 to 7 mm. long, the scarious apex acutish.—Native of Eur., cult. in U. S. and escaped into fields and waste places.

21. *F. subuliflora* Scribn. Culms rather slender, glabrous, 6 to 9 dm. high; sheaths sparsely hispidulous; blades flat, lax, hirsutulous above, 3 to 6 mm. wide; panicle loose, open, drooping, 10 to 20 cm. long, the branches slender, mostly solitary, naked below the middle; spikelets loosely 3 or 4-flowered; glumes subulate, glabrous, 1-nerved, 3 to 4 mm. long; lemmas lanceolate, scabrous toward the apex, 6 to 8 mm. long, tipped with a flexuous awn 10 to 15 mm. long, abruptly contracted at base into a hispidulous tubular structure including the rachilla, the latter apparently disarticulating half way between the florets.—Borders of moist woods, Humboldt and Del Norte Cos.; n. to Vancouver Isl.

22. *F. élmeri* Scribn. & Merr. Culms slender, 4.5 to 9 dm. high, glabrous; sheaths nearly smooth; blades flat, scabrous or pubescent above, 2 to 4 mm. wide; panicle 10 to 20 cm. long, loose, open, the branches mostly in pairs, naked below; spikelets 3 to 4-flowered, 7 to 10 mm. long; glumes lanceolate, glabrous; lemmas lanceolate, membranaceous, minutely hispidulous, 6 mm. long, the apex toothed, the scabrous awn 2 to 8 mm. long.—Wooded hillsides: Coast Ranges; Marysville Buttes; n. to Ore. Var. *LUXURIANS* Piper. Panicle rather close; spikelets 5 or 6-flowered.—Moist groves, San Francisco Bay region.

23. *F. subulata* Bong. Culms scaberulous, 4.5 to 12 dm. high; sheaths nearly smooth; blades flat, thin, 3 to 10 mm. wide, auriculate at base, usually scabrous on both surfaces, lax, spreading; panicle very loose, drooping, 15 to 40 cm. long, the branches mostly in pairs, naked below; spikelets 3 to 5-flowered, 8 to 12 mm. long; glumes subulate; lemmas membranaceous, narrowly lanceolate, 3-nerved, somewhat keeled, attenuate into a scabrous awn 6 to 20 mm. long.—Moist rocky woods and shady banks: Sequoia Park; Warner Mts.; n. to Alas., e. to Wyo.

24. *F. confinis* Vasey. Culms stout, erect, glabrous, 4.5 to 9 dm. high; sheaths smooth, striate; blades firm, flat or loosely involute, coarsely striate, 3 to 6 mm. wide; panicle narrow, erect, 8 to 20 cm. long, the branches short, appressed, floriferous nearly to base; glumes broadly lanceolate, subscarious, nearly smooth; lemmas ovate, acuminate, faintly nerved, scabrous all over the back, 5 to 8 mm. long.—Dry meadows, high montane: San Bernardino Mts.; cent. Sierra Nevada (Nevada Co.); n. to Ore.; e. to Mont. and Col.

### 3. GLYCÈRIA R. Br.

Tall aquatic or marsh perennials with flat blades, closed or partly closed sheaths, and open or contracted panicles. Spikelets few to many-flowered, subterete or slightly compressed. Glumes unequal, short, obtuse or acute, usually scarious, mostly 1-nerved. Lemmas broad, convex, firm, usually obtuse, awnless, scarious at the apex, 5 to 9-nerved, the nerves parallel, usually prominent. (Greek *glukeros*, sweet.) (*Panicularia* Heister.)

- Spikelets linear, 1 to 1.5 cm. long; axis of panicles erect.  
 Lemmas smooth between the slightly scabrous nerves, thin.....2. *G. borealis*  
 Lemmas scabrous between the distinctly scabrous nerves, firm.  
 Lemmas 4 to 6 mm. long, subacute.....1. *G. fluitans*.  
 Lemmas about 3 mm. long, broadly obtuse.....3. *G. leptostachya*.  
 Spikelets ovate or oblong, not over 5 mm. long; panicles nodding.  
 Lemmas with 5 prominent nerves.  
 Panicle ovate or pyramidal, open.....4. *G. pauciflora*.  
 Panicle narrow, branches ascending.....5. *G. erecta*.  
 Lemmas with 7 prominent nerves.....6. *G. elata*.

1. *G. fluitans* R. Br. MANNA GRASS. Culms ascending from a decumbent rooting base, rather thick and succulent, 9 to 15 dm. high; blades 3 to 10 mm. wide, scabrous above; panicle long and narrow; glumes short, very unequal, obtuse; lemmas purple-tinged, broad, subacute, 4 to 6 mm. long, prominently 7-nerved, with an additional short pair near the margin, very scabrous on the nerves and somewhat so between them.—Shallow water, Mendocino Co.; n. to B. C.; n. N. Am. and Eurasia. (*G. plicata* Fries.)

62. *Glyceria borealis* Batchelder; a, habit  $\times \frac{1}{2}$ ; b, spikelet  $\times 2$ ; c, florets  $\times 3$ .

2. *G. borealis* (Nash) Batchelder. Fig. 62. Culms 6 to 9 dm. high, erect, from a more or less decumbent and rooting base; sheaths keeled; blades flat or usually folded, scabrous above, erect, 3 to 4 mm. wide; panicle long and narrow, the branches and slender pedicels appressed; spikelets nearly terete, pale, not purple-tinged; lemmas oblong, 4 mm. long, 7-nerved, smooth or indistinctly scabrous on the nerves.—Shallow water: Sierra Nevada, 4000 to 6000 ft.; North Coast Ranges; n. to Alas., e. to N. Eng.

3. *G. leptostachya* Buckl. Culms about 12 dm. high; blades minutely scabrous above, about 4 mm. wide; panicle long and narrow; lemmas oblong, truncate, more or less purple-tinged, about 3 mm. long, prominently 7-nerved, distinctly scabrous.—In shallow water, Sonoma Co.; n. to Wash. (*Panicularia davyi* Merr.)

4. *G. pauciflora* Presl. Culms 3 to 12 dm. high, from a decumbent rooting base with creeping rhizomes; blades scattered, 6 to 12 mm. wide, scabrous; panicle nodding, 10 to 20 cm. long, open, the branches spreading, naked below, rather densely flowered toward the ends; spikelets about 4 mm. long, about 5-flowered; glumes short, broad, obtuse; lemmas 2 mm. long, rounded and somewhat erose at

summit, prominently 5-nerved, very scabrous on the nerves and somewhat so between.—Swamps, shallow water and wet meadows: Sierra Nevada; along the coast from San Francisco n. to Alas.; e. to Col.

5. *G. erecta* Hitchc. Differs from no. 4 in having shorter culms, the leaves somewhat crowded at base, and smaller less drooping panicles; intergrades with no. 4.—Springy places in mt. meadows, 4000 to 10,000 ft., Sierra Nevada; n. to Ore.

6. *G. elata* (Nash) Hitchc. Culms erect, smooth, succulent, 9 to 18 dm. high; blades flat, usually 6 to 10 mm. or sometimes only 4 mm. wide, scabrous; panicle diffuse, becoming oblong, 15 to 30 cm. long, the branches naked below,

the lower usually reflexed at maturity; spikelets 3 to 5 mm. long, usually 6 to 8-flowered; glumes broad, obtuse, much shorter than the lower lemmas, nerveless; lemmas firm, obovoid, obtuse or acutish, prominently 7-nerved.—Wet meadows, springs, and shady moist soil of woods in the mts.; n. to B. C. and Ida.

#### 4. PLEUROPÖGON R. Br.

Soft annuals or perennials, with flat blades and loose racemes of rather large many-flowered linear spikelets; glumes unequal, membranaceous or subhyaline, scarious at the somewhat lacerate tip, the first 1-nerved, the second obscurely 3-nerved; lemmas membranaceous, 7-nerved, with a round indurate callus at the base, the apex entire or 2-toothed, the midnerve extending into a short mucro or into an awn; keels of the palea winged on the lower half. (Greek *pleura*, side, and *pogon*, beard.)

Lemmas about 6 mm. long, scabrous and strongly nerved; spikelets not refracted; culm usually not over 6 dm. tall.....1. *P. californicus*.

Lemmas about 8 mm. long, smooth or slightly scabrous; spikelets often refracted; culms usually over 9 dm. tall.....2. *P. refractus*.

63. *Pleuropogon californicus* Benth.: a, habit x  $\frac{1}{4}$ ; b, spikelet x 1; c, glumes x 1; d, palea x 1.

1. *P. californicus* (Nees) Benth. Fig. 63. Annual; culms 3 to 6 dm. high; blades short, abruptly narrowed at apex; racemes 15 to 20 cm. long; spikelets distant, about 2.5 cm. long, erect or somewhat spreading, short-pedicelled; glumes obtuse; lemmas rather distant, 6 mm. long, scabrous, toothed and scarious at apex, the nerves prominent; awn variable, usually 6 to 12 mm. long, sometimes wanting; wings of palea prominent, toothed about the middle.—Wet meadows and marshy ground, San Mateo and Contra Costa Cos. to Mendocino Co.

2. *P. refractus* (Gray) Benth. Perennial; culms 9 to 15 dm. high; spikelets often reflexed; lemmas 8 mm. long, only minutely scabrous, the nerves less prominent; awn variable, as much as 1 cm. long or nearly wanting; palea narrow, keeled to about the middle, scarcely toothed.—Bogs, wet meadows and mt. streams, Mendocino and Humboldt Cos.; n. to Wash.

#### 5. PUCCINÉLLIA Parl.

Low pale smooth cespitose annuals or perennials with narrow or open panicles. Spikelets several-flowered, usually terete or only slightly flattened. Glumes unequal, shorter than the first lemma, obtuse or acute, rather firm, often scarious at the tip, the first 1-nerved or sometimes 3-nerved, the second 3-nerved. Lemmas usually firm, rounded on the back, obtuse or acute, rarely acuminate, usually scarious and often erose at the tip, glabrous or puberulent toward the base, 5-nerved, the nerves parallel, obscure or indistinct, rarely rather prominent. Palea about as long as the lemma or somewhat shorter. (Benedetto Puccinelli, an Italian botanist.)

Panicle open at maturity, the branches spreading or reflexed.

Leaves mostly in a short basal cluster; panicle usually less than 10 cm. long; lemmas smooth.....1. *P. lemmoni*.

Leaves scattered; panicle usually more than 10 cm. long; lemmas minutely pubescent toward base.....2. *P. nuttalliana*.

Panicle narrow, the branches ascending or appressed.

Plant annual; panicles strict.....3. *P. simplex*.

Plant perennial; panicles narrow but not strict.

Lemma entire at apex; plants mostly less than 3 dm. tall; panicles not much exceeding the leaves, the branches smooth or nearly so. 4. *P. paupercula*.

Lemma ciliate at apex; plants mostly more than 3 dm. tall; panicles large, exceeding the foliage, the lower branches as much as 7 cm. long, strongly scabrous.....5. *P. nutkaensis*.

1. *P. lemmoni* (Vasey) Scribn. Fig. 64. Plants perennial, slender, 1.5 to 3.8 dm. high; blades short, filiform, mostly basal, smooth, involute; panicle 5 to 10 cm. long, becoming open, the branches spreading; spikelets 5 to 6 mm.

long; glumes 1-nerved, 2 and 3 mm. long; lemmas 3 mm. long.—Alkaline soil, Sierra Nevada from Sierra Co. n.; Nev. to Ore.

2. *P. nuttalliana* (Schult.) Hitchc. ALKALI MEADOW GRASS. Plants perennial, tufted, erect, 4.5 to 6 dm. high; sheaths and involute blades smooth; panicle open, 15 to 20 mm. long, the branches spreading, naked below; spikelets terete, about 6 mm. long, usually pale; glumes acutish, 1 and 2 mm. long; lemmas about 3 mm. long.—Alkaline soil throughout Cal.; e. to the Dakotas and Tex.

3. *P. simplex* Scribn. Culms 0.8 to 2 dm. high; blades narrow, soft, flat, scattered; panicle about  $\frac{1}{2}$  the entire length of the plant, the branches few, short, appressed; spikelets 6 to 8 mm. long, appressed; glumes strongly 3-nerved, 1 and 2 mm. long; lemmas 3.5 mm. long, tapering from below the middle to the acute apex, pubescent on lower half.—Alkaline soil, Great Valley and Mohave Desert.

4. *P. paupercula* (Holm) Fer. & Weath. var. *alaskana* (Scribn. & Merr.) Fer. & Weath. Culms erect, tufted, about 3 dm. high; blades involute, erect, smooth; panicles narrow, 5 to 8 cm. long, the branches appressed; spikelets about 6 mm. long; glumes 3-nerved, 2 and 3 mm. long; lemmas 3 mm. long, sparingly pubescent at base, especially on the lower part of the rather prominent marginal nerves.—Saline soil, Mendocino Co.; n. to Alas.; on Atlantic Coast from Conn. northw. (*P. angustata* Nash.)

5. *P. nutkaensis* (Presl) Fer. & Weath. Culms in small tufts, rather stout, 4.5 to 6 dm. high; leaves scattered, smooth, the blades loosely involute, more or less spreading; panicle 10 to 15 cm. long, the branches appressed; spikelets about 8 mm. long; glumes nearly equal, 3-nerved, narrow, about 3 mm. long; lemmas 4 mm. long, smooth.—Saline soil near the coast, San Mateo Co. to Marin Co.; n. to B. C. (*P. festucaeformis* of authors.)

64. *Puccinellia lemmoni* Scribn.; a, habit  $\times \frac{1}{2}$ ; b, glumes  $\times 3$ ; c, florets  $\times 3$ .

## 6. POA L. BLUE GRASS

Annuals or usually perennials with open or contracted panicles, and narrow blades with boat-shaped tips (except in no. 5). Spikelets 2 to several-flowered, the uppermost floret reduced or rudimentary. Glumes acute, keeled, somewhat unequal, the first 1-nerved, the second usually 3-nerved. Lemmas somewhat keeled, acute or acutish, awnless, membranaceous, often somewhat scarious at the tip, 5-nerved. (Greek poa, grass or fodder.)

Plants annual.

Lemmas villous on the nerves below.

Panicle pyramidal, open; sheaths smooth.....1. *P. annua*.

Panicle narrow, contracted; sheaths scabrous.....2. *P. bigelovii*.

Lemmas not villous on the keel and nerves.

Sheaths rough; lemmas pubescent on the back.....3. *P. howellii*.

Sheaths smooth; lemmas smooth.....4. *P. bolanderi*.

Plants perennial.

Plants sod-forming, with creeping rhizomes.

Culms conspicuously flattened.....12. *P. compressa*.

Culms terete or slightly flattened.

Glumes about 8 mm. long; spikelet 1 to 1.5 cm. long.....5. *P. macrantha*.

- Glumes and spikelets smaller.  
 Blades involute; plants of seacoast dunes.  
 Lemmas pilose on the keel; panicle a dense ovoid head; plants dioecious.....6. *P. douglasii*.  
 Lemmas not pilose; panicle small but rather open...7. *P. confinis*.  
 Blades flat or folded; not seacoast plants.  
 Lemmas without cottony hairs at base.  
 Panicle almost spike-like; leaves mostly basal.....8. *P. atropurpurea*.  
 Panicle open; culms leafy throughout.....9. *P. nervosa*.  
 Lemmas with a tuft of cottony hairs at base.  
 Lemmas not pilose on keel or nerves; leaves mostly basal....10. *P. kelloggii*.  
 Lemmas pilose on keel and marginal nerves; culms leafy throughout.  
 Lemmas 3 mm. long; lower panicle branches in 5s.....11. *P. pratensis*.  
 Lemmas 5 mm. long; lower panicle branches mostly in 2s.....13. *P. rhizomata*.  
 Plants in bunches, without creeping rhizomes.  
 Lemmas villous on the nerves or with a tuft of cottony hairs at base.  
 Lemmas with cottony hairs at base; blades flat.  
 Cottony hairs scant; plants less than 5 dm. tall; panicle few-flowered...14. *P. leptocoma*.  
 Cottony hairs copious; plants commonly 6 to 13.5 dm. tall; panicle many-flowered.  
 Sheaths smooth; spikelets bronzed at tip.....15. *P. palustris*.  
 Sheaths retrorsely scaberrulous.  
 Spikelets about 3 mm. long; panicle 0.8 to 1.6 dm. long, green.....16. *P. trivialis*.  
 Spikelets 5 to 7 mm. long; panicle 1.5 to 3 dm. long; pale...17. *P. occidentalis*.  
 Lemmas without cottony hairs at base (see also no. 14, sometimes very obscurely cottony).  
 Blades soft, lax; alpine species.....18. *P. rupicola*.  
 Blades firm, stiff, folded or involute.  
 Ligule not over 1 mm. long.....19. *P. fendleriana*.  
 Ligule 5 to 7 mm. long.....20. *P. longiligula*.  
 Lemmas neither villous on the nerves nor with a cottony tuft at base, the inter-nerves sometimes puberulent toward the base.  
 Lemmas minutely crisp-puberulent on the lower half or third.  
 Sheaths scaberrulous; panicle usually narrow, somewhat elongate, the short branches mostly appressed.....21. *P. scabrella*.  
 Sheaths smooth.  
 Culms erect from a dense tuft of short leaves; panicle narrow....22. *P. sandbergii*.  
 Culms decumbent and loose at base, the basal leaves relatively long; panicle open.....23. *P. gracillima*.  
 Lemmas glabrous or scabrous.  
 Panicle mostly over 1 dm. long, narrow, the branches appressed except in anthesis; plants rather robust, usually 6 dm. tall or more.  
 Sheaths scabrous; ligule 4 mm. long.....24. *P. nevadensis*.  
 Sheaths smooth; ligule not over 2 mm. long.....25. *P. brachyglossa*.  
 Panicle less than 1 dm. long, compact or open.  
 Culm blades flat, the lower 2 to 3 mm. wide.....26. *P. epilis*.  
 Culm blades folded or involute, narrow or filiform.  
 Panicle compact, spike-like; plants of seacoast cliffs.....27. *P. unilateralis*.  
 Panicle not spike-like, if narrow not compact.  
 Glumes 4 to 5 mm. long; panicle shining, usually pale...28. *P. pringlei*.  
 Glumes 3 mm. long; panicle usually purple.....29. *P. leibergii*.
1. *P. annua* L. In tufts or mats; culms flattened, 0.8 to 2 dm. long, decumbent at base, sometimes rooting at the lower nodes; blades soft, panicle 2.5 to 7 cm. long; spikelets crowded, 3 to 6-flowered, 3 to 4 mm. long; lemma not cottony at base, distinctly 5-nerved, the nerves pilose on lower half.—Open ground, along roadsides and in waste places, throughout the state, except in the deserts; extends from Alas. to Mex.; nat. from Eur.
  2. *P. bigelovii* Vasey & Scribn. Culms erect, 1.5 to 3.8 dm. high; panicle narrow, 7.5 to 15 cm. long, the branches short, appressed; spikelets ovate, about 6 mm. long; glumes acuminate; lemmas cottony at base, copiously pilose on the lower part of the lateral nerves and keel, villous on lower part of internerves.—Open ground, mostly in the deserts, Inyo Co. to San Diego Co.; e. to western Tex., s. to Mex.
  3. *P. howellii* Vasey & Scribn. Culms 3 to 9 dm. high; sheaths retrorsely scabrous; panicle  $\frac{1}{2}$  to  $\frac{1}{2}$  the entire height of the plant, open, the branches

in rather distant fascicles, spreading, naked below, some short branches intermixed; spikelets 3 to 4 mm. long, usually 3 or 4-flowered; glumes narrow, acuminate; lemmas cottony at base, 2 mm. long, ovate, pubescent over the lower  $\frac{1}{2}$  or  $\frac{3}{4}$ , the nerves all rather distinct.—Rocky banks and shaded slopes at moderate altitudes, mostly in the Coast Ranges; s. to S. Cal., n. to Vancouver Isl.

4. *P. boländeri* Vasey. Culms erect, 1.5 to 6 dm. high; sheaths smooth; panicle open, about  $\frac{1}{2}$  the entire plant, the branches few, distant, smooth, stiffly spreading or somewhat reflexed, naked below; spikelets, usually 2 or 3-flowered, about 5 mm. long; glumes broad; lemma sparsely cottony at base, smooth, scabrous on the keel, acute, the marginal nerves rather indistinct, the intermediate nerves obsolete.—Open ground or open woods, at high altitudes: San Jacinto Mts.; Sierra Nevada and n. to Siskiyou Co.; n. to Wash. and Alb., e. to Utah.

5. *P. macrantha* Vasey. Rhizomes extensively creeping; culms erect from a decumbent base, 1.5 to 4.5 dm. tall, the sterile shoots widely spreading; sheaths smooth, tawny, papery; blades smooth, involute, more or less curved or flexuous; panicle narrow, sometimes dense and spike-like, 5 to 13 cm. long, pale or tawny; spikelets about 5-flowered; glumes smooth, 3-nerved, or the second indistinctly 5-nerved; lemmas 8 mm. long, not webbed at base, short-pilose on the keel and marginal nerves below, slightly scabrous on the keel above and sparingly on the back near margins; palea ciliate on keels.—Sand dunes along the coast, Del Norte Co.; n. to Wash.

6. *P. douglasii* Nees. Fig. 65. Rhizomes extensively creeping; culms ascending from a decumbent base, usually less than 3 dm. high; sheaths smooth, tawny and papery; blades involute, some usually exceeding the culm; panicles ovoid or oblong, dense, spike-like, 2.5 to 5 cm. long, pale or tawny; spikelets 8 to 10 mm. long; glumes broad, 3-nerved, smooth, scabrous on upper part of keel, nearly equal; lemmas 6 mm. long, slightly cottony at base, villous on the lower part of keel and marginal nerves, scabrous on keel above, 1 to 3 pairs of indistinct intermediate nerves; palea ciliate on keels.—Sand dunes near the coast, Monterey Co. to Mendocino Co.

7. *P. confinis* Vasey. Culms low, often geniculate or ascending at base, usually less than 1.5 dm. high; sheaths and involute blades smooth; panicle narrow, contracted, 1.5 to 2.5 cm. long, tawny; spikelets about 4 mm. long; lemmas 3 mm. long, scabrous, sparsely cottony at base, the nerves faint.—Sand dunes and sandy meadows near the coast, Mendocino Co.; n. to Alas.

8. *P. atropurpurea* Scribn. Culms 3 to 4.5 dm. high, slender; sheaths smooth; blades folded or involute, firm, smooth on under surface, the uppermost culm-leaf below the middle; panicle purple-tinged, 2.5 to 5 cm. long; spikelets 3 to 4 mm. long, turgid; glumes broad; lemmas 2, to 2.3 mm. long, broad, smooth, the

65. *Poa douglasii* Nees; a, staminate plant  $\times \frac{1}{2}$ ; b, pistillate plant  $\times \frac{1}{2}$ ; c, d, glumes and florets of pistillate spikelet  $\times 4$ ; e, f, glumes and florets of staminate spikelet  $\times 2$ .

nerves faint.—Bear Valley, San Bernardino Mts., 6000 ft., not otherwise known.

9. *P. nervosa* (Hook.) Vasey. Culms 3 to 7.5 dm. high; sheaths smooth or lower scaberulous, rarely retrorsely puberulent; ligule 1 to 2 mm. long; blades flat, lax, 3 to 4 mm. wide; panicle loose, the capillary branches spikelet-bearing at the ends; lemmas typically strongly nerved, scaberulous.—Moist rocks and banks, high montane; S. Cal. mts.; Sierra Nevada; n. to B. C. In the typical form the intermediate nerves of lemma are strong, but spikelets with faint intermediate nerves are found in same panicle with strongly-nerved ones. *P. olneyae* Piper is a form with faint intermediate nerves and smooth lemmas.

10. *P. kellóggii* Vasey. Culms 3 to 6 dm. high; blades flat or folded, scabrous on upper surface; panicle pyramidal, open, 7.5 to 15 cm. long, the branches mostly in 1s or 2s, slender, spreading or reflexed, bearing a few spikelets toward the ends; spikelets rather loosely flowered, 4 to 6 mm. long; lemmas acute or almost cuspidate, 3 to 4 mm. long, smooth, rather obscurely nerved, conspicuously cottony at base.—Coast Ranges from Santa Cruz Co. to Humboldt Co.; n. to Ore.

11. *P. pratensis* L. KENTUCKY BLUE GRASS. Culms tufted, 3 to 9 dm. high; terete or slightly flattened; sheaths smooth, compressed; ligule about 2 mm. long; blades soft, flat or folded, the basal often elongate; panicle pyramidal, open, the slender branches in remote fascicles of 3 to 5, ascending or spreading, naked at base, some of them short; spikelets crowded, 3 to 5-flowered, 4 to 5 mm. long; lemmas 3 mm. long, copiously cottony at base, silky villous on keel and marginal nerves, the intermediate nerves prominent.—Open woods, banks, open ground; not in the deserts; extends throughout the northern part of N. Am. and Eurasia; extensively cult. as a pasture and lawn grass. Some forms are clearly native in the mts., while others, especially at low altitudes, are escaped from cult.

12. *P. compressa* L. CANADA BLUE GRASS. Culms not tufted, geniculate-ascending, flattened, wiry, bluish green, 1.5 to 4.5 dm. high; panicle narrow, 2.5 to 10 cm. long, the usually short branches in pairs, spikelet-bearing to the base; spikelets crowded, subsessile, 3 to 6-flowered, 4 to 6 mm. long; lemmas firm, obscurely nerved, 2 to 2.5 mm. long, sparingly cottony at base, short-pubescent below on keel and marginal nerves.—Open ground, open woods, meadows and waste places throughout the U. S.; nat. from Eur.; often a troublesome weed. Distinguished from *P. pratensis* by the color and the flattened culms.

13. *P. rhizomata* Hitchc. Culms erect, 3 to 6 dm. high; lower sheaths loose, papery; ligule 2 to 3 mm. long; blades flat or folded; panicle long; exserted, oblong, contracted, 2 to 5 cm. long, the branches short, mostly in 2s, ascending, few-flowered; spikelets about 6 mm. long, 3 to 5-flowered; glumes unequal, rather broad, acute, scabrous on the keels; lemmas 5 mm. long, acutish, copiously cottony at base, short-pilose on keel below, and sparingly so on lower part of marginal nerves, the intermediate nerves faint; palea ciliate on the keels.—Damp shady woods, Siskiyou and Modoc Cos.; n. to Ore. and Ida.

14. *P. leptocoma* Trin. Culms loosely tufted, erect from a slightly decumbent base, rather lax, 1.3 to 4.5 dm. high; blades lax, scaberulous; panicle loose, open, 5 to 10 cm. long, the slender spreading branches naked below, mostly in 2s; spikelets mostly 2 or 3-flowered, 5 to 7 mm. long; lemmas villous on the keel and less so on marginal nerves, intermediate nerves indistinct, the cottony tuft at base sometimes obscure.—Boggy or springy places at high altitudes, often in shade, Mt. Dana; Wash. to Alas.

15. *P. palustris* L. FOWL-BLUE GRASS. Culms somewhat decumbent, flattened, and commonly purplish at base, 4.5 to 12 dm. high; ligule 3 to 5 mm. long; blades soft; panicle oblong-pyramidal, nodding, bronze or purplish, mostly more than 15 cm. long, the distant fascicled branches naked below; spikelets 2 to 4-flowered, about 4 mm. long; lemmas villous on keel and mar-

ginal nerves, intermediate nerves faint.—Meadows and moist open ground, Sierra Valley (rare in Cal.); throughout cold-temperate N. Am. and Eurasia.

16. *P. trivialis* L. ROUGH BLUE GRASS. Culms erect from a decumbent base, often rather lax, scabrous below the panicle, 4.5 to 9 dm. high; ligule 4 to 6 mm. long; blades scabrous; panicle oblong, the lower branches mostly 5 in a whorl; spikelets usually 2 or 3-flowered; keel of lemma slightly pubescent, lateral nerves glabrous.—Moist places, Humboldt Co.; introd. from Eur.

17. *P. occidentalis* Vasey. Culms rather robust, erect, scabrous, 9 to 13.5 dm. high; ligule 6 to 8 mm. long; blades scabrous, sometimes 7 mm. wide; panicle very loose, the slender distantly whorled spreading or reflexed branches spikelet-bearing toward the ends; spikelets 3 to 6-flowered; keel of lemma villous below, marginal nerves slightly villous.—Open woods, cent. Cal.; Alas. to Col. and N. Mex.

18. *P. rupicola* Nash. Culms erect, rather stiff, smooth, 1 to 2 dm. high; ligule about 1 mm. long; blades erect, 1 mm. wide or less, flat or loosely involute; panicle purplish, narrow, 2 to 4 cm. long; spikelets mostly 3-flowered, 5 mm. long; lemmas villous below on keel and marginal nerves; intermediate nerves faint.—Rocky slopes at high altitudes, Mono Pass in the Sierra Nevada; Ore., Rocky Mts.

19. *P. fendleriæna* (Steud.) Vasey. MUTTON GRASS. Densely tufted, pale; culms erect, smooth, scabrous below panicle, 3 to 4.5 dm. high; sheaths somewhat scabrous; ligule less than 1 mm. long; blades mostly basal, scabrous; panicle long-exserted, narrow, contracted, 2.5 to 8 cm. long; glumes broad; lemmas 4 mm. long, long-pilose on the lower portion of keel and marginal nerves, the intermediate nerves obscure.—Mesas and hills: San Bernardino Mts.; Panamint Mts.; Great Basin region from Wash. and Wyo. to N. Mex.

20. *P. longiligula* Scribn. & Wms. Similar to no. 19; culms smooth, 3 to 6 dm. high; sheaths and blades smooth; ligule 5 to 7 mm. long, or on the innovations somewhat shorter; panicle looser and often longer; spikelets as in no. 19.—Cañons and banks of streams, San Bernardino Mts.; Nev. to Mont. and N. Mex.

21. *P. scabrëlla* (Thurb.) Benth. MALPAIS BLUE GRASS. Densely tufted; culms erect, 6 to 9 dm. high, usually scabrous, at least below panicle; sheaths scabrous; ligule 3 to 5 mm. long; blades mostly basal, flat, narrow, usually about 1 mm. wide, lax, more or less scabrous; panicle narrow, usually contracted, sometimes rather open at base, 5 to 12 cm. long; spikelets narrow, 6 to 10 mm. long; glumes scabrous; lemmas 4 mm. long, puberulent or scabrous on back, and more or less crisp-pubescent on lower half.—Meadows, woods, rocks and hills, common throughout the state and extending to Ore., Nev. and N. Mex. It is exceedingly variable and several forms have received specific names: *P. orcuttiana* Vasey and *P. acutiglumis* Scribn. represent a less scabrous form with relatively open panicle; *P. nudata* Scribn. is a form with subcapillary lax blades and small dense panicle; *P. limòsa* Scribn. & Wms. is a relatively robust, nearly smooth form with blades 3 to 4 mm. wide.

22. *P. sandbergii* Vasey. LITTLE BLUE GRASS. Similar to no. 21, differing in being smooth, averaging lower and more slender, the cushion of leafy shoots at base denser, the panicle smaller, the blades short and soft, often involute.—Plains and dry or rocky woods: cismontane S. Cal.; n. to B. C., e. to Wyo. Intergrades between this and no. 21 are not rare.

23. *P. gracillima* Vasey. Densely tufted; culms 3 to 6 dm. high, erect from usually a decumbent base; ligule 3 mm. long; blades flat or folded, lax, smooth, mostly basal; panicle pyramidal, loose, 5 to 10 cm. long, the branches in whorls, the lower 2 to 6, 2.5 to 8 cm. long, slender, spreading, sometimes reflexed, naked below; spikelets 4 to 6 mm. long; lemmas about 4 mm. long, minutely scabrous, crisp-pubescent near base, especially on the nerves.—Rocks, woods, cliffs, higher Sierra Nevada; n. to Alas. Exceedingly variable. *P. tenerima* Scribn. represents a form with filiform blades; *P. alcea* Piper is a form with leaves not aggregate at base, the sheaths slightly scaberulous.

24. *P. nevadensis* Vasey. NEVADA BLUE GRASS. Culms densely tufted, 4.5 to 9 dm. high, smooth; blades firm, involute, scabrous; panicle narrow, 10 to 15 cm. long; spikelets 6 to 8 mm. long, narrow; glumes narrow; lemmas smooth or scaberulous, 3 mm. long.—Plains and dry meadows, Mohave Desert and bordering mountain slopes, n. along the east side of the Sierra Nevada (or occasionally on its crests) to Siskiyou Co.; n. to Wash. and e. to Col. *P. thurberiana* Vasey is a rare form with spikelets having only 2 or 3 florets.

25. *P. brachyglóssa* Piper. Culms densely tufted, glabrous, 4.5 to 9 dm. high; blades stiff and firm, flat or involute; panicle narrow, 10 to 20 cm. long; spikelets 8 to 10 mm. long; glumes smooth; lemmas smooth or nearly so, 4.5 mm. long.—Dry slopes and cliffs, Sierra Nevada from Nevada Co. to Lassen Co. and n. to Siskiyou Co.; Nev. to Wash. and Ida.

26. *P. épilis* Scribn. Culms solitary or few in a tuft, 2 to 4 dm. high, with few to many basal shoots with smooth, usually folded blades longer than those of the culm; sheaths smooth; blades of culm leaves flat, 2.5 to 7 cm. long; ligule about 3 mm. long; panicle usually dense, purplish, 2.5 to 8 cm. long; spikelets 7 to 8 mm. long, the glumes 4 to 5 mm., the lemmas 5 to 6 mm. long.—Meadows, high Sierra Nevada; n. to B. C., e. to Col. (Cal. specimens were referred to *P. cottoni* Piper in Jepson Fl. Cal. 1:160.)

27. *P. unilateralis* Scribn. Culms 1 to 3.8 dm. high; sheaths smooth, tawny and papery; panicle oblong, 2.5 to 8 cm. long; spikelets 6 to 8 mm. long; glumes broad, acute, smooth, indistinctly scabrous on keel near apex; lemmas 4 mm. long, scabrous on base of marginal nerves and apex of keel, the intermediate nerves faint; palea ciliate on keels.—Cliffs, bluffs and rocky meadows near the seashore, Humboldt Co. to Monterey Co.

28. *P. pringlei* Scribn. Culms 1 to 2½ dm. high, the base sometimes decumbent and rhizome-like; sheaths smooth, loose and papery; blades mostly basal, involute, usually not over 2.5 to 5 cm. long, smooth, the uppermost culm blade at or below the middle; panicle narrow, contracted, few-flowered; spikelets 6 to 8 mm. long, about 3-flowered; glumes equal, broad; lemmas 5 to 6 mm. long, smooth or scabrous.—Rocks and sand: high Sierra Nevada; Mt. Pinos; Siskiyou Co.; n. to Wash.

29. *P. leibergii* Scribn. Culms 0.8 to 2 dm. high; sheaths smooth; ligule about 2 mm. long; blades mostly basal, firm, involute, smooth, short; panicle narrow, 2.5 to 5 cm. long, the branches short, appressed; spikelets 4 to 6 mm. long; lemmas 3 mm. long, smooth or scaberulous, the nerves obscure.—Alpine meadows and sterile gravelly alpine flats, 8500 to 12,000 ft., Sierra Nevada; n. to Ore. *P. hanseni* Scribn. is a form with finer softer blades and slightly smaller spikelets.

## 7. *BRIZA* L. QUAKING GRASS

Ours low annuals with erect culms, flat blades, and open showy panicles, the pedicels capillary, the spikelets vibrating in the wind. Spikelets several-flowered, broad, often cordate, the florets crowded and spreading horizontally, the uppermost floret reduced. Glumes about equal, broad, papery-chartaceous, with scarious margins. Lemmas papery, broad, with scarious, spreading margins, cordate at base, several-nerved, the nerves often obscure, the apex in our species obtuse or acutish. Palea much shorter than the lemma. (Ancient Greek name for some grain, probably rye.)

66. *Briza minor* L.;  
a, glumes  $\times 10$ ; b,  
florets  $\times 10$ .

Spikelets less than 5 mm. long.....1. *B. minor*.  
Spikelets 10 to 15 mm. long, 10 mm. broad.....2. *B. maxima*.

1. *B. minor* L. Fig. 66. Culms erect, 1 to 3.8 dm. high; panicle erect, pyramidal, many-flowered, the main branches stiffly ascending, the capillary branchlets spreading; spikelets triangular-ovate, 3 mm. long.—Waste places; nat. from Eur.; rather common, cent. Cal., n. to B. C.

2. *B. maxima* L. Culms erect or decumbent at base, 3 to 6 dm. high; panicle nodding, few-flowered; spikelets ovate,

purplish or brownish, drooping, on capillary pedicels.—Native of Eur., sparingly escaped from gardens where cult. for ornament.

### 8. ERAGRÓSTIS Host

Annuals or perennials of various habit. Spikelets few to many-flowered, the florets usually closely imbricate, the lemmas often deciduous, the paleas persistent. Glumes somewhat unequal, shorter than the first lemma, acute or acuminate, 1-nerved, or the second rarely 3-nerved. Lemmas acute or acuminate, keeled or rounded on the back, 3-nerved, the nerves usually prominent. (Eros, love, agrostis, grass, from the common European name, "love-grass.")

Plants perennial; panicle narrow, compact, more or less interrupted. . . . 1. *E. secundiflora*.  
Plants annual.

Plants creeping, dioecious or polygamous. . . . 2. *E. hypnoides*.  
Plants not creeping, culms sometimes decumbent at base; flowers perfect.

Pedicels or keel of lemma (usually both) with minute saucer-shaped glands; naturalized weeds; spikelets about 3 mm. wide. . . . 3. *E. cilianensis*.

Pedicels and keel of lemma not glandular; natives.

Pedicels appressed; panicles pilose in lower axils. . . . 4. *E. caroliniana*.

Pedicels ascending or spreading; panicle not pilose in axils.

Pedicels nearly straight, ascending; tips of lemmas not appressed. . . .

5. *E. mexicana*.

Pedicels flexuous, spreading; tips of lemmas appressed, the margin of

spikelet almost entire. . . . 6. *E. orcuttiana*.

1. *E. secundiflora* Presl. Culms erect or geniculate at base, stiff, 3 to 6 dm. high; sheaths pilose at the throat; panicles reddish or russet, the short mostly distant branches ascending, compactly flowered; spikelets many-flowered, about 4 mm. wide, the closely imbricate, sharp-pointed florets somewhat spreading; lemmas prominently nerved.—Open sandy soil, San Diego Co.; e. to Kan. and Fla., s. to Mex.

2. *E. hypnoides* (Lam.) B.S.P. Culms slender, extensively creeping, forming mats, with divaricate commonly fascicled branches; flowering culms erect, 0.5 to 1.3 dm. high; blades 1 to 3 cm. long; panicles pale, few-flowered, open, or the pistillate dense; spikelets about 2 mm. wide, many-flowered, sometimes 15 mm. or more long.—Sand bars and wet open ground; throughout the U. S., s. to S. Am.

3. *E. cilianensis* (All.) Link. STINK GRASS. SNAKE GRASS. Fig. 67. Culms erect or ascending from a decumbent base, rather flaccid, freely branching, 2 to 6 dm. high; panicles greenish lead-color, 1.3 to 3.8 dm. long, rather densely flowered; spikelets 6 to 12 mm. long, 10 to 40-flowered, the florets closely imbricate; lemmas thin, the lateral nerves prominent.—Fields, roadsides and waste places: Tehama Co.; Butte Co.; Los Angeles; San Bernardino; West Riverside; Mecca; nat. from Eur. Strong-scented when fresh.

*E. POAËOIDES* Beauv., with narrower spikelets and gland-dotted leaf margins was found in Amador Co. (Clinton) in 1896; nat. of Eur.

4. *E. caroliniana* (Spreng.) Scribn. Culms erect to prostrate-spreading, 1.5 to 4.5 dm. high, diffusely branched at base; sheaths sparingly pilose at summit; blades 2 to 3 mm. wide; panicle diffuse, 8 to 20 cm. long; spikelets 5 to 18-flowered, becoming linear, 4 to 8 mm. long; lemmas slightly scabrous on keel, the lateral nerves distinct but not prominent.—Fields, waste places and open ground, San Luis Obispo and Tulare Cos. to S. Cal., rare; e. to Me., s. to Mex. (*E. pilosa* of authors.)

5. *E. mexicana* (Lag.) Link. Culms erect or spreading, 3 to 6 dm. high; sheaths hairy at the throat; blades often elongated; panicle diffuse, about half the entire height of the plant; spikelets 4 to 6 mm. long, 1.5 mm. wide, mostly 6 to 12-flowered, the slender pedicels mostly longer than the spikelet.—Weed in fields and waste places, S. Cal.; e. to N. Mex. and s. to Mex.

67. *Eragrostis cilianensis* Link.  
habit  $\times \frac{1}{4}$ .

6. *E. orcuttiæna* Vasey. Resembles no. 5; differs in the more diffuse panicle with narrower, usually arcuate spikelets on shorter spreading pedicels.—Fields and waste places, S. Cal.

### 9. DISSANTHÆLIUM Trin.

Our species annual. Spikelets mostly 2-flowered. Glumes firm, nearly equal, acuminate, much longer than the lower floret, mostly exceeding all the florets, the first 1-nerved, the second 3-nerved. Lemmas strongly compressed, oval or elliptic, acute, awnless, 3-nerved, the lateral nerves near the margin; palea somewhat shorter than the lemma. (Greek dissos, double, and anthelios, floret.)

68. *Dissanthelium californicum*  
Benth.; a, glumes;  
b, florets. x 5.

1. *D. californicum* (Nutt.) Benth. Fig. 68. Culms 6 to 9 dm. high; ligule 2 to 6 mm. long; blades flat, lax; panicle narrow, loose, 15 to 20 cm. long, the lower fascicles of branches rather remote; lemmas about 3 mm. long, minutely villous, especially below.—San Clemente and Santa Catalina Isls.; rare.

### 10. MONANTHÓCHLOE Engelm.

A creeping wiry diœcious perennial with clustered short subulate leaves, the spikelets at the ends of the short branches, only a little exceeding the leaves. Spikelets 3 to 5-flowered, the uppermost florets rudimentary. Glumes wanting. Lemmas rounded on the back, convolute, narrowed above, several-nerved, those of the pistillate spikelets like the blades in texture. Palea narrow, in the pistillate spikelets convolute around the pistil, the rudimentary uppermost floret inclosed between the keels of the floret next below. (Greek mono, one, anthos, flower, and chloe, grass.)

1. *M. littoralis* Engelm. Fig. 69. Plants forming extensive mats; flowering culms 0.8 to 2 dm. high; blades spreading-arcuate, rigid, 3 to 10 mm. long; inflorescence very inconspicuous.—Coastal salt marshes and mucky or gravelly tidal flats, Santa Barbara to San Diego and s. to tropical Am.; on the Atlantic Coast extending n. to Fla.

### 11. DISTÍCHLIS Raf.

Low diœcious perennial with extensively creeping rhizomes, erect, rigid, culms and short dense rather few-flowered panicles. Spikelets several to many-flowered. Glumes unequal, broad, acute, keeled, mostly 3-nerved, the lateral nerves sometimes faint or obscured by striations and intermediate nerves. Lemmas closely imbricate, firm, the pistillate coriaceous, the margins bowed out near the base, acute or acutish, 3-nerved, with several intermediate nerves or striations. Palea as long as the lemma or shorter, the pistillate coriaceous, inclosing the grain. (Greek distichos, 2-ranked.)

1. *D. spicâta* (L.) Greene. SALT GRASS. Fig. 70. Forming tough sod, glaucous; culms 1 to 6 dm. high; leaves numerous, blades stiff, often conspicuously distichous; panicle narrow, 2.5 to 8 cm. long; spikelets 8 to 15 mm. long.—Salt marshes and alkaline soil, low altitudes, common along

69. *Monanthochloe littoralis* Engelm.;  
a, habit x 1/2; b, infl. x 4.

the coast, and in the interior valleys and deserts; extends from s. Brit. Am. to Mex.

## 12. ARÚNDÓ L.

Tall perennial reeds with broad linear blades and large plume-like terminal panicles. Spikelets several-flowered, the florets successively smaller, the summits of all about equal, the rachilla glabrous. Glumes somewhat unequal, membranaceous, 3-nerved, narrow, tapering into a slender point, about as long as the spikelet. Lemmas thin, 3-nerved, densely long-pilose, gradually narrowed at the summit, the nerves ending in slender teeth, the middle one extending into a straight awn. (Ancient Latin name for reed.)

1. *A. dònax* L. GIANT REED. Culms stout, as much as 6 m. high and 2.5 cm. in diameter at base, from knotty branching rhizomes; blades numerous, broad, flat, 4 to 8 cm. wide on the main culm, smaller on the branches, the base cordate, more or less hairy-tufted; panicle 30 to 60 cm. long; spikelets about 12 mm. long.—Native of the Orient; escaped along irrigating ditches in cent. and S. Cal.

## 13. PHRAGMÎTES Adans. REED

Perennial reeds with broad flat linear blades and large terminal panicles. Spikelets several-flowered, the rachilla clothed with long silky hairs, disarticulating at the base of each joint, the lowest floret staminate or neuter. Glumes 3-nerved, or the upper 5-nerved, lanceolate, acute, unequal, the first about half as long as the upper, the second shorter than

70. *Distichlis spicata* Greene; a, infl. of pistillate plant; b, infl. of staminate plant. x  $\frac{1}{2}$ .

the florets. Lemmas narrow, long-acuminate, glabrous, 3-nerved, the florets successively smaller. Palea much shorter than the lemma. (Greek phragmites, growing in hedges.)

1. *P. communis* Trin. COMMON REED. Fig. 71. Culms robust, as much as 3.6 m. high, from stout creeping rhizomes, these sometimes on the surface, forming leafy stolons as much as 9 m. long; blades as much as 5 cm. wide, flat, the base somewhat narrowed, not hairy; panicle 15 to 40 cm. long; spikelets about 12 mm. long.—Fresh-water swamps, marshes and around springs, Colorado and Mohave deserts and n. to Mendocino Co., not common; throughout temperate regions.

## 14. DÁCTYLIS L.

Perennials with flat blades and fascicled spikelets. Spikelets few-flowered, compressed, nearly sessile in dense one-sided fascicles, these borne at the ends of the few branches of a panicle. Glumes unequal, carinate, acute, hispid-ciliate on the keel. Lemmas compressed-keeled, mucronate, 5-nerved, ciliate on the keel. (Greek, daktulos, a finger.)

1. *D. glomerata* L. ORCHARD GRASS. Fig. 72. Culms in large tussocks, erect, 6 to 12 dm. high; blades broadly linear; panicle 8 to 20 cm. long, the few stiff branches naked below, contracted after flowering; spikelets 5 to 8 mm. long.—Cult. in U. S.; escaped along roadsides and in waste places; nat. of Eur.

*CYNOSÚRUS ECHINATUS* L., a low weedy annual with bristly subglobose heads of two kinds of spikelets, perfect and sterile intermixed, has been found in Marin Co.

72. *Dactylis glomerata* L.; a, glumes; b, florets. x 5.

71. *Phragmites communis* Trin.; a, glumes; b, florets. x 4.

15. *LAMÁRCKIA* Moench

A low erect annual with flat blades and oblong one-sided compact panicles, the crowded fascicles drooping, falling entire, the fertile spikelets hidden, except the awns, by the sterile ones. Spikelets of two kinds, in fascicles, the terminal one of each fascicle fertile, the others sterile. Fertile spikelet with 1 perfect floret, the rachilla produced beyond the floret, bearing a small awned empty lemma or reduced to an awn; glumes narrow, acuminate or short-awned, 1-nerved; lemma broader, raised on a slender stipe, scarcely nerved, bearing just below the apex a delicate straight awn. Sterile spikelets linear, 1 to 3 in each fascicle, consisting of 2 glumes similar to those of the fertile spikelet, and numerous distichously imbricate obtuse awnless empty lemmas. (Jean Baptiste Antoine Pierre Monnet, Chevalier de La Marck, eminent French naturalist.)

1. *L. áurea* Moench. GOLDEN-TOP. Fig. 73. Culms 1 to 3.8 dm. high; leaves smooth; ligule prominent, decurrent as a broad scarious margin; panicle 2.5 to 10 cm. long, 1.5 to 2.5 cm. wide, shining, golden-yellow or purplish; fertile spikelet about 2 mm. long, the sterile 4 to 8 mm. long.—Cult. and waste ground, common in S. Cal., rarer northw.; nat. from Mediterranean region.

73. *Lamarckia aurea* Moench; fascicle of spikelets x 5.

16. *MÉLICA* L.

Rather tall perennials, the base of the culm often swollen into a corm, with closed sheaths, usually flat blades, narrow or sometimes open, usually simple panicles of relatively large spikelets. Spikelets 2 to several-flowered, the rachilla prolonged beyond the perfect florets and bearing at the apex two or three gradually smaller empty lemmas, convolute together or the upper inclosed in the lower. Glumes somewhat unequal, thin, often papery, scarious-margined, obtuse or acute, sometimes nearly as long as the lower floret, 3 to 5-nerved, the nerves usually prominent. Lemmas convex, several-nerved, membranaceous or rather firm, scarious-margined, sometimes conspicuously so, awnless or sometimes awned from between the teeth of the bifid apex. (Old Italian name for sorghum, from mel, honey.)

Spikelets narrow; glumes usually narrow, scarious-margined; sterile lemmas similar to the fertile, the latter acute or awned.—(Sect. *BROMELICA*.)

Lemmas long-awned from a bifid apex.....1. *M. aristata*.  
Lemmas awnless or nearly so.

Culms not bulbous at base; lemmas mucronate.....2. *M. harfordii*.  
Culms bulbous at base; lemmas acute or acuminate, awnless.

Lemmas acuminate; panicle narrow, the branches short....3. *M. subulata*.

Lemmas subacute to obtuse; panicle broad, the branches long and spreading.  
4. *M. geyeri*.

Spikelets broad; glumes broad and papery; lemmas awnless; sterile lemmas small, convolute, more or less hidden in the upper fertile lemmas.—(Sect. *EUMELICA*.)

Culms bulbous at base.

Pedicels capillary, flexuous or recurved.....5. *M. spectabilis*.  
Pedicels stouter, appressed.

Panicle narrow; branches short, erect.....6. *M. bella*.  
Panicle open; branches spreading.

First glume about 3 mm. long.....7. *M. fugax*.

First glume about 8 mm. long.....8. *M. inflata*.

Culms not distinctly bulbous at base (somewhat bulbous in no. 11).

Spikelets reflexed, large.....9. *M. stricta*.

Spikelets not reflexed, smaller.

Fertile florets 3 or 4 in each spikelet; spikelets 10 to 12 mm. long.

Spikelets silvery white; glumes about as long as spikelet; plant tall, somewhat woody.....10. *M. frutescens*.

Spikelets tawny or purplish; glumes shorter than spikelet; plant lower, herbaceous.....11. *M. bulbosa*.

Fertile florets 1 or 2 in each spikelet; spikelets 4 to 6 mm. long.

Fertile lemmas pubescent.....12. *M. torreyana*.

Fertile lemmas glabrous.....13. *M. imperfecta*.

1. *M. aristata* Thurb. Culms erect or decumbent below, not bulbous at base, smooth, 6 to 9 dm. high; sheaths scabrous or pubescent; blades flat,

more or less pubescent; panicle narrow, the branches short, appressed; glumes 5-nerved, 10 to 12 mm. long; lemmas 5-nerved, scabrous, the awn 6 to 10 mm. long.—Dry woods, slopes and meadows, 4000 to 6500 ft., Sierra Nevada from Fresno Co. to Nevada Co. and n. to Siskiyou Co.; far n. to Wash.

2. *M. harfordii* Boland. Culms 6 to 12 dm. high, decumbent below, smooth, not bulbous at base; sheaths smooth; blades scabrous, firm; panicle narrow, the branches appressed; glumes about 6 mm. long, obtuse; lemmas 7-nerved, pilose on lower part of margin, the apex emarginate, mucronate or with an awn less than 2 mm. long.—Open dry woods and slopes, Monterey Co. to Shasta Co.; n. to B. C.

3. *M. subulata* (Griseb.) Scribn. Culms 6 to 12 dm. high, bulbous at base; spikelets 2 to 2.5 cm. long, loosely several-flowered; glumes obscurely nerved; lemmas prominently 7-nerved, gradually acuminate, the keel and marginal nerves pilose-ciliate.—Meadows, banks and shady slopes, Coast Ranges from Marin Co. to Siskiyou Co., thence southeasterly in the Sierra Nevada to Placer Co.; n. to Alas., e. to Wyo.

4. *M. géyeri* Munro. Culms 9 to 15 dm. high, bulbous at base; sheaths glabrous or sometimes pubescent; blades scabrous, flat; panicle open, the lower branches slender, spreading, bearing a few spikelets above the middle; spikelets 1.2 to 2 cm. long; glumes broad, smooth, papery; lemmas scaberulous.—Wooded ravines and along streams, Coast Ranges from Santa Clara Co. northw., and Sierra Nevada from Nevada Co. northw.; n. to Ore.

5. *M. spectabilis* Scribn. SHOWY ONION GRASS. Culms 3 to 9 dm. high; panicle narrow, the branches appressed; spikelets broad, purple-tinged, 10 to 15 mm. long, 4 or 5-flowered, nodding; glumes shorter than the lower lemma; lemmas strongly 7-nerved, obtuse.—Rocky or open woods and thickets, North Coast Ranges; n. to Wash., e. to Col.

6. *M. bella* Piper. ONION GRASS. Culms 3 to 6 dm. high; sheaths and blades glabrous or scabrous; spikelets 10 to 15 mm. long, narrower than in no. 5, papery with age; lemmas obscurely nerved, obtuse or slightly emarginate.—Rocky woods and hills: Sierra Nevada, 4000 to 7000 ft.; Coast Ranges from Santa Clara Co. to Mendocino Co.; n. to Wash., e. to Col. Var. *INTÓNSA* Piper. Leaves softly pubescent.—Coast Ranges; n. to Wash.; Nev.

7. *M. fugax* Boland. Culms 3 to 6 dm. high; sheaths and blades smooth; panicle narrow but open, the few lower branches 2.5 to 5 cm. long, stiffly spreading, few-flowered; spikelets 6 to 7 mm. long, 2 or 3-flowered, usually purple-tinged; second glume nearly as long as spikelet; lemmas obscurely nerved, obtuse or emarginate.—Dry hills, Siskiyou Co.; n. to Wash., e. to Nev.

8. *M. inflata* (Boland.) Vasey. Culms 6 to 9 dm. high; panicle more or less open, the few branches long, spreading at least in anthesis; spikelets several-flowered, 1.5 cm. long, broad, pale green; glumes shorter than the lemmas, scabrous on the strong nerves; lemmas scabrous, strongly nerved.—Wet meadows, Mt. Shasta and Yosemite Park.

9. *M. stricta* Boland. Culms 1.5 to 4.5 dm. high, the base somewhat thickened but not bulbous; panicle narrow, few-flowered, nearly simple, usually 1 or 2 branches below; spikelets large, about 1.5 cm. long, reflexed on rather delicate pedicels; glumes longer than the lower lemma; lemmas scabrous, obtuse.—Rocky slopes and banks: San Bernardino Mts.; Mt. Pinos; Coso Mts.; Sierra Nevada; n. to Ore., e. to Utah.

10. *M. frutescens* Scribn. Culms 6 to 18 dm. high, rather woody below; blades short, especially on the branches and innovations; panicle silvery shining, narrow, the branches short, appressed; spikelets about 1.5 cm. long; glumes prominently 5-nerved; lemmas acute, entire, 7-nerved.—Hills and cañons, Panamint Mts., s. through S. Cal. to L. Cal.

11. *M. bulbosa* Geyer. Fig. 74. Culms 6 to 12 dm. high, the base usually decumbent and often more or less bulbous or corm-like; lower sheaths on the older culms persistent, brown and split into numerous fibers; panicle narrow,

74. *Melica bulbosa* Geyer;  
base of plant  
and part of  
panicle  $\times 1$ .

rather densely flowered, tawny or purplish, not silvery shining; spikelets 10 to 12 mm. long, papery, 3 or 4-flowered; second glume about 7 mm. long; lemmas rather prominently 7-nerved. —Mt. meadows and rocky woods, Ventura Co., n. through the Coast Ranges and Sierra Nevada to Ore. and Nev.

12. *M. torreyana* Scribn. Culms from a loose and decumbent base, 3 to 6 dm. high; blades flat, lax; panicle narrow, rather loose, the branches more or less fascicled, appressed or ascending, the lower fascicles distant; glumes strongly nerved, nearly as long as spikelet; rudiment long-pedicelled, obovoid-truncate, divergent. —Thickets and banks at low altitudes: Coast Ranges from Santa Cruz Co. to Mendocino Co.; Sierra Nevada from Mariposa Co. to Butte Co.

13. *M. imperfecta* Trin. Culms erect, 3 to 9 dm. high; blades narrow, usually not over 2 mm. wide; panicle narrow, 1 to 3 dm. long, the unequal branches more or less fascicled; glumes indistinctly nerved; lemma a little longer than the glumes, smooth, indistinctly nerved, obtuse; rudiment oblong, appressed to the palea. —Dry open woods and rocky hillsides, lower altitudes, frequent in cismontane Cal.: Coast Ranges from Sonoma Co. to San Luis Obispo Co.; Sierra Nevada from Mariposa Co. to Kern Co.; s. to L. Cal. Forms intermediate between the species and the following varieties are not infrequent. Var. *FLEXUOSA* Boland. Lower panicle branches spreading or reflexed. —Wooded hillsides and rocky banks, S. Cal., n. in the Sierra Nevada to Mariposa Co. and n. in the Coast Ranges to Santa Cruz Co. Var. *MINOR* Scribn. Culms less than 3 dm. high; blades sub-filiform; scarcely a distinct variety. —Dry hillsides and crevices of rocks, South Coast Ranges from Santa Cruz Co. s. to S. Cal. and L. Cal.; s. Sierra Nevada in Tulare Co. Var. *REFRACTA* Thurb. Differs in having pubescent blades and spreading or reflexed lower branches of the panicle. —Gravelly brushy slopes, Tehachapi Range and Mt. Pinos, s. to L. Cal.

#### 17. *ANTHÓCHLOA* Nees

Our species a low annual with cylindrical spike-like panicle. Spikelets few-flowered, subsessile, on a simple axis and imbricate, the rachilla disarticulating between the florets. Glumes (in our species) wanting. Lemmas thin-membranaceous, flabelliform, whitish, petal-like, many-nerved. Palea narrower than the lemma, hyaline. (Greek anthos, flower, and chloa, grass.)

1. *A. colusana* (Davy) Scribn. Fig. 75. Culms ascending from a decumbent base, 0.8 to 3 dm. high; leaves overlapping, scarious between the nerves, loosely folded around the culm, not differentiated into sheath and blade, 1 to 1.2 cm. wide at the middle, tapering to each end, minutely ciliate with raised glands on the margins and nerves; panicles pale green, partially included, 4 to 8 cm. long, 8 to 10 mm. wide, the summit of the axis bearing, instead of spikelets, lanceolate-linear empty bracts; spikelets subsessile, usually 5-flowered, 6 to 7 mm. long, erect; lemmas ciliolate-fringed. —Bordering rain-pools on the hard uncultivated alkali "goose-lands" near Princeton, Colusa Co., on the road to Norman, the station now cult. as a rice field; Waterford, Stanislaus Co.

75. *Anthochloa colusana* Scribn.:  
a, habit  $\times \frac{1}{4}$ ; b, spikelet displayed  
 $\times 2$ ; c, spikelet (natural)  $\times 2$ ; d,  
floret  $\times 2$ ; e, lemma  $\times 2$ ; f, palea  
 $\times 2$ ; g, pistil  $\times 4$ .

#### 18. *TRIÓDIA* R. Br.

Erect tufted rarely stoloniferous perennials with usually flat blades and open or

contracted panicles. Spikelets several-flowered. Glumes membranaceous, often thin, nearly equal, the first sometimes narrower, 1-nerved or the second rarely 3 to 5-nerved, acute or acuminate. Lemmas broad, rounded on the back, the apex from minutely emarginate or toothed to deeply and obtusely lobed, 3-nerved, the lateral nerves near the margins, the midnerve excurrent between the lobes as a minute point or as a short awn, the lateral nerves often excurrent as minute points, all the nerves pubescent below, the lateral ones sometimes conspicuously so throughout. Palea broad, the two nerves near the margin, sometimes villous. (Greek tri, three, odous, tooth.) (Tridens R. & S.)

Panicle narrow, exserted.....1. *T. mutica*.  
Panicle capitate, overtopped by the leaves.....2. *T. pulchella*.

1. *T. mutica* (Torr.) Scribn. Culms erect, 3 to 6 dm. high; blades involute, scabrous; panicle narrow, 7.5 to 15 cm. long, the branches short, appressed; spikelets terete, narrow, 8 to 10 mm. long; glumes about 4 mm. long; lemmas obtuse, about 4 mm. long, entire or slightly emarginate, awnless.—Dry slopes and gravelly banks, Silver Mt., Alpine Co.; e. to Col. and Tex.

76. *Triodia pulchella*  
H.B.K.; spikelets x 5.

2. *T. pulchella* H.B.K. Fig. 76. Low and tufted, usually not over 1.5 dm. high; culms slender, scabrous or puberulous, consisting of 1 long internode, bearing at the top a fascicle of leaves, the fascicle finally bending over to the ground, taking root and producing other culms, the fascicles also producing the inflorescence; sheaths striate, papery-margined, pilose at base; blades involute, short, scabrous, sharp-pointed, striate; panicles much reduced, consisting of 1 to 5 nearly sessile spikelets 8 to 10 mm. long; glumes subequal, broad, acuminate, awn-pointed, 6 to 8 mm. long; lemmas 4 mm. long, long-pilose below, cleft about half way, the awn about as long or a little longer than the obtuse lobes.

—Mesas and rocky hills; Death Valley region; Mohave and Colorado deserts; e. to Utah and Tex., s. to Mex.

#### 19. *ORCUTTIA* Vasey

Low caespitose annuals, with short blades and simple spike-like panicles; spikelets relatively large, appressed, the upper aggregate, the lower more or less remote. Spikelets several-flowered, the upper florets reduced; rachilla persistent, continuous, the florets falling away, or tardily disarticulating. Glumes nearly equal, shorter than the lemmas, broad, irregularly 2 to 5-toothed, many-nerved, the nerves extending into the teeth. Lemmas firm, prominently 13 to 15-nerved, the broad summit with 5 long teeth or with numerous short teeth. Palea broad, as long as the lemma. (C. R. Orcutt, a naturalist of San Diego.)

Lemmas toothed; blades pilose on upper surface...

1. *O. greenei*.

Lemmas several-awned; blades not pilose.....

2. *O. californica*.

1. *O. greenei* Vasey. Fig. 77. Culms 1.5 to 2 dm. high, scabrous or appressed-pilose, especially at the nodes; sheaths finely papillose, shorter than the internodes, the ligule very short; blades about 2.5 cm. long, inrolled; panicle 2.5 to 7.5 cm. long, pale;

77. *Orcuttia greenei* Vasey; a, habit x ½; b, spikelet x 2; c, floret in bloom x 2.

spikelets about 1.2 cm. long; glumes and lemmas sparsely long-pilose, more or less papillose, the glumes 4 mm., the lemmas 6 mm. long.—Moist plains near Chico, the only known locality.

2. *O. californica* Vasey. Culms 5 to 10 cm. high, erect, smooth; sheaths and blades smooth, the latter 1 to 2 cm. long, mostly basal; panicle 2 to 6 cm. long, the spikelets distant below, contiguous above; spikelets about 1 cm. long; glumes 4 to 5 mm. long; lemmas 5 mm. long, the teeth acuminate, awn-tipped.—Goose Valley, Shasta Co.; San Quentin Bay, L. Cal.

#### TRIBE 2. *Hórdeae*. BARLEY TRIBE

Spikelets 1 to several-flowered, the rachilla usually disarticulating above the glumes and between the florets, sessile on opposite sides of a jointed or continuous axis forming symmetrical (not one-sided) spikes. (Wheat, rye, and barley belong to this tribe.)

#### 20. *AGROPYRON* Gaertn. WHEAT GRASS

Our species perennial, often with creeping rhizomes, with usually erect culms and narrow spikes. Spikelets several-flowered, solitary (or rarely in pairs), placed flatwise at each joint of a continuous (rarely disarticulating) rachis. Glumes equal, firm, several-nerved, usually shorter than the first lemma, acute or awned, rarely obtuse or notched. Lemmas convex, rather firm, 5 to 7-nerved, usually acute or awned from the apex. Palea shorter than the lemma. (Greek agros, field, and puros, wheat.)

Plants with creeping rhizomes, forming tough sod.

Lemmas not awn-pointed, more or less pubescent.....1. *A. dasystachyum*.

Lemmas awn-tipped or long-awned.....2. *A. smithii*.

Plants without rhizomes; bunch-grasses.

Lemmas awn-tipped.

Nodes appressed-pubescent.....3. *A. parishii*.

Nodes glabrous.....4. *A. tenerum*.

Lemmas long-awned.

Awn straight or nearly so; blades flat.

Spikelets distant, scarcely reaching the one above on the opposite side.....

5. *A. laeve*.

Spikelets overlapping.....6. *A. caninum*.

Awns strongly divergent at maturity.

Glumes acute.....7. *A. spicatum*.

Glumes distinctly awned

Rachis not disjoining at maturity; glumes 3 to 5-nerved. 8. *A. pringlei*.

Rachis disjoining at maturity; glumes 2-nerved.....9. *A. saxicola*.

1. *A. dasystachyum* (Hook.) Scribn. NORTHERN WHEAT GRASS. Culms 4.5 to 9 dm. high; blades narrow, mostly involute, scabrous; spike erect, 5 to 12 cm. long; spikelets few-flowered, 10 to 12 mm. long; glumes lanceolate, the first narrow, 3 to 5-nerved, 8 mm. long, the second broader, 5 to 7-nerved, 9 mm. long; lemmas 8 to 10 mm. long, acute.—Dry or sandy soil, Lassen Co.; n. to Wash. and Saskat., e. to Col. In typical form the lemmas are conspicuously pubescent. Cal. plants mostly have minutely pubescent lemmas. (*A. subvillosum* E. Nels.)

2. *A. smithii* Rydb. COLORADO BLUESTEM. Plant usually tall, glaucous; rhizomes pale; culms 3 to 15 dm. high, rigid; blades bluish green, scabrous, striate, usually becoming involute; spikelets 7 to 13-flowered, 1.2 to 1.5 cm. long, somewhat distant, glabrous or nearly so, acute, compressed, rarely in pairs; glumes acuminate,  $\frac{1}{2}$  to  $\frac{3}{4}$  as long as spikelet, the nerves usually faint; lemmas mucronate or awn-pointed, hard, faintly nerved.—Dry especially alkaline soil, Modoc Co.; n. to Wash., e. to Mich. and Kan.

*A. REPENS* (L.) Beauv., Quack Grass, a troublesome weed of the e. U. S., with thinner flat blades, sparingly pilose on the upper surface, and yellowish rhizomes, has been found near San Francisco and in S. Cal.

3. *A. parishii* Scribn. & Sm. Culms 9 to 12 dm. high; blades flat; spike narrow, as much as 3 dm. long; spikelets narrow, distant, mostly shorter than the internodes of the rachis, about 2 cm. long; glumes several-nerved, acute, more than  $\frac{1}{2}$  as long as spikelet; lemmas smooth, faintly nerved.—Pico Blanco, Santa Lucia Mts.; San Bernardino Mts.; the only known localities.

4. *A. ténerum* Vasey. SLENDER WHEAT GRASS. Culms erect, tufted, 6 to 12 dm. high; blades narrow, flat or involute; spike cylindric, slender, erect, 10 to 15 cm. long; glumes firm, nearly as long as the spikelet, gradually tapering into an awned point.—Open woods, rocky slopes and valley plains, widely scattered through the state; n. to Alas., e. to Labrador and Col.

5. *A. laève* (Scribn. & Sm.) Hitchc. Culms 12 to 15 dm. high; blades flat; spike as much as 30 cm. long; spikelets 1.5 to 2 cm. long; glumes obtuse, several-nerved, 8 to 10 mm. long; lemmas 10 to 12 mm. long; awn 1.5 to 3 cm. long.—Mts. of cismontane S. Cal.; Fresno and Amador Cos. in the Sierra Nevada.

78. *Agropyron caninum* Beauv.; habit  $\times \frac{1}{4}$ .

6. *A. caninum* (L.) Beauv. Fig. 78. Culms erect, 3 to 9 dm. high; blades flat, rather lax, 2 to 6 mm. wide, scabrous; spike more or less nodding, rather dense, 7 to 16 cm. long; spikelets 1.2 to 1.5 cm. long; glumes pointed or awned; lemmas 3 to 5-nerved; awn straight, or somewhat spreading, once or twice the length of the lemma.—Dry hillsides and mt. meadows: San Gabriel Mts.; Santa Lucia Mts.; Sierra Nevada; n. to Alas., e. to N. Eng.

7. *A. spicatum* (Pursh) Scribn. & Sm. BUNCH WHEAT GRASS. Culms slender 4.5 to 9 dm. high, in dense clumps; blades narrow, involute, erect, smooth; spike slender, 5 to 10 cm. long; spikelets rather distant, 1 to 1.5 cm. long; glumes 6 to 10 mm. long, acute but not awned, scarious at margins and tip, strongly 3 to 5-nerved; lemmas faintly nerved; awn slender, 1 to 2 cm. long.—Plains and dry hills, Lassen Co. to Modoc and Siskiyou Cos.; n. to Yukon Terr., e. to Col. Smaller plants of arid ground, with more wiry culms and smaller blades and spikelets, are the forms described as *A. vaseyi* Scribn. & Sm.

8. *A. pringlei* (Scribn. & Sm.) Hitchc. Culms 3 to 4.5 dm. high; blades usually flat, short; spike 5 to 10 cm. long; glumes lanceolate, ending in a short straight awn; lemmas with stout horizontally spreading awns about 2 cm. long.—Gravelly slides and rocky slopes, 7000 to 12,000 ft., Sierra Nevada from Sierra Co. to Tulare Co.

9. *A. saxicola* (Scribn. & Sm.) Piper. Culms 4.5 to 9 dm. high, slender; sheaths smooth; blades short, flat or loosely involute; spike 7.5 to 10 cm. long, flexuous, long-exserted; spikelets sometimes in pairs; glumes subulate or narrowly lanceolate, mostly 2-nerved, narrowed into a slender spreading awn 1.5 to 2.5 cm. long; lemmas 8 mm. long, smooth and rounded below, 5-nerved and somewhat scabrous above, the slender spreading awn about 2.5 cm. long.—Dry mt. slopes, 9000 ft., Mt. Dana; n. to Wash. and Ida. This approaches *Sitanion*. The small form with spreading culms was described as *A. scribneri* Vasey.

*A. JUNCUM* (L.) Beauv., of the Mediterranean coasts, with creeping rhizomes, involute blades, stout spike, readily disarticulating at the joints, and large spikelets with obtuse glumes and lemmas, has been found near San Francisco, probably on ballast.

*TRITICUM* (Wheat) and *SECALE* (Rye) differ from *Agropyron* in being annuals, the first with ovate 3 to several-nerved glumes and broad lemmas, the second with subulate 1-nerved glumes, and narrow lemmas.

## 21. *SCRIBNÈRIA* Hack.

Low annual with slender cylindric spikes. Spikelets 1-flowered, solitary, appressed and lateral to the somewhat thickened continuous rachis, the rachilla prolonged as a very minute hairy stipe. Glumes equal, narrow, firm, acute, keeled on the outer nerves, the first 2-nerved, the second 4-nerved; floret with short hairs at the base. Lemma shorter than the glumes, membranaceous, rounded on the back, obscurely nerved, the apex shortly bifid,

79. *Scribneria bolanderi* Hack.: a, habit  $\times \frac{1}{2}$ ; b, c, spikelet (2 views)  $\times 5$ .

the lobes obtuse, the faint midnerve extending as a slender straight awn. Palea about as long as the lemma. (F. Lamson-Scribner, eminent American agrostologist.)

1. *S. bolanderi* (Thurb.) Hack. Fig. 79. Culms 0.8 to 3 dm. high, tufted, erect or ascending; spike slender, about 1 mm. thick, the joints 4 to 5 mm. long.—Sandy or sterile ground, 3000 to 4000 ft., Sierra Nevada from Fresno Co. to Tuolumne Co.; n. to Wash. Rare.

## 22. *ÉLYMUS* L. WILD RYE

Erect, usually rather tall, mostly perennials, with flat or rarely convolute blades and erect or nodding spikes, the spikelets usually crowded, 2 to 6-flowered, in pairs (rarely 3 or more or solitary) at each node of a continuous rachis, the florets dorsiventral to the rachis. Glumes equal, usually rigid, sometimes indurate below, narrow, sometimes subulate, 1 to several-nerved, acute to aristate, somewhat asymmetric and often placed in front of the spikelets. Lemmas rounded on the back or nearly terete, obscurely 5-nerved, acute or usually awned from the tip. (Greek *elumos*, ancient name for a kind of millet.)

Plants annual; spikes few-flowered, awns of lemma 5 to 10 cm. long. . . 1. *E. caput-medusae*  
Plants perennial; spikes many-flowered; awns less than 4 cm. long.

Plants with slender rhizomes, forming sod.

Glumes lanceolate, scabrous to pubescent.

Glumes about 2 cm. long; lemmas distinctly nerved. . . . . 2. *E. mollis*.

Glumes 1 to 1.5 cm. long; lemmas faintly nerved except at apex. . . . . 3. *E. vancouverensis*.

Glumes subulate or very narrow, glabrous. . . . . 4. *E. triticoides*

Plants without rhizomes (short thick ones in no. 6), forming clumps.

Glumes subulate; plants robust.

Plants cinereous-pubescent. . . . . 5. *E. cinereus*.

Plants glabrous or scabrous, not cinereous. . . . . 6. *E. condensatus*.

Glumes not subulate, lanceolate or narrower, nerved.

Spike slender and dense, 4 to 5 mm. thick; blades mostly less than 4 mm. wide. . . . . 9. *E. marouinii*.

Spike 10 mm. or more thick; blades 5 to 15 mm. wide.

Awns flexuous-spreading. . . . . 10. *E. canadensis*.

Awns straight, erect or nearly so.

Sheaths glabrous.

Glumes and lemmas acuminate or mucronate. . . 7. *E. virescens*.

Glumes and lemmas distinctly awned. . . . . 8. *E. glaucus*.

Sheaths pubescent; var. *jepsonii* of. . . . . 8. *E. glaucus*.

1. *E. caput-medusae* L. Culms branched at base, erect or decumbent at base, slender, 2 to 6 dm. high; blades narrow, short; spike nodding; glumes awl shaped, smooth, indurate below, narrowed into a slender awn 1.5 to 2.5 cm. long; lemmas lanceolate, 3-nerved, 6 mm. long, very scabrous, gradually narrowed into a flat, spreading awn.—Open ground: Los Gatos; Klamathon, Siskiyou Co.; nat. from Eur.

2. *E. mollis* Trin. SEA LYME GRASS. Culms stout, smooth, or pubescent above, glaucous, 6 to 12 dm. high; sheaths and blades smooth or the latter scabrous above; spike erect, dense, 7.5 to 25 cm. long; glumes flat, many-nerved, scabrous or pubescent, acuminate, awnless, about as long as the spikelet; lemmas scabrous or felty-pubescent, acuminate or mucronate.—Sand dunes along the coast from Santa Cruz Co. to Mendocino Co.; n. coasts of N. Am. and Eurasia. (*E. arenarius* of authors.)

3. *E. vancouverensis* Vasey. Culms 7.5 to 12 dm. high; blades flat, involute-pointed, 5 to 8 mm. wide, scabrous on the upper surface; spike erect, 10 to 20 cm. long; glumes narrowly lanceolate, firm, sparsely long-villous, especially toward the acuminate apex; lemmas firm, 1 to 1.5 cm. long, acumi-

nate into a short awn.—Sand dunes on the seacoast, Humboldt Bay; n. to Vancouver Isl.

4. *E. triticoides* Buckl. Culms usually glaucous, 6 to 12 dm. high, commonly in large masses, rhizomes extensively creeping, the scales sometimes reddish; blades mostly 2 to 6 mm. wide, flat, or soon involute; spike 10 to 18 cm. long, slender, sometimes branched, 1 to 1.5 cm. long; lemmas 6 to 10 mm. long, glabrous, short-pointed, brownish.—Moist bottomland and alkaline soil throughout the state; n. to Wash., e. to Col. and Ariz. Var. *PUBESCENS* Hitchc. Sheaths and involute blades hirsute-pubescent.—Griffin, n. Ventura Co.

5. *E. cinereus* Scribn. & Merr. Culms erect, stout, puberulent, 12 to 15 dm. high; blades indurate, pointed; spike erect, 15 to 20 cm. long, dense, interrupted below; spikelets 1.4 to 2 cm. long, scabrous-pubescent; glumes about 1.5 cm. long; lemmas faintly nerved, obtuse, mucronate or awn-tipped.—Mohave Desert (Lancaster) and Inyo Co.; e. to Nev.

6. *E. condensatus* Presl. GIANT RYE GRASS. Culms in large clumps, stout, 9 to 18 dm. high, producing stout knotty rhizomes; blades flat, as much as 2 cm. wide; spike erect, usually dense, 15 to 30 cm. long, sometimes branched; spikelets 1.2 to 2 cm. long; glumes awn-pointed, usually 1-nerved, or nerveless, about as long as the first lemma; lemmas awnless or mucronate.—Dry plains and hillsides and along gullies and ditches: South Coast Ranges near the coast; S. Cal.; e. to Neb., n. to Alb. and B. C. Var. *PUBENS* Piper. Sheaths and blades pubescent.—Santa Barbara; also in Wash.

7. *E. virescens* Piper. Fig. 80. Culms erect, 3 to 6 dm. high, glabrous, glaucous; spike erect, 7.5 to 10 cm. long, closely flowered; spikelets, 1 to 3-flowered; glumes 1 to 1.5 cm. long, prominently several-nerved, the nerves scarious; lemmas firm, indistinctly nerved.—Damp soil, woods or open ground, at scattered stations near the coast: San Diego Co.; Mt. Tamalpais; n. to Alas.

8. *E. glaucus* Buckl. WESTERN RYE GRASS. Culms erect, 6 to 12 dm. high; blades flat (rarely more or less involute), 5 to 10 mm. wide, scabrous on both surfaces; spike somewhat nodding, usually dense, long-exserted, 5 to 15 cm. long, rarely longer; spikelets 1 to 1.2 cm. long; glumes about as long as the spikelet, lanceolate, with 2 to 4 scabrous nerves; awn of lemma 1 to 2 times as long as the body.—Open woods, copses, and dry hillsides, throughout the state; n. to Alas., e. to Mich. and Mo. Var. *JEPSONII* Davy. Distinguished by the more or less pubescent sheaths and blades.—Dry woods and ravines, Napa Valley. The species is exceedingly variable. A short-awned form with scabrous to pubescent sheaths was described as *E. pubescens* Davy; a short-awned form with glabrous sheaths as var. *breviaristatus* Davy; a form with lemmas hispidulous toward the apex as *E. hispidulus* Davy; a narrow-leaved form as *E. angustifolius* Davy. *E. divergens* Davy is a form of var. *jepsonii* with somewhat spreading awns. These names represent specimens rather than recognizable forms.

9. *E. macounii* Vasey. Culms tufted, erect, slender, 4.5 to 9 dm. high; blades erect, rather firm, usually scabrous on both surfaces; spike erect or nearly so, 5 to 10 cm. long; spikelets narrow, closely appressed; glumes narrowly lanceolate, scabrous, short-awned; lemmas scabrous toward the apex, tapering into a straight awn 1 to 1.5 cm. long.—Meadows and open ground in drier regions, east of the Sierra Nevada crest from Nevada Co. to Siskiyou Co.; n. to B. C., e. to Minn. and N. Mex.

10. *E. canadensis* L. Culms in large clumps, rather robust, 9 to 13.5 dm. high; blades flat, spreading, scabrous at least on the upper surface, 5 to 15

80. *Elymus virescens*  
Piper; a, habit  $\times \frac{1}{2}$ ;  
b, glumes  $\times 2$ ; c,  
florets  $\times 2$ .

mm. wide; spike thick, nodding, usually interrupted below, 10 to 20 cm. long, bristly with the numerous spreading awns; spikelets slightly spreading; glumes narrow, scabrous, awned; lemmas scabrous-pubescent, about 1 cm. long, tapering into an awn 2 to 3 cm. long.—Moist copses, wood-borders and shaded banks, Sonoma Co.; throughout temperate N. Am.

### 23. *SITANION* Raf.

Low or rather tall caespitose perennials, with bristly spikes. Spikelets 2 to few-flowered, the uppermost floret reduced, usually 2 at each node of a disarticulating rachis, the rachis breaking at the base of each joint, remaining attached as a pointed stipe to the spikelets above. Glumes narrow or setaceous, 1 to 3-nerved, the nerves prominent, extending into one to several awns, these (when more than one) irregular in size, sometimes mere lateral appendages of the long central awn, sometimes equal, the glume being bifid. Lemmas firm, nearly terete, the apex slightly 2-toothed, 5-nerved, the nerves obscure, the central nerve extending into a long slender finally spreading awn, sometimes one or more of the lateral nerves also extending into short awns. Palea firm, nearly as long as the body of the lemma. (Greek sitos, grain for food.)

Glumes or some of them 3-nerved, lanceolate, entire or sometimes bifid.

Plant glabrous.....1. *S. hanseni*.

Plant pubescent.....2. *S. anomalum*.

Glumes subulate or very narrow, 1 or mostly 2-nerved, entire or cleft into 2 to several lobes.

Glumes cleft into 3 to several lobes.....3. *S. jubatum*.

Glumes entire or 2-cleft.....4. *S. hystrix*.

81. *Sitanion hystrix* J. G. Sm.; a, habit  $\times \frac{1}{2}$ ; b, joint of spike  $\times 2\frac{1}{2}$ ; c, floret  $\times 2\frac{1}{2}$ .

1. *S. hanseni* J. G. Sm. Culms rather slender, loosely tufted 6 to 10 dm. high; sheaths smooth; blades flat or involute; spike rather slender, 5 to 8 cm. long; glumes narrowly lanceolate, some of them 1-nerved and entire, others broader and 3-nerved, often bifid; lemmas smooth, scabrous toward apex, 8 mm. long; awns erect, about 2.5 cm. long.—Open woods and rocky slopes, 2000 to 3000 ft.: Temescal Mts., w. Riverside Co.; Santa Lucia Mts.; Amador Co.; n. to Wash., e. to Utah.

2. *S. anomalum* J. G. Sm. Differs from no. 1 in having more or less pubescent culms, sheaths and blades, and usually narrower blades, especially those of the numerous innovations.—Dry woods and rocky slopes: Templeton, San Luis Obispo Co.; Scotts Valley, Lake Co.; n. to Wash.

3. *S. jubatum* J. G. Sm. Culms erect, 3 to 6 dm. high, rarely taller; sheaths smooth, scabrous or villous-pubescent; blades flat, often becoming involute, smooth or usually more or less pubescent, at least on upper surface, usually not over 3 mm. wide; spike erect, dense, 2.5 to 8 cm. long, thick and bushy from the numerous long awns; glumes split into 3 or more lobes or divisions, each extending into a long awn; lemmas mostly 8 to 10 mm. long, the awns and those of the glumes 4 to 10 cm. long.—Rocky or brushy hillsides and open

dry woods and plains, widely scattered throughout cismontane Cal.; n. to Wash. Exceedingly variable, in size, pubescence and length of awns. Several names have been based on these characters but they are found to be too inconstant to be distinguished even as varieties. *S. breviaristatum* J. G. Sm. is a shorter awned plant.

4. *S. hystrix* (Nutt.) J. G. Sm. Fig. 81. Culms tufted, erect, rather stiff, 3 to 4.5 dm. high; sheaths glabrous to softly pubescent; blades flat or involute, glabrous or puberulent below, usually puberulent above, sometimes softly pubescent all over, rather stiffly ascending or somewhat spreading, 1 to 3 (rarely as much as 5) mm. wide; spike erect, 2 to 7 (rarely 10) cm. long; glumes almost subulate, 1 or 2-nerved, extending into a slender scabrous awn, sometimes bifid at the middle, or with a bristle on one margin; lemmas smooth or scabrous, extending into a slender awn, the awns of glumes and lemmas 2 to 7 cm. long.—Dry hills, plains, open woods, and rocky slopes, S. Cal. mts., n. through the desert ranges and Sierra Nevada to Siskiyou Co., less common in the Coast Ranges; n. to Wash., e. to Kan. Parallels no. 3 in variability. At high altitudes the plants are dwarf. (*S. californicum* J. G. Sm., *S. minus* J. G. Sm., *S. glabrum* J. G. Sm.)

#### 24. *HÝSTRIX* Moench

Erect perennials with flat blades and bristly loosely-flowered spikes. Spikelets 2 to 4-flowered, 1 to 3 at each node of a continuous flattened rachis, spreading at maturity. Glumes reduced to short or minute awns, the first usually obsolete, both often wanting in the upper spikelets. Lemmas convex, rigid, tapering into long awns, 5-nerved, the nerves obscure except toward the tip; palea about as long as the body of the lemma. (Greek *hustrix*, porcupine.)

1. *H. californica* (Boland.) Kuntze. Fig. 82. Culms stout, 10.5 to 18 dm. high; sheaths hispid or the upper smooth; blades flat, as much as 2 cm. wide, scabrous; spike stout, dense and somewhat nodding above, more or less interrupted below, 12 to 25 cm. long; spikelets mostly in pairs, 1 to 3-flowered, on short callus-like pedicels; lemmas 1.2 to 2 cm. long 5-nerved above, the nerves, especially the marginal, ciliate-hispid; awn stout, straight, rough, 2 to 3 cm. long.—Woods and shaded banks near the coast, Marin Co. to Santa Cruz Co.

82. *Hystrix californica*  
Kuntze; habit  $\times \frac{1}{3}$ .

#### 25. *HÓRDEUM* L. WILD BARLEY

Annual or perennial low or rather tall grasses, with flat blades and dense terminal cylindric spikes. Spikelets 1-flowered, 3 (sometimes 2) together at each node of the articulate rachis (continuous in *H. vulgare*, cultivated barley), the back of the lemma turned from the rachis, the middle one sessile or subsessile, the lateral ones pediceled. Rachilla in the central spikelet prolonged behind the palea as a bristle and sometimes bearing a rudimentary floret; lateral spikelets usually imperfect, sometimes reduced to bristles. Glumes narrow, often subulate and awned, rigid, standing in front of the spikelet. Lemmas rounded on the back, 5-nerved, usually obscurely so, tapering into a usually long awn. (Ancient Latin name for barley.)

Plants annual.

Glumes or some of them ciliate.....1. *H. murinum*.  
Glumes not ciliate.

Glumes of the fertile spikelet dilated above the base.....2. *H. pusillum*.  
Glumes not dilated.

Glumes glabrous or nearly so.....3. *H. gussoneanum*.

Glumes very scabrous.....4. *H. depressum*.

Plants perennial.

Awns mostly 4 to 5 cm. long.....5. *H. jubatum*.

Awns not over 1 cm. long.

Spikes rather stout, the central florets rather prominent on each side of the spike; culms 50 to 100 cm. tall.....7. *H. boreale*.

Spikes slender, the awns obscuring the fertile central florets; culms mostly less than 50 cm. tall.....6. *H. nodosum*.

1. *H. murinum* L. WALL BARLEY. FARMER'S FOXTAIL. Culms bushy-branched, spreading; sheaths and blades smooth; spike 5 to 8 cm. long, often partly enclosed in the uppermost inflated sheath; glumes of the central spikelet narrowly spindle-form, 3-nerved, long-ciliate on both margins, the nerves scabrous; awn about 2.5 cm. long; glumes of the lateral spikelets unlike, the inner similar to the central, the outer setaceous, not ciliate; lemmas all broad, 8 to 10 mm. long, the awns somewhat exceeding those of the glumes.—Fields, waste places and open ground, very common and abundant; nat. from Eur.

2. *H. pusillum* Nutt. Culms 1 to 3.8 dm. high; blades erect, flat; spike erect, 2.5 to 5 cm. long, about 1 cm. wide; lateral pair of spikelets reduced, the first glume of each and both glumes of the fertile spikelet dilated above the base, attenuate into a slender awn 8 to 12 mm. long; glumes very scabrous; lemma awnless.—Plains and open, especially alkaline ground, S. Cal.; e. to Ohio.

3. *H. gussoneanum* Parl. Culms numerous, spreading or geniculate at base, 1.5 to 3.8 dm. high; sheaths and flat blades, especially the lower, more or less pubescent; spike erect, oblong, 1.5 to 4 cm. long, about 10 mm. wide, rounded at base; glumes setaceous, about 1.5 cm. long; lemma of lateral spikelets reduced, the awn 2 to 3 mm. long; lemma of central spikelets 5 mm. long, the awn somewhat longer than the glumes.—Fields and waste places, common in cent. Cal., rare in S. Cal.; nat. from Eur.

4. *H. depressum* (Scribn. & Sm.) Rydb. Culms erect or geniculate at base, 1.5 to 3.5 dm. high; blades pubescent; spike 2 to 4 cm. long; glumes subulate; central spikelet as in no. 3, the awns longer; lemma of lateral spikelets awnless.—Open ground, rare: Blacks sta., Yolo Co.; Wash. to Ida., and Ariz.

5. *H. jubatum* L. SQUIRREL-TAIL BARLEY. Fig. 83. Culms erect, or decumbent at base, 3 to 6 dm. high; blades scabrous; spike nodding, 5 to 10 cm. long, about 2.5 cm. wide, soft; lateral pair of spikelets each reduced to 1 to 3 spreading awns; glumes of perfect spikelets awn-like, spreading; lemma 6 to 8 mm. long, with the awn as long as the glumes.—Open ground, fields and waste places: Los Angeles; San Bernardino Mts.; Victorville; Suisun Marshes; Honey Lake Valley; n. to Alas., e. to Ontario and Md.

6. *H. nodosum* L. MEADOW BARLEY. Culms tufted, erect or geniculate-ascending, 1.5 to 6 dm. high; blades relatively short and erect; spike slender, 2 to 8 cm. long; glumes all setaceous, 8 to 15 mm. long; floret of lateral spikelets much reduced.—Meadows and open ground throughout the state; n. to Alas., e. to Ind.; also Eur.

83. *Hordeum jubatum* L.; a, habit  $\times \frac{1}{4}$ ; b, joint of spike  $\times 3$ .

7. *H. boreale* Scribn. & Sm. NORTHERN BARLEY. Similar to no. 6, on the average taller, with longer, laxer blades and thicker spikes, the awns of lateral spikelets somewhat spreading.—Along the coast, Mendocino and Humboldt Cos.; n. to Alas.

## 26. *LOLIUM* L. RYE GRASS

Annuals or perennials, with flat blades and simple terminal flat spikes. Spikelets several-flowered, solitary, placed edgewise to the continuous rachis, one edge fitting to the alternate concavities. First glume wanting (except on the terminal spikelet), the second outward, strongly 3 to 5-nerved, equaling or exceeding the second floret. Lemmas rounded on the back, 5 to 7-nerved, obtuse, acute, or awned. (Ancient Latin name.)

Glume shorter than the spikelet; perennial.

Lemmas awned. . . . . 1. *L. multiflorum*.  
Lemmas nearly or quite awnless. . . . . 2. *L. perenne*.  
Glume as long or longer than the spikelet; annual. . . . . 3. *L. temulentum*.

1. *L. multiflorum* Lam. ITALIAN OR AUSTRALIAN RYE GRASS. Short-lived perennial; culms 3 to 6 dm. high, erect or often decumbent at base, often rough below the spike and on the convex side of the rachis; spike nodding, as much as 30 cm. long; spikelets 1.5 to 2.5 cm. long, much exceeding the glume, 10 to 20-flowered; lemmas 7 to 8 mm. long, the lower short-awned or awnless.—Roadsides and waste places, common, mostly in the Coast Ranges; introd. from Eur. Frequently cult. for lawns and as meadow or pasture grass.

84. *Lolium perenne* L.; habit  $\times \frac{1}{2}$ .

2. *L. perenne* L. PERENNIAL OR ENGLISH RYE GRASS. Fig. 84. Resembling no. 1, but usually more slender, with narrower glossy blades and smaller spikes; culms and convex side of rachis smooth; spikelets usually 8 to 10-flowered, not much exceeding the glume; lemmas smaller, awnless.—Roadsides and waste places, rare; introd. from Eur. Sometimes cult. as a lawn or pasture grass. Var. *TENU* Kunth. Blades narrow, folded, firm, erect; spikes slender, the spikelets few-flowered.—Siskiyou Co.; nat. from Eur.

3. *L. temulentum* L. DARNEL. CHEAT. Culms 6 to 9 dm. high; spikes stout, strict, 12 to 20 cm. long; glume 1.5 to 2.5 cm. long, equaling the 5 to 7-flowered spikelet, firm, pointed, conspicuous; lemmas 6 to 8 mm. long, obtuse, awned; awn as much as 8 mm. long.—Fields and waste places, rather common; nat. from Eur. Var. *ARVENSE* Bab. Differs in having awnless spikelets.—Less common than the species; nat. from Eur.

*L. SUBULATUM* Vis. Spikelets partly sunken in the excavations of the rachis and partly hidden by the appressed obtuse strongly nerved glumes; lemmas 5 mm. long.—Ballast and waste ground, rare; nat. of Eur.; cult. under the name of Winnera Rye Grass.

## 27. *LEPTURUS* R. Br.

Low annuals or perennials with hard cylindric spikes. Spikelets 1-flowered, embedded in the hard, cylindric, articulate rachis, placed edgewise thereto, the first glume wanting except on the terminal spikelet, the second glume closing the cavity of the rachis and flush with the surface, indurate, nerved, acuminate, longer than the joint of the rachis. Lemma hyaline, shorter than the glume, 3-nerved. Palea hyaline, a little shorter than the lemma. Spikelet falling entire, attached to its rachis joint. (Greek *leptos*, slender, and *oura*, tail.) (Monerma Beauv.)

1. *L. cylindricus* (Willd.) Trin. Fig. 85. Culms bushy-branched, spreading or prostrate, 1 to 3 dm. high; spike curved; glume 6 mm. long, acuminate.—Mudflats and salt marshes, San Francisco Bay to San Diego; nat. from Eur.

85. *Lepturus cylindricus* Trin.; sect. infl.  $\times 2$ .

28. **PHOLIURUS** Trin.

Low annuals with cylindric spikes. Spikelets 1 or 2-flowered, embedded in the articulate rachis and falling attached to the joints. Glumes two, placed

86. *Pholiurus incurvus* Schinz & Thell.; habit  $\times \frac{1}{2}$ .

in front of the spikelet and enclosing it, coriaceous, 5-nerved, acute, asymmetric, appearing like halves of a single split glume. Lemma lying next to the axis, smaller than the glumes, hyaline, keeled, scarcely more than 1-nerved. Palea a little shorter than the lemma, hyaline. (Greek pholis, scale of a serpent, and oura, tail.) (Lepturus of authors, not R. Br.)

1. *P. incurvus* (L.) Schinz & Thell. Fig. 80. Culms tufted, decumbent at base, 1 to 2 dm. high; blades short and narrow; spike long, conspicuously flexu-

ous; glumes 7 mm. long, pointed.—Mudflats and salt marshes, Marin Co. to San Diego; nat. from Eur.

TRIBE 3. **AVENEAE**. OAT TRIBE

Spikelets 2 to several-flowered, in open or contracted panicles (rarely in racemes, solitary in *Danthonia unispicata*); rachilla usually disarticulating above the glumes and between the florets; glumes usually as long as or longer than the first lemma, commonly longer than all the florets; lemmas usually awned from the back or from between the teeth of a bifid apex, the awn bent, often twisted, the callus and rachilla joints usually villous.

29. **KOELERIA** Pers.

Annuals or perennials, slender, low or rather tall, with narrow blades and spike-like panicles. Spikelets 2 to 4-flowered, compressed; rachilla prolonged beyond the florets as a slender bristle or bearing a reduced or sterile floret at the tip. Glumes usually about equal in length, the lower narrower and sometimes shorter, 1-nerved, the upper somewhat broader above the middle, 3 to 5-nerved. Lemmas somewhat scarious and shining, the lowermost a little longer than the glume, obscurely 5-nerved, acute or short-awned, the awn, if present, borne just below the apex. (G. L. Koeler, author of a work on European grasses.)

Plants perennial; culm puberulent below panicle.....

1. *K. cristata*.

Plants annual; culm glabrous below panicle.....

2. *K. phleoides*.

1. *K. cristata* (L.) Pers. Fig. 87. Culms erect, 3 to 6 dm. high, the sheaths pubescent, at least the lower; blades mostly basal, rather short; panicle compact, shining, pointed, 5 to 10 cm. long, often interrupted at base; spikelets 4 to 5 mm. long; glumes and lemmas scabrous.—Plains and open woods, mostly in the Coast Ranges and S. Cal. mts.; extends throughout cooler parts of n. hemisphere. Var. *LONGIFOLIA* Vasey. Taller, with longer blades, the basal as much as 3 dm. long, and larger looser panicles.—Open woods, Coast Ranges.

2. *K. phleoides* (Vill.) Pers. Culms 1.5 to 3 dm. high; panicle 2.5 to 7 cm. long, obtuse, spikelets 2 to 4 mm. long; glumes smooth, acute, the

87. *Koeleria cristata* Pers.; a, habit  $\times \frac{1}{2}$ ; b, spikelet  $\times 2$ ; c, spikelet displayed  $\times 2$ .

first narrower; lemmas smooth, short-awned from a bifid apex.—Open ground, San Joaquin, Butte and Lassen Cos.; nat. from Eur.

### 30. *TRISËTUM* Pers.

Tufted perennials with flat blades and open or usually contracted or spike-like panicles. Spikelets usually 2-flowered, sometimes 3 to 5-flowered, the rachilla prolonged behind the upper floret, usually villous. Glumes somewhat unequal, acute, awnless, the second usually longer than the first floret. Lemmas usually short-bearded at the base, 2-toothed at the apex, the teeth often awned, bearing from the back below the cleft apex a straight and included, or usually bent and exserted, awn. (Latin tres, three, and seta, bristle.)

Awn included or wanting.....1. *T. wolfii*.  
Awn exserted.

Panicle loose and open, the branches naked at base.....2. *T. cernuum*.

Panicle narrow or compact.

Panicle narrow but loose; blades flat, usually 5 to 11 mm. wide...3. *T. canescens*.

Panicle spike-like.

Sheaths pubescent.....4. *T. spicatum*.

Sheaths glabrous.....5. *T. sesquiflorum*.

1. *T. wolfii* Vasey. Culms smooth, erect, 3 to 6 dm. high; sheaths smooth or sparsely retrorse-pilose; blades flat, erect, 2 to 4 mm. wide, scabrous or more or less pilose; panicle narrow, usually spike-like, 5 to 10 cm. long; glumes about 6 mm. long, scabrous on the keel, subequal, the first 1-nerved or obscurely 3-nerved, the second 3-nerved; lemmas scaberulous, the lower 4 mm. long, the awn reduced to a bristle scarcely reaching the tip, or on the upper lemma obsolete, the teeth acute, not aristate.—Meadows in the higher Sierra Nevada from Fresno Co. to Eldorado Co.; n. to Wash., e. to Col. (*T. brandegei* Scribn.)

2. *T. cernuum* Trin. Culms rather lax, 6 to 12 dm. high; sheaths smooth; blades thin, flat, lax, scabrous, 6 to 12 mm. wide; panicle lax, drooping, 15 to 30 cm. long, the branches verticillate, slender, flexuous, spikelet-bearing toward the ends; spikelet 6 to 12 mm. long with usually 3 distant florets, the first longer than the second glume; glumes very unequal, the first narrow, acuminate, 1-nerved, 1 mm. long, the second broad, 3-nerved, 3 to 4 mm. long; lemmas with setaceous teeth, and slender spreading awn 1 to 1.5 cm. long.—Moist woods, Mendocino and Humboldt Cos.; n. to Alas. and Mont.

3. *T. canescens* Buckl. Culms erect, or decumbent at base, 6 to 12 dm. high; sheaths more or less retrorse-pilose, at least the lower, often also canescent; blades flat, scabrous or canescent; panicle loose, sometimes interrupted and spike-like, 10 to 20 cm. long; glumes smooth, except the keel, strongly unequal, the first narrow, acuminate, 1-nerved, the second broad, acute, 3-nerved, 5 to 7 mm. long; lemmas firm, scaberulous, the upper exceeding the glumes, the teeth aristate; awns geniculate, spreading, twisted below, attached  $\frac{1}{3}$  below the apex, 10 to 12 mm. long.—Mt. meadows, moist ravines, and along streams: Sierra Nevada; Coast Ranges from Santa Cruz Co. to Mendocino Co.; n. to B. C. and Mont.

*T. FLAVESCENS* (L.) Beauv., differing from no. 3 in the relatively broader and more open yellow panicle, has been found at Blue Lake, Humboldt Co.; adv. from Eur.

4. *T. spicatum* (L.) Richter. Fig. 88. Culms erect, rather stout, 1.5 to 4.5 dm. high, smooth or puberulent; sheaths and usually the blades puberulent; panicle dense, pale or often purple, 5 to 15 cm. long; spikelets 5 to 6 mm. long; glumes somewhat unequal in length, smooth except the keels, the first narrow, acuminate, 1-nerved, the second broader, 3-nerved, acute; lemmas scaberulous, 5 mm. long, the first longer than the glumes, the teeth setaceous; awns geniculate.—A characteristic grass of high

88. *Trisetum spicatum* Richter; a, panicle  $\times \frac{1}{2}$ ; b, glumes  $\times 5$ ; c, florets  $\times 5$ .

altitudes in the Sierra Nevada, especially above timber-line, found up to the limit of vegetation; also in the high San Bernardino Mts. and San Jacinto Mts.; extends from arctic regions of n. hemisphere southw. in the higher mts. to s. hemisphere.

5. *T. sesquiflorum* Trin. Resembling no. 4 but differing in having smooth sheaths and blades, the latter usually flat but sometimes involute, and in having wider panicles, and spikelets about 8 mm. long.—Meadows and slopes above timber-line, Sierra Nevada from Tulare Co. to Nevada Co. and n. to Mt. Shasta; far n. to Alas.; also Siberia. (*T. congonii* Scribn. & Merr.)

### 31. SPHENOPHOLIS Scribn.

Perennials with usually flat blades and narrow panicles. Spikelets 2 or 3-flowered, the pedicel disarticulating below the glumes, the rachilla produced beyond the upper floret as a slender bristle. Glumes unlike in shape, the first narrow, acute, 1-nerved, the second broadly obovate, 3 to 5-nerved, somewhat coriaceous. Lemmas firm, scarcely nerved, awnless, the first a little shorter or a little longer than the second glume. (Greek *sphen*, a wedge, and *pholis*, a scale.) (*Eatonia* of authors, not Raf.)

89. *Sphenopholis obtusata* Scribn. var. *lobata* Scribn.: a, glumes; b, floret. x 5.

1. *S. obtusata* Scribn. var. *lobata* (Trin.) Scribn. Fig. 89. Culms erect, 3 to 6 dm. high; sheaths and blades scabrous; panicle narrow and compact, often spike-like, more or less interrupted or lobed, especially near base, 5 to 10 cm. long; glumes subequal, the second subcucullate, the broad chartaceous margins smooth and shining.—Plains and open woods, rare in Cal.: San Bernardino; Amador Co.; widely distributed throughout U. S., extending into Can. and Mex.

### 32. AVENA L. OAT

Rather tall annuals or perennials, with narrow or open, usually rather few-flowered panicles of usually large spikelets. Spikelets 2 to several-flowered, the rachilla bearded. Glumes about equal, membranaceous or papery, several-nerved, longer than the lower floret, usually exceeding the upper floret. Lemmas indurate, except toward the summit, 5 to 9-nerved, bidentate at the apex, bearing a dorsal bent and twisted awn (this straight and reduced in *A. sativa*). (The classical Latin name.) Lemmas glabrous or nearly so. . . . . 2. *A. sativa*. Lemmas pubescent with long, usually brown hairs.

Teeth of lemmas acuminate, not awned. . . . 1. *A. fatua*.  
Teeth of lemmas awned. . . . . 3. *A. barbata*.

1. *A. fatua* L. WILD OAT. Fig. 90. Culms 3 to 9 dm. high, erect, stout; panicle loose and open, the slender branches usually horizontally spreading; spikelets usually 3-flowered; glumes about 2.5 cm. long; rachilla and lower part of the shining lemma clothed with long stiff brownish hairs; florets readily falling from the glumes; lemma nerved above, about 2 cm. long, awn stout, geniculate, red-brown, twisted below, about 4 cm. long.—Fields and waste places, common, especially in S. Cal.; nat. from Eur. Var. *GLABRATA* Peterm. Differs in having nearly or quite glabrous lemmas.—With the species; nat. from Eur.

2. *A. sativa* L. CULTIVATED OAT. Similar to no. 1; florets not readily separating from the glumes; spikelets usually 2-flowered; lemma glabrous; awn straight, often wanting.—Commonly cultivated and occasionally escaped; native of Eur.

3. *A. barbata* Brot. Similar to no. 1, spikelets somewhat smaller, mostly 2-flowered, the pedicels curved and capillary; lemma clothed with stiff red hairs, the acuminate teeth ending in fine awns 4 mm. long.—Fields and waste places; nat. from Eur.

90. *Avena fatua* L.: habit x 1/4.

**ARRHÈNATHÈRUM ELÀTIUS** (L.) Mert. & Koch. Tall Oat Grass. Panicles narrowly pyramidal; spikelets 2-flowered, 7 to 8 mm. long, the lower floret staminate, its lemma bearing a twisted geniculate awn from near the base, the upper floret perfect, its lemma with a short straight awn from just below the tip.—Adv. near Berkeley and at Jackson in Amador Co.; native of Eur.

### 33. **AÏRA** L.

Low or rather tall annual or usually perennial grasses with shining pale or purplish spikelets in narrow or open panicles. Spikelets 2-flowered, the hairy rachilla prolonged behind the upper floret, sometimes bearing a reduced floret. Glumes about equal, acute or acutish, membranaceous. Lemmas thin, truncate and 2 to 4-toothed at the summit, bearing a slender awn from or below the middle, the awn straight, bent, or twisted. (Ancient Greek name for some weedy grass.) (Deschampsia Beauv.)

Plants annual; awns strongly geniculate.....1. *A. danthonioides*.  
Plants perennial; awns straight.

Panicle loose or open.

Plants slender; panicle branches erect.....2. *A. elongata*.

Plants robust; panicle branches spreading.....3. *A. caespitosa*.

Panicle dense; plant stout.....4. *A. holciformis*.

1. ***A. danthonioides*** Trin. Culms slender, erect, 1.5 to 3.8 dm. high; blades few, short and narrow; panicle open, 8 to 15 cm. long, the branches capillary, stiffly ascending, naked below, bearing a few spikelets toward the ends; glumes 7 to 8 mm. long, acuminate, smooth except the keel, exceeding the florets; lemmas smooth, shining, somewhat indurate, 2 to 3 mm. long, the base of the florets and the rachilla pilose; awns 4 to 6 mm. long.—Open ground at lower altitudes throughout the state; n. to Alas., s. to Mex. A form with smaller spikelets was described as *Deschampsia gracilis* Vasey.

2. ***A. elongata*** Hook. Culms slender, erect, 3 to 12 dm. high; blades flat, narrow, the basal cluster usually capillary; panicle narrow, 15 to 30 cm. long; glumes 4 to 6 mm. long; lemmas 2 mm. long, similar to those of no. 1, the awns shorter.—Open ground: Sierra foothills; common in the Coast Ranges; occasional in S. Cal.; e. to Ariz., n. to Alas.

3. ***A. caespitosa*** L. TUFTED HAIR GRASS. Culms erect, 6 to 12 dm. high; sheaths smooth; blades flat or folded, scabrous above; panicle drooping, 10 to 20 cm. long, the slender scabrous branches spikelet-bearing toward the ends; spikelets 4 mm. long, the florets distant; lemmas smooth, erose-truncate; awn from near the base, but little longer than the lemma, straight, articulated at the base, deciduous.—Common in mt. meadows and bogs: Sierra Nevada; high mts. of S. Cal.; northern regions of the n. hemisphere, south in the mts. to Mex.

4. ***A. holciformis*** (Presl) Steud. Fig. 91. Culms tufted, 6 to 12 dm. high; blades tightly folded or involute, firm, mostly basal, smooth or somewhat scabrous especially toward the tip, the cauline blades short; ligule 4 to 6 mm. long; panicle narrow, mostly dark or bronze-color, 15 to 20 cm. long.—Marshes, bogs, and moist places near the coast, Monterey Co. to Del Norte Co.; n. to Ore.

### 34. **ÁSPRIS** Adans.

Low delicate annuals. Spikelets 2-flowered. Glumes about equal, acute, membranaceous or sub-scarious. Lemmas firm, rounded on the back, tapering into two slender teeth, the callus with a very short tuft of hairs, bearing on the back below the middle a slender geniculate twisted usually exserted awn, this reduced or wanting in the lower floret in one species. (Ancient Greek name, meaning unknown.) (Aira of authors.)

Awns of both florets 3 to 4 mm. long.....1. *A. caryophyllea*.  
Awn of lower floret minute or wanting.....2. *A. capillaris*.

91. *Aira holciformis* Steud.; a, panicle  $\times \frac{1}{2}$ ; b, glumes  $\times 5$ ; c, florets  $\times 5$ .

92. *Aspris caryophyllea*  
Nash; a, spikelet x 8;  
b, florets x 8.

1. *A. caryophyllea* (L.) Nash. Fig. 92. Culms in small tufts, erect, 1 to 3 dm. high; blades short, setaceous; panicle open, the silvery shining spikelets 3 mm. long, clustered toward the ends of the spreading capillary branches; lemmas alike.—Open dry ground, common throughout the state; nat. from Eur.

2. *A. capillaris* (Host.) Hitchc. Similar to no. 1, panicle more diffuse; spikelets scattered at the ends of the branches, 2.5 mm. long; lemma of lower floret awnless or with a minute awn just below the apex, the teeth short.—Waste ground, rare in Cal. (Sonoma Co., Humboldt Co.); nat. from Eur.

### 35. *NOTHOLCUS* Nash

Perennials with flat blades and contracted panicles. Spikelets 2-flowered, the pedicel disarticulating below the glumes, the rachilla curved and somewhat elongate below the first floret, not prolonged above the second floret. Glumes about equal, longer than the two florets. First floret perfect, its lemma awnless; second floret staminate, its lemma awned on the back. (Greek *nothos*, false, and *Holcus*, the genus name formerly applied to this group.) (*Holcus* of authors.)

1. *N. lanatus* (L.) Nash. VELVET GRASS. Fig. 93. Plant grayish, velvety-pubescent; culms erect, 3 to 6 dm. high; panicle 5 to 10 cm. long, narrow, sometimes almost spike-like, purple tinged; spikelets 4 to 5 mm. long; glumes villous, hirsute on the nerves, the second broader than the first, 3-nerved; lemmas ciliate at the apex; awn of the second floret hook-like.—Cult. as a meadow grass in the U. S.; introd. from Eur. and escaped, especially in the Coast Ranges.

*N. mollis* (L.) Hitchc., a European species with glabrous sheaths and producing rhizomes, has been found at Eureka.

93. *Notholcus lanatus*  
Nash; a, glumes; b,  
florets x 5.

### 36. *DANTHONIA* Lam. & DC. OAT GRASS

Tufted, low or rather tall perennials, with few-flowered panicles of rather large spikelets; late in the season producing large 1 to few-flowered cleistogenes in the bases of the lower sheaths, the nodes immediately below commonly breaking. Spikelets several-flowered. Glumes about equal, broad and papery, acute, mostly exceeding the uppermost floret. Lemmas rounded on the back, obscurely several-nerved, the base with a strong callus, the apex bifid, the lobes acute, usually extending into slender awns, a stout awn arising from between the lobes, this flat, tightly twisted below, geniculate, exserted. (Etienne Danthoine, French botanist.)

Sheaths pubescent.

Spikelets 2 to 5. . . . . 1. *D. americana*.

Spikelets solitary. . . . . 2. *D. unispicata*.

Sheaths glabrous, or hairy at throat only.

Spikelets on spreading pedicels. . . . . 3. *D. californica*.

Spikelets on short erect pedicels, forming a narrow spike-like panicle. 4. *D. intermedia*.

1. *D. americana* Scribn. Culms 3 to 6 dm. high, smooth, tending to disarticulate at the nodes; sheaths pilose; blades short, flat, or those of the innovations involute; panicle open, the pedicels usually about 1.5 cm. long, spreading or somewhat reflexed; glumes 1.5 to 2 cm. long, smooth, acuminate, about 7-nerved; lemmas 5 to 7 mm. long, smooth on the back, pilose at base and margins, broad, abruptly contracted into 2 teeth with awns 2 to 6 mm. long.—Wet meadows and moist places in rocks: San Bernardino Mts.; higher Sierra Nevada; along the coast; n. to B. C., e. to Wyo.; also in Chile.

2. *D. unispicata* Munro. Culms short, 1.5 to 2 dm. high, about as long as the numerous basal leaves; sheaths and blades pilose; panicle reduced to a

single perfect spikelet on a flexuous pedicel, with 1 or 2 rudimentary spikelets below, the perfect spikelet similar to those of no. 1; lemma more gradually acuminate into awns.—Rocky hills, Lassen Co. to Modoc Co.; n. to Wash., e. to Wyo.

3. *D. californica* Boland. Fig. 94. Resembles no. 1; culms 6 to 9 dm. high; sheaths glabrous or somewhat pilose at the throat; blades scabrous above, longer, especially those of the less numerous innovations; teeth of lemma more gradually acuminate.—Dry hills, frequent in the Coast Ranges from San Luis Obispo Co. to Mendocino Co., rare in Sierra Nevada (Yosemite; Butte Co.); e. to Mont. and Col.

4. *D. intermedia* Vasey. Culms 1.5 to 3.8 dm. high; blades becoming involute, more or less pilose; panicle compact, often 1-sided, 2.5 to 5 cm. long; glumes 1.2 to 1.5 cm. long; lemmas similar to those of no. 1, the teeth more gradually acuminate, the awns shorter.—Mt. meadows, high Sierra Nevada from Tulare Co. to Eldorado Co.; n. to B. C., e. to Quebec and N. Mex.

94. *Danthonia californica* Boland.; a, habit  $\times \frac{1}{4}$ ; b, spikelet  $\times 2\frac{1}{2}$ ; c, floret  $\times 2\frac{1}{2}$ .

#### TRIBE 4. *Ágrostideae*. TIMOTHY TRIBE

Spikelets 1-flowered, usually perfect, in open, contracted, or spike-like panicles.

#### 37. *CÁLAMAGRÓSTIS* Adans. REED GRASS

Perennials, usually rather tall or robust, with small spikelets in open or narrow panicles. Rachilla disarticulating above the glumes, usually prolonged behind the palea as a short, commonly hairy bristle. Glumes about equal, acute or acuminate. Lemma shorter and usually more delicate than the glumes, the callus bearing a tuft of hairs, awned from the back, usually below the middle, the awn being delicate and straight, or stouter and exserted, bent and sometimes twisted. Palea shorter than the lemma. (Greek *calamos*, reed, and *agrostis*, grass.)

Awn longer than the glume, and geniculate.

Panicle open, the branches spreading.

Blades mostly basal, capillary.....1. *C. breweri*.

Blades scattered, broad and flat.....2. *C. bolanderi*.

Panicle compact, spike-like.

Glumes about 10 mm. long, gradually long-acuminate.....3. *C. foliosa*.

Glumes 6 to 8 mm. long, abruptly acute or acuminate.....4. *C. purpurascens*.

Awn shorter than the glumes, straight or somewhat geniculate.

Panicle loose, the branches spreading or ascending.

Callus hairs copious, as long as lemma.....5. *C. canadensis*.

Callus hairs sparse, shorter than lemma.

Glumes 3 to 4 mm. long.....6. *C. californica*.

Glumes 5 to 6 mm. long.....7. *C. nutkaensis*.

Panicle narrow, more or less spike-like.

Sheaths pubescent on collar.....8. *C. rubescens*.

Sheaths glabrous on collar.

Glumes ovate, firm or indurate, 4 mm. long; awn straight.....9. *C. crassiglumis*.

Glumes lanceolate, thin.

Glumes 5 to 6 mm. long; awn geniculate.....10. *C. densa*.

Glumes 3 mm. long; awn straight.....11. *C. inezpana*.

1. *C. breweri* Thurb. Culms slender, erect, cespitose, 1.5 to 3 dm. high; panicle few-flowered, purple, 2.5 to 8 cm. long; glumes 3 to 4 mm. long, 1-nerved, smooth, acute; lemma nearly as long as glumes, cuspidate-toothed, the awn borne near the base, twisted below, about 2 mm. long above the bend.—Mt. meadows of the high Sierra Nevada.

2. *C. bolanderi* Thurb. Fig. 95. Culms 9 to 12 dm. high; sheaths scabrous; blades flat, scattered, nearly smooth; panicle 10 to 20 cm. long, the branches verticillate, spreading, naked below; glumes 3 to 4 mm. long, purple, scabrous, acute; lemma very scabrous, about as long as glumes, the awn from near

95. *Calamagrostis bolanderi* Thurb.; a, portion of panicle  $\times \frac{1}{2}$ ; b, glumes  $\times 7$ ; c, floret  $\times 7$ .

meadows and on rocks: high Sierra Nevada in Mariposa Co.; Mt. Tamalpais; n. to the arctic, e. to Col.

5. *C. canadensis* (Michx.) Beauv. BLUEJOINT. Culms 6 to 12 dm. high, from creeping rhizomes; blades scattered, flat, rather lax, scabrous, 4 to 8 mm. wide; panicle rather narrow but loose and open, especially at base; glumes 4 mm. long, smooth, scabrous on keel, acuminate; lemma nearly as long as glumes, smooth, narrowed toward summit; awn delicate, inconspicuous, straight, attached just below the middle of the lemma and extending to or slightly beyond its tip; rachilla joint delicate, sparsely long-pilose.—Mt. meadows and open woods, high Sierra Nevada from Tulare Co. to Eldorado Co.; n. to Alas., e. to the Atlantic. Exceedingly variable.

6. *C. californica* Kearn. Culms 9 dm. high; blades flat, firm, rather rigid, 4 mm. wide, those of the innovations involute; panicle 15 to 20 cm. long, narrow, loose; glumes scabrous, acuminate; lemma shorter than the glumes, strongly nerved; awn delicate, straight, attached below the middle, extending to tip of lemma.—Known only from a coll. by Lemmon in the Sierra Nevada, probably in Sierra Co. Resembling no. 5 but having more rigid firm blades.

7. *C. nutkaensis* (Presl) Steud. Culms stout, 9 to 15 dm. high; blades flat, becoming inrolled, elongate, gradually narrowed into a long involute point; panicle narrow, rather loose, 15 to 30 cm. long, the branches rather stiffly ascending; glumes acuminate; lemma 4 mm. long, indistinctly nerved, the callus hairs  $\frac{1}{2}$  as long; awn rather stout, attached below the middle, slightly geniculate, extending to summit of lemma.—Bogs and swamps near the coast, Monterey Co. to Del Norte Co.; n. to Alas. (*C. aleutica* Bong.)

8. *C. rubescens* Buckl. PINE GRASS. Culms slender, 6 to 9 dm. high; from creeping rhizomes; sheaths smooth, but pubescent on the collar; blades flat or somewhat involute; panicle spike-like, pale or purple, 7 to 15 cm. long; glumes 4 to 5 mm. long, narrow, acuminate; lemma pale, thin, about as long as glumes, smooth, scarcely nerved, the callus hairs about  $\frac{1}{3}$  as long; awn attached near base, geniculate, exserted at side of glumes, the terminal part about 1 mm. long.—Open pine woods, banks and prairies, Santa Clara and Santa Cruz Cos. to Mendocino Co.; n. to B. C., e. to Manit. and Col.

9. *C. crassiglumis* Thurb. Culms rather stout, 1.5 to 4.5 dm. high; blades flat, or somewhat involute, smooth, firm, about 4 mm. wide; panicle spike-like, 2.5 to 5 cm. long; glumes 4 mm. long, rather abruptly acuminate, purple, scaberulous; lemma about as long as glumes, broad, obtuse; callus hairs abundant, about half as long as lemma; awn attached at middle of back, about as long as lemma; rachilla joint 1 mm. long, the hairs reaching to apex of lemma.—Swampy ground, Mendocino Co. (only known loc. in Cal.); n. to Vancouver Isl.

base, about 3 mm. long above the bend.—Bogs and moist ground, prairie or open woods near the coast, Mendocino and Humboldt Cos.

3. *C. foliosa* Kearn. Culms tufted, erect, 3 to 6 dm. high; leaves mostly basal, numerous, the blades involute, firm, smooth, nearly as long as culm; panicle 5 to 8 cm. long; lemma 5 to 7 mm. long, acuminate, 4-nerved, the nerves ending in setaceous teeth; awn from near base, about 8 mm. long above the bend; callus hairs numerous, 3 mm. long.—Near the coast, Mendocino and Humboldt Cos.

4. *C. purpurascens* R. Br. PURPLE REED GRASS. Culms tufted, erect, 4.5 to 6 dm. high; sheaths scabrous; blades flat or more or less involute, scabrous; panicle 5 to 13 cm. long, pale or sometimes purple; lemma nearly as long as glumes, 4-nerved, apex with 4 setaceous teeth, the awn from near base, finally geniculate, exserted about 2 mm.—In mt.

10. *C. densa* Vasey. Culms 4.5 to 9 dm. high, with creeping rhizomes; ligule 3 to 5 mm. long; blades flat or becoming somewhat involute, firm, scabrous, 2 to 4 mm. wide; panicle spike-like, more or less interrupted at base, 5 to 10 cm. long, pale or purple; glumes acuminate; lemma 3 to 4 mm. long, scaberulous; awn attached near base, shorter than the glumes, the upper part 2 mm. long, exserted at side of glumes; callus hairs scant, very short; rachilla joint, including hairy tip, half as long as floret.—Dry hills and banks, Coast Ranges, s. to San Diego Co.; n. to Siskiyou Co. and Ore. The taller coarser plants are typical *C. densa* found in Cal. only. *C. koelerioides* Vasey, a form with slender culms, ligule 2 to 3 mm. long, and callus hairs  $\frac{1}{4}$  to  $\frac{1}{3}$  as long as lemma, extends from Ore. to San Diego.

11. *C. inexpansa* Gray. Culms 3 to 6 dm. high, producing stout rhizomes; sheaths smooth, the outer basal ones numerous, marcescent, persistent; blades loosely involute, scabrous, 2 to 4 mm. wide; panicle 5 to 8 cm. long; glumes scaberulous; lemma about as long as glumes, scabrous, the callus hairs  $\frac{1}{2}$  to  $\frac{3}{4}$  as long; awn attached about the middle, about as long as glumes; rachilla joint minute, some of the hairs reaching to tip of lemma.—Meadows and marshes, Sierra Nevada, 5000 to 9000 ft., from Tulare Co. to Lassen Co.; extends from n. U. S. to arctic Am.; also Eurasia. Widespread and variable. *C. hyperborea* Lange, a European species, has a denser panicle.

### 38. AMMOPHILA Host

A tough rather coarse erect perennial, with hard scaly creeping rhizomes, long tough involute blades, and a pale dense spike-like panicle. Spikelets 1-flowered, compressed, the rachilla disarticulating above the glumes, produced beyond the palea as a short bristle, hairy above; glumes about equal, chartaceous; lemma similar to and slightly shorter than the glumes, the callus bearing a tuft of short hairs; palea nearly as long as the lemma. (Greek ammos, sand, and philein, to love.)

1. *A. arenaria* (L.) Link. BEACH GRASS. Fig. 96. Culms stout, 6 to 9 dm. high; blades elongate, gradually narrowed into an involute point; panicle 10 to 30 cm. long; spikelets 1 to 2 cm. long.—Introd. on the Pacific Coast where it has been used as a sandbinder on seacoast sand-dunes; native of Eur.

96. *Ammophila arenaria* Link;  
habit  $\times \frac{1}{2}$ .

### 39. AGRÓSTIS L. BENT GRASS

Annuals or usually perennials, delicate or rather tall, with glabrous culms, scabrous blades, and open or contracted panicles of small spikelets. Rachilla disarticulating above the glumes, usually not prolonged. Glumes equal or nearly so, acute, acuminate, or sometimes awn-pointed, carinate; lemma obtuse, usually shorter and thinner in texture than the glumes, awnless or dorsally awned, often hairy on the callus. Palea usually shorter than the lemma, 2-nerved in only a few species, usually small and nerveless or obsolete. (Ancient Greek name of a forage grass, from agros, a field.)

Rachilla prolonged behind the palea. . . . . 1. *A. thurberiana*.  
Rachilla not prolonged.

Palea evident, 2-nerved.

Panicle contracted, lobed or verticillate; glumes scabrous. . . . . 2. *A. verticillata*.

Panicle open or contracted, but not lobed; glumes scabrous on keel, otherwise smooth.

Plants with rhizomes, the culms not creeping. . . . . 3. *A. palustris*.

Plants extensively creeping. . . . . 4. *A. maritima*.

Palea wanting or a small nerveless scale.

Lemma with a delicate awn 5 mm. long; annual. . . . . 5. *A. exigua*.

Lemma awnless or short-awned; perennials.

Plants spreading by rhizomes (see *A. lepida* with short rhizomes).

Callus hairs 1 to 2 mm. long. . . . . 6. *A. hallii*.

Callus hairs minute or wanting.

Panicle contracted. . . . . 7. *A. pallens*.

Panicle open. . . . . 8. *A. diegoensis*.

Plants tufted, not producing rhizomes or only very short ones.

Panicle narrow, usually a part of the lower branches spikelet-bearing from base.

Panicle strict, branches short, appressed; plant low, tufted. . . . . 9. *A. breviculmis*.

Panicle narrow but not strict, or somewhat open.

Panicle short to elongate; glumes scabrous on the back; plants of low and middle altitudes. . . . . 10. *A. exarata*.

Panicle 2 to 4 cm. long; glumes not scabrous on the back; low plant of high altitudes. . . . . 11. *A. rossae*.

Panicle open, sometimes diffuse; branches naked at base.

Lemma awned; panicle purple; ligule 5 to 8 mm. long. . . . . 16. *A. longiligula*.

Lemma awnless; ligule usually short.

Panicle very diffuse; spikelets clustered toward end of branches. . . . . 12. *A. hiemalis*.

Panicle open, but not conspicuously diffuse.

Plants producing short rhizomes. . . . . 15. *A. lepida*.

Plants not producing rhizomes.

Plants delicate, 1 to 3 dm. tall. . . . . 13. *A. idahoensis*.

Plants taller, over 4.5 dm. tall. . . . . 14. *A. oregonensis*.

1. *A. thurberiana* Hitchc. Culms slender, erect, 2 to 3.8 dm. high; panicle narrow, lax, more or less drooping, 5 to 8 cm. long; spikelets green or pale, rarely purple, 2 mm. long; lemma nearly as long as glumes, the palea about  $\frac{2}{3}$  as long; prolonged rachilla minute.—Bogs and moist places, high Sierra Nevada from Tulare Co. to Lassen Co. and n. to Siskiyou Co.; far n. to B. C., e. to Mont.

2. *A. verticillata* Vill. Culms usually decumbent at base, sometimes with long creeping and rooting stolons; panicle verticillate, especially at base, 4 to 10 cm. long, light green or rarely purplish, the branches spikelet-bearing from the base; glumes equal, obtuse, 2 mm. long; lemma  $\frac{1}{2}$  as long, awnless, truncate, toothed at apex; palea nearly as long as the lemma.—Moist ground, especially along irrigation ditches and near the coast, Mendocino, Mariposa and Inyo Cos., s. to S. Cal.; nat. from Eur. Resembles in habit *Polypogon lutosus* which differs in having awned glumes. (*A. stolonifera* of authors.)

97. *Agrostis palustris* Huds.; a, habit  $\times \frac{1}{2}$ ; b, spikelet  $\times 8$ ; c, floret lifted above glumes  $\times 8$ .

3. *A. palustris* Huds. REDTOP. Fig. 97. Culms erect or decumbent and rooting at base, 3 to 9 dm. high, sending out from the base rhizomes or stolon-like stems; panicle pyramidal, loose but not diffuse, 5 to 30 cm. long, the lower branches in whorls; glumes acute, 2 to 3 mm. long, scabrous on keel; lemma a little shorter than the glumes, obtuse, rarely awned on back; palea  $\frac{1}{2}$  to  $\frac{2}{3}$  as long as lemma.—Cult. as a meadow grass, frequently escaped along roadsides and in waste places; introd. from Eur. (*A. alba* of authors.)

4. *A. maritima* Lam. Differs from no. 3 in having decumbent rooting base and often widely spreading short-bladed stolons, and narrow contracted panicles.—Along the coast from Sonoma Co. to Del Norte Co.; n. coasts of N. Am. and Eur. On moist sand-dunes the stolons are conspicuous. (*A. alba* var. *maritima* Meyer.)

5. *A. exigua* Thurb. Culms delicate, 3 to 12 dm. high; panicle  $\frac{1}{2}$  the length of plant, finally open; glumes 1.5 mm. long, scaberulous; lemma equaling the glumes, bearing below the tip a slender awn 4 times as long.—Wet open ground, Howell Mt. and Sierra foothills; very rare.

6. *A. hallii* Vasey. Culms erect, stout, 6 to 9 dm. high; ligule usually conspicuous; panicle 10 to 15 cm. long, narrow, open; glumes about 2 lines long; lemma awnless, 3 mm. long, the callus hairs about  $\frac{1}{2}$  as long.—Mostly in woods near the coast, Santa Barbara Co. to Del Norte Co.; n. to Ore. Var. *PRINGLEI* Hitchc. Differs in the narrower and more compact panicles, narrower and more involute blades and more stramineous foliage.—Near the coast, Mendocino Co.

7. *A. pallens* Trin. Culms 2 to 3.8 dm. high, erect; panicle almost spike-like, 5 to 10 cm. long; glumes 2.5 to 3 mm. long; lemma a little shorter than

the glumes, awnless.—Sandy soil near the coast from Marin Co. to Del Norte Co.; n. to Wash.

8. *A. diëgoënsis* Vasey. Differs from no. 7 in the taller culms, and more open panicles, the branches rather stiffly ascending; lemma awnless (in most of the Cal. specimens) or with a straight or rarely a bent awn.—Meadows and open woods: San Jacinto Mts.; Sierra Nevada from Mariposa Co. north; along the coast from San Diego to Humboldt Co.; n. to B. C.

9. *A. breviculmis* Hitchc. Culms erect, 1 to 1.5 dm. high; panicle about 2.5 cm. long; glumes 3 mm. long, acute; lemma a little more than  $\frac{1}{2}$  as long as glumes, awnless or bearing a very short awn near the middle of the back; palea a minute nerveless scale.—Open ground and on cliffs, Ft. Bragg, Mendocino Co.; also in Peru.

10. *A. exarata* Trin. Culms erect, 3 to 12 dm. high, or often depauperate; panicle contracted and spike-like or loose and somewhat spreading, the branches densely flowered; glumes 2.5 to 3.5 mm. long; lemma 2 mm. long, awnless, or rarely with a short prickle on the back; palea a minute nerveless scale.—Moist to rather dry open ground, throughout the state from the seacoast to middle altitudes in the mts.; extends from Alas. to Mex. and the Rocky Mts. Exceedingly variable. The form originally described as *A. exarata* is about the center of the range of variation, being 3 to 6 dm. high, with lemmas awnless or with a rudimentary awn. *A. glomerata* (Presl) Kunth is a low seacoast form with a compact panicle and often inflated sheaths; *A. microphylla* Steud. has well-developed awns; *A. grandis* Trin. and *A. ampla* Hitchc. are robust forms with blades up to 8 mm. wide; the first with compact panicles and awnless lemmas, the second with looser panicles and awned lemmas.

11. *A. rössae* Vasey. Culms 1 to 2 dm. high; panicles contracted, the branches appressed; spikelets green or purple, 2 mm. long; lemma 1.5 mm. long, awnless; palea minute.—Rocky creeks and mt. slopes, Sierra Nevada from Kern Co. to Nevada Co., 7000 to 9000 ft.; n. to Wash., e. to Wyo. Differs from no. 10 chiefly in size, possibly an alpine form of that species.

12. *A. hiemalis* (Walt.) B. S. P. TICKLE GRASS. Culms slender, in tufts with numerous short setaceous basal leaves, 2 to 9 dm. high; but usually delicate; panicle few-flowered, 15 to 30 cm. long, about as wide, the branches scabrous, long and capillary, stiff, not flexuous; glumes 1.5 to 2 mm. long, acute or acuminate; lemma  $\frac{2}{3}$  to  $\frac{3}{4}$  as long as glumes, awnless or rarely awned; palea wanting.—Meadows and moist places: Sierra Nevada; high mts. of S. Cal.; throughout N. Am. Var. *GEMINATA* Hitchc. Differs in having a smaller, less diffuse panicle; culms usually less than 1 ft. high; lemma awnless in Cal. specimens.—Kern River; Lassen Peak; n. to Alas.

13. *A. idahoënsis* Nash. Culms slender; panicle loosely spreading, 5 to 10 cm. long, the branches capillary, flexuous; spikelets 1.5 mm. long; lemma 2 mm. long, awnless; palea minute.—Mt. meadows, 4000 to 6500 ft.: San Bernardino Mts.; Sierra Nevada from Tulare Co. to Sierra Co.; n. to Wash., e. to Col.

14. *A. oregonënsis* Vasey. Culms 6 to 9 dm. high; panicle oblong, 10 to 30 cm. long, the branches verticillate, rather stiff and ascending, the lower whorls numerous, the longer 7 to 15 cm. long, branching above the middle; glumes 2.5 to 3 mm. long; lemma 1.5 mm. long, awnless; palea minute.—Wet meadows, 5000 to 7000 ft.: San Jacinto Mts.; San Bernardino Mts.; Sierra Nevada from Mariposa Co. to Plumas Co.; n. to B. C., s. to Mex. (*A. schiedeana* of authors.)

15. *A. lépida* Hitchc. Culms tufted, 3 to 4.5 dm. high, erect, producing numerous short rhizomes; ligule long, especially on the innovations, these as much as 4 mm. long, narrow, pointed; blades mostly basal, firm, erect, flat or folded, the upper culm leaf below the middle of the culm; panicle 10 to 15 cm. long, the branches in verticils, stiff and straight, becoming divaricately spreading, the lowermost 2.5 to 5 cm. long, spikelet-bearing from about the middle, some short branches intermixed; glumes 3 mm. long; lemma 2 mm. long.—Meadows and open woods, 8000 to 10,500 ft., upper Kern River.

16. *A. longiligula* Hitchc. Culms erect, about 6 dm. high; ligule 5 to 6 mm. long; panicle narrow, but loosely flowered, bronze-purple, 10 to 15 cm. long, the branches very scabrous; glumes 4 mm. long; lemma 2.5 mm. long, bearing at the middle a bent exserted awn; palea minute.—Bogs and moist places near the coast, Mendocino Co.; n. to Alas.

*A. RETROFRÁCTA* Willd., an Australian species, with very open panicle nearly half the entire height of the plant, and florets with the rachilla prolonged behind the palea, is adventive near Stockton.

#### 40. *CINNA* L.

Tall perennials with flat blades and large panicles. Spikelets disarticulating below the glumes, the rachilla forming a stipe below the floret and produced behind the palea as a minute bristle. Glumes equal, 1-nerved. Lemma nearly as long, 3 nerved, bearing a minute short straight awn just below the apex. (Ancient Greek name for some kind of grass.)

98. *Cinna latifolia* Griseb.;  
a, panicle  $\times \frac{1}{2}$ ; b, glumes  
 $\times 5$ ; c, floret  $\times 5$ .

1. *C. latifolia* (Trevir.) Griseb. Fig. 98. Culms 6 to 12 dm. high; blades 1 to 1.5 cm. wide; panicle 15 to 30 cm. long, the flexuous capillary branches spreading or drooping; glumes scabrous, 4 mm. long; nerves of the palea so close together as to appear like a single one.—Moist places in woods and along streams, Sierra Nevada from Tulare Co. to Eldorado Co., 6500 to 9500 ft.; cooler regions of N. Am. and Eurasia.

#### 41. *ALOPECURUS* L. MEADOW FOXTAIL

Low perennials with flat blades and soft dense spike-like panicles. Spikelets disarticulating below the glumes, strongly compressed laterally. Glumes equal, usually united at base, ciliate on the keel. Lemma about as long as the glumes, 5-nerved, obtuse, the margins united at base, bearing from below the middle a slender dorsal awn, this included or exserted two or three times the length of the spikelet; palea wanting. (Greek alopex, fox, and oura, tail.)

Spikelets 3 to 4 mm. long; panicle oblong, 6 to 7 mm. wide..... 1. *A. saccatus*.  
Spikelets 2 mm. long; panicle narrow, linear, 3 to 4 mm. wide..... 2. *A. aequalis*.

1. *A. saccatus* Vasey. Culms 1.5 to 6 dm. high; sheaths inflated; panicles oblong, 2.5 to 5 cm. long; glumes 3 to 4 mm. long; lemma sparsely pilose on the sides, the awn exserted about 3 mm.—Meadows and wet places: Coast Ranges s. to San Diego Co.; Merced Co.; n. to Wash. and Ida. Taller specimens with spikelets 3 mm. long are the form described as *A. californicus* Vasey.

2. *A. aequalis* Sobol. Fig. 99. Culms erect or spreading, 1.5 to 6 dm. high; panicles narrow-cylindric, 2.5 to 7 cm. long; glumes 2 mm. long; awn scarcely exserted.—In water and wet places throughout the state at middle and high altitudes; throughout colder part of N. Am. Occasional specimens with longer awns occur, approaching *A. geniculatus* L. (*A. aristulatus* Michx.)

*A. PRATENSIS* L., the cult. Meadow Foxtail, resembling no. 1, but with spikelets about 6 mm. long, is sparingly nat. from Eur.

#### 42. *POLYPÖGON* Desf.

Annuals or perennials, usually decumbent, with flat blades and dense bristly spike-like panicles. Pedicel disarticulating a short distance below the glumes, leav-

99. *Alopecurus aequalis* Sobol.; a, spikelet;  
b, floret.  $\times 10$ .

ing a short-pointed callus; glumes equal, entire or 2-lobed, awned from the tip or from between the lobes, the awn slender, straight; lemma much shorter than the glumes, hyaline, usually bearing a slender straight awn shorter than the awns of the glumes. (Greek *polus*, much, and *pogon*, beard.)

Sheaths scabrous; awn about as long as the glumes; panicles more or less interrupted or lobed. .... 1. *P. lutosus*.

Sheaths smooth.

Awn slightly exceeding body of glumes; panicle spike-like. .... 2. *P. monspeliensis*.

Awn twice as long as glumes; panicle scarcely lobed. .... 3. *P. maritimus*.

1. *P. lutosus* (Poir.) Hitchc. Culms geniculate at base, 3 to 7.5 dm. high; sheaths scabrous; ligule 2 to 4 mm. long or the uppermost longer; panicles oblong, 5 to 15 cm. long, more or less interrupted or lobed; glumes scabrous, 2 to 3 mm. long, bearing an awn as long; lemma smooth and shining, 1 mm. long, minutely toothed at the truncate apex; awn about as long as the glumes.—Waste ground, throughout the state, especially along irrigation ditches; nat. from Eur. (*P. littoralis* Sm.)

2. *P. monspeliensis* (L.) Desf. BEARD GRASS. Fig. 100. Culms erect or decumbent at base, scabrous below panicle, depauperate or as much as 9 dm. long; sheaths smooth, the ligule large; panicles soft, dense, spike-like, 2.5 to 15 cm. long, tawny-yellow; glumes hispidulous; floret turgid, the awn slightly exceeding the body of the glumes.—Waste places, common along irrigation ditches; nat. from Eur.

100. *Polypogon monspeliensis*

Desf.; a, spikelet; b, floret.

x 10.

3. *P. maritimus* Willd. Culms 2 to 3 dm. high, upright or spreading; sheaths smooth; ligule as much as 6 mm. long; blades usually less than 5 cm. long, 2 to 4 mm. wide; panicle cylindric, scarcely lobed, 5 cm. long or less, 1 cm. thick; glumes lanceolate, about 3 mm. long, villous, the awn as much as 7 mm. long.—Waste ground, cent. Cal.; nat. from Eur.

#### 43. PHLEUM L.

Annuals or perennials, with erect culms, flat blades, and dense spike-like panicles. Spikelets laterally compressed, disarticulating above the glumes. Glumes equal, membranaceous, keeled, abruptly mucronate or awned. Lemma shorter than the glumes, hyaline, broadly truncate, 3 to 5-nerved. Palea narrow, nearly as long as the lemma. (Greek *phleos*, a kind of reed.)

Heads cylindric, several times longer than wide. .... 1. *P. pratense*.

Heads ovoid or oblong, 1½ to 2 times as long as broad. .... 2. *P. alpinum*.

1. *P. pratense* L. TIMOTHY. Fig. 101. Culms 6 to 12 dm. high, from a swollen or bulb-like base; panicles 3 to 15 cm. long.—Commonly escaped from cult., along roadsides and in fields and waste places; nat. of Eur.

2. *P. alpinum* L. MOUNTAIN TIMOTHY. Culms 2 to 4.5 dm. high, from a decumbent somewhat creeping base; panicles ellipsoid or short-cylindric.—Common in mt. meadows, bogs and wet places: San Jacinto Mts.; high Sierra Nevada; Mendocino Co.; cooler parts of N. Am. and Eurasia; in mts. extending to S. Am.

101. *Phleum pratense* L.; a, spikelet; b, floret. x 8.

#### 44. GASTRIDIDIUM Beauv.

Annuals with flat blades and pale shining spike-like panicles. Spikelets disarticulating above the glumes, the rachilla prolonged behind the palea as a minute bristle. Glumes unequal, somewhat enlarged or swollen at the base. Lemma much shorter than the glumes, hyaline, broad, truncate, awned. Palea about as long as the lemma. (Greek *gaster*, belly, referring to the saccate glumes.)

102. *Gastridium ventricosum* Schinz & Thell.; a, spikelet; b, floret. x 6.

1. *G. ventricosum* (Gouan) Schinz & Thell. NIT GRASS. Fig. 102. Culms about 3 dm. high, smooth; panicle 5 to 8 cm. long, dense; glumes 3 to 6 mm. long, gradually acuminate; lemma globular, about 1 mm. long, pubescent at apex, the awn 5 mm. long, geniculate.—Open ground and waste places at middle altitudes, mostly in the Coast Ranges, s. to S. Cal.; nat. from Eur. (*G. lendigerum* Gaud.)

#### 45. *LAGURUS* L.

Low annual with pale dense ovoid or oblong woolly heads. Spikelets disarticulating above the glumes, the rachilla produced beyond the palea. Glumes thin, 1-nerved, villous, tapering into a plumose point. Lemma shorter than the glumes, thin, glabrous, bearing a slender exserted somewhat geniculate dorsal awn, the summit bifid, the divisions delicately awn-tipped. Palea narrow, thin, the keels ending in minute awns. (Greek lagos, hare, and oura, tail.)

1. *L. ovatus* L. HARE'S-TAIL GRASS. Fig. 103. Plants softly pubescent throughout, 1 to 3 dm. high; blades cordate at base; panicle about 2.5 cm. long, nearly as thick; glumes very narrow, 10 mm. long.—Cult. for ornament and sparingly escaped, along the coast only (San Francisco, Berkeley and Monterey), mostly on points that extend into the ocean; native of Eur.

103. *Lagurus ovatus* L.; a, panicle x  $\frac{1}{2}$ ; b, glumes x 3; c, floret x 3.

#### 46. *EPICAMPES* Presl

Tall caespitose perennials, ours with narrow spike-like panicles. Spikelets disarticulating above the glumes. Glumes about equal. Lemma 3-nerved, awnless in our species. (Greek epicampes, curved.)

104. *Epicampes rigens* Benth.; a, habit x  $\frac{1}{2}$ ; b, spikelet x 10.

1. *E. rigens* Benth. DEER GRASS. Fig. 104. Culms erect, 9 to 12 dm. high; sheaths smooth or slightly scabrous, covering the nodes; ligule truncate, 1 to 2 mm. long; blades scabrous, elongate, involute, tapering into a long slender point; panicle spike-like, slender, 30 cm. or more long; glumes 2 to 3 mm. long, oblong, obtuse or somewhat erose, scarcely keeled; lemma slightly exceeding the glumes, scaberulous, sparsely pilose at base.—Dry or open ground, hillsides, gullies and open forest, Sierra Nevada foothills, s. to Santa Barbara and San Diego; s. to N. Mex., s. to Mex.

#### 47. *MUHLENBERGIA* Schreb.

Mostly perennials, tufted or rhizomatous, the culms usually wiry, the inflorescence a narrow or open panicle. Spikelets disarticulating above the glumes. Glumes usually shorter than the lemma, obtuse to acuminate or awned, the first sometimes small, rarely obsolete. Lemma firm-membranaceous, 3 to 5-nerved, with a very short, usually minutely pilose callus, the apex extending into a straight or flexuous awn, or sometimes only mucronate. (Rev. Dr. Henry Muhlenberg, distinguished American botanist.)

Plants annual; lemmas long-awned. . . . . 1. *M. microsperma*.  
Plants perennial (if delicate and seemingly annual, lemmas mucronate only).

Lemmas mucronate or cuspidate only, much longer than the glumes, glabrous or nearly so; blades less than 2 mm. wide.

- Culms extensively creeping; blades conspicuously recurved-spreading; ligule about 1 mm. long.....2. *M. repens*.  
 Culms not creeping; ligule 2 to 3 mm. long.  
 Plants with scaly rhizomes; culm minutely nodulose-roughened.....  
 3. *M. squarrosa*.  
 Plants tufted, without rhizomes, commonly decumbent at base; culm smooth.  
 Glumes ovate, entire; culms slender, often filiform.....4. *M. filiformis*.  
 Glumes truncate, toothed; culms wiry.....11. *M. jonesii*.  
 Lemmas awned, or if awnless, shorter than the awned glumes.  
 Plants with scaly rhizomes.  
 Callus hairs copious, about as long as the floret; panicle silvery grayish or purplish.....5. *M. andina*.  
 Callus hairs scant, inconspicuous; panicle not silvery.  
 Panicle subcylindric, bristly, spike-like; glumes awned, much exceeding the awnless lemma.....8. *M. racemosa*.  
 Panicle not spike-like; glumes not exceeding the awned lemma.  
 Blades minutely scaberrulous, 2 to 3 mm. wide; panicle not compactly flowered.....6. *M. lemmoni*.  
 Blades very scabrous on both surfaces, 3 to 6 mm. wide; panicle rather compactly flowered.....7. *M. californica*.  
 Plants without rhizomes; bunch grasses.  
 Culms branching; panicle diffuse.....9. *M. porteri*.  
 Culms simple; panicle narrow.  
 Awn of lemma flexuous, 2 to 5 times as long as the body.....  
 10. *M. montana*.  
 Awn of lemma straight, not longer than the body.....11. *M. jonesii*.

1. *M. microspérma* (DC.) Kunth. Plants branching, commonly purple; culms spreading, 1.5 to 3.8 dm. long; blades 2 to 5 cm. long, about 1 mm. wide; panicles narrow, loose, 2 to 8 cm. long; spikelets about 3 mm. long; glumes less than half as long as the spikelet, obtuse; awn of lemmas 3 to 5 times as long as the body.—Open ground, Monterey Co.; Kern Cañon; s. to the Mohave Desert; San Bernardino; e. to Ariz., s. to Mex. Cleistogamous spikelets are developed at the base of the lower sheaths. These are solitary or few in a fascicle in each axil, each spikelet included in the indurate thickened, tightly inrolled prophyllum, the glumes wanting and awn of lemma reduced, but the grain larger than that of spikelets in the terminal inflorescence. The prophyllum enclosing the spikelet is narrowly conical and readily disarticulates from the plant at maturity.

2. *M. repens* (Presl) Hitchc. APAREJO GRASS. Plants with scaly rhizomes; culms slender, wiry, 1.5 to 3.8 dm. long; flowering branches ascending; blades involute, 1 to 3 cm. long; panicles narrow, interrupted, few-flowered, 1 to 2.5 cm. long; glumes ovate, acute, 1.5 mm. long, smooth; lemma exceeding the glumes, about 2 mm. long, smooth or sparsely pubescent, acute or mucronate, the lateral nerves often obsolete.—Death Valley region; e. to Ariz., thence s. to Mex.

3. *M. squarrosa* (Trin.) Rydb. Culms wiry, erect or decumbent at base, 1 to 5 dm. long; blades 1 to 5 cm. long; panicles narrow, interrupted, sometimes spike-like, 2.5 to 15 cm. long; glumes ovate, 1 mm. long; lemma lanceolate, acute, mucronate, 2 mm. long.—Dry or moist open ground: San Jacinto Mts.; Donner Lake; n. to Wash. and Mont., s. to Mex.

4. *M. filiformis* (Thurb.) Rydb. Plants often erect, or decumbent at base, rather soft and lax; culms 10 to 25 cm. high; blades flat, usually less than 2.5 cm. long; panicles narrow, interrupted, few-flowered, 2.5 cm. long or less; glumes 2 mm. long; lemma lanceolate, acute, mucronate, 2 mm. long.—Mt. meadows and open woods: San Jacinto Mts.; San Bernardino Mts.; Sierra Nevada and n. to Siskiyou Co.; n. to Wash., e. to Col. Depauperate plants blooming the first year are found on wet sand.

5. *M. andina* (Nutt.) Hitchc. Culms erect or sometimes spreading, pubescent about the nodes, 4.5 to 9 dm. high; sheaths keeled; ligule 1 mm. long, short-ciliate; blades flat, 2 to 6 mm. wide, scabrous; panicles narrow, spike-like, usually more or less lobed or interrupted, often purple-tinged, 8 to 15 cm. long; glumes narrow, acuminate, 3 to 4 mm. long; lemma 3 mm. long, gradually narrowed into a capillary awn, 4 to 8 mm. long.—Open ground, montane, mostly 5000 to 9000 ft.: San Bernardino Mts.; Sierra Nevada; Mt. Shasta; n. to Wash., e. to Wyo. (*M. comata* Thurb.)

6. *M. lemmoni* Scribn. Fig. 105. Culms slender, wiry, erect or ascending, 3 to 6 dm. high; blades flat or somewhat involute; panicles narrow, inter-

105. *Muhlenbergia lemmoni*  
Scribn.: a, habit  $\times \frac{1}{2}$ ; b,  
glumes  $\times 5$ ; c, floret  $\times 5$ .

lemma purple, acuminate, minutely pilose, 3 to 4 mm. long, the awn about 6 mm. long.—Rocky places, Colorado Desert; e. to Tex., s. to Mex.

10. *M. montana* (Nutt.) Hitchc. Culms densely tufted, with numerous short leafy shoots at base, 18 to 50 cm. high; ligule 4 to 6 mm. long; blades involute, scabrous, sharp-pointed; panicles loose, 5 to 10 cm. long; glumes broad, oblong, sparsely pubescent, 2 mm. long, more or less erose at apex, the second 3-toothed; lemma 3 mm. long, sparsely pubescent at base and margins.—Dry ground, Sierra Nevada from Eldorado Co. to Mariposa Co., 4000 to 7000 ft.; e. to Wyo., s. to Mex. (*M. gracilis* of authors.)

11. *M. jonesii* (Vasey) Hitchc. Culms tufted, erect, slender, about 3 dm. high; blades mostly basal, involute, flexuous, scabrous; panicles narrow, loose, 5 to 8 cm. long; glumes equal, obtuse, toothed at apex, 1 to 1.2 mm. long; lemma 2 mm. long, acuminate, awn-pointed.—Placer Co. to Siskiyou and Modoc Cos., 4000 to 6000 ft.

rupted, the branches short; glumes narrow, gradually acuminate, awn-tipped, about 3 mm. long; lemmas 3 mm. long, acuminate into an awn as much as 6 mm. long, the callus hairs rather sparse, about  $\frac{1}{2}$  as long as body of lemma.—Deserts, San Diego Co., e. to Tex.

7. *M. californica* Vasey. Culms erect, somewhat woody below, smooth, puberulent about nodes, 3 to 6 dm. high; sheaths scaberulous, keeled; ligule scarcely 1 mm. long; blades flat, usually short; panicles narrow, spike-like or interrupted, 8 to 15 cm. long; glumes narrow, acuminate or awn-tipped, 3 to 4 mm. long; lemma about 3 mm. long, scabrous, the callus hairs rather sparse, about  $\frac{1}{2}$  as long as lemma; awn 2 mm. long or less.—Borders of streams and irrigation ditches, cismontane S. Cal.

8. *M. racemosa* (Michx.) B. S. P. Culms erect, simple or sparingly branched, 3 to 9 dm. high; blades 0.5 to 1 dm. long, scabrous; panicles 5 to 10 cm. long, dense, interrupted or lobed; spikelets 4 to 6 mm. long; glumes equal, the tips somewhat spreading.—Moist meadows and low ground, South Fork Eel River, Humboldt Co.; n. to Wash., e. to the Atlantic.

9. *M. porteri* Scribn. MESQUITE GRASS. Culms woody or persistent at base, numerous, wiry, widely spreading or clambering through bushes, scaberulous, more or less branched from all the nodes, 3 to 9 dm. long or more; sheaths smooth, spreading away from the branches, the prophyllum conspicuous; blades flat, 2.5 to 5 cm. long, early deciduous from the sheath; panicles 5 to 10 cm. long, the slender branches and branchlets brittle, widely spreading, bearing rather few long-pediceled spikelets; glumes narrow, acuminate, slightly unequal, the second longer, about 2 mm. long;

#### 48. *SPOROBOLUS* R. Br. DROPSEED

Annuals or perennials with small spikelets in open or contracted panicles. Spikelets disarticulating above the glumes. Glumes usually unequal, the second often as long as the spikelet. Lemma membranaceous, 1-nerved, awnless. Palea usually prominent and as long as the lemma or longer; seed free from the pericarp. (Greek spora, seed, and bolos, throwing.)

- Plants annual; glumes sparsely spreading-pilose.....1. *S. confusus*.  
 Plants perennial; glumes glabrous.  
 Culms decumbent-spreading.....2. *S. asperifolius*.  
 Culms erect.  
 Panicles diffuse.....3. *S. airoides*.  
 Panicles contracted, dense.....4. *S. contractus*.

1. *S. confusus* (Tourn.) Vasey. Culms slender, 1.5 to 2 dm. high, often depauperate; panicles oblong, diffuse, often more than half the length of the entire plant, the branches capillary; glumes about  $\frac{1}{2}$  as long as the spikelet, equal, obtuse.—Open sandy or gravelly usually moist ground, Sierra Nevada from Mariposa and Mono Cos. to Nevada Co., 4000 to 7000 ft.; n. to Wash. and Mont., s. to Mex.

2. *S. asperifolius* Nees & Meyen. Plants producing slender rhizomes; culms 3 to 6 dm. high, ascending from a creeping or decumbent base; blades flat, 2.5 to 5 cm. long, about 2 mm. wide, scabrous; panicles diffuse, tardily exerted, 10 to 15 cm. long, about as wide; spikelets 1.5 mm. long, the glumes unequal, a little shorter than the spikelet.—Meadows and wet places, especially in alkaline soil, Riverside and n. Ventura Co., e. to Death Valley, thence n. to Lassen Co.; n. to B. C., e. to N. Dak., s. to Mex.; also in S. Am.

3. *S. airoides* Torr. ALKALI SACATON. Fig. 106. Culms densely tufted, forming large tussocks, smooth, stout, spreading at base, 3 to 9 dm. high; sheaths sparsely pilose at the throat; blades involute, elongate, the upper short; panicles finally about  $\frac{1}{2}$  the length of the entire plant; spikelets 1.5 to 2 mm. long, obtuse; first glume oval,  $\frac{1}{2}$  as long as spikelet, the second as long as spikelet.—Bottomlands and valleys, often in saline soil: Colorado and Mohave deserts; Amador Co.; Wash. to S. Dak., s. to Mex.

4. *S. contractus* Hitchc. Culms erect, 6 to 12 dm. high; panicle as much as 30 cm. long; spikelets 2.5 mm. long; first glume less than half as long as the spikelet; second glume as long as spikelet.—Dry soil, Colorado Desert (w. end of Salton Sea); e. to Tex.

#### 49. *CRÛPSIS* Ait.

A spreading annual, with capitate inflorescences in the axils of broad bracts, these being enlarged sheaths with short rigid blades. Spikelets disarticulating below the glumes. Glumes about equal, narrow, acute. Lemma broad, thin. Palea readily splitting between the nerves; seed free from the thin pericarp. (Greek *krupsis*, hiding, from the partly concealed inflorescence.)

1. *C. aculeata* (L.) Ait. Plants prostrate, 3 dm. in diameter, or depauperate and only 3 to 5.5 cm. wide; glumes about 2.5 mm. long; lemmas about as long as the glumes, scabrous on keel.—Overflowed lands of the Sacramento and San Joaquin valleys; nat. from Eur.

106. *Sporobolus airoides* Torr.; habit  $\times \frac{1}{4}$ .

#### 50. *ORYZOPSIS* Michx.

Perennials with flat or often involute blades and narrow or open panicles. Spikelets disarticulating above the glumes. Glumes about equal, obtuse or acuminate. Lemma indurate, usually about as long as the glumes, broad, oval or oblong, nearly terete, usually pubescent, with a short blunt callus, and a short deciduous sometimes bent awn. Palea inclosed by the edges of the lemma. (Greek *oruzá*, rice, and *opsis*, appearance.)

- Lemma smooth; spikelets numerous, 3 mm. long; blades flat.....1. *O. miliacea*.  
 Lemma pilose; blades involute.  
 Branches of panicle and capillary pedicels divaricately spreading...2. *O. hymenoides*.  
 Branches of panicle and pedicels erect or ascending.  
 Glumes about 4 mm. long; lemma sparingly pilose.....5. *O. kingii*.  
 Glumes 8 to 10 mm. long; lemma densely long-pilose.  
 Awn 6 mm. long; culms 1.5 to 3 dm. tall.....3. *O. webberi*.  
 Awn 12 mm. long; culms 3 to 6 dm. tall.....4. *O. bloomeri*.

107. *Oryzopsis hymenoides*  
Ricker; habit x  $\frac{1}{2}$ .

1. *O. miliacea* (L.) B. & H. Culms erect from a decumbent base, 6 to 9 dm. high; sheaths smooth; ligule about 2 mm. long; blades 8 to 10 mm. wide; panicle as much as 30 cm. long, loose, the branches spreading; glumes 3 mm. long, equal; lemma 2 mm. long, the straight awn about 4 mm. long.—Waste places, Los Angeles, Ventura, Santa Barbara, Cahto (Mendocino Co.); sparingly nat. from Eur.

2. *O. hymenoides* (Roem. & Schult.) Ricker SAND BUNCH GRASS. INDIAN MOUNTAIN RICE. Fig. 107. Culms tufted, 3 to 6 dm. high; ligule about 6 mm. long; blades slender, nearly as long as the culms; panicle diffuse, 8 to 15 cm. long, the capillary branches in pairs, the branchlets dichotomous, all divaricately spreading, the ultimate pedicels flexuous, enlarged below the spikelets; glumes equal, about 6 mm. long, papery, ovate, 3-nerved, abruptly narrowed into an awn-like point; lemma fusiform, turgid, about 3 mm. long, nearly black at maturity, densely long-pilose, with white hairs 3 mm. long; awn about 4 mm. long, straight, readily deciduous.—Deserts and plains, Mohave Desert and northw. on the e. side of the Sierra Nevada to Mt. Shasta; Wash. and Manit. to Tex. and L. Cal.

3. *O. wébberi* (Thurb.) Benth. Culms tufted, erect, 1.5 to 3 dm. high; blades involute, filiform, scabrous; panicle narrow, 2.5 to 5 cm. long, the branches appressed; glumes equal, narrow, obscurely 5-nerved, acuminate, about 8 mm. long; lemma narrow, 6 mm. long, densely long-pilose.—Deserts and dry gravelly stream channels in the mts.; se. Nevada Co.; Lassen Co.; e. to Col.

4. *O. blóomeri* (Boland.) Ricker. Culms tufted, 3 to 6 dm. high; ligule about 1 mm. long; blades crowded at the base, involute, narrow, firm; panicle 8 to 15 cm. long, the branches slender, rather stiffly ascending, bearing spikelets from about the middle; glumes comparatively broad, indistinctly 3 to 5-nerved, rather abruptly acuminate, equal; lemma elliptical, 5 mm. long, densely long-villous; awn tardily deciduous, geniculate, the lower part slightly twisted, appressed-villous.—Dry regions, Modoc Co.; Mt. Diablo; w. Mohave Desert; n. to Wash., e. to Manit. and N. Mex.

5. *O. kingii* (Boland.) Beal. Culms tufted, slender, 2 to 3.8 dm. high; blades crowded at the base, involute, filiform; ligule about 1 mm. long; panicle narrow, loose, few-flowered; glumes broad, papery, nerveless, obtuse, purple at base, the first about 3.5 mm. long, the second a little longer; lemma elliptic, 3 mm. long, rather sparingly appressed-pubescent, the callus short; awn more or less sickle-shaped, not twisted, minutely pubescent, not readily deciduous, about 12 mm. long.—Dry open ground, Sierra Nevada from Mariposa Co. to Fresno Co., 7000 to 9500 ft.

#### 51. *STIPA* L. PORCUPINE GRASS. SPEAR GRASS

Perennials, with usually convolute blades and narrow panicles. Spikelets disarticulating above the glumes, the articulation oblique, leaving a bearded, sharp-pointed callus attached to the base of the floret. Glumes membranaceous, often papery, acute or acuminate, usually long and narrow. Lemma narrow, terete, firm or indurate, strongly convolute, terminating in a bent and twisted prominent persistent awn. Palea inclosed in the convolute lemma. (Greek *stupa*, tow, referring to the feathery awns of some species.)

Awn plumose.

Awn with 1 bend, copiously long-plumose below the bend.....1. *S. speciosa*.

Awn with 2 bends, plumose to second bend.

Ligule 3 to 6 mm. long.....2. *S. thurberiana*.

Ligule very short.

Sheaths pubescent.....3. *S. elmeri*.

- Sheaths glabrous.  
 Blades involute, mostly basal.....4. *S. occidentalis*.  
 Blades flat, tardily involute, scattered.....5. *S. californica*.  
 Awn more or less scabrous, but not plumose.  
 Lemma clothed with copious hairs 4 mm. long.  
 Awn with 2 bends; plants 1 m. or more tall.....6. *S. coronata*  
 Awn with usually 1 bend; plant less than 6 dm. tall.....7. *S. parishii*  
 Lemma more or less hairy, the hairs not over 1 mm. long.  
 Panicle open, the branches naked below, more or less spreading.  
 Upper glume 5-nerved; lower glume 3 or 5-nerved.....8. *S. comata*  
 Upper and lower glumes 3-nerved.  
 Ligule evident; terminal segment of awn mostly 4 cm. or more long...  
 9. *S. pulchra*.  
 Ligule minute; terminal segment of awn mostly less than 2 cm. long...  
 10. *S. lepida*.  
 Panicle narrow, the branches erect.  
 Glumes 1.5 to 2 cm. long; blades as much as 7 mm. wide...11. *S. stillmanii*.  
 Glumes 1 cm. or less long.  
 Sheaths hairy at the throat.....12. *S. vaseyi*.  
 Sheaths not hairy at the throat.  
 Glumes broad, usually 5-nerved; fruit fusiform...13. *S. lemmonii*.  
 Glumes narrow, 3-nerved.  
 Blades short, slender, involute; lemma scarcely 5 mm. long...  
 14. *S. lettermanii*.  
 Blades commonly elongate, flat; lemma usually more than 5  
 mm. long.....15. *S. minor*.

1. *S. speciosa* Trin. & Rupr. Culms densely tufted, 3 to 6 dm. high; sheaths smooth, or lower pubescent or felty at the very base, the throat bearded; blades elongate, involute-filiform, mostly basal, more or less deciduous from the outer and older persistent sheaths; panicle narrow, dense, 10 to 15 cm. long, not much exceeding the leaves, white or tawny, conspicuously feathery; glumes smooth, about 1.5 cm. long, 3-nerved, long-acuminate, papery; lemma 7 to 9 mm. long, densely short-pubescent; awn about 4 cm. long.—Deserts and arid hills, especially characteristic species from Mono Co. to the Mohave and Colorado deserts; n. in the South Coast Ranges but rare; s. to L. Cal., e. to Col.; also in Chile.

2. *S. thurberi* Piper. Culms 1.5 to 4.5 dm. high; leaves mostly basal; blades involute, scabrous; panicle 5 to 10 cm. long, often subtended by an enlarged sheath; glumes about 1.2 cm. long, acuminate, 3-nerved; lemma 7 mm. long, appressed-pilose; awn about 4 cm. long.—Open dry woods in the mts., Siskiyou and Modoc Cos.; n. to Wash.

3. *S. elmeri* Piper & Brodie. Culms 6 to 9 dm. high, more or less puberulent, especially at the nodes; blades flat or becoming involute, pubescent on the upper surface, or those of the innovations also on the lower surface; panicle narrow, rather loose, 15 to 40 cm. long; glumes 3-nerved, gradually acuminate, thin, papery, 1.2 to 1.4 cm. long, the first a little the longer; lemma about 7 mm. long, appressed-pubescent; awn 3 to 3.5 cm. long.—Open ground, in the mts., 4000 to 7000 ft.: San Jacinto Mts.; San Bernardino Mts.; Sierra Nevada; n. to Wash.

4. *S. occidentalis* Thurb. Fig. 108. Culms slender, tufted, 3 to 6 dm. high; blades narrow; panicle narrow, 10 to 20 cm. long; glumes 8 to 10 mm. long, acuminate, 3-nerved; lemma 6 mm. long, long-pilose; awn about 2.5 cm. long, sometimes pilose throughout.—Open dry woods of the Sierra Nevada, 6000 to 9600 ft.; n. to Mt. Shasta; s. to the San Gabriel Mts.; far n. to Wash., e. to Wyo.

5. *S. californica* Merr. & Davy. Culms 6 to 15 dm. high, smooth, or the nodes pubescent; sheaths villous at the throat; panicle narrow, usually 30 to 45 cm. long, the branches fasciated, appressed; glumes thin, papery, about 1 cm. long, 3-nerved, the lateral nerves rather indistinct; lemma about 6 mm. long, appressed-villous; awn 2 to 3 cm. long.—Meadows and open woods, 6000 to 8000 ft.: San Jacinto Mts.; Sierra Nevada from Nevada Co. to Mariposa Co.; n. to Ore.

6. *S. coronata* Thurb. Culms robust, commonly 12 to 18 dm. high, smooth or pubescent below the nodes;

108. *Stipa occidentalis* Thurb.; portion of inf. x 1.

sheaths smooth, the margin and throat villous; ligule about 2 mm. long, ciliate-margined; blades elongate, flat, with a slender involute point; panicle narrow, dense, purplish, thick, 30 to 45 cm. long; glumes gradually acuminate, 3-nerved, the first about 2 cm. long, the second 2 to 4 mm. shorter; lemma 8 to 10 mm. long; awn about 3.5 cm. long.—Open ground, Santa Lucia Mts to cismontane S. Cal.; s. to L. Cal.

7. *S. parishii* Vasey. Culms stout, 3 to 6 dm. high; sheaths smooth, villous at the throat; ligule short, ciliate; blades firm, flat, with a slender involute point, very scabrous above, about 4 mm. wide; panicle 15 to 20 cm. long, narrow, dense, purple-tinged; glumes 3-nerved, long-acuminate, the first 1.4 cm. long, the second 2 mm. shorter; lemma 7 mm. long, densely long-villous, especially above; awn about 2.5 cm. long.—Open ground: San Diego Co.; San Jacinto Mts.; San Bernardino Mts.; w. Nev.

109. *Stipa comata*  
Trin. & Rupr.;  
panicle  $\times \frac{1}{2}$ .

8. *S. comata* Trin. & Rupr. NEEDLE-AND-THREAD. Fig. 109. Culms 6 to 12 dm. high, smooth; sheaths smooth; ligule 4 to 6 mm. long; blades becoming involute, elongate; panicle loose, 15 to 25 cm. long; branches slender, ascending, or in anthesis spreading, bearing usually 2 spikelets toward the ends; glumes about 2.5 cm. long, gradually narrowed into an awn, thin, papery; lemma 1 to 1.2 cm. long, rather sparsely appressed-villous; callus 3 mm. long; awn 8 to 12 cm. long, twice bent and flexuous.—Dry open ground: Argus Mts.; White Mts.; Lake Tahoe; n. to Wash., e. to the Great Plains.

9. *S. pulchra* Hitchc. Culms 6 to 9 dm. high; blades long, narrow, flat or involute; ligule about 1 mm. long; panicle about 15 cm. long, loose, the branches spreading, slender, some of the lower 2.5 to 5 cm. long; glumes narrow, long-acuminate, purplish, the first about 2 cm. long, the second 2 to 4 mm. shorter; lemma 8 mm. long, sparingly pilose; awn 5 to 8 cm. long, short-pubescent to the second bend.—Open ground at low altitudes: common in the Coast Ranges; Sierra foothills; s. to San Diego Co. and L. Cal. (*S. setigera* of authors.)

10. *S. lepida* Hitchc. Culms slender, puberulent below the nodes, 6 to 9 dm. high; sheaths sparingly villous at throat; blades flat, narrow, 2 to 4 mm. wide, pubescent on upper surface near base; panicle rather loose, usually 15 to 20 cm. or sometimes more than 30 cm. long, the branches distant, slender; glumes acuminate, the first 6 to 10 mm. long, the second about 2 mm. shorter; lemma about 6 mm. long, sparingly villous, nearly glabrous toward the hairy-tufted apex; awn indistinctly twice bent, 2.5 to 4 cm. long, scabrous.—Open ground, Berkeley Hills to San Bernardino and San Diego; s. to L. Cal. (*S. eminens* of authors.) Var. *ANDERSONII* (Vasey) Hitchc. Differs chiefly in the slender involute blades; plant on the average smaller, with narrower few-flowered panicles, the spikelets usually smaller.—Range about that of the species but extending n. to Mt. Shasta.

11. *S. stillmanii* Boland. Culms stout, 6 to 9 dm. high; sheaths puberulent at the throat and collar; ligule very short; blades folded or involute, firm, the uppermost filiform; panicle dense or interrupted at base, the branches short fasciated; glumes equal, 2 to 3 cm. long, papery, minutely scabrous, acuminate into a scabrous awn-point, the first 3-nerved, the second 5-nerved; lemma 9 mm. long, short-pilose, with 2 slender teeth at the summit, the callus short; awn about 2.5 cm. long, once or indistinctly twice-geniculate.—Blue Cañon, Placer Co., only known station.

12. *S. vaseyi* Scribn. SLEEPY GRASS. Culms 6 to 9 dm. high; blades elongate, involute; panicle about 30 cm. long, dense; glumes acuminate, scabrous, the first a little longer, rather strongly 5 to 7-nerved, 1 cm. long; lemma about 6 mm. long, appressed-pilose, the callus short; awn twice-geniculate,

about 2.5 cm. long, minutely puberulent.—San Nicolas Isl.; Ariz. to Col., Tex. and Mex.

13. *S. lemmöni* (Vasey) Scribn. Culms 6 to 9 dm. high, sometimes pubescent below the nodes; ligule about 1 mm. long; blades usually flat, pubescent on upper surface; panicle loose, 10 to 15 cm. long; glumes subequal, scarious, acuminate, 1.2 cm. long; lemma 7 mm. long, rather thinly appressed-pilose, the callus short; awn about 2.5 cm. long, twice-geniculate, appressed-pilose to the second bend.—Open woods, Mendocino Co.; Sierra Nevada from the Tehachapi Range to Siskiyou Co.; n. to Wash. Var. *JONESII* Scribn. Differs in the more slender firm involute blades, and smaller spikelets; glumes about 8 mm. long; lemma about 6 mm. long, the awn 2 cm. long, tending to be incurved, the pubescence shorter.—Mts. of San Diego Co.; Sierra Nevada from Mariposa Co. to Siskiyou Co.; n. to Wash. and Ida.

14. *S. lettermani* Vasey. Culms tufted, slender, 3 to 4.5 dm. high; ligule very short; leaves crowded at base; panicle 7 to 20 cm. long; glumes acuminate, about 8 mm. long; lemma 5 mm. long, pilose; awn very slender, about 1.2 cm. long, nearly smooth, twice bent.—Dry soil, higher altitudes, 5800 to 7000 ft.: San Bernardino Mts.; Sierra Nevada from Nevada Co. to Sierra Co.; Ore. to Ida. and Col.

15. *S. minor* (Vasey) Scribn. Culms in small tufts, 6 to 9 dm. high; ligule very short; blades flat or becoming involute, narrow, up to 30 cm. long; panicle 15 to 20 cm. long; glumes 6 mm. long; lemma pilose; awn 1 to 1.5 cm. long, nearly smooth, twice bent.—Open ground, 7000 to 10,000 ft., Sierra Nevada from Tulare Co. to Nevada Co.; n. to Wash., e. to Col.

## 52. *ARÍSTIDA* L. NEEDLE GRASS

Annuals or perennials with narrow, often convolute blades and narrow or sometimes open panicles. Spikelets disarticulating above the glumes. Glumes narrow, acute, acuminate, or awn-tipped. Lemma indurate, narrow, terete, convolute, with a hard sharp-pointed minutely bearded callus at base, terminating above in a usually trifid awn. (Latin *arista*, awn.)

Neck of fruit jointed at base. . . . . 1. *A. californica*.  
Neck of fruit not jointed at base.

Lateral awns wanting or reduced to mere points. . . . . 2. *A. schiedeana*.  
Lateral awns evident.

Panicle diffuse, open, the main branches usually horizontally spreading; glumes about equal; plants perennial. . . . . 3. *A. divaricata*.

Panicle narrow, somewhat open, the branches not divaricate.

Plants annual.

Glumes 2 to 3 cm. long, nearly equal; awns 4 to 7 cm. long. . . . . 4. *A. oligantha*.

Glumes not over 1 cm. long, the lower about half as long as the upper; awns about 1 cm. long. . . . . 5. *A. adscensionis*.

Plants perennial.

Glumes nearly equal. . . . . 6. *A. parishii*.

Glumes unequal, the first  $\frac{1}{2}$  to  $\frac{2}{3}$  as long as the second.

Neck of fruit slender, straight or slightly twisted, about as long as the body; panicle narrow, strict. . . . . 7. *A. reverchonii*.

Neck of fruit short or not differentiated from the body.

Pedicels slender, more or less recurved. . . . . 8. *A. purpurea*.  
Pedicels stiffly erect.

Panicle short, few-flowered; no ciliate line on collar of leaf. . . . . 9. *A. fendleriana*.

Panicle elongate, many-flowered; collar of leaf with pubescent line. . . . . 10. *A. wrightii*.

1. *A. californica* Thurb. Perennial; culms tufted, much-branched at base, 1.5 to 3 dm. high; blades short, involute, sharp-pointed; panicles numerous, loose, 2.5 to 5 cm. long, few-flowered; glumes smooth or the first slightly scabrous near apex, 8 mm. long, the second about twice as long; lemma 6 mm. long, the narrowed apex articulated with the slender spirally twisted base of the awns, the base 1.8 cm. long; awns equal, spreading, about 2.5 cm. long.—Colorado Desert and e. Mohave Desert to n. Mex.

2. *A. schiedeana* Trin. & Rupr. Perennial; culms erect, scaberulous, 3 to 6 dm. high; sheaths scaberulous, villous at the throat; blades involute in drying, the persistent basal ones flat and flexuous, 10 to 20 cm. long; panicle somewhat open, about half the entire height of the plant, the lower branches

slender, ascending or spreading; glumes acuminate or short-awned, the first longer, about 1 cm. long; neck of fruit twisted, 5 to 8 mm. long, the central awn spreading, 7 to 10 mm. long; fruit, including neck, 15 to 18 mm. long.—Deserts and rocks, Ariz. to N. Mex. and Mex.; probably in the Colorado Desert, recorded from San Diego.

3. *A. divaricata* Humb. & Bonpl. Culms tufted, erect, 3 to 6 dm. high; blades involute, as much as 15 cm. long; panicle usually more than  $\frac{1}{2}$  the entire length of the plant; branches distant, mostly in pairs, spikelet-bearing toward the ends; glumes 1 to 1.2 cm. long, short-awned, the first scabrous on the keel; lemma about 1 cm. long, scabrous toward the scarcely narrowed apex; awns about equal, 1.2 to 2 cm. long, somewhat spreading.—Deserts and rocky hills, Bakersfield to Los Angeles and San Diego; e. to Tex. and Mex. Variable in length of awns.

4. *A. oligantha* Michx. Culms erect, branched at base and all the nodes, 3 to 6 dm. high, often woolly at the very base; blades usually involute, as much as 15 cm. long, sparingly pilose at base, the prophyllum often conspicuous at base of branches; panicles narrow, loosely few-flowered, bearing a few scattered large appressed short-pedicelled spikelets; glumes long-awned from a bifid apex, the first strongly 5 to 7-nerved; lemma a little shorter than the glumes, the gradually narrowed neck scaberulous, the callus rather minutely pubescent; awns about equal, widely spreading, 4 to 7 cm. long.—Open ground, e. side of the Great Valley (Merced Falls; lower Mokelumne River; Chico); Ore.; middle and e. U. S.

110. *Aristida adscensionis* L.; a, habit  $\times \frac{1}{2}$ ; b, glumes  $\times 2\frac{1}{2}$ ; c, floret  $\times 2\frac{1}{2}$ .

5. *A. adscensionis* L. DOGTOWN GRASS. Fig. 110. Culms much-branched at the base, 1 to 3 dm. high, erect or prostrate; blades 2.5 to 5 cm. long, usually involute; panicle narrow, rather dense, 5 to 8 cm. long, the branches short, fascicled; glumes 1-nerved, obtuse or slightly mucronate; lemma 8 to 10 mm. long, the callus with a dense tuft of short hairs, the apex scarcely narrowed; awns flat at base, equal, finally spreading, about 1 cm. long.—Open ground, San Luis Obispo Co. to San Diego Co., e. to Inyo Co. and the Colorado River; e. to N. Mex., s. to S. Am.; Mediterranean region and Afr. Also called Six-weeks Grass. (*A. bromoides* H.B.K.)

6. *A. parishii* Hitchc. Culms tufted, 3 to 6 dm. high; sheaths ciliate at the throat; blades firm, flat or more or less involute, scabrous on the upper surface, smooth below or scabrous toward the tip, 1.5 to 3 dm. long; panicle narrow, about 15 cm. long, the branches rather stout, ascending or appressed; glumes short-awned, 1-nerved or the first 3-nerved, the second 1.2 cm. long; lemma a little shorter than the glumes, very scabrous on the upper half, the neck rather stout, not twisted, the awns ascending, the central about 2 cm. long, the lateral a little shorter.—Dry ground, Palm Sprs. of Mt. San Jacinto to Riverside and s. to San Diego.

7. *A. revérchoni* Vasey. Culms densely tufted, erect 3 to 6 dm. high; blades involute, more or less flexuous, as much as 15 cm. long; panicle 10 to 15 cm. long; glumes awnless, the first about 6 mm. long, the second about 10 mm. long; lemma 1 to 1.2 cm. long; awns equal, about 2 cm. long.—Deserts and plains, e. Mohave Desert; e. to Tex.

8. *A. purpurea* Nutt. Culms tufted, erect, about 6 dm. high; blades flat or involute, 5 to 12 cm. long; panicles 10 to 15 cm. long, rather loose; glumes short-awned, 1-nerved, the first 6 mm. long, the second about twice as long; lemma about 1.2 mm. long, purple, strongly scabrous in lines, the apex somewhat narrowed, flattened and slightly twisted; awns equal, 3 to 3.5 cm. long.—Plains and deserts: cismontane S. Cal., e. to the Colorado River; far e. to Tex.

9. *A. fändleriana* Steud. Plants forming dense cushions, the crowded blades curly, involute, arcuate, sharp-pointed, pilose at base, usually 2.5 to 5 cm. long, sometimes longer; culms 1.5 to 3 dm. high; panicle narrow, 5 to 10 cm. long, bearing a few, mostly short-pedicelled, loosely arranged, more or less appressed spikelets; glumes awnless, 1-nerved, the first about 6 mm. long, the second 10 to 12 mm. long; lemma 8 mm. long, scaberulous and slightly narrowed above; callus 1 mm. long; awns equal, about 2.5 cm. long, ascending.—Deserts and plains: ne. (desert) side of the San Bernardino Mts., 6000 to 7000 ft.; e. to Tex.

10. *A. wrightii* Nash. Culms tufted, erect, 6 dm. high, wiry; blades involute, often curved; panicle 10 to 20 cm. long, the longer branches bearing 2 to 4 spikelets; spikelets 1.2 to 1.4 cm. long; glumes 1-nerved, the first half as long as the second; awns ascending, the central a little longer, about 2.5 cm. long.—Dry soil, Split Mt., Colorado Desert; e. to Tex.

#### TRIBE 5. *Nazieae*. CURLY-MESQUITE TRIBE

Spikelets sessile in groups of 3, the group falling entire from the continuous axis, the perfect spikelet 1-flowered, the staminate 2-flowered; glumes usually firmer than the lemma and palea, sometimes awned, the lemma awnless.

#### 53. *HILARIA* H. B. K.

Stiff perennials, the groups of spikelets appressed to the axis, in terminal spikes. Spikelets sessile, in groups of 3, the groups falling from the axis entire, the central spikelet (next the axis) fertile, 1-flowered, the 2 lateral spikelets staminate, 2-flowered. Glumes coriaceous, those of the 3 spikelets forming a false involucre, in some species connate at the base, more or less asymmetric, usually bearing an awn on one side from about the middle. Lemma and palea hyaline, about equal in length. (August de St. Hilaire, French botanist.) (Pleuraphis Torr.)

Culms felty pubescent. . . . . 1. *H. rigida*.  
Culms glabrous or nearly so. . . . . 2. *H. jamesii*.

1. *H. rigida* (Thurb.) Benth. GALLETA. Fig. 111. Plants grayish, felty-pubescent throughout; culms numerous from woody rhizomes, 4.5 to 9 dm. high; blades 2.5 to 6 cm. long, 2 to 4 mm. wide, more or less involute, rigid, sharp-pointed; spikelets about 8 mm. long; glumes of central spikelet broadened upward from a narrow base, woolly-ciliate, several-awned from the tip, a stronger dorsal awn from about the middle; lemma 3-nerved, inclosing the palea and a rudimentary second floret, the nerves villous on the back, extending into delicate awns between the ciliate lobes of the apex; lateral spikelets similar, narrower, the glumes less awned, the second floret similar to the first.—Mohave and Colorado deserts; Ariz. to Mex. The most valuable forage grass in the desert.

2. *H. jamesii* (Torr.) Benth. Culms erect from stout rhizomes, glabrous, the nodes villous; sheaths 2.5 to 4 cm. long, sparingly villous at the throat; blades mostly 2 to 4 mm. wide, rigid, soon involute, the upper reduced; spikelets 6 to 8 mm. long, long-villous at base; glumes of central spikelet pubescent, cuneate, 2-lobed, the lobes 2 or 3-awned, the central nerve between, extending from below the middle into an awn somewhat longer than the others, the awns all minutely plumose; lemma erose at apex, glabrous, 3-nerved, the nerves parallel, the central extending into a short awn; glumes of lateral spikelets narrow, pubescent, the first unsymmetrical, 5-nerved, the second nerve on one side extending into a dorsal awn from below the

111. *Hilaria rigida* Benth.:  
a, habit x 1; b, infl. x 1.

middle, the apex unequally 2-lobed, the sinus extending down about half-way to the point of departure of the awn, the lobes minutely ciliate; second glume 5-nerved, awnless, entire, ciliate, conduplicate around the floret; lemma as in fertile spikelet.—Deserts of Inyo Co.; e. to Wyo. and Tex.

#### TRIBE 6. *Chlorideae*. GRAMA TRIBE

Spikelets 2 to several-flowered, sessile or short-pedicel, approximate or somewhat distant along one side of a slender rachis, the rachilla disarticulating above the glumes and between the florets; glumes unequal or nearly equal, awnless or mucronate, 1-nerved, usually shorter than the first lemma; lemmas obtuse or acute, sometimes 2-toothed and mucronate or short-awned from between the teeth, 3-nerved, the nerves sometimes pubescent.

#### 54. *LEPTÓCHLOA* Beauv.

Our species annuals with flat blades and numerous spikes or racemes scattered along a common axis, forming a panicle. Spikelets 2 to several-flowered, subsessile, approximate or somewhat distant along one side of a slender rachis. Glumes unequal or nearly equal, 1-nerved, usually shorter than the first lemma. Lemmas obtuse or acute, sometimes 2-toothed and mucronate or short-awned from between the teeth, 3-nerved, the nerves sometimes pubescent. (Greek *leptos*, slender, and *chloa*, grass.)

Glumes longer than first lemma; sheaths papillose-hispid . . . . . 1. *L. filiformis*.  
Glumes shorter than first lemma; sheaths smooth.

Lemmas awned . . . . . 2. *L. fascicularis*.  
Lemmas awnless . . . . . 3. *L. uninervia*.

112. *Leptochloa filiformis* Beauv.; a, habit  $\times \frac{1}{4}$ ; b, glumes  $\times 3$ ; c, florets  $\times 3$ .

1. *L. filiformis* (Lam.) Beauv. FEATHER GRASS. Fig. 112. Culms 3 to 9 dm. high, often depauperate; spikes numerous, slender, 2.5 to 10 cm. long, usually purple, the spikelets rather distant, about 3 mm. long; glumes more or less mucronate, nearly equaling the 3 or 4 awnless florets.—Open ground, fields and moist depressions, Imperial Co.; common in the warmer parts of Am.

2. *L. fascicularis* (Lam.) Gray. Culms erect or spreading, 3 to 6 dm. high; blades erect, as long or longer than the culms; spikes numerous, 7 to 12 cm. long; spikelets 7 to 11-flowered, the florets much longer than the lanceolate glumes; lemmas hairy-margined toward the base, short-awned from the toothed apex.—Ditches and moist, especially alkaline soil, Fresno and Kern Cos., rare; e. to Md. and Fla.; also trop. Am.

3. *L. uninervia* (Presl) Hitchc. & Chase. Resembles nō. 2; usually strictly erect, the panicle more oblong in outline, with shorter commonly dull purplish spikes; glumes broader and more obtuse; lemmas apiculate but not awned.—Ditches and moist places: San Bernardino Mts.; Colorado Desert; e. to La., s. to Mex. (*L. imbricata* Thurb.)

*ELEUSINE INDICA* (L.) Gaertn., Goose Grass, a spreading smooth weedy annual with thick digitate spikes of crowded several-flowered spikelets, has been found near Los Angeles; native of the Old World.

#### 55. *CYNODON* Rich.

Usually low perennials with creeping stolons or rhizomes, short blades, and several slender spikes digitate at the summit of the upright flowering culms. Spikelets 1-flowered, sessile, the rachilla prolonged behind the palea, sometimes bearing a rudimentary lemma. Glumes narrow, acuminate, 1-nerved, about equal, shorter than the floret. Lemma strongly compressed, pubescent on the keel, firm, 3-nerved, the lateral nerves close to the margins. (Greek *kuon*, a dog, and *odous*, tooth.) (*Capriola* Adans.)

1. *C. dactylon* (L.) Pers. BERMUDA GRASS. DEVIL GRASS. Fig. 113. Culms flattened, wiry, glabrous; ligule a conspicuous ring of white hairs; spikes

113. *Cynodon dactylon*  
Pers.; stolon and  
inf. x  $\frac{1}{2}$ .

4 to 6, 2.5 to 6 cm. long; spikelets imbricate, 2 mm. long.—Moist valley fields and along irrigating ditches; native of warmer parts of Old World.

#### 56. *BECKMANNIA* Host

An erect rather stout annual with flat blades and numerous short appressed pedunculate spikes in a narrow more or less interrupted panicle. Spikelets 1-flowered, rarely 2-flowered, laterally compressed, subcircular, nearly sessile and closely imbricate, disarticulating below the glumes, falling entire. Glumes equal, inflated, obovate, 3-nerved, strongly gibbous above, the apex apiculate. Lemma narrow, 5-nerved, acuminate, about as long as the glumes. Palea nearly as long as the lemma. (Johann Beckmann, 1739-1811, professor of botany at Göttingen.)

1. *B. erucaefórmis* (L.) Host.  
SLOUGH GRASS. Fig. 114. Plants light green; culms 3 to 9 dm. high; panicle 10 to 25 cm. long; spikelets 3 mm. long; glumes transversely wrinkled, the acuminate apex of the lemma protruding.—Moist ground and ditches, San Francisco Bay to Siskiyou and Lassen Cos.; cooler parts of northern hemisphere.

114. *Beckmannia*  
*erucaefórmis*  
Host; habit  
x  $\frac{1}{2}$ .

#### 57. *SPARTINA* Schreb.

Stout erect tall perennials, with extensively creeping firm scaly rhizomes, long tough blades, and two to many appressed or sometimes spreading spikes racemose on the main axis. Spikelets 1-flowered, much flattened laterally, sessile and usually closely imbricate, disarticulating below the glumes, the rachilla not produced beyond the floret. Glumes keeled, 1-nerved, acute or short-awned, the first shorter, the second often exceeding the lemma. Lemma firm, keeled, the lateral nerves obscure, narrowed to a rather obtuse point. Palea keeled and flattened, the keel between or at one side of the nerves. (Greek spartion, a cord, referring to the tough leaves.)

115. *Spartina gracilis* Trin.;  
a, habit x 1-7; b, spikelet  
x 3; c, floret x 3.

Spikes closely approximate, forming a cylindrical inflorescence; blades wide, flat below. . . . . 1. *S. foliosa*.  
Spikes distinct; blades narrow and soon involute. . . . . 2. *S. gracilis*.

1. *S. foliosa* Trin. Culms as much as 1.5 cm. thick at base, usually rooting from the lower nodes, 3 to 12 dm. high, somewhat spongy; blades 8 to 12 mm. broad at the flat base, gradually narrowed to a long involute tip, smooth; inflorescence dense, spike-like, about 15 cm. long; spikes numerous, close-appressed, 2.5 to 5 cm. long; spikelets indurated, about 1.2 cm. long; glumes ciliate on keel, acute, the first narrow, about  $\frac{2}{3}$  as long as second, smooth, the second sparingly hispidulous, striate-nerved; lemma hispidulous on sides, smooth on keel, a little shorter than the second glume; palea longer than lemma.—Salt marshes and tidal flats along the coast, San Francisco Bay to San Diego. Useful in reclaiming marshland.

2. *S. grácilis* Trin. Fig. 115. Culms 6 to 9 dm. high; blades 15 to 20 cm. long, very scabrous

above; spikes 4 to 8, closely appressed to the axis, 2 to 2.5 cm. long; spikelets about 6 mm. long; glumes smooth except the ciliate keel, acute, the first about  $\frac{1}{2}$  as long as the second; lemma about as long as second glume, ciliate on keel; palea as long as lemma, obtuse.—Alkaline meadows, Inyo Co.; n. to Wash. and Saskat.

### 58. *CHLORIS* Swartz

Perennials or annuals with flat blades and two to several digitate spikes. Spikelets with 1 perfect floret, sessile, the rachilla produced beyond the perfect floret and bearing 1 to several reduced florets consisting of empty lemmas, these often truncate, and, if more than one, the smaller ones inclosed in the lower, forming a usually club-shaped rudiment. Glumes somewhat unequal, the first shorter, narrower, acute. Lemma keeled, usually broad, 1 to 5-nerved, often villous on the callus and villous or long-ciliate on the keel or marginal nerves, awned from between the short teeth of a bifid apex, the awn slender or sometimes reduced to a mucro, the sterile lemmas awned or awnless. (Latin *Chloris*, the goddess of flowers.)

1. *C. virgata* Swartz. Fig. 116. Culms erect or spreading, 3 to 9 dm. high; sheaths much compressed, especially the basal, the uppermost often inflated around the base of the inflorescence; spikes 6 to 12, 2.5 to 8 cm. long, flexuous at summit; spikelets imbricate; glumes 1-nerved, the second about 3 mm. long, awn-pointed; lemma somewhat fusiform, about 2 mm. long, 3-nerved, short pilose at base and along the lower half of the keel, long-pilose on the margins near the apex, with a slender straight awn about 1 cm. long, from just below apex; rudiment reaching about to tip of fertile floret, truncate, the awn somewhat shorter.—Fields and waste places, Riverside to the Colorado Desert; extends to W. I. and Brazil. (*C. elegans* H.B.K.)

116. *Chloris virgata* Sw.:  
a, inf.  $\times \frac{1}{2}$ ; b, glumes  $\times 5$ ;  
c, florets  $\times 5$ .

*C. VERTICILLATA* Nutt., Windmill Grass, a low perennial with long stiff divergent slender spikes, has been found at Berkeley; adv.; native of Tex.

### 59. *BOUTELOÛA* Lag. GRAMA GRASS

Low or rather tall perennials or annuals with two to many spikes racemose on a common axis (sometimes solitary), the spikelets few to many in each spike, pectinate or more loosely arranged and appressed, the rachis of the spike usually produced beyond the insertion of the spikelets. Spikelets 1-flowered, with the rudiments of one or more florets above. Glumes 1-nerved, acuminate or awn-tipped, the first shorter and narrower. Lemma as long as the second glume or a little longer, 3-nerved, the nerves extending into awns, the internerves usually extending into teeth. Palea sometimes 2-awned; rudiment various, usually 3-awned, a second rudimentary floret sometimes present. (The brothers Claudio and Esteban Boutelou, Spanish gardeners.)

- Spikes containing 1 to 3 spikelets, numerous along a main axis; spikes falling entire.  
Plants perennial.....1. *B. curtipendula*.  
Plants annual.....2. *B. aristoides*.  
Spikes usually few, containing numerous spikelets; florets falling from the glumes; rachis of spike persistent except in no. 6.  
Plants annual.....3. *B. arenosa*.  
Awns about 3 mm. long; spikes 2 to 4.....4. *B. barbata*.  
Awns barely protruding; spikes 4 to 6 or more.....5. *B. rothrockii*.  
Plants perennial; tufted bunchgrasses.....6. *B. radicata*.  
Spikes several.  
Spikes narrow, strictly 1-sided; spikelets numerous.....  
Spikes broad, loose, irregularly 1-sided; spikelets few.....

Spikes usually 1 to 3, rarely 4.

Rachis not prominently produced; second glume sparsely hairy.....  
7. *B. gracilis*.

Rachis produced beyond the spikelets as a naked point; second glume prominently tuberculate-hispid on the keel.....  
8. *B. hirsuta*.

1. *B. curtispéndula* (Michx.) Torr. SIDE-OAT GRAMA. TALL GRAMA. Culms erect, 3 to 12 dm. high; spikes numerous on an elongated rachis, 1 to 2 cm. long, reflexed, mostly turned to one side; glumes narrow, scabrous on keel and somewhat so on the back, the second about 5 mm. long; lemma as long as second glume, ovate-lanceolate, scabrous toward tip, 3-toothed, the palea about as long; rudiment as long as lemma, 4-lobed, 3-awned between the lobes, the lateral lobes and awns shorter, the rudiment sometimes much reduced.—Plains and rocky hills, Santa Rosa Mt., Riverside Co.; Mont. to Mex.

2. *B. aristidoides* (H.B.K.) Griseb. NEEDLE GRAMA. Culms spreading, slender, 1.5 to 3.8 dm. high; spikes several, slender, about 1.2 cm. long, the 1 to 3 spikelets distant, appressed to the rachis, the latter ending in a slender naked point; glumes narrow, the first  $\frac{1}{2}$  as long as the second; lemma narrowly lanceolate, the nerves pilose, the lateral ending in awned teeth as long as the central acuminate point; rudiment consisting of a pilose stipe and 3 awns longer than the spikelet.—Open ground, deserts and foothills: e. Riverside Co.; Colorado Desert; e. to Tex., s. to S. Am.

3. *B. arenosa* Vasey. Culms spreading or prostrate, about 1.5 dm. high; spikes many-flowered, about 1.2 cm. long; first glume 2 mm., the second 3 mm. long; lemma a little shorter than the second glume, pilose below, 4-lobed, the lateral lobes short, 3-awned from between the lobes, the awns about 3 mm. long; palea 4-toothed, 2-awned; rudiment 1 mm. long, triangular-truncate, pilose at base, 4-lobed, with 3 long awns between the lobes.—Loose sandy soil, Cargo Muchacho, Colorado Desert; e. to N. Mex., s. to Mex.

4. *B. barbata* Lag. SIX-WEEKS GRAMA. Culms spreading or prostrate, 1.5 to 3 dm. high; spikes 1.2 to 2 cm. long; spikelets numerous, imbricate; glumes scabrous on keel and somewhat so on back, awn-pointed from a toothed apex, the second twice as long as the first, 3 mm. long; lemma pilose below, 3-awned, the central awn between the obtuse scabrous lobes; rudiment pilose at base, 2-lobed, 3-awned.—Desert valleys, lower Colorado River; e. to Utah, s. to Mex.

5. *B. rothrockii* Vasey. Culms erect or spreading, 3 to 6 dm. high; spikes usually 4 to 6, 1.2 to 2.5 cm. long; spikelets numerous, imbricate; glumes scabrous on keel and back, cuspidate and 2-toothed at apex, the second 2.5 mm. long, about twice as long as the first; lemma pilose below, 4-lobed, 3-awned, the awns equal, 2.5 mm. long; rudiment pilose at base, consisting of 2 short truncate lobes, 3 equal awns about 2 mm. long, and an included orbicular scale.—Mesas and foothills, Jamacha, San Diego Co.; e. to Utah, s. to Mex.

6. *B. radicata* (Fourn.) Griff. Culms 1.5 to 6 dm. high, erect; blades mostly basal, flat; spikes several to many, 2 to 2.5 cm. long; glumes rather broad, the second about 6 mm. long; lemma smooth, bearing 3 short awns; rudiment lanceolate, with 3 long awns.—Upper foothills and mountains, Ariz. and N. Mex. to Mex.; collected by Orcutt in Cal., probably in the Colorado Desert.

7. *B. gracilis* (H.B.K.) Lag. BLUE GRAMA. Culms erect, 1.5 to 4.5 dm. high; sheaths and blades glabrous; spikes 1 to 3, 2.5 to 5 cm. long, usually a little curved; spikelets 5 to 6 mm. long, densely crowded, pectinate; glumes narrow, the first about  $\frac{1}{2}$  as long as the second, the latter sparsely papillose-pilose on the keel; lemma pilose, 3-cleft, the lateral divisions awned, the terminal 2-toothed, awned between the teeth; rudiment 3-awned, pilose at base, a second rudimentary scale above.—Mts. and mesas of S. Cal. from the San Bernardino Mts. to San Diego Co.; extends from Manit. and Mont. to Mex.

8. *B. hirsuta* Lag. HAIRY OR BLACK GRAMA. Fig. 117. Culms erect, 2 to 4.5 dm. high; sheaths smooth; blades sparsely papillose-hairy, especially on the margins; spikes 1 to 4, 1.8 to 5 cm. long; first glume narrow, setaceous:

117. *Bouteloua hirsuta* Lag.;  
infl.  $\times \frac{1}{2}$ .

second glume acuminate, twice as long as first, equaling the floret; lemma pubescent, 3-cleft; rudiment of 2 obtuse lobes and 3 equal awns, not pilose at base.—Mesas and dry hills, Jamacha, San Diego Co.; B. C. and S. Dak. to Mex.

TRIBE 7. *Phalarideae*. CANARY GRASS TRIBE

Spikelets with one perfect terminal floret, and below this, a pair of staminate or neuter florets, the rachilla disarticulating above the glumes, the sterile florets falling attached to the fertile one.

60. *TORRÉSIA* R. & P. HOLY GRASS

Perennial low erect sweet-smelling grasses with small panicles of bronze-colored spikelets. Spikelets with one perfect floret and two staminate florets. Glumes equal, broad, thin and papery, smooth, acute. Sterile lemmas about as long as the glumes, mostly somewhat appressed-hispid. Fertile lemma somewhat indurate, about as long as the others, smooth or nearly so, awnless. (Hieronymus de la Torre, Spanish botanist.) (*Hierochloa* R. Br.)

1. *T. macrophylla* (Thurb.) Hitchc. CALIFORNIA VANILLA GRASS. Fig. 118. Culms few, erect, 6 to 9 dm. high; sheaths scabrous; blades crowded toward base, flat, rather stiffly upright, scabrous above, glaucous beneath, acuminate-pointed, 6 to 14 mm. wide; panicle somewhat open, 8 to 12 cm.

long, the lower branches spreading or drooping; glumes 4 mm. long.—Redwood belt from Monterey Co. to Humboldt Co.; n. to Wash.

61. *ANTHOXÁNTHUM* L.

Sweet-smelling annuals or perennials, with flat blades and spike-like panicles.

118. *Torresia macrophylla* Hitchc.; a,  
spikelet; b,  
florets.  $\times 5$ .

Spikelets with 1 perfect floret and 2 sterile lemmas. Glumes unequal, acute or mucronate. Sterile lemmas shorter than the glumes, empty, awned from the back. Fertile lemma shorter than the sterile ones, awnless. Palea 1-nerved, rounded on the back, inclosed in the lemma. (Greek anthos, flower, and xanthos, yellow.)

1. *A. odoratum* L. SWEET VERNAL GRASS.

Fig. 119. Perennial; culms slender, erect, 2 to 6 dm. high; panicle 4 to 8 cm. long, pointed; spikelets brownish green, 8 to 10 mm. long; glumes sparsely pilose; first sterile lemma short-awned below the apex, the second bearing a strong bent scarcely exerted awn near its base.—Meadows and waste ground, Humboldt and Del Norte Cos.; nat. from Eur.

119. *Anthoxanthum odoratum* L.;  
a, habit  $\times \frac{1}{2}$ ; b, spikelet  $\times 2\frac{1}{2}$ ;  
c, florets  $\times 2\frac{1}{2}$ .

62. *PHALARIS* L.

Erect annuals or perennials, with flat blades and spike-like panicles. Spikelets laterally compressed, with 1 perfect floret and 2 reduced sterile lemmas, usually in dense spike-like panicles. Glumes equal, boat-shaped, often winged on the keel. Sterile lemmas reduced to 2 small scales (rarely only 1). Fertile lemma coriaceous, shorter than the glumes, inclosing the palea. (Ancient Greek name for some grass.)

Spikelets in groups of 7, 1 fertile surrounded by 6 sterile. . . . . 1. *P. paradoxa*.  
Spikelets single, all alike.

Plants perennial.

Rhizomes absent; panicle dense, ovate or oblong. . . . . 2. *P. californica*.

Rhizomes present; panicle spreading during anthesis. . . . . 3. *P. arundinacea*.

Plants annual.

Glumes broadly winged; panicle ovate or short-oblong. . . . . 4. *P. minor*.

Glumes wingless or nearly so; panicles oblong or linear, dense.

Glumes acuminate; fertile lemma turgid, the acuminate apex smooth. . . . . 5. *P. lemmoni*.

Glumes acute; fertile lemma less turgid, villous to the acute apex.  
Panicle 2.5 to 5 cm. long; sterile lemmas  $\frac{1}{3}$  as long as fertile. . . . . 6. *P. caroliniana*.

Panicle 5 to 12 cm. long; sterile lemmas  $\frac{1}{2}$  as long as fertile. . . . . 7. *P. angusta*.

1. *P. paradoxa* L. GNAWED CANARY GRASS. Annual; culms tufted, more or less spreading at base, 3 to 6 dm. high; panicle dense, narrowed at base, 2.5 to 5 cm. long, often inclosed at base in the uppermost enlarged sheath; spikelets falling in groups of 7, the central fertile, nearly sessile, the others sterile, slender-pedicelled; glumes of sterile spikelets narrow, with faint lateral nerves, the keel prominently winged above, the wing extending into a more or less well-marked tooth, the apex of the glume narrowed into an acuminate point or awn, the glumes of the 4 outer sterile spikelets in the lower part of the panicle more or less deformed into knobs; glumes of fertile spikelet lanceolate, 6 to 8 mm. long, the lateral nerves prominent, the wing on the keel more tooth-like, the apex of the glume narrowed into an awn about 2 mm. long; fertile lemma smooth, shining, 3 mm. long, the sterile lemmas obsolete.—Grain fields, often abundant and widely distributed in the state; nat. from the Old World. Var. *PRAEMORSA* (Lam.) Coss. & Dur. Sterile spikelets short-pedicelled, the 4 outer much reduced, the apex deformed into knobs or variously incurved; fertile spikelet somewhat indurate, several-nerved at base, acuminate, the wing fin-like.—Waste places, San Diego Co. to the Sacramento Valley; the commoner form in Cal.; nat. from Eur.

2. *P. californica* H. & A. Culms erect or somewhat geniculate; blades flat, rather lax, 6 to 12 mm. wide; panicle 2.5 to 5 cm. long, 1.5 to 2 cm. thick, often purplish tinged; glumes about 6 to 7 mm. long, narrow, gradually narrowed from below the middle to an acute apex, the lateral nerves somewhat nearer the margin than the keel; fertile lemma ovate-lanceolate, about 4 mm. long, rather sparsely villous, often exposing the palea, the sterile lemmas about  $\frac{1}{2}$  as long.—Ravines and open moist ground, Coast Ranges from San Luis Obispo Co. to Mendocino Co.; n. to Ore.

3. *P. arundinacea* L. REED CANARY GRASS. Culms erect, 6 to 15 dm. high; panicle 8 to 17 cm. long, narrow, the lower branches as much as 5 cm. long; glumes narrow, 4 mm. long, abruptly narrowed to an acute apex, the keel scabrous, not winged, the lateral nerves about midway between margin and keel; fertile lemma lanceolate, 3 mm. long, shining, sparsely villous; sterile lemmas villous,  $\frac{1}{2}$  as long.—Swamps and moist places, occasional: Lower San Joaquin; Siskiyou Co.; Modoc Co.; common throughout the n. parts of N. Am., Eur. and Asia. A form with variegated leaves is cult. under the name of Ribbon Grass.

4. *P. minor* Retz. Culms erect, 3 to 9 dm. high; panicle ovate-oblong to oblong, 1.5 to 5 cm. long; glumes oblong, 4 to 6 mm. long, broadened, strongly winged on the keel above, with a green stripe on each side of the keel at the base of the wing, the wing scabrous on the margin and more or less toothed; fertile lemma ovate, acute, villous, about 3 mm. long, the

sterile lemma solitary, about  $\frac{1}{3}$  as long.—Waste places, rather abundant: Sacramento Valley, s. to S. Cal.; nat. from Mediterranean region.

*P. CANARIENSIS* L., Canary Grass, with somewhat thicker panicles and larger spikelets with more conspicuously striped glumes and a pair of sterile lemmas about half as long as the fertile one, is sparingly escaped from cult., Yreka, San Diego, Pasadena, Berkeley, Monterey; native of Mediterranean region.

*P. BRACHYSTACHYS* Link, resembling *P. canariensis*, but with smaller spikelets and a pair of minute sterile lemmas, has been found in waste ground at Nelson, Butte Co.; native of Mediterranean region.

5. *P. lémmoni* Vasey. Culms erect, 3 to 9 dm. high; panicle 5 to 10 cm. long; glumes about 5 mm. long, narrow, the lateral acuminate, dark-colored at maturity, villous except the acuminate tip, 3.5 mm. long; sterile lemmas less than  $\frac{1}{3}$  as long.—Localized: Sierra Nevada foothills (Butte Co. and Chinese Camp); South Coast Ranges; s. to S. Cal.

6. *P. caroliniana* Walt. Culms erect, 3 to 6 dm. high; panicle oblong; glumes 5 to 6 mm. long, oblong, rather abruptly narrowed to an acute apex, the keel scabrous and narrowly winged above from below the middle, the lateral nerves about midway between keel and margin; fertile lemma ovate, acute, densely villous, about 4 mm. long.—Waste ground, rare, Mendocino and Ventura Cos.; native of se. U. S., apparently introduced on Pacific Coast.

7. *P. angusta* Nees. Culms 9 to 15 dm. high, smooth; blades flat, 6 to 8 mm. wide; panicle dense, linear-oblong, about 8 mm. thick; glumes about 4 mm. long, narrow, rounded at apex to a mucronate tip, scabrous on keel, nerves, and more or less on the back, especially near the apex, lateral nerves near the margin; fertile lemma ovate-lanceolate, acute, villous, 3 mm. long.—Open ground, at low altitudes: South Coast Ranges; upper San Joaquin Valley; cismontane S. Cal.; e. to La.

#### TRIBE 8. *Panicaceae*. MILLET TRIBE

Spikelets with one perfect terminal floret and below this a sterile floret and two glumes; fertile lemma and palea indurate, or at least firmer than the glumes and sterile lemma; articulation below the spikelet.

#### 63. *SYNTHERISMA* Walt.

Annuals or perennials with slender racemes digitate or aggregate at the summit of the culm. Spikelets lanceolate or elliptic, plano-convex, solitary or in 2s or 3s, subsessile or short-pedicelled, alternate in two rows on one side of a 3-angled winged or wingless rachis. First glume minute or wanting; second glume equaling the sterile lemma or shorter. Fertile lemma cartilaginous, the hyaline margins pale. (Greek syn, with, and therismos, harvesting.) (Digitaria of authors, not Heist.)

120. *Syntherisma sanguinalis* Dulac; a, infl.  $\times \frac{1}{2}$ ; b, c, spikelet (2 views)  $\times 7$ .

1. *S. sanguinalis* (L.) Dulac. CRAB GRASS. Fig. 120. Annual, usually much-branched at base; culms 3 to 9 dm. high, geniculate-spreading, or creeping and rooting at the nodes, the flowering culms erect; sheaths more or less papillose-hirsute; blades lax, flat, 6 to 15 cm. long, 4 to 10 mm. wide, often pilose; racemes 3 to 12, subdigitate, 5 to 12 cm. long; spikelets in pairs, about 3 mm. long, usually appressed-pubescent between the nerves; pedicels angled; first glume minute; second glume about  $\frac{1}{2}$  as long as the spikelet.—Weed in cult. and waste ground, San Diego; throughout warm and temperate Am.; nat. from Eur.

#### 64. *ERIÓCHLOA* H.B.K.

Annuals or perennials, with terminal panicles consisting of several to many racemes, along the main axis. Spikelets more or less

pubescent. solitary or sometimes in pairs, short-pedicceled or subsessile, in two rows on one side of a narrow usually hairy rachis, the pedicels often clothed with long stiff hairs, the back of the fertile lemma turned from the rachis. Lower rachilla joint thickened, forming a more or less ringlike, usually dark-colored callus below the second glume, the first glume reduced to a minute sheath about this and adnate to it. Second glume and sterile lemma about equal, acute or acuminate. Fertile lemma indurate, minutely papillose-rugose, mucronate or awned, the awn often readily deciduous. (Greek erion, wool, and chloa, grass.)

1. *E. aristata* Vasey. Fig. 121. Plants annual, branched at base; culms erect, sometimes decumbent at base, 3 to 9 dm. high; leaves glabrous, the blades flat, 4 to 10 mm. wide; racemes ascending or appressed, 2 to 3 cm. long, several to many on a pubescent axis 5 to 10 cm. long; spikelets approximate on a pubescent rachis, lanceolate, subulate-pointed, 6 to 8 mm. long, appressed-villous; fruit apiculate.—Moist open ground, lower Colorado River (Bard, Ft. Yuma); Ariz. to Mex.

### 65. *PÁSPALUM* L.

Ours perennials, with 2 to many spike-like racemes. Spikelets plano-convex, usually obtuse, subsessile, solitary or in pairs, in two rows on one side of a narrow or dilated rachis, the back of the fertile lemma toward it. First glume usually wanting; second glume and sterile lemma commonly about equal. Fertile lemma usually obtuse, chartaceous-indurate, the margins inrolled. (Paspalos, a Greek name for millet.)

1. *P. distichum* L. JOINT GRASS. Culms erect from a decumbent rooting base, with numerous creeping rhizomes, 3 to 6 dm. high; sheaths glabrous or nearly so; blades flat, glabrous, rarely pubescent, 5 to 8 cm. long, the upper shorter; racemes 2, paired, slender, ascending or appressed, 2.5 to 6 cm. long, sometimes a third below the pair; spikelets elliptic, 3 mm. long; first glume commonly developed in one or more spikelets of a raceme, nearly as long as spikelet; second glume pubescent; sterile lemma glabrous.—Along the seacoast and interior irrigation ditches, Los Angeles, Merced, Crescent City; n. to the Columbia River; common near coasts throughout warmer parts of both hemispheres.

*P. dilatatum* Poir., a tall perennial with elongate blades and panicles of 5 to 10 rather heavy spreading racemes on a slender axis, the flat overlapping spikelets 3 to 3.5 mm. long and with silky hairs around the margin; adv. near Los Angeles; native of S. Am.

*P. LARRAÑAGAI* Arech., somewhat more robust than *P. dilatatum*, with conspicuously villous lower sheaths and denser panicles, the racemes ascending, the spikelets smaller and more hairy, has been found along irrigation ditches at Berry Creek, Butte Co. and at Palm Springs, Mt. San Jacinto; native of S. Am.

### 66. *PÁNICUM* L. PANIC GRASS

Annuals or perennials. Spikelets arranged in open or compact panicles, rarely racemes. Glumes usually very unequal, the first often minute, the second typically equaling the sterile lemma, the latter of the same texture and simulating a third glume, bearing in its axil a membranaceous or hyaline palea and sometimes a staminate flower, the palea rarely wanting. Fertile lemma chartaceous-indurate, typically obtuse, the nerves obsolete, the margins inrolled over an inclosed palea of the same texture. (Ancient Latin name for common millet.)

Plants annual.

Fruit transversely rugose.....1. *P. arizonicum*.

Fruit smooth.

Panicle drooping, heavy.....5. *P. miliaceum*.

121. *Eriochloa aristata* Vasey; a, spikelet; b, fertile floret. x 10.

## Panicle erect.

Panicle more than  $\frac{1}{2}$  the length of the entire plant.Spikelets 2 to 2.5 mm. long.....2. *P. capillare*.Spikelets 3 to 3.3 mm. long.....3. *P. barbipulvinatum*.Panicle not more than  $\frac{1}{2}$  the entire height of plant; spikelets 2.8 to 3.3 mm. long.....4. *P. hirticaule*.

## Plants perennial.

Spikelets 6 to 7 mm. long, pointed.....6. *P. urvilleanum*.

Spikelets less than 3.5 mm. long, obtuse.

Spikelets turgid, strongly nerved, sparsely hispid, 3.2 to 3.3 mm. long.....13. *P. scribnerianum*.

Spikelets not turgid or strongly nerved, pubescent, less than 3 mm. long.

Spikelets about 2.5 mm. long.....12. *P. shastense*.

Spikelets not over 2 mm. long.

Sheaths glabrous or nearly so.....7. *P. lindheimeri*.

Sheaths pubescent.

Plants velvety-pubescent throughout.....11. *P. thermale*.

Plants more or less pubescent but not velvety.

Vernal blades glabrous or nearly so above.....9. *P. occidentale*.

Vernal blades pubescent above.

Upper surface of blades pilose; autumnal phase decumbent-spreading.....10. *P. pacificum*.Upper surface of blades appressed-pubescent; autumnal phase erect or ascending.....8. *P. huachucae*.

A. Subgenus EUPANICUM Gren. & Godr. Annuals or perennials of various habit, but not forming winter rosettes of leaves different in appearance from the culm leaves, nor presenting distinct vernal and autumnal aspects.

1. *P. arizonicum* Scribn. & Merr. Fig. 122. Culms usually branching from the base, glabrous except below the panicle, 2 to 6 dm. high; nodes sometimes slightly pubescent; sheaths glabrous to strongly papillose-pubescent; blades 5 to 15 cm. long, 6 to 12 mm. wide, glabrous or papillose-hispid beneath; panicles long-exserted, finely pubescent and copiously papillose-hirsute, 7.5 to 22 cm. long, the branches solitary, ascending, few-flowered; spikelets 3.5 to 3.8 mm. long, obovate-elliptic, abruptly pointed, densely hirsute to glabrous, borne on very short appressed branchlets. — Open ground, Jamacha, San Diego Co.; e. to Tex., s. to Mex.

122. *Panicum arizonicum* Scribn. & Merr.; a, b, spikelet (2 views); c, fertile floret. x 10.

## P. DICHOTOMIFLORUM Michx.,

a smooth freely branching annual with numerous open many-flowered panicles of short-pedicelled spikelets, the first glume minute, broad and blunt, has been found in cult. soil at Fresno and southw.; native of e. U. S.

2. *P. capillare* L. OLD-WITCH GRASS. Erect, 3 to 6 dm. high; foliage conspicuously papillose-hispid; blades 10 to 25 cm. long, 6 to 10 mm. wide; panicle large, diffuse, included at the base until maturity, the whole panicle finally breaking away and rolling before the wind; spikelets elliptic, abruptly pointed. — Rare, Pinegrove, Amador Co.; a common weed in e. U. S.

3. *P. barbipulvinatum* Nash. Closely resembling no. 2, of which it is the western representative, but stouter, branching mostly from the base, with shorter less pubescent blades crowded toward the base, the spikelets about 3 mm. long. — Open ground and cultivated soil, lower altitudes throughout the state; B. C. to N. Dak. and Tex.

4. *P. hirticaule* Presl. Erect or nearly so, 1.5 to 6 dm. high, more or less papillose-hispid throughout, especially on the sheaths; blades 4 to 12 mm. wide, often sparsely hispid toward the often cordate base; panicle open, the branches ascending; spikelets acuminate, usually reddish brown. — Open sandy ground, Jamacha, San Diego Co.; e. to Tex., s. to S. Am.

5. *P. miliaceum* L. HOG MILLET. BROOM-CORN MILLET. Plants coarse, as much as 9 dm. high, often depauperate; culms and leaves more or less papillose-hispid; panicle 10 to 30 cm. long, rather compact, the numerous branches ascending, spikelet-bearing toward the summit; spikelets 4.5 to 5 mm. long, ovate, acuminate, strongly many-nerved; first glume  $\frac{1}{2}$  the length of the spikelet. — Sparingly escaped from cult., Kenwood, Sacramento, Riverside; native of Eur.

6. *P. urvilleanum* Kunth. Fig. 123. Plants robust, 6 to 9 dm. high, perennial from creeping rhizomes; culm solitary or few in a tuft, the nodes densely bearded but usually hidden by the harshly villous sheaths; blades 4 to 6 mm. wide, flat, tapering to a long involute-setaceous point; panicle about 30 cm. long, open; spikelets densely silvery or tawny-villous; first glume acuminate,  $\frac{2}{3}$  to nearly as long as spikelet. — Sandy deserts, Mohave and Colorado deserts; e. to southern Ariz.; also Chile and Argentina.

B. Subgenus *DICHANTHELIUM*

Hitchc. & Chase. Tufted perennials, producing winter rosettes of leaves different in shape from the culm leaves; vernal culms slender, simple, bearing small open comparatively few-flowered terminal panicles; autumnal culms repeatedly branched, with numerous reduced branchlets, reduced leaves and partly included cleistogamous panicles.

7. *P. lindheimeri* Nash. Vernal culms stiffly ascending or spreading, 3 to 6 dm. high, glabrous, or the lower part somewhat pubescent; blades ciliate on the margin toward the base; ligule a ring of hairs 4 to 5 mm. long; panicle 4 to 8 cm. long, open; spikelets about 1.5 mm. long, obovate, obtuse, turgid, pubescent; autumnal culms stiffly spreading or radiate-prostrate, with tufts of short appressed branches at the nodes; blades involute-pointed, often conspicuously ciliate at base. — Open mostly moist ground, rare: Sacramento; Three Rivers; throughout mid. and e. U. S.

8. *P. huachucae* Ashe. Vernal phase usually stiffly upright, more or less harsh-pubescent throughout; culms 3 to 6 dm. high, the nodes bearded; ligule of stiff hairs about 4 mm. long; panicle 5 to 8 cm. long, the axis and usually the branches pilose; spikelets 1.6 to 1.8 mm. long, obovate, pubescent; autumnal phase stiffly erect, the branches fascicled, the crowded blades ascending. — Open ground, rare, San Bernardino Mts.; chiefly in the Mississippi Valley.

9. *P. occidentale* Scribn. Vernal phase yellowish green; culms slender, 1.5 to 3 dm. high, spreading, sparsely pubescent; leaves mostly at the base; sheaths sparsely pubescent; ligule ciliate, about 4 mm. long; blades appressed-pubescent beneath; panicle 5 to 8 cm. long, open; spikelets 1.8 mm. long;

123. *Panicum urvilleanum* Kunth; a, habit x  $\frac{1}{2}$ ; b, c, d, spikelet (3 views) x 3; e, staminate floret x 3; f, fertile floret (2 views) x 3.

autumnal phase branching from the lower nodes, forming a spreading tussock.—Peat bogs and moist sandy soil, scattered stations at low or middle altitudes: San Diego; Sierra Nevada; North Coast Ranges; n. to B. C.

10. *P. pacificum* Hitchc. & Chase. Vernal phase light green, more or less papillose-pilose throughout, 3 to 6 dm. high; ligule ciliate, about 4 mm. long; spikelets 1.8 to 2 mm. long; autumnal phase prostrate-spreading, repeatedly branching from the upper and middle nodes.—Sandy shores and slopes, and moist crevices in rocks: San Bernardino Mts. and Sierra Nevada, 500 to 4000 ft.; along the coast from Pt. Reyes to Del Norte Co.; n. to B. C. The commonest species of the genus in Cal. Distinguished from no. 9 by the more copious pubescence, more leafy culms, and, in the autumnal phase, by the branching habit.

11. *P. thermale* Boland. Vernal phase grayish green, densely tufted, 1 to 3 dm. high; culms ascending or spreading; nodes bearded; ligule ciliate, about 3 mm. long; blades thick, mostly about 5 cm. long; spikelets about 2 mm. long; autumnal phase widely spreading, repeatedly branching, forming a dense cushion.—Wet saline soil, mostly in vicinity of hot springs: Sonoma Co.; Lassen Peak; n. to B. C. and the Yellowstone.

12. *P. shastense* Scribn. & Merr. Vernal phase 3 to 4.5 dm. high; papillose-pilose throughout; ligule sparsely ciliate, 3 mm. long; spikelets papillose-pubescent; autumnal phase spreading, with geniculate nodes and elongate arched internodes, rather sparingly branching from the middle nodes.—Meadows, Castle Crag, upper Sacramento River (the only known locality).

13. *P. scribnerianum* Nash. Vernal phase erect, 3 to 6 dm. high; sheaths papillose-hispid; ligule ciliate, about 1 mm. long; blades 5 to 8 cm. long, 6 to 12 mm. wide, firm, rounded and ciliate at base, glabrous above, often pubescent beneath; panicles 5 to 8 cm. long; spikelets blunt, sparsely hispid or nearly glabrous; autumnal phase branching from the middle and upper nodes, the branches longer than the internodes, late in the season producing crowded branchlets with ascending, not greatly reduced blades and small, partly included panicles from their upper nodes.—Meadows, Castle Crag, upper Sacramento River; e. to Me.; common in the Mississippi Valley.

#### 67. *ECHINOCHLOA* Beauv.

Coarse, often succulent, our species annual with compressed sheaths, linear flat blades, and rather compact panicles of short densely flowered racemes along a main axis. Spikelets plano-convex, often stiffly hispid, subsessile,

124. *Echinochloa crusgalli* Beauv.; habit  $\times \frac{1}{4}$ .

solitary or in irregular clusters on one side of the panicle branches. First glume about half the length of the spikelet, pointed; second glume and sterile lemma equal, pointed, mucronate, or the glume short-awned and the lemma long-awned, sometimes conspicuously so, inclosing a membranaceous palea and sometimes a staminate flower. Fertile lemma plano-convex, smooth and shining, acuminate-pointed, the margins inrolled below, flat above, the apex of the palea not inclosed. (Greek echinos, hedgehog, and chloa, grass.)

Sterile and fertile lemmas awn-tipped or long awned. . . . .

1. *E. crusgalli*.

Sterile and fertile lemmas scarcely mucronate. . . . .

2. *E. colonum*.

1. *E. crusgalli* (L.) Beauv. WATER GRASS. Fig. 124. Culms stout, branching from the base or erect, usually 6 to 9 dm. high, sometimes larger; leaves glabrous; panicle dense, 10 to 25 cm. long, consisting of several erect spreading or even drooping racemes; spikelets green or purple, long-awned or nearly awnless, about 3 mm. long, exclusive of awns, densely and irregularly

crowded in 3 or 4 rows.—Fields and cult. soil, especially along irrigating ditches: serious pest in the Sacramento Valley rice-fields; nat. from Eur. Var. *zelayensis* (H.B.K.) Hitchc. An erect pale short-awned form with short ascending racemes.—Open, often alkaline soil, mostly along irrigating ditches, Imperial Co.; e. to Tex., s. to Mex.

2. *E. colònum* (L.) Link. Culms erect, spreading or prostrate, 3 to 6 dm. high; leaves smooth; panicle of 5 to 10 dense racemes, 1.5 to 2.5 cm. long, rather distant, racemose, erect or nearly so; spikelets about 3 mm. long; glumes and sterile lemma pubescent.—Occasional in moist places in S. Cal.; introd. from the Old World into the warmer parts of Am.

#### 68. *CHAETÓCHLOA* Scribn. FOXTAIL MILLET

Annuals or perennials with narrow usually dense and spike-like panicles. Spikelets subtended by one to several bristles (sterile branchlets), falling free from the bristles. First glume broad, usually less than half the length of the spikelet, 3 to 5-nerved; second glume and sterile lemma equal, or the glume shorter, several-nerved. Fertile lemma coriaceous indurate, smooth or rugose. (Greek chaete, bristle, and chloa, grass.) (Setaria Beauv.)

Plants annual.

Bristles backwardly barbed.....

1. *C. verticillata*.

Bristles forwardly barbed.

Bristles below each spikelet 5 or more.....

3. *C. lutescens*.

Bristles below each spikelet 1 to 3...2. *C. viridis*.

Plants perennial by short rhizomes or knotty crown. 4. *C. geniculata*.

1. *C. verticillata* (L.) Scribn. Fig. 125. Culms 3 to 6 dm. high; blades scabrous; panicles usually green, 5 to 10 cm. long, somewhat lobed or interrupted at base, tapering above; bristles 4 to 6 mm. long; spikelets 2 to 2.5 mm. long.—Waste ground, S. Cal. (Upland), rare; nat. from Eur.

125. *Chaetochloa verticillata* Scribn.; Stuntz; infl. x  $\frac{1}{2}$ .

2. *C. viridis* (L.) Scribn. GREEN FOXTAIL. Culms 3 to 6 dm. high; blades flat, not twisted; panicle green, oblong-ovate, 2.5 to 8 cm. long; bristles 1 to 3, slender, 6 to 12 mm. long; spikelets 2 mm. long; fruit faintly wrinkled.—Waste ground, rare, San Bernardino Valley; nat. from Eur.

3. *C. lutescens* (Weig.) Stuntz. YELLOW FOXTAIL. PIGEON GRASS. Fig. 126. Culms branching at the base, compressed, erect or ascending, 3 to 6 dm. high; blades flat, with a spiral twist; panicle yellowish, cylindric, dense, 2.5 to 8 cm. long; bristles 5 or more, 4 to 8 mm. long; spikelets 3 mm. long;

125. *Chaetochloa verticillata* Scribn.; a, habit x  $\frac{1}{2}$ ; b, branchlet with spikelet and bristles x 4.

fruit cross-wrinkled.—Weed in fields and waste places, somewhat rare: Sacramento; Fresno; Three Rivers; Los Angeles; Riverside; nat. from Eur. (*Setaria glauca* of authors.)

4. *C. geniculata* (Lam.) Millsp. & Chase. Culms erect, 9 to 12 dm. high; blades 4 to 6 mm. wide, flat or folded; panicle slender, linear, 5 to 10 cm. long, 5 to 6 mm. thick; bristles 5 to 8, twice as long as spikelet, pale or tawny; spikelets 2 mm. long; fruit cross-wrinkled.—Open ground, rare: Fresno; Los Angeles; Pomona; Riverside; e. to southern U. S., s. to Argentina. (*Setaria gracilis* H.B.K.)

#### 69. *PENNISËTUM* Rich.

Ours perennial with dense thick panicles. Spikelets solitary or in groups of 2 or 3, surrounded by an involucre of bristles, these not united except at the very base, often plumose, falling attached to the spikelets. First glume shorter than the spikelet, sometimes minute or wanting; second glume shorter than or equaling the sterile lemma. Fertile lemma chartaceous, smooth, the margin thin, inclosing the palea. (Latin penna, feather, and seta, bristle.)

1. *P. villòsum* R. Br. Culms geniculate, 3 to 6 dm. high, with dense soft feathery terminal spike-like panicles 2.5 to 8 cm. long; bristles of the involucre slender, plumose, about 2.5 cm. long.—Cult. for ornament; escaped in hills near Santa Barbara and Ventura; native of Abyssinia.

#### 70. *CÉNCHRUS* L.

Our species annual with flat blades and racemes of readily deciduous burs. Spikelets solitary or few together, surrounded and inclosed by a spiny bur composed of numerous coalescing bristles (sterile branchlets), the bur globular, the peduncle short and thick, articulate at base, falling with the spikelets and permanently inclosing them, the seed germinating within the old involucre. (Greek kegehros, millet.)

1. *C. pauciflorus* Benth. SANDBUR. Fig. 127. Culms flattened, much branched, ascending or spreading, 3 to 6 dm. high; blades flat; burs 8 to 20, spiny, the body 4 to 6 mm. thick; spikelets 2 to 3 in each bur.—Sandy soil, nearly across the continent; rare in Cal. but spreading; Mecca; Redlands; San Bernardino; betw. Ontario and

127. *Cenchrus pauciflorus* Benth.; habit  $\times \frac{1}{2}$ .

Colton; Kerman; Fresno. (*C. caroliniana* of authors.)

#### TRIBE 9. *Andropogoneae*. SORGHUM TRIBE

Spikelets in pairs along a rachis, the usual arrangement being one of the pair sessile and fertile, the other pedicellate and staminate or neuter, or rarely wanting, only the pedicel present; fertile spikelet consisting of one perfect terminal floret and below this, a staminate or neuter floret, the lemmas thin or hyaline, and two awnless glumes, usually one or both firm or indurate.

#### 71. *IMPERATA* Cyr.

Slender erect perennials with narrow silky panicles. Spikelets all alike, awnless, in pairs, unequally pedicellate on a slender continuous rachis, surrounded by long silky hairs. Glumes about equal, membranaceous. (Ferrante Imperate, Italian naturalist.)

128. *Imperata hookeri* Rupr.; a, panicle  $\times \frac{1}{4}$ ; b, rachis and pedicels  $\times 5$ ; c, spikelet  $\times 5$ .

129. *Andropogon saccharoides* Sw.: a, habit  $\times \frac{1}{2}$ ; b, fertile spikelet displayed  $\times 2\frac{1}{2}$ ; c, pair of spikelets  $\times 2\frac{1}{2}$ .

usually bearing a bent and twisted awn from the apex or from between the lobes. Palea small or wanting. Pedicellate spikelet reduced. (Greek aner, man, and pogon, beard.)

Inflorescence a flabellate panicle of numerous racemes, sessile on the main axis. ....  
1. *A. saccharoides*.

Inflorescence of numerous compound branches, the racemes in pairs subtended by spathes. ....  
2. *A. glomeratus*.

1. *A. saccharoides* Sw. Fig. 129. Culms tufted, erect or somewhat spreading at base, 6 to 12 dm. high, glabrous except the densely ascending-hispid nodes; sheaths glabrous; blades 3 to 6 mm. wide, flat, scabrous above, the upper much reduced; panicle 5 to 8 cm. long, silky-white; glumes of sessile spikelet 5 mm. long, the awn about 1 cm. long, bent at the middle, tightly twisted below.—Dry hills, Santa Barbara to San Diego; e. to Tex. and W. I., s. to S. Am. (*A. barbinodis* Lag.)

2. *A. glomeratus* (Walt.) B.S.P. Fig. 130. Culms stout, erect, wand-like, 6 to 9 dm. high; sheaths compressed, usually sparsely villous; inflo-

1. *I. hookeri* Rupr. Fig. 128. Culms erect from creeping rhizomes, 9 to 15 dm. high, glabrous; sheaths glabrous; blades elongate, the lower narrowed at the long conduplicate base, 8 to 12 mm. wide, acuminate, glabrous, the uppermost much reduced; panicle 15 to 30 cm. long, pale, tawny, or somewhat rose-tinted; spikelets about 3 mm. long, the hairs twice as long.—Death Valley to the Colorado Desert; e. to N. Mex., s. to Mex.

## 72. ANDROPÖGON L. BEARD GRASS

Our species perennials with solid culms, the spikelets in racemes, these numerous, aggregate on a common axis, or single, in pairs, or sometimes in 3s or 4s, the common peduncle usually inclosed by a spathe-like sheath, these sheaths often numerous, forming a compound inflorescence. Rachis readily disarticulating, the joints and the pedicels of the sterile spikelets often villous. Glumes of the fertile spikelet coriaceous, narrow, the first rounded, flat, or concave on the back, several-nerved, the median nerve weak or wanting. Fertile lemma

130. *Andropogon glomeratus* B.S.P.: a, habit  $\times \frac{1}{2}$ ; b, joint of raceme  $\times 3$ ; c, glumes  $\times 6$ ; d, sterile lemma  $\times 6$ ; e, fertile lemma  $\times 6$ .

escence oblong or corymbose,  $\frac{1}{2}$  to  $\frac{3}{4}$  the entire height of the plant; spathes scabrous; racemes 2 to 3 cm. long, the slender joints of the rachis clothed with long silky hairs; awns delicate, straight.—Rocky slopes, San Bernardino foothills to the Funeral Mts.; e. to Mass. and Fla.

### 73. *HÓLCUS* L.

Annuals or perennials with flat blades and terminal panicles of 1 to 5 jointed tardily disarticulating racemes. Pedicellate spikelets usually staminate, the terminal joint with two pedicellate spikelets. (Old Latin name for a grass, probably from Greek *holcos*, attractive.) (Sorghum Pers.)

131. *Holcus halepensis* L.:  
a, rhizome and panicle x  
 $\frac{1}{3}$ ; b, pair of spikelets x 5.

1. *H. halepensis* L. JOHNSON GRASS. Fig. 131. An erect glabrous robust perennial with extensively creeping rhizomes; culms 6 to 12 dm. high; blades flat, 6 to 18 mm. wide, the midrib prominent, white; panicle 15 to 25 cm. long, open; fertile spikelets about 5 mm. long, the glumes pubescent, becoming glabrate and shining; fertile lemma with a bent readily deciduous awn; staminate spikelets narrow, 4 mm. long, on pedicels about 3 mm. long, the glumes membranaceous, nerved, glabrous.—Occasional from Santa Barbara to San Diego Co. along the coast; introd. from the Old World. A valuable forage grass but often becoming an aggressive weed. (*Andropogon halepensis* Brot.) The Sudan Grass of cultivation is *Holcus sorghum* var. *sudanensis* (Piper) Hitchc.; rootstocks none; branches few; midribs not white.

### CYPERACEAE. SEDGE FAMILY

Grass-like or rush-like herbs with fibrous roots, annuals, or many species perennial by long rootstocks. Stems solid (rarely hollow), usually triangular or terete, commonly scape-like with mostly basal leaves. Leaves alternate, narrow, with closed sheaths, often 3-ranked. Flowers one in the axil of each bract (scale), borne in spikelets or spikes arranged in clusters, heads, racemes, panicles or umbels. Perianth none or represented by usually 4 to 6 bristles. Stamens 1 to 3. Pistil 1; ovary 1-celled with 1 ovule, the single style with 2 or 3 stigmas. Fruit a lenticular or 3-angled achene. Embryo minute in mealy endosperm.

Flowers all, or at least some of them, perfect.

Flowers all perfect; spikelets many-flowered, with 1 or 2 of the lower scales empty.—

#### SCIRPEAE.

Spikelets flattened, the scales in 2 opposite ranks.

Inflorescence terminal, involucrate; flowers without bristles; achene beakless.....1. *CYPERUS*.

Inflorescence axillary; flowers with bristles; achene beaked.....2. *DULICHIMUM*.

Spikelets cylindrical (or sometimes a little flattened in no. 5) the scales imbricated around the axis in several rows.

Style enlarged or bulbous at base.

Bulbous base of style persistent on the achene; perianth bristles generally present; spikelet solitary, terminating the naked stem, the leaves at base reduced to sheaths.....3. *ELEOCHARIS*.

Bulbous base of style deciduous, not persistent on achene; perianth bristles none; spikelets umbellate or capitate, the stems leafy at base.....4. *FIMBRISTYLIS*.

Style not enlarged at base.

Scales not enclosing a bractlet; perianth bristles usually present.

Perianth bristles 1 to 8, barbed or none; stamens mostly 3; spikelets solitary or clustered or in a compound umbel; stem often leafy at base and inflorescence involucrate; perennials except 2 species.....5. *SCIRPUS*.

Perianth bristles numerous, naked, long-exserted and silky in fruit; stamens 1 to 3; spikelets few, otherwise as in *Scirpus*; perennials.....6. *ERIOPHORUM*.

- Scales enclosing a minute bractlet; bristles none; annuals.....  
 7. HEMICARPHA.  
 Flowers of 2 kinds, perfect and staminate; spikelets few (1 or 2, sometimes to 6)-  
 flowered, with 3 to several of the lower scales empty.—RYNCHOSPOREAE.  
 Scales 2-ranked; style wholly deciduous.....8. SCHOENUS.  
 Scales spirally imbricated.  
 Style wholly deciduous; perianth bristles none.....9. CLADIUM.  
 Style or its base persistent as a tubercle or beak on the achene; perianth  
 bristles commonly present.....10. RYNCHOSPORA.  
 Flowers unisexual; spikes many-flowered, the lower scales not empty; achene enclosed  
 in a sac (perigynium) or spathe.—CARICEAE.....11. CAREX.

# 1. CYPÉRUS L. GALINGALE

Annuals or perennials. Stems triangular or terete, never branched, leafy at base. Inflorescence subtended by a conspicuous leafy involucre, umbellate with unequal rays and a sessile central spike, or capitate. Flowers in flattened or subterete spikelets, the spikelets in capitate clusters or arranged in spikes borne on the rays. Scales concave, more or less carinate, 2-ranked. Perianth none. (Greek Kupeiros, the ancient name.)

- Style 2-cleft; achene lenticular or at least not triangular; spikelets flat; scales falling from the rachis; rachis not winged; stems with a single simple cluster of spikelets.  
 Spikelets in a close terminal cluster; scales sharply carinate; achene lenticular.  
 Achene oblong; stamens 2; scales obtuse, 1 line long.....1. *C. melanostachyus*.  
 Achene ovoid; stamens 3; scales acute, 2 lines long.....2. *C. bromoides*.  
 Spikelets in an apparently lateral cluster; stamens 3; scales scarcely carinate; achene plano-convex.....3. *C. laevigatus*.  
 Style 3-cleft; achene 3-angled; inflorescence compound, the clusters of spikelets borne on rays, or sometimes congested and capitate.  
 Spikelets flattened; scales falling away from the rachis which is persistent on the spike.  
 Rachis naked or nearly so, the scales not decurrent upon it; stamen 1.  
 Scales not toothed on back; low or dwarf annuals.  
 Scales 7 to 9-nerved, with strongly recurved setaceous tips.....  
 4. *C. aristatus*.  
 Scales obscurely 3-nerved, with short recurved tips...5. *C. acuminatus*.  
 Scales minutely toothed on back at apex, obtuse or merely acute, without recurved tips; tall perennial.....6. *C. virens*.  
 Rachis with the scales decurrent upon it as narrow scarious wings; stamens 3.  
 Wings of the rachis soon separating to the base; annual.  
 Wings persistent on the rachis.....7. *C. erythrorhizos*.  
 Wings readily deciduous.....8. *C. sphacelatus*.  
 Wings of the rachis persistent; perennial by means of tuber-bearing rootstocks.....9. *C. esculentus*.  
 Spikelets not so strongly flattened, deciduous from (but the 2 lowest scales persistent on) the spike; scales decurrent on the rachis as wings; wings broad, scarious, wholly adnate to rachis; stamens 3.  
 Perennials with basal tuber-like corms; spikelets falling whole; wings not enclosing achenes.....10. *C. strigosus*.  
 Annuals; spikelets breaking up into 1-fruited joints; wings very broad, enclosing achenes.  
 Spikes oblong, compact.....11. *C. speciosus*.  
 Spikes short, loose and spreading.....12. *C. ferax*.

1. *C. melanostachyus* H.B.K. Annual; stems very slender, triangular,  $\frac{3}{4}$  to 1 ft. high; leaves elongate-tapering, 1 line wide or less; involucre bracts 2 or 3, foliaceous, narrowly linear,  $\frac{1}{2}$  to  $3\frac{1}{2}$  in. long; spikelets oblong, 3 to 6 lines long, in a small capitate cluster; scales chestnut-brown, keeled, 3-nerved on back, very obtuse, 1 line long; achene lenticular, sharply beaked.—Rivers and valleys, widely scattered, not common, 20 to 2000 ft.; s. to Mex. and Argentina.

2. *C. bromoides* Link. Annual; stems slender, 1 to  $1\frac{3}{4}$  ft. high, exceeding the few rough-margined leaves; spikelets 4 to 9 lines long; involucre bracts 2 to 4, the longest 4 to  $5\frac{1}{2}$  in. long; scales acute, yellow-brown, about 2 lines long, the keel 3-nerved and the margins scarious; achene ovoid, black,  $\frac{1}{3}$  as long as scale.—Los Angeles Co.; Mex. and tropical regions of the Americas.

3. *C. laevigatus* L. Perennial, the stems arising at intervals from a wiry rootstock; stems subterete, slender, 3 to 10 in. high, hardly surpassing the erect filiform leaves; spikelets 2 to 5, 2 to 4 lines long, in a sessile apparently lateral cluster; involucre of usually 2 bracts, one long (1 to 2 in.) and erect, in continuation of stem, the other short (3 or 4 lines long) or wanting; rachis deeply pitted transversely; scales orbicular, 3-nerved in middle, a brown blotch on each side, closely imbricated,  $\frac{3}{4}$  line long; achene oblong, gray,

$\frac{1}{2}$  as long as scale.—Along streams in wet sand: cismontane S. Cal.; Colorado Desert; Death Valley; s. to Mex.; all continents.

4. *C. aristatus* Rottb. Dwarf annual; stems  $\frac{1}{2}$  to 6 in. high, barely exceeding the leaves; leaves flat,  $\frac{1}{2}$  line or less wide; involucre bracts foliaceous,  $\frac{1}{2}$  to 2 in. long; spikelets linear-oblong,  $1\frac{1}{2}$  to 3 lines long, in a dense compound head or in close clusters on 2 or 3 short ( $\frac{1}{4}$  to 1 in. long) rays; rachis not winged; scales 7 to 9-nerved, with strongly recurved setaceous tips, chestnut-brown or greenish,  $\frac{2}{3}$  to 1 line long; achene 3-angled.—Widely scattered, valleys, mts. and deserts, 500 to 4000 ft., but not common; n. to B. C., e. to the Atlantic; S. Am., Afr., Asia, Austr.

5. *C. acuminatus* Torr. & Hook. Annual; stems slender, tufted, 5 to 12 in. high; leaves commonly less than 1 line wide; bracts of the involucre 2 or 3, much elongated; spikelets 3 or 4 lines long, capitate on the rays or the whole inflorescence congested and head-like; scales oblong, obscurely 3-nerved, with a short recurved tip; achene 3-angled, about  $\frac{1}{2}$  as long as scale.—S. Sierra Nevada in Tulare Co. (rare); n. to Wash.; Ariz. to La. and Ill.

6. *C. virens* Michx. Perennial; stems acutely triangular, 1 to 3 ft. high; involucre bracts 4 to 6, very long and leafy, broad and strongly keeled; umbel compound, or the spikes capitate on the rays, or the whole often much reduced and subcapitate; spikelets numerous, many-flowered, long-oblong, 4 to 8 lines long; scales concave-carinate, serrulate on back at apex, 1 line long; achene 3-angled.—Cismontane, 20 to 5000 ft., widely scattered; e. to N. C. and s. to Cent. Am.

7. *C. erythrorhizos* Muhl. Annual; stems 1 to  $1\frac{1}{2}$  ft. high, stout, triangular; leaves flat or conduplicate, 6 to 14 in. long, 2 to 3 lines wide; involucre bracts 6 to 8, foliaceous, 4 to 12 in. long; rays  $1\frac{1}{2}$  in. long or less, bearing umbels of spikes which are  $\frac{1}{2}$  to 1 in. long; bracts of involucre shorter, foliaceous; spikelets usually 2 to 3 lines long, narrowly linear, somewhat crowded, horizontally spreading, nearly flat, bright chestnut-color; rachis clothed with the persistent wings of the scales; scales elliptical, obtuse, mucronulate,  $\frac{2}{3}$  line long; keel smooth; achene 3-angled.—Clear Lake; Sacramento and San Joaquin rivers; e. to the Atlantic.

8. *C. sphacelatus* Rottb. Annual, similar in habit to no. 9; stems tufted, slender, 4 to 10 in. high; leaves 1 to  $2\frac{1}{2}$  lines wide, shorter than the stems; spikelets numerous, densely short-spicate, linear, 1 line wide; rachis at length wingless, the narrow wings early deciduous; scales oblong-lanceolate, purple-green, several nerved, 1 line long; achenes nearly black, 3-angled,  $\frac{1}{2}$  as long as scale.—S. Cal.; Mex., trop. Am.

*C. ROTUNDUS* L. Nut-grass. Perennial; stems  $\frac{1}{2}$  to 1 ft. high; rootstock slender, scaly, bearing tubers; umbel compound or nearly simple; spikelets few, clustered on the ends of the unequal rays; scales closely appressed; achene linear, 3-angled,  $\frac{1}{2}$  as long as the scale.—Introd. weed in cult. lands or orchards: San Joaquin Valley; Upland; Colton; Riverside; e. U. S., trop. Am., Eur.

9. *C. esculentus* L. CHUFA. RUSH-NUT. Perennial, with slender rootstocks bearing small globose tubers; stems triangular,  $\frac{1}{2}$  to 1 ft. high; spikes in an umbel subtended by foliaceous bracts 7 in. long or less; spikelets chestnut-brown, linear, 4 to 8 in. long, the joints of the rachis with a narrow wing on each side subtending the achene; scales ovate, obtuse, 3 or 4 nerves each side of the keel,  $1\frac{1}{2}$  lines long; achene black, 3-angled.—Infrequent but widely scattered in Cal.; e. to the Atlantic; all continents. Var. *HEERMANNII* Britt. Spikes clustered at summit of rays and involucre; spikelets sometimes bracteate.—Kern River.

10. *C. strigosus* L. Perennial; stems 1 to  $1\frac{1}{2}$  ft. high; spikes dense,  $\frac{1}{2}$  to 1 in. long, on rays 5 in. long or less, in a more or less compound umbel, the foliaceous involucre bracts 2 to 10 in. long; spikes with the lowest scales persistent on rachis after fall of spikelet from spike; spikelets linear, 6 to 9-flowered, 4 to 9 lines long, the slender joints with a scarious wing embracing

one margin of the achene; scales slender ovate, 2 (or 3) callous striae on each side the keel, 2 lines long; achene oblong, 3-angled.—Mariposa Co.; Tex. to Fla. and Me.

11. *C. speciosus* Vahl. Annual; stems stout, 1 ft. high; umbel compound or simple, subtended by several foliaceous bracts 5 to 13 in. long; rays 1 to 2 in. long; spikelets linear-lanceolate, 3 to 6 lines long, spreading at mostly right angles to the spike, the very short joints of its rachis winged with very broad scarious margins which inclose the 3-angled achene; scales ovate, overlapping, with a round green back and scarious rusty red sides,  $1\frac{1}{2}$  lines long.—Visalia; coastal S. Cal.; e. to the Atlantic; trop. regs.

12. *C. ferox* Rich. Annual, closely related to *C. speciosus*, but leaves shorter, broader and with smoother margins; scales more rigid; spikelets stouter.—Coastal S. Cal.; e. to Mo.; trop. Am.

## 2. *DULICHIMUM* Pers.

Perennial herb with terete hollow jointed stems, leafy to the top. Leaves linear, short, flat, 3-ranked. Spikes axillary, peduncled. Spikelets linear, flattened, sessile in 2 ranks. Scales lanceolate, decurrent as wing-like margins on the joints below. Perianth-bristles 6 to 9, downwardly barbed. Stamens 3. Style 2-cleft above. Achene linear-oblong, flattened, beaked with the long persistent style. (Etymology uncertain.)

1. *D. arundinaceum* (L.) Britt. Plants 1 to 3 ft. high—Muddy borders of peaty ponds: e. Fresno Co.; Humboldt Co.; n. to B. C., e. to the Atlantic.

## 3. *ELEOCHARIS* R. Br. SPIKE-RUSH

Annuals or chiefly perennials. Stems tufted, simple, terminating in a solitary spikelet not subtended by an involucre. Leaves reduced to sheaths or the lowest rarely blade-bearing. Spikelets several to many-flowered. Scales concave. Stamens 2 or 3. Perianth-bristles 3 to 9, commonly retrorsely barbed. Style 3-cleft and achene 3-angled, or 2-cleft and achene lenticular; base of the style enlarged and persistent as a tubercle on the summit of the achene. (Greek *elos*, marsh, and *charis*, delight.)

Style mostly 2-cleft; achene lenticular or biconvex.

Achene jet-black; tubercle depressed; annual.....1. *E. capitata*.

Achene light-brown.

Perennial; tubercle conical, less than half as broad as the body of the achene; spikelet lanceolate.....2. *E. palustris*.

Annual; tubercle thin, deltoid, as broad or nearly as broad as the achene; spikelet ovate.

Bristles often nearly twice as long as the achene.....3. *E. obtusa*.

Bristles  $\frac{1}{4}$  to  $\frac{1}{2}$  as long as the achene.....4. *E. monticola*.

Style 3-cleft; achene turgid or 3-angled; perennial.

Tubercle reduced to a mere scar or very obscure.....5. *E. bolanderi*.

Tubercle well-developed and more or less prominent.

Achene with several longitudinal ridges connected by a transverse lattice-work; spikelet flattened.....6. *E. acicularis*.

Achene smooth.

Stems erect or nearly so, not rooting at tip; tubercle constricted at base or at least sharply defined from the achene.

Spikelet lanceolate; scales acute.....7. *E. parishii*.

Spikelet oblong; scales obtuse.....8. *E. montana*.

Stems or some of them bending over and rooting at tip; tubercle subulate or narrowly pyramidal, continuous with the achene.....

9. *E. rostellata*.

1. *E. capitata* R. Br. Stems erect, tufted, 7 to 8 in. high; spikelet ovate,  $1\frac{1}{4}$  to 2 lines long; bristles 6 (or 7), about as long as the achene; stamens 2 or 3; achene black and shining, lenticular; tubercle white, thin and a little like a skull-cap.—Wet sandy soil, S. Cal.; e. U. S.; Asia, Afr., Aust.

2. *E. palustris* R. & S. COMMON SPIKE-RUSH. WIRE-GRASS. Fig. 132. Stems  $\frac{1}{2}$  to 2 ft. high, stoutish, mostly terete, sheathed at the base, leafless, creeping, stoloniferous; sheaths sub-truncate; rootstock stout; spikelet many-flowered, 6 to 14 lines long; bracts ovate-oblong to oblong-lanceolate; scales ovate-oblong, purplish brown with scarious margin; bristles 3, rather shorter

132. *Eleocharis palustris* R. & S.;  
a, spikelet x 1;  
b, achene x 8.

longer, sometimes nearly twice longer than the achene; achene smooth, shining, obovoid with a narrow base, somewhat flattened or biconvex with cord-like or thickened margins, the broad summit bearing a very thin deltoid acutish tubercle, in outline something like a cocked hat.—Moist places or in shallow water, Sierra Nevada

134. *Eleocharis bolanderi* Gray;  
nutlet and  
bristles x 28.

9 or 10 longitudinal ribs connected by fine transverse lines; tubercle broad, short and blunt. — Moist places throughout Cal., but not reported from the deserts; all continents.

7. *E. parishii* Britt. Fig. 136. Stems 4 to 7 in. high, strongly striated, arising from a slender rootstock; spikes slender-lanceolate, 3 to 7 lines long, dark chestnut-color; bristles 6 (or 7), ciliate, exceeding or sometimes rather shorter than the achene; achene nearly plane on one side, convex and somewhat keeled on the other; tubercle narrow, short, somewhat like a fool's cap.—Valley and mountain marshes throughout Cal.

than the achene; style 2-cleft; achene obovoid, biconvex; tubercle deltoid, constricted at the point of junction.—Ponds, marshes and shallow slow-moving creeks, at low altitudes in Cal.; n. to B. C., e. to the Atlantic; Eur., Asia. Var. *GLAUDESCENS* Gray. Tubercle narrower, sometimes half as long as the achene.—Mts. of S. Cal.

3. *E. obtusa* Schult. Fig. 133. Stems tufted, numerous, erect, nearly terete, striate, 7 to 10 (16) in. high; annual with fibrous roots; spikes oblong-ovate to broadly ovate, 2 to 4 lines long; scales ovate to sub-orbicular, rounded at apex; bristles 6 to 9, mostly

133. *Eleocharis obtusa* Schult.; a,  
spikelet x 4; b, achene and  
bristles x 13.

4. *E. monticola* Fer. Resembling *E. obtusa*; stems 4 to 10 in. high; spikes ovate-lanceolate, 3 to 4½ lines long; scales acutish, more spreading. — N. Sierra Nevada; n. to Ore. and Ida.

5. *E. bolanderi* Gray. Fig. 134. Stems tufted, 8 to 9 in. high, arising from rootstocks; spikes dark-colored, narrow-ovate, 2½ to 3 lines long; bristles 3 or 4, about ¼ to ½ (or ⅔) as long as the achene; achene obovoid, triangular with cord-like ridges at the angles; tubercle reduced to a flatish scar, very short and broad or somewhat obscure.—Central Sierra Nevada, 6000 to 7000 ft.

6. *E. acicularis* R. & S. SLENDER SPIKE-RUSH. Fig. 135. Stems tufted, ½ to 1½ (or 8) in. high, filiform or setaceous; rootstock very slender, creeping; spikelets a little flattened, 1 to 3 lines long, few-flowered; achene obovoid-oblong, ½ line long, obscurely triangular, with

135. *Eleocharis acicularis* R. & S.; a, entire  
plant x 1; b, spikelet x 5; c, bract x 18;  
d, achene x 18.

136. *Eleocharis parishii* Britt.; *a*, spikelet  $\times 4$ ; *b*, achene and bristles  $\times 21$ .

broadened at base.—S. Cal; Mendocino Co.; Tuolumne Co.; e. to Col., s. to S. Am.

9. *E. rostellata* Torr. WALKING-SEDGE. Fig. 138. Stems from a short caudex, 1 to 2½ ft. high, the sterile ones bending over and rooting at the apex; spikelet oblong,

138. *a*, *Eleocharis rostellata* Torr., achene and bristles  $\times 7$ . *b*, Var. *congdonii* Jepson  $\times 7$ .

3 to 5-flowered; scales light-brown or straw-color; bristles 6, exceeding the achene; achene obovoid, obtusely triangular; tubercle stoutly subulate or narrowly pyramidal, half or nearly half as long as the achene.—Marshy meadows: coastal S. Cal.; Colorado and Mohave deserts. Mostly throughout N. Am. Var. *congdonii* Jepson. Bristles equaling the achene; tubercle barely ½ as long as the achene.—San Francisco.

137. *Eleocharis montana* R. & S.; *a*, spikelet  $\times 4$ ; *b*, achene and bristles  $\times 21$ .

#### 4. FIMBRISTYLIS Vahl

Annuals or perennials. Stems leafy below. Spikelets umbellate or capitate, terete, subtended by a 1 to many-leaved involucre. Scales spirally imbricated all around, mostly deciduous. Perianth bristles none. Stamens 1 to 3. Style 2 to 3-cleft, its base swollen, and commonly tuberculate, the whole falling away from the achene at maturity. Achene lenticular or 3-angled. (Latin *fimbriae*, fringe, and *stylus*, style.)

Achene triangular; tubercle more or less persistent; style glabrous; annual..... 1. *F. capillaris*.

Achene flattened or biconvex; tubercle deciduous. Spikelets clustered; style glabrous, at least below; annual..... 2. *F. vahliei*.

Spikelets umbellate, solitary on the rays or in the forks; style ciliate; perennial..... 3. *F. thermalis*.

1. *F. capillaris* Gray. Fig. 139. Stems tufted, somewhat bristle-like, 2 to 7 in. high, much exceeding the filiform leaves, and bearing 1 to 3 spikelets, when 3 the stem shortly forked at apex and bearing 1 spikelet in the fork; spikelets narrowly ovate, 1½ to 2½ lines long; involucre lanceolate-setaceous; achene obovoid, triangular, lightly wrinkled transversely, the angles somewhat thickened; tubercle small, deltoid, more or less persistent.—Yosemite.

139. *Fimbristylis capillaris* Gray; a, entire plant x 1; b, spikelet x 2; c, scale x 12; d, achene x 12.

at base. Spikelets terete or somewhat flattened, solitary or in heads, spikes or umbels, subtended by an involucre of 1 to several leaves or the involucre wanting. Perianth bristles 1 to 6, barbed or ciliate or smooth, or none. Stamens 2 or 3. Style 2 or 3-cleft, not swollen at the base, deciduous or its base persistent on the achene. Achene triangular, lenticular or plano-convex. (Latin *scirpus*, bulrush.)

2. *F. vahlii* Link. Fig. 140. Stems slender, densely tufted, 1 to 4 in. high, longer than or equaling the filiform leaves; spikelets in clusters, subtended by filiform elongated upright bracts which exceed the cluster 4 to 6 times; achene minute, transversely reticulate. — Clear Lake; Visalia; Ft. Yuma. Se. U. S.; S. Am.

3. *F. thermalis* Wats. Fig. 141. Stems 1 to 2 ft. high, bearing few to many spikelets in a simple or compound umbellate cluster; leaves  $\frac{1}{2}$  to  $\frac{2}{3}$  as tall as the stems; spikelets oblong-ovate, 4 to 5 (or 7) lines long; style hairy; achene whitish, broadly obovoid, flattened, the tubercle linear, nearly as long, soon deciduous. — Margins of hot springs: Arrowhead Sprs., San Bernardino; Owens Valley. Nev.

5. *SCIRPUS* L. CLUB-RUSH. BULRUSH

Perennials or annuals. Stems leafy or the leaves reduced to mere sheaths

140. *Fimbristylis vahlii* Link; a, entire plant x 1; b, spikelet x 2; c, bractlet x 10; d, achene x 15.

Spikelets solitary and terminal; stems low, slender.—Subgenus *ISOLEPIS*.

Annual; involucre bract present.

Scales obtuse or merely acute.....1. *S. cernuus*.

Scales acute, shortly beaked, strongly keeled.....2. *S. carinatus*.

Perennial; involucre bract none.....3. *S. pauciflorus*.

Spikelets in clusters; perennial.—Subgenus *EUSCIRPUS*.

Stems low; achene longitudinally ribbed and horizontally striate.....4. *S. setaceus*.

Stems tall; achene not longitudinally ribbed.

Bristles retrorsely barbed or ciliate, rarely wanting.

Stems terete or nearly so; spikelets congested or umbellate.

Stems leafy at base; spikelets in a sessile cluster.....5. *S. nevadensis*.

Stems leafless; spikelets in an umbellate or congested cluster.

Bristles barbed.

Achene 1 line long, nearly equaling the scale; umbels mostly long-rayed; very rare.....6. *S. validus*.

Achene (1 or)  $1\frac{1}{4}$  to  $1\frac{1}{2}$  lines long,  $\frac{1}{4}$  to  $\frac{1}{2}$  shorter than the scale; umbels capitate or of a few short rays; very common.....7. *S. acutus*.

Bristles plumose; umbels long-rayed.....8. *S. californicus*.

Stems 3-angled.

Stems with a single head or compact umbel, leafy below or the leaves mainly basal.

Involucre bract solitary; spikelets densely capitate-clustered, the inflorescence apparently lateral.

Stems very slender, leafy below; scales awn-tipped.....9. *S. americanus*.

Stems stout, leafless or mostly so; scales truncate or obtuse, quite awnless or with a minute point.....10. *S. olneyi*.

Involucre leaves several, foliaceous; inflorescence terminal, the spikelets capitate, or in an umbel with unequal mostly short rays; leaves mainly basal.

Awn of scale glabrous, smooth; achene plano-convex.....11. *S. campestris*.

Awn of scale minutely scabrid; achene as if trigonous, in reality flat on one face, carinate-convex on the other.....12. *S. fluviatilis*.

Stems bearing a panicle of irregular umbels, leafy to the top.

Pedicels or raylets erect or spreading, bearing few to several sessile spikelets.

Achenes rounded on the back; bristles 4.....13. *S. microcarpus*.

Achenes angled on the back; bristles 6.....14. *S. congdonii*.

Pedicels drooping, bearing a single spikelet.....15. *S. lineatus*.

Bristles with the barbs pointed upward; mature heads conspicuously hairy on account of the elongated bristles.....16. *S. criniger*.

141. *Fimbristylis thermalis* Wats.; a, cluster of spikelets x 1; b, scale x 5; c, achene x 5.

obovoid, flattish on one side, convex-rounded and with a fine median ridge on the other, finely or somewhat obscurely papillate, apiculate.—Springy or marshy places near the coast, San Bernardino Valley to Humboldt Co.; n. to Ore. All continents.

1. *S. cernuus* Vahl. Fig. 142. **SLENDER CLUB-RUSH.** Stems tufted, filiform or setaceous, 2 to 9 in. high, sheathed at base, the uppermost sheath often bearing a short slender blade; involucre bract 1 to 3 lines long or almost none; spikelet solitary, oblong-ovate, 1 to  $1\frac{1}{2}$  or 2 lines long; scales round-ovate, concave, obtuse or merely acute, lineate-carinate; style 3-cleft; achene brown,  $\frac{1}{3}$  line long,

142. *Scirpus cernuus* Vahl; a, scale; b, achene. x 12.

*S. CAESPITOSUS* L.  
Stems naked; spikelet solitary; involucre bract present; bristles longer than the achene.—Rae Lake, Kings River (*S. clementis* Jones). *S. YOSEMITANUS* Smiley. Stems leafy; bristles shorter than the achene (ex char.).—Tuolumne Mdw.

2. *S. carinatus* Gray.  
DWARF CLUB-RUSH. Fig. 143. Stems tufted, slender, triangular, 1 to 2 in. high, shortly leaved at base; involucre bract 4 to 9 lines long; spikelet solitary, ovate,  $1\frac{1}{2}$  to 2 or 3 lines long; scales strongly keeled, acute, 2 to 3-nerved on the sides, the midrib excurrent as a short beak; achene strongly triangular, globose in outline, light-brown,  $\frac{3}{4}$  line long, obscurely short-necked at base.—Swamps and low spots near the coast: Mendocino Co. to San Diego Co.

143. *Scirpus carinatus* Gray; a, entire plant x 1; b, c, scale, dorsal and ventral views x 12; d, achene x 12.

144. *Scirpus pauciflorus* Lightf.; a, spikelet x 5; b, achene and bristles x 16.

as the leaves, the horizontal rootstocks very slender; involucre bracts 2 to 4 lines long; spikelets 1 or 2 in a place, narrow-ovate,  $1\frac{1}{2}$  lines long; scales more or less dark brown with a broad green midvein; achenes elliptic-obovoid,  $\frac{1}{2}$  line long, flattish on one side, convex and somewhat angled on the other, longitudinally and rather regularly ribbed, finely and horizontally striate between the ribs, apiculate.—Moist places, Humboldt Co. Eur., Asia, Afr., Austr.

3. *S. pauciflorus* Lightf. Fig. 144. Stems striate, 3-angled, leafless, slightly tufted, very slender ( $2\frac{1}{2}$  to  $4\frac{1}{2}$  in. high), from slender rootstocks; spikelet solitary, terminal, 2 to 3 lines long, without involucre bracts, few (about 3)-flowered; scales narrow-ovate, obtusish; bristles 2 to 6, as long as the achene or longer; stamens 3; style 3-cleft; achene obovoid-oblong, rather strongly beaked.—San Jacinto Mts. to the S. Sierra Nevada. Ore. to B. C., e. to Me. Eur., Asia.

4. *S. setaceus* L. Fig. 145. Stems caespitose, 4 to 5 in. high, twice as high

145. *Scirpus setaceus* L.; a, cluster of spikelets x 3; b, achene x 27.

146. *Scirpus nevadensis* Wats.; a, cluster of spikelets  $\times 1$ ; b, scale  $\times 4$ ; c, nutlet  $\times 4$ .

ovate, flat on one face, rounded or hemispheric on the other; bristles 1 to 3, less than half the length of the achene.—Moist alkaline lands, east of the Sierra Nevada; Nev. to Wash.

6. *S. validus* Vahl. GREAT BULRUSH. Stems 3 to 8 ft. high from stout scaly rootstocks; basal sheaths soft, the hyaline margins soon lacerate; spikelets narrow-ovate, in clusters of 1 to 5, borne on the rays of a lax panicle; scales equaling or but little longer than the achene, roundish, ciliate, mucronate; bristles 4 or usually 5 or 6, retrorsely barbed, shorter than or usually slightly longer than the achene; style 2-cleft; achene broadly obovoid, plano-convex, apiculate.—Known only at a few scattered stations in Cal.: Santa Ana River; Russian River; Siskiyou Co. Widely distributed in N. Am.

7. *S. acutus* Muhl. COMMON TULE. Fig. 147. Stems arising from stout creeping rootstocks, terete or very obtusely trigonous above, 3 to 9 ft. high,

147. *Scirpus acutus* Muhl.; a, panicle of spikelets  $\times 1$ ; b, scale  $\times 4$ ; c, achene  $\times 4$ ; d, achene and bristles  $\times 7$ .

Newf. and Ariz. It is our estimate that originally there were in California about 250,000 acres of tule lands; much of this area has now been reclaimed to cultivation. Tule stems were used by the native tribes to build their balsas or small boats and to weave mats. At the present day the stems are used for packing nursery stock for shipment, thatching hay-stacks, and as a source of potash.

8. *S. californicus* Britt. CALIFORNIA BULRUSH. Fig. 148. Similar to *S. acutus*; umbel irregular, looser, its rays more slender, up to 4 in. long; spikelets dark reddish brown, cylindric or narrow-ovate, (3 or) 4 to 5 lines long; scales short-aristate; bristles 2, 3 or 4, ribbon-shaped, dark red, conspicuously short-hairy or somewhat plumose.—Marshes throughout Cal.; e. to Fla.; S. Am.

5. *S. nevadensis* Wats. Fig. 146. Stems clustered from a creeping rootstock, 9 to 18 in. high; leaves  $\frac{1}{2}$  to  $\frac{2}{3}$  height of the stems,  $\frac{1}{3}$  to  $\frac{2}{3}$  line wide, channeled, involute; spikelets chestnut-brown, oblong-ovate, 4 to 10 lines long, 3 or 4 ('' to 8'') in a terminal sessile cluster; involucre bract narrowly linear or acicular,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; scales ovate, obtusish, not awned; achenes nearly circular or round-

leafless or with a short terete leaf from the upper basal sheath; inflorescence apparently lateral, 1 to 5 in. long; involucre bract stout, shorter than the inflorescence; spikelets 3 to 6 lines long, numerous, congested capitate, or in an irregular umbel with unequal rays; scales ovate, ciliate, shortly awned,  $\frac{1}{4}$  to  $\frac{1}{3}$  longer than the achene; bristles 6, slender, retrorsely barbellate, slightly shorter than or about equaling the achene; style 2-cleft; achene lenticular, gray, abruptly mucronate.—Salt and freshwater marshes and borders of lakes and streams, very common: Cal. to B. C.,

148. *Scirpus californicus* Britt.; *a*, cluster of spikelets  $\times 1$ ; *b*, scale  $\times 10$ ; *c*, achene and bristles  $\times 10$ .

stout, triquetrous, sheathed at base, leafless or with a single very short leaf; involucreal bract 1 to  $1\frac{1}{4}$  in. long; spikelets 2 to 26 in a single crowded sessile cluster, oblong-ovate, 2 to 5 lines long; scales brown, elliptic, membranous, obtuse, glabrous or slightly ciliate; style 2-cleft; achene obovate, flattish on one side, convexish on the other, beaked, smooth.—Common in brackish marshes. East to the Atlantic.

9. *S. americanus* Pers. THREE SQUARE. Fig. 149. Stems  $\frac{3}{4}$  to 2 ft. high, very slender, triangular, somewhat leafy; leaves short, the blade 1 to 3 or  $7\frac{1}{2}$  in. long; involucreal bract solitary, pungent, 1 to 4 in. long; spikelets 1 to 6, oblong-ovate, 3 to 7 lines long, borne in a single crowded sessile cluster; scales dark brown, usually conspicuously tipped with a stout pale-colored awn about a line long; achene flat on one face, convex on the other and somewhat obscurely keeled; bristles 2 to 6, very unequal, the longer about as long as the achene.—Marshy often brackish places, occasional throughout Cal.; N. Am., Chile.

10. *S. olneyi* Gray. OLNEY BULRUSH. Fig. 150. Stems from the bulbous nodes of running rootstocks, 2 to 5 ft. high or more,

149. *Scirpus americanus* Pers.; *a*, cluster of spikelets  $\times 1$ ; *b*, scale  $\times 5$ ; *c*, achene and bristles  $\times 5$ .

150. *Scirpus olneyi* Gray; *a*, cluster of spikelets  $\times 1$ ; *b*, scale (lower)  $\times 5$ ; *c*, scale (upper) from a different plant  $\times 5$ ; *d*, achene and bristles  $\times 5$ .

151. *Scirpus campestris* Britt.; a, cluster of spikelets  $\times 1$ ; b, scale  $\times 3$ ; c, achene  $\times 3$ ; d, achene and bristles  $\times 3$ .

11. *S. campestris* Britt. BULL TULE. Fig. 151. Stems 1 to 3 ft. high, stout, acutely triangular, the point of junction with the slender rootstock often enlarged into hard woody tubers; leaves equaling or exceeding the stem, keeled, flat or deeply channeled, 2 to 4 lines wide; involucre of few unequal spreading foliaceous bracts 3 to 13 in. long, one much the longer and more erect; inflorescence terminal, the spikelets in clusters of 1 to 3, the clusters congested-capitate or commonly somewhat umbellate with unequal rays; rays  $\frac{1}{4}$  to  $1\frac{1}{2}$  in. long; spikelets ovate or oblong-ovate, acute, 6 to 10 lines long; scales thinly scarious, obscurely puberulent or subglabrous, keeled, bifid or lacerate, with a short soon recurved subulate awn between the teeth; bristles 2 to 6, minutely and retrorsely scabrous, shorter than the achene; style 2-cleft; achene round-obovate, sublenticular, obtuse or truncatish, slightly apiculate, dark brown, shining.—Salt marshes and moist alkaline soils: throughout Cal.; n. to Ore., e. to N. J.

12. *S. fluviatilis* Gray. Fig. 152. Similar to *S. campestris*; bract of the inflorescence exceedingly elongated; scales minutely puberulent, the subulate awn recurved; bristles exceeding the achene; achene brownish or drab, narrow-obovoid, flattish on one face, strongly carinate-keeled on the other, obscurely apiculate, shortly attenuate at base.—Borders of lakes and streams: Sutter Co.; Honey Lake; e. to N. J.

152. *Scirpus fluviatilis* Gray; achene and bristles  $\times 6$ .

13. *S. microcarpus* Presl. PANICLED BULRUSH. Fig. 153. Stems from stout creeping rootstocks,

stout, triangular, leafy, 2 to 5 ft. high; leaves flat, 4 to 8 lines wide; margins scabrid; involucre of several spreading foliaceous bracts, about 1 to 2 times as long as the inflorescence; spikelets 1 to 5 in terminal and axillary clusters, the clusters in an umbellate compound panicle; panicle large and open, the rays 1 to 6 in. long, the raylets  $\frac{1}{4}$  to  $\frac{3}{4}$  in. long; spikelets narrow-ovate, greenish or lead-colored, 1 to  $2\frac{1}{2}$  lines long; scales ovate, membranous, with broad green midrib; bristles 4, barbed to the base; stamens 2; style 2-cleft; achene pale, plano-convex, not angled on the back, abruptly short-beaked,  $\frac{1}{2}$  line long.—Common along streams and in fresh-water marshes: throughout Cal.; n. to Alas., e. to Newf.

14. *S. congdonii* Britt. Similar to *S. microcarpus*, but panicle less diffuse, its rays 3 to 6, 2 to  $3\frac{1}{2}$  in. long; spikelets densely capitate at the ends of the rays; style 3-cleft; bristles rather longer than the achene; achene oblong-obovate, flat on one face, angled on the back.—Fresno Co. and Plumas Co. in the Sierra Nevada.

15. *S. lineatus* Michx. Stems slender, triangular, from a stout rootstock, densely leafy at base, less leafy above,  $1\frac{1}{2}$  to 3 ft. high; leaves flat, 3 to 6 lines wide, scabrous-margined; panicle of umbels compound, 2 to 5 in. long, the spikelets mostly solitary at the ends of the raylets, the very slender rays becoming pendulous; involucre bracts much shorter than the inflorescence; spikelets reddish brown, short-cylindric, (2 or) 4 to 6 lines long; scales ovate or oblong, short-awned, membranous with a green midvein; bristles 6, weak, entangled, smooth, equaling or exceeding the scales; stamens 3; style 3-cleft; achene obovoid, flat on one face; convex-ridged on the other, short-beaked,  $\frac{1}{2}$  line long.—Dry hills, Siskiyou Co. Ore. to the Atlantic.

153. *Scirpus microcarpus* Presl; a, panicle  $\times \frac{1}{2}$ ; b, spikelet  $\times 6$ ; c, scale  $\times 9$ ; d, achene and bristles  $\times 9$ .

branous, 1 to 5-nerved. Perianth-bristles numerous, filiform, silky-white, becoming greatly elongated in fruit. Stamens 1 to 3. Style very slender and elongated, 3-cleft. Achene triangular. (Greek erion, wool, phoros, bearing, referring to the woolly heads.)

154. *Scirpus criniger* Gray; a, head of flowers  $\times 1$ ; b, achene and bristles  $\times 3$ .

16. *S. criniger* Gray. Fig. 154. Stems  $\frac{3}{4}$  to 3 ft. high, triangular and striate; leaves  $1\frac{1}{2}$  to 4 in. long,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  lines wide; spikelets 9 to 18, 5 to 7 lines long, congested in a sessile head; filaments slender, much exserted and exceeding the 6 very long bristles; style 3-cleft; achene oblong, sulcate-triangular, shortly beaked, 1 line long. — High mountains, 7000 to 8000 ft., Sierra Nevada, n. to Siskiyou Co., thence s. to Mendocino Co. Also sw. Ore.

#### 6. *ERIOPHORUM* L.

##### COTTON-SEDGE

Bog perennials with triangular or nearly terete stems from creeping rootstocks. Leaves linear or the uppermost reduced to sheaths. Spikelets terminal on a leafy or naked stem, solitary or clustered or umbellate, subtended by an involucre of leaf-like bracts or none. Scales mem-

155. *Eriophorum gracile* Koch var. *cauricum* Fer.; cluster of spikelets in fruit  $\times 1$ .

1. *E. grácile* Koch. SLENDER COTTON-SEDGE. Stems subterete, weak and very slender, 1 to 2 ft. high, with one or more erect, very narrow, triangular-channelled leaves; involucre of a single erect colored bract much shorter than the inflorescence; rays 4 to 6 lines long, slightly nodding, roughish-puberulent; spikelets 2 to 5, oblong, 3 to 4 lines long; scales lead-color or blackish; perianth bristles 6 to 7 lines long in fruit.—Cold swamps, San Francisco and Sonoma Co. northward; Boreal regions around the earth. Var. *CAURIANUM* Fer. Fig. 155. Scales straw-color or brownish.—Northern Sierra Nevada and n.

156. *Hemicarpha micrantha* Pax; a, entire plant x 1; b, spikelet x 7; c, scale x 18; d, achene x 18.

7. *HEMICÁRPHA* Nees & Arn.

Dwarf tufted annuals, with almost filiform stems and leaves. Spikelets small, terminal, terete, solitary or clustered, subtended by a 1 to 3-leaved involucre. Scales enclosing a minute hyaline bractlet between the flower and the axis of the spikelet. Perianth none. Stamen 1. Style 2-cleft. Achene subterete. (Greek hemi, half, and karphe, chaff, in reference to the inner bractlet.)

Scales spreading only at the tip or erect, little exceeding the achenes... 1. *H. micrantha*. Scales spreading, 2 to 3 times as long as the achenes..... 2. *H. occidentalis*.

1. *H. micrantha* (Vahl) Pax. Fig. 156. Stems  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. high, sheathed at base with 1 or 2 short filiform leaves; involucreal bract  $\frac{1}{2}$  to 6 lines long; spikelets 1 to 3, ovate, reddish-brown, 1 to  $1\frac{1}{2}$  lines long; scales cuneate-obovate, short-acuminate and slightly spreading at the tip or erect, little longer than the ( $\frac{1}{4}$  line long) achene;

bractlet adherent to the achene.—San Diego Co. and Sierra Nevada foothills; Wash. e. to the Atlantic; S. Am. Var. *ARISTULATA* Cov. Stems 4 to 8 in. high; spikelets conspicuously squarrose by reason of the abruptly attenuate scales; achene black.—Great Plains region; also Wash. and Cal.

2. *H. occidentalis* Gray. Fig. 157. Similar; stems 1 to 2 in. high; spikelets greenish, broadly ovate; scale  $\frac{3}{4}$  to 1 line long, its body oblong or lanceolate, 3 or 4-nerved, abruptly tapering into a spreading awn-like tip 1 to  $1\frac{1}{2}$  times as long; bractlet not adherent to the achene; achene brownish, narrow-obovoid, somewhat flattened.—Middle altitudes: cismontane S. Cal.; Sierra Nevada. N. to Wash.

8. *SCHOENUS* L.

Mostly perennials with rush-like tufted rigid stems. Leaves semi-terete, basal, the sheaths dark-colored. Spikelets 1 to 6-flowered, aggregated in a terminal cluster. Scales in 2 ranks, the lower ones empty, the upper with perfect or pistillate flowers, the uppermost with staminate flowers or empty. Perianth of 3 to 6 plumose or smooth bristles or none. Stamens usually 3. Style-branches 3. Achene 3-angled, without a tubercle. (Greek schoinos, a rush.)

157. *Hemicarpha occidentalis* Gray; a, habit x 1; b, spikelet x 8; c, scale x 18; d, achene x 18.

158. *Schoenus nigricans* L.; a, cluster of spikelets  $\times 1$ ; b, achene  $\times 5$ .

1. *S. nigricans* L. BLACK GALINGALE. Fig. 158. Perennial; stems 10 to 20 in. high, surpassing the erect rigid pungent leaves; heads 5 to 7 lines high, dark chestnut-color; spikelets flattened; bristles naked in our form; achene white.—Alkaline soil: Lone Pine Cañon, Cañon Pass; Arrowhead Sprs.; Death Valley; Nev., Tex., Fla., Eur., Afr., Asia.

#### 9. *CLADIUM* P. Br. SAW-GRASS

Very tall leafy perennials. Stems terete (in ours), from stout rootstocks. Leaves much elongated, serrate on the margin and folded on the midrib so as to be channeled above. Spikelets small, few-flowered, borne in terminal and lateral compound panicles and consisting of several loosely imbricated scales; lower scale empty, the middle one or two bearing staminate flowers, the upper one usually perfect and fertile. Stamens in ours 2. Style 2 or 3-cleft, deciduous. Achene ovoid or globose, without tubercle. (Diminutive of Greek *klados*, a branch, referring to the branched inflorescence.)

1. *C. mariscus* R. Br. Stems numerous, stout, 6 to 10 ft. high, forming very dense and heavy hummocks; leaves 4 to 7 ft. long, 4 to 5 lines broad; panicles diffuse, drooping, the lateral ones 4 to 8 in number, from the axils of short sheathing leaves; spikelets narrowly oblong, 2 lines long, in clusters of 2 or 3; achene brown, cylindric-ovate, 1 to  $1\frac{1}{4}$  lines long.—Moist ground: s. bases San Gabriel and San Bernardino mountains; Inyo Co. S. Nev. All continents.

#### 10. *RYNCHOSPORA* Vahl

Chiefly perennials with erect more or less leafy and triangular stems from rootstocks. Spikelets ovate, globular, or fusiform, variously clustered; scales plane or a little concave, not keeled, the uppermost subtending imperfect flowers. Perianth of 1 to 20 bristles. Stamens commonly 3 (in ours usually 2.) Style 2-cleft. Achene lenticular or globular, crowned by the persistent base of the style. (Greek *ryncos*, snout, and *spora*, seed.)

1. *R. álba* Vahl. WHITE-BEAK RUSH. Perennial; stems almost filiform,  $\frac{1}{2}$  to 2 ft. high; leaves narrowly linear or almost bristle-like; spikelets disposed in a head-like terminal corymb (and usually 1 or 2 lateral ones), white or whitish, becoming tawny with age, perfecting only a single flower; bristles 9 to 12 (or 20); tubercle flattened, triangular-subulate, nearly as long as the achene.—Bogs, Mendocino Co. N. Am., Eur., Asia.

#### 11. *CAREX* L. SEDGE

By K. K. MACKENZIE

Grass-like sedges, perennial by rootstocks. Culms (stems) mostly triangular, often strongly phyllopodic (leafy at base) or aphyllopodic (not leafy at base). Leaves 3-ranked, the upper (bracts) elongate or short, and subtending the spikes of flowers or wanting. Flowers monoecious or sometimes dioecious. Spikes 1 to many, either wholly pistillate, wholly staminate, androgynous or gynaeceandrous, sessile or peduncled, the base of the peduncle often with a perigynium-like or spathe-like organ (clado-prophyllum) surrounding it. Perianth none. Stamens 3 (or rarely 2). Achene 3-angled, lenticular or plano-convex, completely enclosed by the sac-like perigynium. (The Latin name.)

**A. Spike one, androgynous, bractless; perigynia glabrous, beaked, the beak with closed suture at apex dorsally.**

Achenes triangular; stigmas 3, rarely 2.

Pistillate scales persistent; perigynia inflated, sessile, not becoming reflexed. . . . .

1. *INFLATAE*.

Pistillate scales deciduous; perigynia not inflated, stipitate, at least the lower reflexed at maturity. . . . .

2. *ATHROCHLAENAE*.

Achenes lenticular; stigmas 2. . . . .

3. *CAPITATAE*.

**B. Spikes one to many; if one, not as in A.**

1. *Achenes lenticular and stigmas 2; lateral spikes sessile; terminal spike partly pistillate, or if staminate the lateral spikes short or heads dioecious.*
- Perigynia not white-punctulate.
  - Rootstocks long-creeping, the culms arising singly or few together; perigynia with beak obliquely cut, at most bidentulate.
    - Spikes densely aggregated into a globose or ovoid head, appearing like one spike. 4. FOETIDAE.
    - Spikes, at least the lower, distinct. 5. DIVISAE.
  - Cespitose or rootstocks short-creeping; perigynia with beak obliquely cut to deeply bidentate.
    - Spikes androgynous (i. e., staminate flowers uppermost).
      - Perigynia abruptly contracted into the beak.
        - Spikes few (usually 10 or less); perigynia green or tinged with reddish-brown. 6. MUHLENBERGIANAE.
        - Spikes numerous; perigynia yellowish or brownish at flowering.
          - Perigynia yellowish; opaque part of leaf-sheath usually transversely rugulose. 7. MULTIFLORAE.
          - Perigynia brownish; opaque part of leaf-sheath not transversely rugulose. 8. PANICULATAE.
      - Perigynia tapering into the beak. 9. STENORHYNCHAE.
    - Spikes gynaeandrous (i. e., pistillate flowers uppermost).
      - Perigynia at most thin-edged.
        - Perigynia spreading or ascending at maturity. 10. STELLULATAE.
        - Perigynia appressed. 11. DEWEYANAE.
      - Perigynia narrowly to broadly wing-margined. 12. OVALES.
  - Perigynia white-punctulate. 13. CANESCENTES.
2. *Achenes triangular and stigmas 3, or lenticular and stigmas 2; if lenticular, lower lateral spikes conspicuously peduncled, or terminal spike staminate and lateral spikes elongated.*
- Staminate and pistillate spikes on different culms; stigmas 3, short. 17. SCIRPINAE.
- Staminate and pistillate spikes on the same culms.
  - Spike solitary.
    - Perigynia many-nerved, rounded and beakless at apex; stigmas 3, short. 14. POLYTRICHOIDEAE.
    - Perigynia 2-keeled, not rounded at apex, beakless or beaked.
      - Perigynia glabrous; stigmas 3, elongated. 15. FIRMICULMES.
      - Perigynia pubescent or puberulent; stigmas 3. 16. FILIFOLIAE.
  - Spikes more than one.
    - Perigynia closely enveloping the achene, strongly tapering at base, pubescent or puberulent; bracts sheathless or nearly so; stigmas normally 3, long. 18. MONTANAE.
    - Perigynia not as above; or if so, at least the lowest bract strongly sheathing.
      - Bracts (at least lowest) long-sheathing, more or less purplish-tinged, the blades absent or rudimentary; stigmas 3, early deciduous. 19. DIGITATAE.
    - Lowest bract sheathless or long-sheathing; if long-sheathing its blade well-developed.
      - Lowest bract strongly sheathing; perigynia never strongly bidentate with stiff teeth.
        - Achenes lenticular; stigmas 2. 20. BICOLORES.
        - Achenes triangular; stigmas 3.
          - Scales greenish or light reddish-brown or purplish-tinged.
            - Rootstocks long-creeping; scales purplish-tinged. 21. PANICEAE.
            - Rootstocks not long-creeping; scales greenish to reddish-brown tinged.
              - Perigynia glabrous or hispidulous; leaves not pubescent.
                - Pistillate spikes erect on stiff peduncles. 22. LAXIFLORAE.
                - Pistillate spikes slender on slender peduncles, the lower drooping. 24. DEBILES.
              - Perigynia or leaves or both strongly pubescent. 23. TRIQUETRAE.
            - Scales dark reddish-brown to blackish tinged. 25. FRIGIDAE.
        - Lowest bract sheathless or sheathing; if sheathing, perigynia strongly bidentate with stiff teeth.
          - Perigynia or leaves or both pubescent; stigmas 3. 31. HIRTAE.
        - Neither perigynia nor leaves pubescent.
          - Style jointed with the achene, deciduous.
            - Achenes triangular; stigmas 3.
              - Lowest bract sheathless.
                - Pistillate spikes narrowly cylindric, elongated; perigynia not bidentate. 26. ANOMALAE.
                - Pistillate spikes ovoid, oblong or linear; perigynia bidentate or entire. 27. ATRATAE.

Lowest bract sheathing; perigynia bidentate.....

32. EXTENSÆ.

Achenes lenticular; stigmas 2.

Achenes constricted in the middle; scales sharp-pointed, three-nerved...29. CRYPTOCARPÆ.

Achenes not constricted in the middle...28. ACUTÆ.

Style persistent, continuous with the achene.

Perigynia nerveless, except for the marginal nerves; stigmas 3.....30. TRACHYOLAENÆ.

Perigynia several to many-nerved.

Perigynia coarsely ribbed; stigmas 3 or 2.....

33. PHYSOCARPÆ.

Perigynia finely and closely ribbed; stigmas 3....

34. PSEUDO-CYPERÆÆ.

### 1. Inflatae.

Pistillate scales 1-nerved; perigynia ovoid, inflated, tapering at apex; staminate part of spike scarcely conspicuous; achenes 1.25 to 1.5 mm. long....1. *C. engelmannii*.

Pistillate scales 3-nerved; perigynia broadly ovoid, strongly inflated, abruptly minutely-beaked; staminate part of spike conspicuous; achenes 2 mm. long...2. *C. breweri*.

### 2. Athrochlaenae.

Represented by one species in our range.....3. *C. nigricans*.

### 3. Capitatae.

Represented by one species.....4. *C. capitata*.

### 4. Foetidae.

Represented by one species in our range.....5. *C. vernacula*.

### 5. Divisae.

Rootstocks, slender, light-brownish; culms obtusely triangular, normally smooth.....

6. *C. douglasii*.

Rootstocks stout; culms acutely triangular, normally rough above.

Perigynia chestnut, thick, the beak about one-fifth as long as the body...7. *C. simulata*.

Perigynia blackish in age, the beak one-third to one-half as long as the body.

Scales very dark chestnut-brown, shining; perigynia 3.5 to 4.5 mm. long, polished, scarcely hyaline at orifice.....8. *C. pansa*.

Scales lighter colored, dull; perigynia 3 to 4 mm. long, dull, strongly hyaline at orifice.....9. *C. praegracilis*.

### 6. Muhlenbergianae.

Densely caespitose; head orbicular or oblong-ovoid.....10. *C. hoodii*.

Rootstocks elongate; head linear, interrupted.....11. *C. tumulicola*.

### 7. Multiflorae.

Scales strongly hyaline-margined; sheaths normally not cross-rugulose.

Perigynia lanceolate-ovate, sharp-margined to base, membranaceous, straw-colored...12. *C. stenoptera*.

Perigynia ovate, truncate at base, short-beaked, sharp-margined above, not membranaceous, brownish-black at maturity.....13. *C. alma*.

Scales not strongly hyaline-margined; sheaths normally more or less cross-rugulose; perigynia straw-colored, yellowish or tawny at maturity, sharp-margined to base.

Perigynia 3.5 to 4.5 mm. long, the beak much shorter than the body; pistillate scales (except lowest) acute or cuspidate.

Ligule conspicuous, as long as wide; scales brownish-tinged; perigynia strongly nerved ventrally.....14. *C. densa*.

Ligule very short; scales reddish-brown tinged.

Perigynia flat and nerveless or nearly so ventrally, the body sparingly ser-  
rulate above, contracted into a beak.....15. *C. vicaria*.

Perigynia low-convex and strongly nerved ventrally, the body strongly ser-  
rulate above, abruptly contracted into a beak...16. *C. breviligulata*.

Perigynia 2.25 to 3.25 mm. long, the beak about length of the body; pistillate scales strongly awned.....17. *C. dudleyi*.

### 8. Paniculatae.

Leaf-blades 1.25 mm. wide; head little interrupted; perigynia 2 to 2.75 mm. long, shining, not concealed by the scales.....18. *C. diandra*.

Leaf-blades 2.5 to 6 mm. wide; head interrupted, compound; perigynia 3 to 4 mm. long, dull, concealed by the scales.....19. *C. cusickii*.

### 9. Stenorhynchae.

Perigynia 3 to 4 mm. long, the beak much shorter than the body; scales strongly dark-  
tinged.

Leaves clustered at base; sheaths not green and white mottled dorsally; culms  
slender.....20. *C. jonesii*.

- Leaves not clustered at base, the lower blades much reduced; sheaths green and white mottled dorsally; culms stout.....21. *C. nervina*.  
 Perigynia 4 to 6 mm. long, the beak about length of body; scales not or scarcely dark tinged.....22. *C. stipata*.

10. *Stellulatae*.

- Spikes more or less widely separate, not brownish-black.  
 Body of perigynium broadest near middle; beak with few weak serrulations.....23. *C. laeviculmis*.  
 Body of perigynium broadest near base; beak strongly serrulate.  
 Beak of perigynium bluntly bidentate,  $\frac{1}{4}$  to  $\frac{1}{3}$  length of body, the ventral suture obsolete or inconspicuous; scale obtuse,  $\frac{1}{2}$  length of body of perigynium.....24. *C. interior*.  
 Beak of perigynium sharply bidentate, the ventral suture conspicuous.  
 Beak of perigynium chestnut-brown tipped; culms obtusely triangular; pistillate scales obtuse or obtusish, chestnut-brown tinged with broad shining margins and apex, rounded and not keeled, the midvein obscure at apex.  
 Spikes widely separate, the terminal long-clavate; perigynia 3.5 to 4 mm. long.....25. *C. ormantha*.  
 Spikes approximate, the terminal short-clavate; perigynia 3.75 to 4.5 mm. long.....26. *C. phyllomanica*.  
 Beak of perigynium reddish-brown tipped; culms sharply triangular; pistillate scales obtusish to cuspidate, yellowish-brown tinged, the margins and apex narrow, opaque or dull whitish, keeled with the sharp midvein which is prominent to apex.....27. *C. angustior*.  
 Spikes 3 to 5 in a small (6 to 10 mm. long), densely capitate, brownish-black head.....28. *C. illota*.

11. *Deweyanae*.

- Perigynia shallowly bidentate, 3.5 to 4 mm. long, the beak about  $\frac{1}{3}$  length of body.....29. *C. leptopoda*.  
 Perigynia deeply bidentate, 4 to 4.5 mm. long, the beak about  $\frac{1}{2}$  length of body.....30. *C. bolanderi*.

12. *Ovales*.

- Sheaths green-striate opposite blades, except at mouth.....31. *C. feta*.  
 Sheaths white-hyaline opposite blades.  
 Sheaths strongly prolonged upward at mouth opposite blade in a very membranaceous appendage; perigynia and scales greenish.....32. *C. fracta*.  
 Upper sheaths (at least) concave or truncate at mouth opposite blades.  
 Beak of perigynium flat and serrulate to the usually strongly bidentate tip.  
 Perigynia 3.5 to 5 mm. long, 2 to 3 mm. wide.  
 Perigynia thin with margins conspicuously wrinkled dorsally; culms 1 to 4 dm. high; spikes ovoid, densely capitate.....33. *C. stramineiformis*.  
 Perigynia thick with margins not wrinkled dorsally; culms 3 to 9 dm. high; spikes oblong in an oblong head.....34. *C. multicosata*.  
 Perigynia 3 to 3.5 mm. long, 1 to 1.5 mm. wide.....35. *C. subfusca*.  
 Beak of perigynium terete toward apex, the upper 1 to 3 mm. smooth or nearly so.  
 Perigynia appressed, nearly or entirely covered by scales, the beaks not conspicuous in the spikes.  
 Culms slender; spikes in a flexuous nodding head.....36. *C. praticola*.  
 Culms stiff; spikes approximate in an erect head.  
 Culms 1 to 6 dm. high, the leaves not bunched near base; blades 2 to 3 mm. wide, flat; beak of perigynium not hyaline at orifice.....37. *C. tracyi*.  
 Culms 1 to 3 dm. high, in large tufts, the leaves bunched near base; blades 1.5 to 2 mm. wide, more or less involute; perigynium beak hyaline at orifice.  
 Perigynia oblong-ovate, rather strongly margined.....38. *C. phaeocephala*.  
 Perigynia linear-lanceolate, very narrowly margined, boat-shaped.....39. *C. leporinella*.  
 Upper part of perigynia conspicuous in the spikes, not covered by scales.  
 Perigynia lanceolate, 5.5 to 8.5 mm. in length, 3 to 5 times as long as wide.  
 Spikes about three, not capitate; scales little more than  $\frac{1}{2}$  length of perigynia.....40. *C. davyi*.  
 Spikes 6 to 12, capitate; scales equaling bodies of perigynia.....41. *C. specifica*.  
 Perigynia ovate or if lanceolate shorter than 5.5 mm. in length.  
 Lower bracts leaflet-like, much exceeding head.  
 Perigynia with the beak ferruginous at orifice, bidentate; lowest bract appearing like a continuation of the culm.....42. *C. unilateralis*.  
 Perigynia with the beak hyaline at orifice, bidentulate; lowest bract not appearing like a continuation of the culm.....43. *C. athrostachya*.

Lower bracts scale-like, much shorter than or slightly exceeding head.

Perigynia with membranaceous or submembranaceous walls.

Perigynia thin and flat save where distended by achene.

Perigynia 3.5 to 5 mm. long; culms slender.....

44. *C. festivella*.

Perigynia 4.5 to 6 mm. long; culms low, ascending

or decumbent.....

45. *C. nubicola*.

Perigynia strongly plano-convex at maturity.

Perigynia nerveless ventrally or with impressed

nerves.....

46. *C. pachystachya*.

Perigynia with conspicuously raised nerves on inner

face.

Perigynia conspicuously hyaline-tipped; spikes

densely capitate.....

47. *C. abrupta*.

Perigynia reddish-tipped; spikes more or less

strongly separate.....

48. *C. mariposana*.

Perigynia with thick, firm walls.

Perigynia very small (2.25 to 3.5 mm. long).

Margins of perigynia entire (or very obscurely sub-

serrulate).....

49. *C. integra*.

Margins of perigynia strongly serrulate.....

50. *C. teneraeformis*.

Perigynia longer (3.5 mm. long or more).

Lower bracts (at least) strongly amplexant; beaks

of perigynia and scales little reddish tinged.

51. *C. amplexans*.

Bracts not amplexant; beaks of perigynia and scales

strongly reddish-tinged.

Perigynia strongly nerved ventrally, the nerves

prominent; scales with sharply de-

defined midvein.

Sterile shoots not conspicuous; lower

bladeless sheaths short; culms

slender; scales mostly acute,

reddish-brown.....

52. *C. harfordii*.

Sterile shoots numerous, elongate; lower

bladeless sheaths very long;

culms very slender; scales cus-

pidate or short-awned, yellowish-

brown.....

53. *C. montereyensis*.

Perigynia nerveless or very obscurely nerved

ventrally.

Perigynia with a few raised nerves dor-

sally; coastal species.

Spikes strongly capitate; leaf-blades

averaging 2.5 to 3 mm.

wide; culms 3.5 to 12 dm.

high.....

54. *C. sub-bracteata*.

Spikes not capitate, the head slender;

leaf-blades averaging 1.5 to

2 mm. wide; culms 1 to 6

dm. high.....

55. *C. gracilior*.

Perigynia many-striate or with impressed

nerves dorsally; species of the

Sierra Nevada.

Spikes not few-flowered; culms slen-

der; leaves not clustered,

the blades long.....

56. *C. pachycarpa*.

Spikes 6 to 12-flowered; culms stiff;

leaves clustered, the blades

short.....

57. *C. pauciflorus*.

### 13. Canescentes.

Spikes androgynous; perigynia unequally biconvex.....

58. *C. disperma*.

Spikes gynaeandrous; perigynia plano-convex.

Perigynia broadest near middle, short-beaked, smooth or little roughened.....

59. *C. canescens*.

Perigynia ovate, broadest near the base; beak conspicuous, strongly serrulate.....

60. *C. arcta*.

### 14. Polytrichoideae.

Represented by one species.....

61. *C. leptalea*.

### 15. Firmiculmes.

Not stoloniferous; culms smooth, terete; leaf-blades 1.5 mm. wide; bracts long-awned....

62. *C. multicaulis*.

Stoloniferous; culms very rough, triangular; leaf-blades 2 to 3.5 mm. wide; bracts not

long-cuspidate.....

63. *C. peyeri*.

**16. Filifoliae.**

Represented by one species in our range.....64. *C. exserta*.

**17. Scirpinae.**

Represented by one species in our range.....65. *C. gigas*.

**18. Montanae.**

Basal spikes not developed.....66. *C. inops*.

Basal spikes present.

Perigynia finely many-ribbed as well as strongly 2-keeled.

Scales purplish-tinged, obtuse to cuspidate; body of perigynium globose; staminate spikes many-flowered; basal pistillate spikes on elongated very slender peduncles.....67. *C. globosa*.

Scales reddish-brown tinged, cuspidate or long-awned; body of perigynium oval; staminate spikes few-flowered; basal pistillate spikes on short, erect peduncles.....68. *C. brainerdii*.

Perigynia strongly 2-keeled, otherwise nerveless.

Bract of lowest non-basal pistillate spike leaflet-like, exceeding culms, if at all colored, purplish-brown tinged at base.

Perigynia 2.5 to 3 mm. long, the beak 0.25 to 0.75 mm. long, shallowly bidentate.....69. *C. brevipes*.

Perigynia 3 to 4.5 mm. long, the beak 0.75 to 1.50 mm. long, bidentate.....70. *C. rossii*.

Bract of lowest non-basal pistillate spike squamiform and shorter than culm or, if longer, auriculate and strongly reddish-brown tinged at base.....71. *C. brevicaulis*.

**19. Digitatae.**

Represented by one species in our range.....72. *C. concinnoides*.

**20. Bicolores.**

Perigynia short-tapering at apex, straw-colored, 2.5 to 3.75 mm. long; achenes strongly apiculate.....73. *C. salinaeformis*.

Perigynia rounded or truncate at apex, orange-colored or white-pulverulent, smaller; achenes minutely apiculate.

Mature perigynia whitish, ellipsoidal, not fleshy or translucent, rather obscurely ribbed; scales appressed.....74. *C. hassei*.

Mature perigynia orange or brownish, broader, fleshy or translucent, strongly ribbed; scales divaricate at maturity.....75. *C. aurea*.

**21. Paniceae.**

Perigynia beakless or nearly so; bract sheaths short; plant glaucous; leaf-blades narrow, involute.....76. *C. livida*.

Perigynia strongly beaked; bract sheaths long; plant not glaucous; leaf-blades broad, flat.....77. *C. californica*.

**22. Laxiflorae.**

Represented by one species in our range.....78. *C. hendersonii*.

**23. Triquetrae.**

Lowest bract sheathless or very short-sheathing; perigynia glabrous, strongly ribbed or nerved.

Perigynia ovoid, 3.5 to 4.25 mm. long, abruptly short-beaked, the sides several-nerved.....79. *C. flaccifolia*.

Perigynia ovoid-lanceolate, 3.75 to 5 mm. long, tapering into the beak, the sides strongly ribbed.....80. *C. whitneyi*.

Lowest bract long-sheathing; perigynia hairy, faintly nerved or nerveless.

Leaf-blades hairy; pistillate spikes oblong or short-oblong, the upper approximate.

Perigynia 4 to 5 mm. long, round-tapering at base, finely many-nerved.....81. *C. gynodynema*.

Perigynia 3.5 to 4 mm. long, tapering at base, 2-keeled, obscurely striate.....82. *C. hirtissima*.

Leaf-blades not hairy; pistillate spikes linear, widely separate.....83. *C. triquetra*.

**24. Debiles.**

Represented by one species in our range.....84. *C. mendocinensis*.

**25. Frigidae.**

Perigynia triangular or slightly flattened, the beak bidentulate; scales obtusish, the mid-vein not prominent at apex.

Spikes widely separate, the staminate one strongly overtopping the uppermost pistillate one; perigynia triangular, 3.5 mm. long or less.....85. *C. lemmonii*.

Uppermost pistillate spikes bunched, little exceeded by the staminate one; perigynia compressed-triangular, longer.

- Pistillate spikes oblong; scales reddish-brown.....86. *C. luzulina*.  
 Pistillate spikes linear-oblong; scales dark-tinged.....87. *C. ablata*.  
 Perigynia strongly flattened, the beak bidentate; scales sharp-pointed with midvein prominent to apex.  
 Perigynia glabrous; scales smooth; bract sheaths strongly enlarged upward; leaf-blades very leathery.....88. *C. luzulaefolia*.  
 Perigynia sparsely hairy; scales more or less hairy; bract sheaths scarcely enlarged upward; leaf-blades not leathery.....89. *C. fissuricola*.

## 26. Anomalae.

- Represented by one species in our range.....90. *C. amplifolia*.

## 27. Atratae.

- Terminal spike staminate or sometimes with perigynia in the middle.  
 Basal sheaths not filamentose.  
 Culms few-leaved, strongly aphyllopodic.....91. *C. spectabilis*.  
 Culms many-leaved, clothed at base with dried-up leaves of previous year.....92. *C. raynoldsii*.  
 Basal sheaths filamentose.....93. *C. bifida*.  
 Terminal spike gynaeandrous, i. e., the terminal flowers pistillate.  
 Culms aphyllopodic, strongly purplish-red at base, the lower sheaths filamentose.....94. *C. buzbaumii*.  
 Culms phyllopodic.  
 Spikes 3 to 5, not oblong-cylindric; perigynia walls not papery; perigynia 2.5 to 4.5 mm. long, nerveless or obscurely nerved on face, dull green to brownish-black.  
 Perigynia not papillate-roughened.  
 Spikes contiguous, sessile or nearly so, forming a dense head; scales lanceolate, strongly exceeding perigynia; culms stiff, erect.....95. *C. helleri*.  
 Lower spike or spikes more or less peduncled, usually distant, erect or nodding; scales wider, shorter than or about equaling perigynia; culms more slender.  
 Scales with midvein largely obsolete; mature perigynia 3.5 to 4.5 mm. long, as wide or wider on either side than achene, the latter on stipe of nearly its own length; sheaths not purplish-tinged ventrally.....96. *C. epapillosa*.  
 Scales with prominent midvein; mature perigynia 3.5 mm. long, narrower on either side than achene, the latter much longer than its stipe; sheaths normally purplish-tinged ventrally.....97. *C. heteroneura*.  
 Perigynia papillate-roughened, especially on upper margins.....98. *C. albo-nigra*.  
 Spikes 6 to 10, oblong-cylindric; perigynia 5 mm. long, lightly 3-nerved, light green, the walls papery; scales much shorter than perigynia.....99. *C. mertensii*.

## 28. Acutae.

### A. FLOWERING CULMS ARISING FROM THE CENTER OF PREVIOUS YEAR'S TUFT OF LEAVES AND SURROUNDED AT BASE WITH DRIED-UP LEAVES OF PREVIOUS YEAR.

1. Lower sheaths of flowering culms not breaking and becoming filamentose.  
 Strongly stoloniferous, the culms arising one to few together, low; lowest bract normally much shorter than inflorescence; scales with obsolete or slender midvein.  
 Dried first year leaf-blades at base of fertile culms stiff, rigid and conspicuous, concealing the culms; fertile culm leaves all blade-bearing, the lower sheaths not purplish or hispidulous dorsally.....100. *C. scopulorum*.  
 Dried first year leaf-blades at base of fertile culms much desiccated, not stiff, rigid or conspicuous, and not concealing the culms; lowest fertile culm leaves not blade-bearing, the lower sheaths purplish and more or less strongly hispidulous dorsally.....101. *C. gymnoclada*.  
 Culms taller, less stiff, in larger clumps; lowest bract equaling or exceeding inflorescence; scales with slender midvein or broader light colored center.  
 Perigynia strongly nerved ventrally, the nerves raised.  
 Perigynia coriaceous, sessile or nearly so, the beak bidentate; strongly stoloniferous.....102. *C. nebraskensis*.  
 Perigynia membranaceous, more or less slenderly stipitate, the beak entire, cespitose.  
 Perigynia substipitate, orbicular, minutely papillate-roughened; scales deciduous.....103. *C. paucicostata*.  
 Perigynia strongly stipitate, ovate.  
 Perigynia yellowish-green, ribbed, papillate-roughened; scales deciduous.....104. *C. hindsii*.  
 Perigynia light green or in age glaucous green, nerved, very minutely granular; scales long persistent.....105. *C. kelloggii*.  
 Perigynia nerveless ventrally or with obscure impressed nerves.  
 Sheaths colored ventrally at mouth; lower pistillate spikes cernuous or sub-cernuous on long peduncles; scales in age whitened at tip.....106. *C. sitchensis*.  
 Sheaths not colored ventrally at mouth; lower pistillate spikes not nodding; scales not whitened at tip.....107. *C. aquatilis*.

## 2. Lower or middle sheaths of flowering culms breaking and becoming filamentose.

- Beak of perigynium bidentate, hispidulous between teeth; scales strongly rough-awned.... 108. *C. barbarae*.  
 Beak of perigynium entire or emarginate, not hispidulous between teeth; scales not rough-awned.  
 Lower culm sheaths strongly yellowish-brown tinged, sharply keeled; culms stout, the leaf-blades 6 to 12 mm. wide.....109. *C. schottii*.  
 Lower culm sheaths purplish-tinged, not sharply keeled; culms more slender, the leaf blades narrower.....110. *C. senta*.

## B. SOME OR ALL OF THE FLOWERING CULMS ARISING Laterally and NOT ENVELOPED AT BASE BY PREVIOUS YEAR'S TUFT OF LEAVES.

- Culms very densely cespitose, forming dense stools; lowest sheaths strongly filamentose; lowest bract little developed, usually much exceeded by inflorescence..... 111. *C. nudata*.  
 Culm much less densely cespitose, forming beds, conspicuously stoloniferous; lowest bract well-developed, from somewhat shorter than to exceeding inflorescence.  
 Perigynia orbicular or nearly so.....112. *C. eurycarpa*.  
 Perigynia oblanceolate.....113. *C. oxycarpa*.

## 29. Cryptocarpae.

- Perigynia dull, straw-colored or light brown, slightly granular; lower sheaths of sterile shoots not filamentose.....114. *C. lyngbyei*.  
 Perigynia shining, brown, smooth; lower sheaths of sterile shoots strongly filamentose.... 115. *C. obnupta*.

## 30. Trachychlaenae.

- Represented by one species in our range.....116. *C. spissa*.

## 31. Hirtae.

- Beak of perigynium obliquely cut, shallowly bidentate at maturity; foliage pubescent; staminate scales long-ciliate.....117. *C. yosemitana*.  
 Beak of perigynium deeply bidentate; staminate scales at most erose.  
 Foliage not pubescent; teeth of perigynium beak short.  
 Lowest bract strongly sheathing; fertile culms phyllopodic with many leaves, the sheaths not breaking and becoming filamentose.....118. *C. oregonensis*.  
 Lowest bract not sheathing; fertile culms aphyllopodic with few leaves, the sheaths breaking and becoming filamentose.....119. *C. lanuginosa*.  
 Sheaths and under surface of leaf-blades hairy; teeth of perigynium beak conspicuous.....120. *C. sheldonii*.

## 32. Extensae.

- Represented by one species in our range.....121. *C. viridula*.

## 33. Physocarpae.

- Perigynia ascending; lower sheaths more or less strongly filamentose; culms sharply triangular.  
 Perigynia 4 to 8 mm. long, abruptly contracted into beak.....122. *C. vesicaria*.  
 Perigynia 7 to 10 mm. long, tapering into beak.....123. *C. exsiccata*.  
 Perigynia spreading at maturity; lower sheaths not filamentose; culms bluntly triangular below spikes.....124. *C. rostrata*.

## 34. Pseudo-Cypereae.

- Perigynia suborbicular in cross-section, more or less inflated; teeth of perigynium beak 0.5 to 1 mm. long.....125. *C. hystricina*.  
 Perigynia obtusely triangular, scarcely inflated, closely enveloping achene; teeth of perigynium beak 1.5 to 2 mm. long, recurved or spreading.....126. *C. comosa*.

SECT. 1. INFLATAE Kük. Cespitose, the rootstocks elongate. Leaf-blades filiform. Spike solitary, ovoid, androgynous, densely flowered, bractless. Perigynia inflated, the walls very thin, slightly nerved, sessile, the smooth beak hyaline-tipped, obliquely cut, in age bidentulate. Achenes triangular. Stamens 3.

1. *C. engelmannii* Bailey. Culms 5 to 20 cm. high; spike 10 to 15 mm. long, 6 to 10 mm. wide, the lower  $\frac{3}{4}$  pistillate; scales acute to cuspidate, all except lower shorter than perigynia; perigynia 4.5 to 5 mm. long, 2.25 mm. wide.—Alpine peaks or meadows, Sierra Nevada in Tulare Co.; n. to Wash., e. to Col.

2. *C. breweri* Boott. Fig. 159. Culms 1 to 2.5 dm. high; spike 1 to 2 cm. long, 6 to 10 mm. wide, the upper third staminate; scales ovate, short-acuminate, narrower and shorter than perigynia; perigynia 5 mm. long, 3.5 mm.

159. *Carex breweri* Boott; *a*, habit  $\times \frac{1}{2}$ ; *b*, scale  $\times 2\frac{3}{4}$ ; *c*, perigy.  $\times 2\frac{3}{4}$ .

3. *C. nigricans* C. A. Mey. Fig. 160. Culms 5 to 30 cm. high, stiff, firm, smooth; leaves 4 to 9 to a fertile culm, the blades 1.5 to 3 mm. wide, flat, or channeled at base; spike 8 to 15 mm. long, 6 to 9 mm. wide, the upper half staminate, the lower with 10 to 25 perigynia;

161. *Carex capitata* L.; *a*, habit  $\times \frac{1}{2}$ ; *b*, scale  $\times 4$ ; *c*, perigy.  $\times 4$ .

wide.—High alpine peaks of the Sierra Nevada from Mt. Whitney to Mt. Shasta; n. to Wash.

SECT. 2. *ATHROCHLAENAE* Holm. Cespitose or with creeping rootstocks. Leaf-blades narrow. Spike solitary, androgynous, bractless, narrow, densely many-flowered. Pistillate scales soon falling. Perigynia slenderly strongly stipitate, widely spreading or the lower reflexed, obscurely triangular, nerveless, membranaceous, long-beaked, the beak obliquely cut, becoming bidentulate. Achenes usually triangular, slightly apiculate. Stigmas 3 or occasionally 2.

160. *Carex nigricans* C. A. Mey.; *a*, habit  $\times \frac{1}{2}$ ; *b*, infl.  $\times \frac{1}{2}$ ; *c*, scale  $\times 3$ ; *d*, perigy.  $\times 3$ .

scales ovate, obtuse to acutish, dark-brown tinged with hyaline margins, shorter than perigynia; perigynia 4 mm. long, brownish, tapering into a smooth beak.—Arctic alpine in the Sierra Nevada, from Tulare Co. to Eldorado Co.; n. to Alas., e. to Col.

SECT. 3. *CAPITATAE* Christ. Cespitose. Leaf-blades filiform. Spike solitary, ovoid, androgynous, densely flowered, bractless. Perigynia plano-convex, sharp-edged, not inflated, essentially nerveless, sessile, the walls thinnish, the smooth terete beak conspicuously hyaline-tipped, in age bidentulate. Achenes lenticular, apiculate. Stigmas 2.

4. *C. capitata* L. ARCTIC SEDGE. Fig. 161. Culms 1 to 3.5 dm. high, roughish above, the basal sheaths purplish; spike 4 to 10 mm. long; scales ovate-orbicular, obtuse, shorter and narrower than perigynia, chestnut-brown with broad hyaline margins; perigynia 2 to 3 mm. long, pale green, smooth, rounded at base, the abrupt beak slender, dark-colored, less than 1

mm. long.—Sierra Nevada in Fresno and Tulare Cos., 6500 to 8000 ft.; n. to Alas., e. to Greenland, s. to Mex.

SECT. 4. *FORTIDAE* Tuckerm. Leaf-blades narrow. Spikes few to several, androgynous, in a dense subglobose or ovoid head. Perigynia spreading, plano-convex, membranaceous, usually obsolete nerved, loosely enveloping the achene, rounded at base, stipitate, the beak obliquely cut, at times bidentulate. Achenes lenticular. Stigmas 2.

5. *C. vernacula* Bailey. Fig. 162. Culms 0.5 to 2 dm. high, smooth; leaf-blades 2 to 4 mm. wide, stiff; head about 1 cm. in diameter, the staminate flowers inconspicuous; scales ovate, brown, sharp-pointed, rather wider and from shorter to longer than perigynia; perigynia ovoid, 3.5 to 4.5 mm. long, not margined, tapering into the smooth beak  $\frac{1}{3}$  length of body.—

Alpine slopes, Sierra Nevada from Tulare Co. to Modoc Co.; n. to Wash., e. to Col.

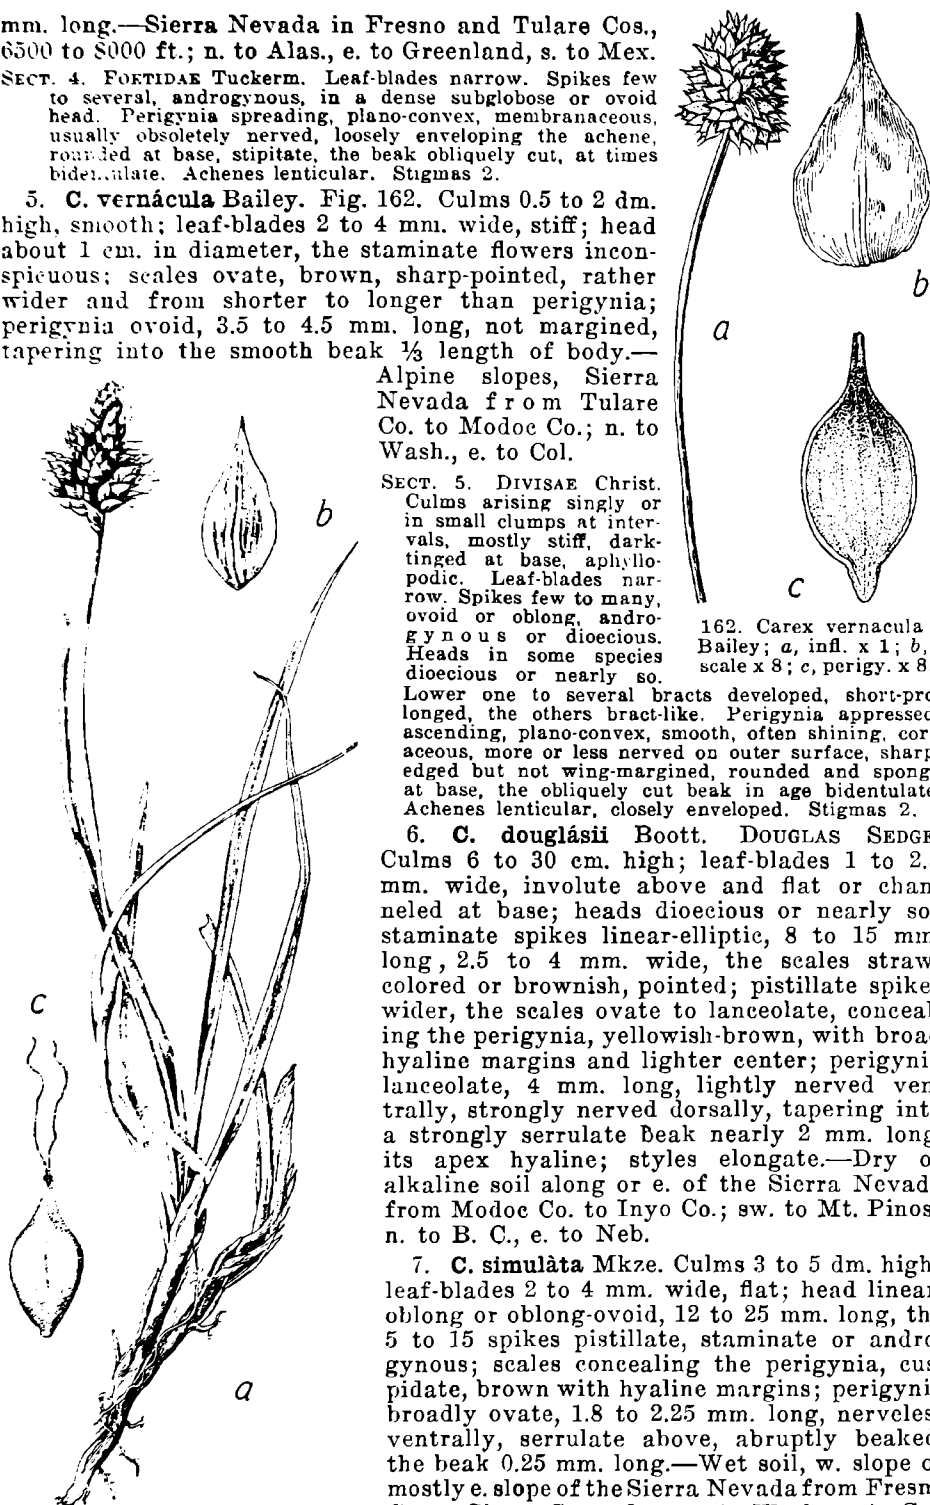

SECT. 5. *DIVISAE* Christ. Culms arising singly or in small clumps at intervals, mostly stiff, dark-tinged at base, aphyllodipodic. Leaf-blades narrow. Spikes few to many, ovoid or oblong, androgynous or dioecious. Heads in some species dioecious or nearly so.

Lower one to several bracts developed, short-prolonged, the others bract-like. Perigynia appressed-ascending, plano-convex, smooth, often shining, coriaceous, more or less nerved on outer surface, sharp-edged but not wing-margined, rounded and spongy at base, the obliquely cut beak in age bidentulate. Achenes lenticular, closely enveloped. Stigmas 2.

6. *C. douglasii* Boott. DOUGLAS SEDGE. Culms 6 to 30 cm. high; leaf-blades 1 to 2.5 mm. wide, involute above and flat or channeled at base; heads dioecious or nearly so; staminate spikes linear-elliptic, 8 to 15 mm. long, 2.5 to 4 mm. wide, the scales straw-colored or brownish, pointed; pistillate spikes wider, the scales ovate to lanceolate, concealing the perigynia, yellowish-brown, with broad hyaline margins and lighter center; perigynia lanceolate, 4 mm. long, lightly nerved ventrally, strongly nerved dorsally, tapering into a strongly serrulate beak nearly 2 mm. long, its apex hyaline; styles elongate.—Dry or alkaline soil along or e. of the Sierra Nevada from Modoc Co. to Inyo Co.; sw. to Mt. Pinos; n. to B. C., e. to Neb.

7. *C. simulata* Mke. Culms 3 to 5 dm. high; leaf-blades 2 to 4 mm. wide, flat; head linear-oblong or oblong-ovoid, 12 to 25 mm. long, the 5 to 15 spikes pistillate, staminate or androgynous; scales concealing the perigynia, cuspidate, brown with hyaline margins; perigynia broadly ovate, 1.8 to 2.25 mm. long, nerveless ventrally, serrulate above, abruptly beaked, the beak 0.25 mm. long.—Wet soil, w. slope or mostly e. slope of the Sierra Nevada from Fresno Co. to Sierra Co. and n.; n. to Wash., e. to Col.

8. *C. pansa* Bailey. Fig. 163. Culms 1.5 to 3 dm. high; leaf-blades 1 to 3 mm. wide; head

163. *Carex pansa* Bailey; a, habit  $\times \frac{1}{2}$ ; b, scale  $\times 5$ ; c, perigy.  $\times 5$ .

162. *Carex vernacula* Bailey; a, infl.  $\times 1$ ; b, scale  $\times 8$ ; c, perigy.  $\times 8$ .

164. *Carex hoodii* Boott.; a, infl. x 1; b, scale x  $7\frac{1}{2}$ ; c, perigy. x  $7\frac{1}{2}$ .

green-margined above, the beak  $\frac{1}{3}$  length of body.—Mountain meadows and slopes, Sierra Nevada from Tulare Co. to Shasta Co.; n. to B. C., e. to Col.

11. *C. tumulicola* Mkze. FOOTHILL SEDGE. Fig. 165. Culms 2 to 8 dm. high; leaf-blades 1.5 to 2.5 mm. wide; head 2 to 5 cm. long, slender, the upper spikes aggregated, the lower separate, with 10 or fewer appressed perigynia; lower bracts long-cuspidate; scales largely concealing perigynia, brownish straw-color with hyaline margin and green midrib, acuminate to cuspidate; perigynia lanceolate, 4 to 5 mm. long, the serrulate beak  $\frac{1}{3}$  to  $\frac{1}{2}$  length of body.—Dry soil, 50 to 2000 (or 5000) ft.: coastal counties from Monterey Co. to Humboldt Co.; Sierra Nevada from Tuolumne Co. to Calaveras Co.; n. to Wash.

165. *Carex tumulicola* Mkze.; a, infl. x 1; b, scale x  $7\frac{1}{2}$ ; c, perigy. x  $7\frac{1}{2}$ .

SECT. 7. MULTIFLORAE Kunth. Densely cespitose. Culms sharply triangular. Opaque part of sheaths usually transversely rugulose, red-dotted. Spikes numerous, small, androgynous or pistillate, but never gynaeandrous, the lower more or less compound. Bracts frequently conspicuous. Perigynia plano-convex, appressed-ascending or spreading, not thick-walled, somewhat spongy at base, short-stipitate, sharp-margined, more or less nerved, conspicuously rough-beaked, the beak bidentate. Achenes lenticular. Stigmas 2.

12. *C. stenoptera* Mkze. Culms 2.5 to 4 dm. high; leaf-blades 2 to 3 mm. wide, channeled, the sheaths tight; head decompound, 2 to 5.5 cm. long, with spikes 5 to 8 mm. long, 4 to 6 mm. wide; bracts inconspicuous; scales ovate-lanceolate, obtusish to short-cuspidate, brownish, exceeding perigynia; perigynia 3 to 3.5 mm. long, nerved dorsally, nerveless ventrally or nearly so, round-tapering at base, tapering into a serrulate beak about  $\frac{1}{2}$  length of body.—San Antonio Mts., S. Cal.

1.5 to 2.5 cm. long, the spikes lance-ovoid, 7 to 10 mm. long, the several to many perigynia appressed; scales with conspicuous white-hyaline margins, concealing perigynia; perigynia oblong-lanceolate, nerveless ventrally, tapering at apex, the beak 1 mm. long, serrulate.—Drifting sands along the seacoast from Monterey Co. to Del Norte Co.; n. to Wash.

9. *C. praegracilis* W. Boott. FIELD SEDGE. Culms 2 to 7.5 dm. high; leaf-blades 1.5 to 3 mm. wide, flattened or canaliculate; head 1 to 5 cm. long, the 5 to 15 spikes densely aggregated, androgynous, with 4 to 10 perigynia; scales ovate-lanceolate, acute to cuspidate, nearly concealing the perigynia; perigynia nerved on the outer, nearly nerveless on the inner face.—Meadows, widely distributed except on the higher mts.; n. to Alas., e. to Iowa, s. to Mex.

SECT. 6. MUHLENBERGIANAE Tuckerm. Cespitose or with more or less elongated rootstocks. Culms not flattened. Spikes few, androgynous or pistillate but never gynaeandrous, rarely compound. Perigynia plano-convex, appressed to reflexed, often strongly spongy at base, narrowly sharp-margined, conspicuously beaked, the beak sharply bidentate. Achenes lenticular. Stigmas 2.

10. *C. hoodii* Boott. Fig. 164. Culms 3 to 8 dm. high; leaf-blades 1.5 to 3.5 mm. wide; head 1 to 2 cm. long, the spikes with 5 to 10 ascending perigynia; scales ovate, sharp-pointed, chestnut-brown with lighter keel and broad hyaline margins; perigynia lance-ovate, 4 to 5 mm. long,

13. *C. álma* Bailey. Fig. 166. Culms 3 to 12 dm. high, strict, rough on angles; leaf-blades 3 to 6 mm. wide; head 2.5 to 20 cm. long, decom-pound, the clusters closely aggregated to strongly separate; scales ovate, short-pointed to obtusish, straw-colored or brownish; perigynia 3.5 to 4 mm. long, smooth, shining, narrowly green-margined, serrulate from middle, lightly few-nerved on both sides, tapering into the serrulate beak.—Along streams, Monterey and Tulare Cos. to S. Cal.; e. to s. Nev. and Ariz.

14. *C. dénsa* Bailey. Fig. 167. Culms 3 to 6 dm. high, smooth or roughened above, from exceed- ing to shorter than the leaves; leaf-blades 3 to 6 mm. wide, the sheaths septate dorsally, and thin, hyaline and more or less cross-rugulose ven- trally, prolonged and

convex at the mouth; head 2 to 5 cm. long; bracts inconspicuous, except 1 or 2 lower ones; perigynia 3.5 to 4.5 mm. long, strongly convex dorsally, ovate or ovate-lanceolate from a round-tapering base, narrowly green-margined, serrulate above middle, the beak about  $\frac{1}{2}$  length of body.—Dry soil, cis- montane: Sierra Nevada from Mariposa Co. n.; Marysville Buttes; Coast Ranges from Santa Clara Co. n.; n. to Ore.

167. *Carex densa* Bailey;  
a, inf. x 1; b, scale x  $7\frac{1}{2}$ ;  
c, perigy. x  $7\frac{1}{2}$ .

166. *Carex álma* Bailey; a,  
inf. x 1; b, scale x 8;  
c, perigy. x 8.

15. *C. vicària* Bailey. RUSTY SEDGE. Culms 3 to 6 dm. high, exceeding the leaves, rough above; leaf-blades 3 to 4.5 mm. wide, the sheaths tight, not conspicuously septate dorsally, thin-hyaline and more or less cross-rugulose ventrally, short-prolonged and convex at mouth; head 1.5 to 3 cm. long; bracts inconspicuous except 1 or 2 lower ones; perigynia 3 to 3.5 mm. long, ovate from a rounded base, green-margined, serrulate above middle, the beak  $\frac{1}{2}$  length of body.—Marshes, Mendocino Co. (Round Valley); n. to Wash.

16. *C. breviligulàta* Mkze. Culms 3 to 6 dm. high, exceeding leaves, rough above; leaf-blades 3 to 4.5 mm. wide, the sheaths tight, not conspicuously septate dorsally, thin-hyaline and more or less cross-rugulose ventrally, truncate at mouth; head 1.5 to 3.5 cm. long; bracts usually not conspicuous; perigynia 3.25 to 3.75 mm. long, ovate from a round-tapering base, green-margined, serrulate from middle, the beak  $\frac{1}{2}$  length of body.—Marshes and swales: North Coast Ranges; Sierra Nevada; n. to Ore.

17. *C. dúdleyi* Mkze. Culms 3 to 7 dm. high, rough above, exceeding leaves; leaf-blades 4 to 7 mm. wide, the sheaths tight, inconspicuously septate dorsally, white-hyaline and scarcely cross-rugulose ventrally, the ligule as long as wide; head 2 to 3.5 cm. long; bracts setaceous, the lower conspicuous; perigynia narrowly ovate from a rounded base, brownish-yellow with green margin, nerved ventrally, the beak serrulate.—Coast Ranges from Monterey Co. to Lake Co.; apparently local.

168. *Carex cusickii* Mkze.; a, infl.  $\times 1$ ; b, scale  $\times 7\frac{1}{2}$ ; c, perigy.  $\times 7\frac{1}{2}$ .

spreading, not thick-walled but strongly spongy at base, stipitate, strongly many-nerved, the margins nearly obsolete on the lower half, conspicuously beaked, the beak bidentate. Achenes lenticular. Stigmas 2.

20. *C. jonesii* Bailey. Fig. 169. Culms 2 to 6 dm. high, slender; leaf-blades 1 to 2 mm. wide;

170. *Carex nervina* Bailey; a, infl.  $\times 1$ ; b, scale  $\times 6$ ; c, perigy.  $\times 6$ .

SECT. 8. PANICULATÆ Kunth. Densely or loosely cespitose. Culms not flattened. Opaque part of leaf-sheaths strongly red-dotted. Spikes numerous, small, androgynous or pistillate, but never gynæcandrous, the lower compound or decompound. Bracts usually inconspicuous. Perigynia thick, high convex on the dorsal and often somewhat convex on the ventral face, ascending or spreading, coriaceous, spongy at base, stipitate, narrowly margined, more or less nerved, conspicuously rough-beaked, the beak bidentate. Achenes lenticular. Stigmas 2.

18. *C. diandra* Schrank. Culms 3 to 7 dm. high, slender; leaf-blades canaliculate at base; sheaths not copper-colored at mouth; head 2.5 to 5 cm. long; scales acute, brownish; perigynia round-truncate at base, the beak serrulate.—Wet meadows, very local: San Bernardino Valley; Oriole Lake, Tulare Co.; n. to Alas. e. to Newf.

19. *C. cusickii* Mkze. Fig. 168. Culms stout, 7 to 12 dm. high; leaf-blades flat with slightly revolute margins, the sheaths copper-tinged at mouth; head 4 to 8 cm. long; scales chestnut-tinged; perigynia truncate at base, the beak setulose-serrulate. — Wet meadows near the coast from San Francisco to Del Norte Co. Rare. N. to B. C., e. to Mont.

SECT. 9. STENORHYNCHÆ Holm. Densely cespitose or with more or less elongated rootstocks. Culms triangular or somewhat flattened. Opaque part of leaf-sheaths usually transversely rugulose or red-dotted. Spikes few to many, androgynous or pistillate, but never gynæcandrous, the lower simple to compound. Bracts little developed. Perigynia plano-convex, yellowish or yellowish-brown, appressed ascending to

169. *Carex jonesii* Bailey; a, infl.  $\times 1$ ; b, scale  $\times 7$ ; c, perigy.  $\times 7$ .

perigynia; scales exceeding or shorter than the perigynia, ovate, dark brown; perigynia ovate-lanceolate, 3 to 4 mm. long, 1.5 mm. wide, the beak very slightly serrulate,  $\frac{1}{3}$  length of body.—High mountains, 5000 to 7200 ft.: San Bernardino Mts.; Sierra Nevada from Tulare Co. to Siskiyou Co.; n. to Wash., e. to Mont.

21. *C. nervina* Bailey. AWL SEDGE. Fig. 170. Culms 3 to 9 dm. high, strongly aphyllopodic, slightly flattened in drying; opaque part of sheaths olive-tinged, truncate or concave at the mouth; head 1.5 to 3 cm. long, the larger with 6 to 12 ascending perigynia, the staminate flowers rarely conspicuous; scales ovate, brownish; perigynia ovate-lanceolate, 3.5 to 4 mm. long, the beak

171. *Carex stipata* Muhl.;  
a, inf. x 1; b, scale x 7½;  
c, perigyn. x 7½.

or truncate base, not punctulate, nerved on the outer, nerved or nerveless on the inner surface, the beak bidentate or obliquely cut. Achenes lenticular. Stigmas 2.

23. *C. laeviculmis* Meinsh. Fig. 172. Culms 3 to 7 dm. high, weak; leaf-blades 1 to 2 mm. wide, light green, flat, soft; spikes 3 to 8, widely separate or upper approximate, suborbicular, 3 to 10 mm. long, with 3 to 10 perigynia; uppermost spike long-clavate at base; scales ovate, about length of body of perigynium, with conspicuous green midvein; perigynia green or brownish-green, oblong-ovoid, plano- or concave-convex, 2.5 to 4 mm. long, 1.5 mm. wide, thin-walled, lightly nerved ventrally, the beak ½ length of body.—Wet shaded places: Humboldt Co.; n. Sierra Nevada from Eldorado Co. to Butte Co.; n. to Alas. and Ida.

24. *C. interior* Bailey. Culms 1.5 to 5 dm. high, slender and wiry; leaf-blades 1 to 3 mm. wide, flat or somewhat canaliculate; head 1 to 2 cm. long, the 3 or 4 spikes approximate, the lateral pistillate, suborbicular, 4 mm. long, with 3 to 10 widely spreading perigynia, the upper long-tapering and staminate at base; scales ovate-orbicular, brownish, hyaline-margined all around, the center lighter-colored, the midvein not sharply defined; perigynia oblong-ovoid, straw-color or light-brownish, plump, 2.5 to 3 mm. long, sparingly serrulate on the upper margins, abruptly beaked, the beak with very short teeth.—Boggy meadows, northern Sierra Nevada from Plumas Co. to Siskiyou Co.; n. to B. C., e. to Newf., s. to Mex.

25. *C. ormantha* Mke. Culms 1.5 to 4 dm. high, slender but rather stiff; leaf-blades slightly canaliculate, 1.5 to 2 mm. wide; head 2 to 6 cm. long; spikes 3 or 4, the lateral suborbicular, 6 to 8 mm. wide, with 2 to 12 widely radiating perigynia; perigynia rounded at base, tapering into the bidentate beak more than ½ length of body, the teeth short.—Boggy places in the mountains, mostly 4000 to 6000 ft.: San Bernardino Mts.; Sierra Nevada from Tulare Co. to Tehama Co.; also in Ore.

26. *C. phyllomanica* W. Boott. Culms 2.5 to 6 dm. high, smooth or nearly so; leaf-blades flat, 1.75 to 2.75 mm. wide; head 1.5 to 3.5 cm. long; spikes 3 or 4, the lateral suborbicular, 7 mm. wide with 8 to 15 widely spreading

smoothish, 1 mm. long, the teeth erect.—High mountains, 4000 to 7000 ft., Sierra Nevada from Tulare Co. to Siskiyou Co.; n. to s. Ore.

22. *C. stipata* Muhl. Fig. 171. Culms 3 to 12 dm. high, rather weak, sharply triangular, strongly serrulate above; leaf-blades 4 to 8 mm. wide, flat, flaccid, the sheaths strongly septate dorsally, the opaque part thin, quickly broken, cross-rugulose; head 3 to 10 cm. long, yellowish-brown; scales ovate-triangular, light-brownish, about length of body of perigynium; perigynia lanceolate, 4 to 5 mm. long, the serrulate beak longer than or nearly equaling the body.—Swamps and wet meadows: Coast Ranges from Sonoma Co. to Siskiyou Co., thence s. in the Sierra Nevada to Sierra Co.; n. to Alas., e. to Newf.

SECT. 10. STELLULATAE Kunth. Densely cespitose. Culms triangular. Sheaths not red-dotted or cross-rugulose. Spikes 2 to 10, or by reduction 1, gynaeandrous, pistillate or in a few species staminate, not compound. Bracts inconspicuous. Perigynia plano-convex, yellow-brown or brown, spreading at maturity, the body orbicular, ovate or broadly oval, strongly spongy at base, sharp-edged nearly if not entirely to the rounded

172. *Carex laeviculmis* Meinsh.; a, inf. x 1;  
b, scale x 7; c,  
perigyn. x 7.

perigynia; perigynia round-truncate at base, tapering into a beak scarcely  $\frac{1}{2}$  length of body, the teeth short.—Swampy places near the coast, Mendocino Co. to Del Norte Co.; n. to Alas.

27. *C. angustior* Mkze. Culms very slender but strict, 1 to 6 dm. high, somewhat roughened above; leaf-blades 1 to 2 mm. wide, flat, or canaliculate; spikes 2 to 5, approximate, 4 to 6 mm. long, with 3 to 15 perigynia, the terminal long-clavate, the lateral rounded at base; scales as long as body of perigynia, ovate; perigynia 2.5 to 3.5 mm. long, yellowish-brown, impressed-nerved ventrally, tapering into a bidentate beak more than  $\frac{1}{2}$  length of body.—Boggy places, rare: Eldorado Co.; Humboldt Co.; n. to Wash., e. to Newf.

28. *C. illota* Bailey. SHEEP SEDGE. Culms 1 to 3.5 dm. high, slender but strict; leaf-blades 1.5 to 3 mm. wide; scales broadly ovate, obtuse, brownish-black; perigynia ovate, 3 mm. long, obscurely nerved, brownish-black, the beak  $\frac{1}{3}$  length of body, smooth or nearly so, emarginate.—High montane, Sierra Nevada from Tulare Co. to Eldorado Co.; n. to Wash., e. to Col.

SECT. 11. DEWEYANAE Tuckerm. Densely cespitose. Culms triangular. Sheaths not red-dotted or cross-rugulose. Spikes 3 to 8, gynaeandrous, pistillate or rarely staminate, simple. Lower one or two bracts often conspicuous. Perigynia plano-convex, light- or yellowish-green, appressed, the body ovate- or linear-oblong, strongly spongy at base, only upper half sharp-edged, round-tapering at base, nerved on the outer face, nerved or nerveless on the inner face, the beak bidentulate to deeply bidentate. Achenes lenticular. Stigmas 2.

173. *Carex bolanderi* Olney;  
a, inf.  $\times 1$ ; b, scale  $\times 7\frac{1}{2}$ ;  
c, perigy.  $\times 7\frac{1}{2}$ .

29. *C. leptopoda* Mkze. Culms erect, 2 to 8 dm. high, roughened beneath head; leaf-blades 2.5 to 5 mm. wide; spikes ovoid-oblong or linear-oblong, with 6 to 18 perigynia; scales not reddish-brown tinged, mostly cuspidate, shorter than the bodies of the ovate-lanceolate perigynia.—Damp woods: Sierra Nevada from Tulare Co. to Shasta Co., 4000 to 8000 ft.; Coast Ranges from Santa Cruz Co. to Trinity Co., 50 to 3000 ft.; n. to B. C., e. to Ida.

30. *C. bolanderi* Olney. WOOD SEDGE. Fig. 173. Culms 1.5 to 9 dm. high, little roughened beneath head; leaf-blades 2.5 to 5 mm. wide; spikes linear-oblong or linear, with 8 to 30 perigynia; scales usually reddish-brown tinged, mostly acute or mucronate, concealing the bodies of the lanceolate perigynia.—Widely distributed in the mountain ranges, mostly at lower altitudes, 100 to 2000 (or 6000) ft.: San Bernardino Mts.; Coast Ranges; Sierra Nevada; n. to B. C., e. to N. Mex. and Mont.

SECT. 12. OVALES Kunth. Densely cespitose or (rarely) with short-prolonged rootstocks. Culms triangular. Opaque part of leaf-sheaths not red-dotted or cross-rugulose, but sometimes green-striate. Spikes 2 or 3 up to 30, with several to many perigynia, the terminal gynaeandrous, the lateral pistillate or gynaeandrous, simple, the inflorescence capitate to moniliform. Perigynia scale-like or flat (except where distended by achene) to thick and plano-convex, the body subulate to reniform, narrowly to broadly wing-margined, appressed or ascending or spreading, little corky-thickened at base, prominently beaked, the beak bidentate, or obliquely cut, often becoming bidentulate, usually serrulate on the margins. Achenes lenticular. Stigmas 2.

31. *C. feta* Bailey. WESTERN SEDGE. Fig. 174. Culms 5 to 12 dm. high, smooth; leaf-blades 2.5 to 4 mm. wide; head 2 to 8 cm. long, the spikes 5 to 15, greenish, aggregated or more or less separate, 6 to 10 mm. long, the perigynia appressed, or spreading in age; bracts inconspicuous; scales ovate, greenish, acute; perigynia plano-convex, thickish, ovate, greenish, 3 to 3.5 mm. long, nearly nerveless ventrally, contracted into a flat beak less than  $\frac{1}{2}$  length of body.—Foothills and mountains, 100 to 7800 ft.: coastal S. Cal.; Coast Ranges; Sierra Nevada; n. to B. C.

174. *Carex feta* Bailey; *a*, infl.  $\times 1$ ; *b*, scale  $\times 8$ ; *c*, perigy.  $\times 8$ ; *d*, sheath  $\times 2$ ; *e*, culm and sheath  $\times 2$ .

32. *C. frácta* Mkze. Culms 5 to 12 dm. high; leaf-blades 3 to 6 mm. wide; head 2.5 to 7.5 cm. long, the spikes 7 to 15, aggregated or the lower slightly separate, short-oblong or obovoid, 8 to 12 mm. long, the perigynia appressed or ascending in age; bracts inconspicuous; scales lance-ovate, acuminate or short-cuspidate, shorter than the perigynia; perigynia lance-ovate, thickish over achene, 3 to 4.5 mm. long, strongly nerved ventrally, narrowly margined, serrulate above; beak about length of body.—Mts. of S. Cal.; Sierra Nevada; North Coast Ranges; alt. 4000 to 7000 ft.; n. to Wash.

33. *C. stráminifórmis* Bailey. Leaf-blades 2 to 3.5 mm. wide; head 1.5 to 2.5 cm. long, containing 3 to 6 spikes, 6 to 10 mm. long with many spreading-ascending perigynia; scales ovate-lanceolate, acute, reddish-brown; perigynia broadly ovate, strongly winged, nerveless or nearly so ventrally, abruptly beaked, the beak  $\frac{1}{2}$  length of body.—High summits of the Sierra Nevada, 8000 to 11,700 ft.; n. to Wash.

34. *C. múlticostáta* Mkze. Leaf-blades 2.5 to 6 mm. wide; spikes about 10, 8 to 16 mm. long; scales ovate,

obtuse to acute, reddish-brown; perigynia appressed, ovate, several-nerved ventrally, winged to the rounded base, abruptly contracted into the beak 1 mm. long.—Mts. of S. Cal.; Sierra Nevada in Nevada Co.; rare.

35. *C. subfúscá* W. Boott. Culms 2 to 6.5 dm. high, smooth; leaf-blades 1.5 to 3 mm. wide; head oblong or ovoid, 1 to 2 cm. long, the spikes 4 to 12, well defined but closely aggregated, ovoid or oblong, 4 to 10 mm. long, rounded at apex, rounded or somewhat tapering at base, the perigynia appressed-ascending; scales ovate, acute, brownish; perigynia ovate, plano-convex, thickish, winged to the rounded base, serrulate above, faintly nerved ventrally, contracted into beak  $\frac{1}{2}$  length of body or more.—High montane in coastal S. Cal. and in the Sierra Nevada, 4000 to 8000 ft.; Coast Ranges from Monterey Co. to Siskiyou Co., mostly 500 to 2500 ft.; n. to Ore., e. to Ariz.

36. *C. prácticola* Rydb. Culms 2 to 7 dm. high, roughened beneath head; leaf-blades 1 to 3.5 mm. wide, flat; spikes 2 to 7, elliptic, 6 to 16 mm. long, the upper contiguous, the lower remote; bracts except lowest not developed; scales ovate, acutish, brownish tinged, shining; perigynia concealed by scales, ovate-lanceolate, 4.5 to 6.5 mm. long, narrowly winged, nearly nerveless ventrally, tapering to a short hyaline-tipped beak  $\frac{1}{3}$  length of body.—Meadows and open woods, Humboldt Co.; n. to arctic Am.

37. *C. trácyi* Mkze. Head stiff, narrow, 1.5 to 4 cm. long, the spikes 4 to 7, ovoid or short-oblong, 7 to 15 mm. long; scales ovate, acute, covering perigynia, brownish-red; perigynia ovate, 4 to 5 mm. long, winged to the rounded base, serrulate above, strongly nerved dorsally and ventrally, abruptly beaked, the beak obliquely cut dorsally, at length bidentulate, dark reddish-brown at tip, shorter than body.—Humboldt Co.; n. to B. C.

38. *C. phaëocéphala* Piper. Fig. 175. Spikes 2 to 5 (rarely 7), 6 to 12 mm. long, forming a head 12 to 25 mm. long; lowest bract occasionally developed; scales ovate, acute, dark brownish, covering perigynia; perigynia 4.5 mm. long, obscurely nerved ventrally, contracted into a beak about 1 mm.

175. *Carex phaeocephala* Piper; a, infl. x 1; b, scale x 7; c, perigy. x 7.

scales oblong-ovate, very obtuse, chestnut; perigynia thin, 7.5 mm. long, striate dorsally and ventrally, narrowly margined to base and serrulate to middle, the sharply bidentate beak not differentiated from body.—High Sierra Nevada from Placer Co. to Tulare Co., 6000 to 10,000 ft.

41. *C. specifica* Bailey. Culms 2.5 to 8 dm. high, smooth, stiff; leaf-blades 2 to 5 mm. wide; head globose, 1.5 to 4 cm. long, the spikes oblong-ovoid, 6 to 9 mm. long; bracts little developed; scales lance-ovate, acute, reddish-brown; perigynia thin, plano-convex, 6 mm. long, several to many-nerved on both faces, narrowly winged to base, serrulate above, tapering into a bidentate beak  $\frac{1}{2}$  length of body.—Sierra Nevada from Eldorado Co. to Tulare Co., 6500 to 8000 ft.

42. *C. unilátalis* Mke. Culms 2 to 9 dm. high, slender, leaf-blades 2 to 4 mm. wide; spikes 5 to 20, ovoid, 5 mm. long, densely aggregated into an ovoid head 1 to 3 cm. long; lowest 2 or 3 bracts dilated and strongly brownish hyaline margined at base; scales ovate, strongly cuspidate, reddish; perigynia appressed, ovate-lanceolate, thin, 4 to 5 mm. long, wing-margined, serrulate above, tapering into a short flat beak, serrulate nearly to apex.—Wet meadows and copses, Humboldt Co.; n. to B. C.

43. *C. áthrostáchya* Olney. Fig. 176. Culms 1 to 9 dm. high, slender; leaf-blades 1.5 to 4 mm. wide; spikes 4 to 20, ovoid, 4 to 10 mm. long, densely aggregated into an ovoid head 1 to 3 cm. long; lowest 2 or 3 bracts dilated and strongly brownish hyaline-margined at base, spreading; scales ovate, shorter than the perigynia, acute or short-cuspidate, brown; perigynia ascending, ovate-lanceolate, thin, 3 to 4.5 mm. long, wing-margined, serrulate above, tapering into a beak 1 mm. long, the tip slender, terete.—Wet meadows and copses: San Bernardino Mts.; Sierra Nevada from Tulare Co. to Lassen Co.; North Coast Ranges from Mendocino Co. to Siskiyou Co.; n. to Alas., e. to Col.

44. *C. festivélla* Mke. Culms 3 to 10 dm. high; leaf-blades 2 to 6 mm. wide; spikes 5 to 20, ovoid, 5 to 12 mm. long, densely aggregated into a head 12 to 25 mm. long; bracts inconspicuous; scales ovate, obtuse to acutish, dark chestnut to brownish-black; perigynia ovate, appressed, lightly nerved ventrally, the beak  $\frac{1}{2}$  length of body.—High montane, 7000 to 10,000 ft.: Sierra Nevada from Eldorado Co. to Tulare Co.; White Mts.; n. to Wash., e. to Col.

long. — High peaks of the Sierra Nevada from Mt. Whitney to Mt. Shasta; n. to Alas., e. to Col.

39. *C. léporinélla* Mke. Spikes 3 to 8, narrowly oblong-oval, 6 to 15 mm. long, forming a head 1.5 to 3 cm. long; lowest bract occasionally somewhat developed; scales ovate, acute, reddish-brown, covering perigynia; perigynia 4 mm. long, few-nerved ventrally, tapering into a beak 1 mm. long.—High summits, cent. Sierra Nevada from Mariposa Co. to Placer Co.; n. to Wash.

40. *C. dávyi* Mke. Culms 2.5 to 3.5 dm. high, smooth, slender; leaf-blades 1.5 to 2.5 mm. wide; head about 2.5 cm. long, the spikes oblong-obovoid, 12 to 18 mm. long; bracts not developed;

176. *Carex athrostachya* Olney; a, infl. x 1; b, scale x 8; c, perigy. x 8.

45. *C. nubicola* Mkze. Culms 1 to 4 dm. high; leaf-blades 1.5 to 4 mm. wide; head 9 to 18 mm. long, the 4 to 7 densely aggregated ovoid or subglobose spikes 5 to 9 mm. long, the perigynia ascending with spreading beaks; bracts inconspicuous; scales ovate, acute, blackish; perigynia ovate, strongly winged, abruptly contracted into a beak  $\frac{1}{2}$  length of body.—Summits of high mountains: Mt. Dana (our only known locality); n. to Alb., e. to Col.

46. *C. pachystachya* Cham. Culms 3 to 10 dm. high; leaf-blades 2 to 4 mm. wide; spikes 4 to 8, densely aggregated or more or less separate, ovoid or suborbicular, 5 to 8 mm. long, with 10 to 30 at length spreading perigynia; scales ovate, dark colored; perigynia ovate, 3.5 to 5 mm. long, olive-brown, the beak  $\frac{1}{2}$  length of body.—Humboldt Co. to Siskiyou Co.; n. to the Aleutian Isls., e. to Col. It has a wide altitudinal as well as a wide geographical range, and individual plants vary very considerably.

177. *Carex abrupta* Mkze.; a, infl. x 1; b, scale x  $7\frac{1}{2}$ ; c, perigy. x  $7\frac{1}{2}$ .

perigynia oblong-lanceolate, 3.75 to 4 mm. long, soon brownish tinged, abruptly contracted into the beak.—High montane, 5600 to 10,000 ft., mts. of S. Cal. and Sierra Nevada; seacoast, Humboldt Co.

48. *C. mariposana* Bailey. Culms 2.5 to 6 dm. high; leaf-blades 2 to 3 mm. wide; head oblong or ovoid, 2 to 3.5 cm. long, the spikes 4 to 12, the upper approximate, the lower 1 to 3 slightly separate, oblong-ovoid, 8 to 12 mm. long, the perigynia closely appressed; scales ovate, acute; perigynia narrowly ovate, 5 mm. long, green or in age straw-colored, tapering into a beak  $\frac{1}{4}$  length of body.—High montane, 5000 to 9000 ft.: Sierra Nevada from Shasta Co. to Tulare Co.; San Gabriel Mts. and San Bernardino Mts.

49. *C. integra* Mkze. Fig. 178. Culms 1.5 to 3.5 dm. high, smooth; leaf-blades 1 to 2 mm. wide; head 1 to 2 cm. long, the spikes 4 to 8, densely aggregated, oblong-obovoid, 4 to 8 mm. long, the perigynia appressed-ascending; scales ovate, acute, dark chestnut; perigynia nerveless or nearly so ventrally, narrowly margined, the beak  $\frac{1}{2}$  length of body or more.—Montane, Sierra Nevada from Tulare Co. to Siskiyou Co., 4000 to 8000 ft.; n. to Ore.

178. *Carex integra* Mkze.; a, infl. x 1; b, scale x 7; c, perigy. x 7.

50. *C. teneraeformis* Mkze. Culms 3 to 4.5 dm. high, very slender, smooth or nearly so; leaf-blades averaging 1.5 mm. wide; head 1.5 to 2.5 cm. long, the spikes 5 to 8, readily distinguishable and more or less separate, 3.5 to 6 mm. long, the perigynia loosely appressed; scales ovate, acute, light brown; perigynia plano-convex, thickish, nerveless or nearly so ventrally, tapering into the slender beak 1 mm. long.—Middle altitudes, 4000 to 8000 ft.: Sierra Nevada from Butte Co. to Tulare Co.; Lake Co.; San Gabriel Mts.

51. *C. ampléctens* Mkze. Fig. 179. Culms stiff, 5 to 8 dm. high; leaf-blades 2.5 to 4 mm. wide; head 2.5 to 5 cm. long, the 6 to 12 spikes approximate, oblong-ovoid, 7 to 15 mm. long, the perigynia closely appressed; scales ovate, acute or short-cuspidate, greenish; perigynia ovate, 3.5 to 4 mm. long, light green, narrowly margined, several-nerved on both faces, contracted into a beak  $\frac{1}{2}$  length of body or less.—Sierra Nevada from Shasta Co. to Tulare Co., 4000 to 9000 ft.

179. *Carex amplexens* Mkze.; a, inf.  $\times 1$ ; b, scale  $\times 7\frac{1}{2}$ ; c, perigy.  $\times 7\frac{1}{4}$ .

a beak  $\frac{1}{3}$  length of body.—Coast Ranges from Mendocino Co. to San Mateo Co.

56. *C. pachycarpa* Mkze. Culms 3 to 6 dm. high, smooth; leaf-blades 2.5 to 4 mm. wide, 1 to 2 dm. long; head 1.5 to 2.5 cm. long, the spikes 5 to 8, closely aggregated, 6 to 10 mm. long, the 10 to 20 perigynia appressed; scales ovate, acute, light reddish-brown; perigynia ovate, plano-convex, thick, 5 mm. long, faintly many-striate ventrally, the beak  $\frac{1}{2}$  length of body.—Montane in the Sierra Nevada from Tulare Co. to Siskiyou Co., 5000 to 9000 ft.; Humboldt Co.; n. to Ore.

57. *C. paucifructus* Mkze. Culms 1 to 2.5 dm. high; leaf-blades 1.5 to 3 mm. wide, 3 to 7 cm. long; head 1 to 2 cm. long, the spikes 4 to 8, aggregated, 6 to 9 mm. long, the perigynia appressed or appressed-ascending; scales ovate, chestnut; perigynia 4 mm. long, ovate, thick, strongly plano-convex, nerveless ventrally, tapering into a beak  $\frac{1}{2}$  length of body.—Sierra Nevada in Sierra and Eldorado Cos., 6000 to 7000 ft.

SECT. 13. CANESCENTES Fries. Cespitose, some species with slender stolons. Culms triangular. Sheaths not cross-rugulose. Spikes 1 to 10, with few to many perigynia, simple, the terminal gynaeandrous, the lateral pistillate or gynaeandrous, or rarely all androgynous. Bracts inconspicuous. Perigynia plano- or bi-convex, white-punctulate, lanceolate, ovoid, oval or obovoid, appressed to spreading, beakless to prominently beaked, more or less nerved on both sides, not winged or margined, but acute-angled above, nearly or entirely filled by the lenticular achene. Stigmas 2.

58. *C. dispérma* Dewey. SOFT SEDGE. Culms very weak, 1.5 to 6 dm. high; leaf-blades 0.75 to 2 mm. wide, flaccid; spikes distant or upper aggregated, with 1 to 5 ascending perigynia and 1 or 2 staminate flowers; scales shorter than perigynia, ovate-triangular, sharp-pointed; perigynia ovoid-elliptic, 2 mm. long, finely nerved, abruptly beaked, the beak smooth, 0.25 mm. long.—Boggy spots, Sierra Nevada from Tulare Co. to Mono Co., chiefly on the e. side; n. to Alas., e. to Newf.; n. Eurasia.

59. *C. canescens* L. SILVER SEDGE. Fig. 180. Culms 1 to 8 dm. high; leaf-blades glaucous, flat, 2 to 4 mm. wide; spikes 4 to 9, 3 to 12 mm. long;

52. *C. harfórdii* Mkze. HARFORD SEDGE. Culms 2.5 to 8 dm. high; leaf-blades 2.5 to 4.5 mm. wide; head 1.5 to 2.5 cm. long, the 10 to 20 spikes closely aggregated, ovoid, 6 to 10 mm. long, the perigynia appressed-ascending; scales ovate; perigynia narrowly ovate, 3.5 to 4.25 mm. long, tapering into a beak  $\frac{1}{4}$  length of body.—Coastal counties from Humboldt Co. to San Mateo Co.

53. *C. montereyénsis* Mkze. Culms 8 to 10 dm. high; leaf-blades 2.5 to 3 mm. wide; head 1.5 to 2.5 cm. long, the 8 to 12 spikes closely aggregated, ovoid, 6 to 9 mm. long, the perigynia ascending; scales narrowly ovate; perigynia ovate, 3.25 mm. long, tapering into a beak  $\frac{1}{2}$  length of body.—Pine forests, Pacific Grove, Monterey Co.

54. *C. sub-bracteata* Mkze. Head 1.5 to 2.5 cm. long, the spikes 5 to 10, ovoid, 6 to 10 mm. long, the perigynia 10 to 20, appressed or in age appressed-ascending; one or more lower bracts conspicuous; scales ovate, obtuse or acutish, reddish-brown; perigynia narrowly ovate, 3.5 to 4.5 mm. long, thick, plano-convex, contracted into a beak  $\frac{1}{3}$  length of body.—Coast Ranges from Humboldt Co. to Santa Barbara Co.

55. *C. gracilior* Mkze. Head 12 to 20 mm. long, the spikes 3 to 6, the lower 1 or 2 more or less separate, suborbicular, 5 to 8 mm. long, the 4 to 12 perigynia ascending or spreading-ascending with conspicuous beaks; scales ovate, obtuse or acutish, chestnut-brown; perigynia narrowly ovate, 3.5 to 4.5 mm. long, thick, plano-convex, contracted into

scales shorter than perigynia, ovate, sharp-pointed; perigynia appressed-ascending, 1.8 to 3 mm. long, faintly few-nerved, minutely beaked, the beak with margins minutely serrulate.—Swamps and bogs, higher Sierra Nevada from Tulare Co. to Placer Co., 5000 to 9000 ft.; n. to Alas., e. to Va.

60. *C. árcta* Boott. CLUSTER SEDGE. Culms 1.5 to 3 dm. high, very rough above; leaf-blades 2 to 4 mm. wide; spikes 5 to 15, 5 to 10 mm. long, aggregated; scales shorter than perigynia, ovate, obtusish to short-cuspidate; perigynia ascending or somewhat spreading, ovate, 2 to 3 mm. long, lightly nerved at base ventrally, rounded at base, the beak shallowly bidentate.—Swamps and wet woods, Humboldt Co.; n. to B. C., e. to N. B.

SECT. 14. POLYTRICHOIDEAE Tuckerm. Densely tufted. Culms slender. Leaf-blades narrow. Spike solitary, linear, androgynous, bractless. Rachis straight, not dilated. Perigynia appressed, membranaceous, the upper part empty, oblong-elliptic, many-nerved, not 2-ribbed, compressed-triangular, beakless. Achenes triangular, the sides concave. Stigmas 3, short.

61. *C. leptálea* Wahl. Culms 1.5 to 6 dm. high; leaf-blades 0.5 to 1.25 mm. wide; spike 4 to 15 mm. long; pistillate scales ovate, obtuse to short-pointed,  $\frac{1}{2}$  length of perigynia; perigynia 1 to 10, 2.5 to 4.5 mm. long, more or less strongly overlapping, round or somewhat flattened in cross-section.—Bogs and wet meadows, Humboldt Co.; n. to Alas., e. to the Atlantic.

SECT. 15. FIRMICULMES Kük. Culms wiry, aphyllopodic, the leaf-blades often rudimentary at flowering time. Spike one, androgynous, the staminate part in age short-peduncled, the pistillate loosely few-flowered. Scales more or less chartaceous. Perigynia 1 to several, obtusely triangular, smooth, 2-keeled, but otherwise nerveless, tapering at the base, very minutely beaked, the orifice truncate. Achenes triangular with nearly flat sides, closely enveloped by the perigynia, apiculate-tipped, constricted at base. Stigmas 3, elongated.

151. *Carex multicaulis* Bailey; a, infl. x 1; b, scale x 4; c, perigy. x 4.

62. *C. multicaulis* Bailey. Fig. 181. Culms 2 to 6 dm. high, deep green; leaves with well developed blades 1 or 2 to a culm; inflorescence consisting of a terminal staminate part and of 2 to several perigynia in the axils of long (the lower) or short (the upper) awned scales, these enlarged and white hyaline at base; staminate scales very obtuse, broadly white hyaline margined; perigynia oblong-obovoid, 5 to 7 mm. long.—Dry soil, coastal S. Cal., 3500 to 6000 ft.: Sierra Nevada from Tulare Co. to Shasta Co., 4000 to 6000 ft.; Coast Ranges from Monterey Co. to Siskiyou Co., 100 to 4000 ft.; n. to Ore.

63. *C. géyeri* Boott. ELK-GRASS. Culms 1 to 4 dm. high; leaves with well-developed blades usually 2 to a culm, the blades thick, developing after flowering; inflorescence of the terminal staminate part with oblong-ovate striate obtusish straw-colored scales; perigynia 2 or 3, the lower in the axils of short-awned scales, the upper in the axils of obtusish or acutish straw-colored scales; perigynia appressed-ascending, oblong, 6 mm. long.

—Dry mountain sides and open woods, Siskiyou Co.; n. to Alb., e. to Col.

SECT. 16. FILIFOLIAE Tuckerm. Densely caespitose. Leaf-blades filiform or narrow. Spike solitary, linear or linear-oblong, androgynous, densely flowered, bractless. Perigynia more or less triangular, nerveless except for the 2 lateral ribs, submembranaceous, not stipitate, not inflated, puberulent or pubescent, beaked or nearly beakless, hyaline-tipped and obliquely cut at apex. Achenes triangular, apiculate. Stigmas 3.

64. *C. exsérta* Mkze. SHORT-HAIR. Fig. 182. Culms very slender and wiry, 5 to 25 cm. high; spike 7 to 15 mm. long, the pistillate part with 2 to 12

180. *Carex canescens* L.; a, infl. x 1; b, scale x 8; c, perigy. x 8.

182. *Carex exserta* Mkze.;  
a, habit  $\times \frac{2}{3}$ ; b, scale  $\times 3$ ;  
c, perigy.  $\times 3$ .

Lowest bract squamiform or leaflet-like, sheathless or sub-sheathing. Scales often reddish-brown tinged, acute to cuspidate. Perigynia membranaceous, ascending, the body pubescent at least at base of beak, obovoid to elliptic, triangular or round-triangular in cross-section, 2-keeled, strongly stipitate at base, abruptly contracted into a cylindric emarginate to deeply bidentate hyaline-tipped beak. Achenes normally triangular, the sides convex, closely enveloped, short-apiculate. Stigmas normally 3, long.

66. *C. inops* Bailey. Fig. 183. Strongly stoloniferous, the culms 2 to 3.5 dm. high, roughened above, reddened and fibrillose at base; leaf-blades 1.5 to 2.5 mm. wide, very rough above; staminate spike 1.5 to 2.5 cm. long, sessile or short-peduncled; pistillate spikes 1 to 3, approximate or more or less separate, sessile or short-peduncled, with 4 to 10 ascending perigynia; scales ovate, sharp-pointed; perigynia 3.5 mm. long, nearly orbicular in cross-section, the beak 0.75 to 1.5 mm. long.—Dry soil, Siskiyou Co.; n. to Wash.

67. *C. globosa* Boott. Stoloniferous, the culms 1.5 to 3.5 dm. high, rough above; leaf-blades 1.5 to 2.5 mm. wide; staminate spike short-peduncled, 1 to 2 cm. long; pistillate spikes 5 to 10 mm. long, with 4 to 10 ascending perigynia; lower bract shorter than to exceeding inflorescence; perigynia 5 mm. long, the beak 0.75 to 1.25 mm. long, strongly bidentate.—Coastal counties from San Diego Co. to Sonoma Co.

68. *C. brainerdii* Mkze. Fig. 184. Culms up to 15 cm. high; leaf-blades 1.5 to 3 mm. wide, much roughened; pistillate spikes 4 to 6, 1 to 4-flowered; lower bract of non-basal spikes exceeding inflorescence, chestnut-tinged, more or less strongly sheathing; perigynia 4.5 mm. long, the beak 1 mm. long.—Sierra Nevada from Mariposa Co. to Siskiyou Co., 4000 to 5000 ft.; also in s. Ore.

ascending perigynia, the pistillate scales orbicular-ovate, obtuse, dull reddish brown with hyaline margins; perigynia obovoid, 2.5 mm. long, essentially beakless.—Dry places in the mountains, 4000 to 11,000 ft.: San Bernardino Mts.; White Mts.; Sierra Nevada from Tulare Co. to Eldorado Co.; n. to s. Ore. Forms a large part of the "short-hair meadows" in the Sierra Nevada and readily eaten by stock.

SECT. 17. SCIRPINAE Tuckerm. Rootstocks creeping. Culms leafy below. Leaf-blades narrow. Spikes usually 1, linear, staminate or pistillate, many-flowered, normally with an empty scarcely sheathing squamiform bract a short distance below the spike. Perigynia triangular or flattened-triangular, membranaceous, 2-keeled, pubescent or puberulent, tapering at base, constricted at apex into the short cylindric entire or bidentate beak. Achenes triangular with flat sides, sessile, apiculate. Stigmas 3, short.

65. *C. gigas* (Holm) Mkze. Rootstocks densely matted; culms 3 to 4.5 dm. high; leaves 5 to 10, the blades 2.5 mm. wide; pistillate spike 1.5 to 2.5 cm. long, often with a second smaller peduncled spike; scales oblong-ovate, brownish, covering perigynia; perigynia numerous, black, 3 mm. long, oval, flattish, rounded at apex, the beak 0.5 mm. long, bidentate.—Siskiyou Co., 6800 to 8000 ft.; not otherwise known.

SECT. 18. MONTANAE Fries. Culms slender, leafy at base. Leaf-blades narrow, rough above. Terminal spike linear, normally staminate. Lateral spikes 1 to 5, small, pistillate or sometimes androgynous, subglobose to oblong, closely few to many-flowered, approximate and sessile or short-peduncled, or in some species basal and long-peduncled.

183. *Carex inops* Bailey;  
a, infl.  $\times 1$ ; b, scale  
 $\times 8$ ; c, perigy.  $\times 8$ .

184. *Carex brainerdii* Mke.; a, infl. x 2; b, scale x  $7\frac{1}{2}$ ; c, perigy. x  $7\frac{1}{2}$ .

long.—Along the coast from Monterey Co. to Del Norte Co.; n. to B. C.

SECT. 19. DIGITATAE Fries. Culms slender, leafy at base. Leaf-blades narrow, the sheaths usually strongly purplish. Terminal spike linear, staminate. Lateral spikes 1 to 5, approximate or separate or sometimes basal, oblong to linear, 5- to 20-flowered in few ranks, the peduncles included or exserted. Bracts sheathing, more or less strongly purplish-tinged, subspathaceous, the blade absent to rudimentary. Pistillate scales strongly purplish or reddish-brown tinged. Perigynia membranaceous, appressed, oblong-obovoid, pubescent to glabrate, triangular, long-tapering to the stipitate base, abruptly contracted into the minute beak, the orifice entire or nearly so. Achenes triangular, closely enveloped. Stigmas 3, early deciduous.

72. *C. concinnoïdes* Mke. Fig. 185. Strongly stoloniferous, the culms 1.5 to 3.5 dm. high, smooth; leaf-blades light green, 2 to 4 mm. wide; staminate spike nearly sessile, 8 to 22 mm. long; pistillate spikes 1 or 2, approximate, rather closely 5 to 10-flowered, sessile or short-peduncled; scales narrowly ovate, sharp-pointed, ciliate; perigynia 2.5 to 3 mm. long, loosely pubescent, the beak 0.5 mm. long, wider and longer than the scales.—Dry soil, Mendocino Co.; n. to B. C., e. to Mont.

SECT. 20. BICOLORES Tuckerm. Stoloniferous. Culms central, slender, leafy toward base. Leaf-blades narrow. Basal sheaths light brown. Terminal spike linear, staminate or gynaeandrous. Lateral spikes 2 to 5, pistillate, rather closely few to many-flowered, in few ranks on erect exserted peduncles. Bracts sheathing, not colored or dark-auricled, the blades elongated, leaf-like. Scales reddish- or purplish-brown tinged. Perigynia ascending, broadly oval or ellipsoid, circular in cross section, nerved, glabrous,

69. *C. brevipes* W. Boott. In dense clumps from stout matted rootstocks, the culms from very short to 18 cm. high; leaf-blades 1.5 to 2.5 mm. wide; staminate spike short-peduncled or sessile, 4 to 12 mm. long; pistillate spikes 3 to 5, usually 10 to 20-flowered, the upper 1 or 2 approximate, sessile to strongly peduncled; scales ovate; perigynia with body little longer than wide.—Montane, 4000 to 7000 ft.: Sierra Nevada from Placer Co. to Tulare Co.; San Gabriel Mts.; n. to Wash.

70. *C. rössii* Boott. Densely cespitose; culms wiry, 5 to 25 cm. high; leaf-blades 1 to 2.5 mm. wide; staminate spike usually conspicuous, 3 to 10 mm. long; pistillate spikes globose to short-oblong, 3 to 5 mm. long, 2 to 12-flowered, the upper contiguous; scales ovate, sharp-pointed; perigynia nearly globose in cross section.—Sierra Nevada from Mariposa Co. to Shasta Co., thence w. to Humboldt Co.; n. to Alas., e. to Mich. The most widely distributed and abundant species of the group in the w. U. S., but sparingly collected with us.

71. *C. brevicaulis* Mke. Stoloniferous, the culms 5 to 10 cm. high, very rough; leaf-blades 1.5 to 3.5 mm. wide; staminate spike short-peduncled, few-flowered, 6 to 9 mm. long; lateral spikes 2 to 4, 4 to 6 mm. long, the upper 1 or 2 sessile and approximate; scales ovate, acute to short-cuspidate; perigynia about 4 mm. long, the body globose, 2.25 mm. wide, the beak 1 mm.

185. *Carex concinnoïdes* Mke.; a, infl. x 1; b, scale x 8; c, perigy. x 8.

186. *Carex salinaeformis* Mkze.; a, inf. x 1; b, scale x  $7\frac{1}{2}$ ; c, perigy. x  $7\frac{1}{2}$ .

golden-yellow or white-pulverulent or straw-color at maturity, tapering or rounded at base, essentially beakless. Achenes lenticular, apiculate, closely enveloped. Stigmas 2.

73. *C. salinaeformis* Mkze. Fig. 186. Culms 5 to 15 cm. high, smooth; leaf-blades 2 to 5 mm. wide; staminate spike 8 to 16 mm. long; pistillate spikes 3 or 4, the upper approximate, short-peduncled, the lower widely separate, long-peduncled, 6 to 12 mm. long, with 8 to 15 appressed-ascending perigynia; perigynia slightly constricted at apex.—Mendocino coast, not otherwise known.

74. *C. hássel* Bailey. Culms 1.5 to 7 dm. high, usually much roughened above; leaf-blades 2 to 4 mm. wide; staminate spike 6 to 20 mm. long, often pistillate at apex; pistillate spikes 3 to 5, the upper approximate and short-peduncled, the lower long-peduncled, linear-oblong, 8 to 20 mm. long, with 6 to 20 ascending perigynia; perigynia obovoid, 2.5 to 3 mm. long; style becoming short-exserted and somewhat persistent.—River banks and wet rocks: San Gabriel Mts. and San Bernardino Mts.; Sierra Nevada from Tulare Co. to Siskiyou Co., 4000 to 5000 ft.; very local in the Coast Ranges; n. to Alas., e. to Lab.

75. *C. aurea* Nutt. GOLDEN SEDGE. Culms 0.3 to 5.5 dm. high, smooth or somewhat roughened; leaf-blades 2 to 4 mm. wide; staminate spike 3 to 10 mm. long; pistillate spikes 3 to 5, the upper approximate and short-peduncled, the lower separate and often strongly peduncled, 4 to 20 mm. long, with 4 to 20 ascending perigynia; perigynia umbonate, 2 to 3 mm. long.—Wet places, high montane, 5000 to 9000 ft.: Sierra Nevada from Modoc Co. to Tulare Co.; occurring locally in the San Gabriel Mts. and San Bernardino Mts.; n. to Alas., e. to Newf.

SECT. 21. PANICEAE Tuckerm. Stoloniferous. Culms central, slender. Basal sheaths brownish or purplish tinged. Terminal spike staminate, linear or linear-oblong. Lateral spikes 1 to 5, pistillate, loosely to rather closely several to many-flowered, in few or several ranks, on erect, exserted or included peduncles. Bracts sheathing, not colored or dark-auricled, the blades developed. Scales purplish- or reddish-brown tinged. Perigynia ascending or spreading, ovoid or obovoid, membranaceous, obtusely triangular, slightly inflated, glabrous, punctulate, light or olive green, pointed or beaked, the orifice entire or nearly so. Achenes triangular, apiculate. Stigmas 3.

76. *C. livida* (Wahl.) Willd. Rootstocks very slender; culms 1 to 6 dm. high, smooth, light brownish at base, phyllopodic; leaf-blades 0.5 to 3.5 mm. wide; staminate spike 1.5 to 2.5 cm. long; pistillate spikes 1 or 2, approximate, sessile or short-peduncled, 1 to 2 cm. long, closely 5 to 15-flowered; perigynia 3.5 to 4.5 mm. long, the body ellipsoid, glaucous, faintly nerved, exceeding the scales.—Sphagnum bogs, Mendocino Co.; n. to Alas., e. to Lab.

77. *C. californica* Bailey. Fig. 187. Rootstocks stout; culms 2 to 7 dm. high, smooth, reddish-purple at base, strongly aphyllopodic; culm-leaves 2 to 4, the blades 1.5 to 5 mm. wide, glandular-dotted beneath; staminate spike 1.5 to 3.5 cm. long; pistillate spikes 2 to 4, strongly separate, the upper short exsert-peduncled, the lower often nearly basal and long-exsert-peduncled,

linear-oblong, 1 to 3 cm. long, with 7 to 20 appressed perigynia; scales hispidulous; perigynia 3.5 to 4 mm. long, the body suborbicular, green, several-nerved, the beak 0.75 mm. long with slightly oblique orifice.—Meadows and prairies, Mendocino Co.; n. to Wash. Rare and local.

SECT. 22. LAXIFLORAE Kunth. Cespitose. Fertile culms mostly lateral, the sterile shoots leafy, conspicuous. Basal sheaths brownish or purplish-tinged. Terminal spike staminate, linear. Lateral spikes 2 to 5, pistillate or androgynous, loosely to closely few to many-flowered, in few to several ranks, on erect to drooping, included or exserted peduncles. Bracts sheathing, the sheaths green or purplish tinged, the blades leaf-like or sometimes reduced. Scales green with hyaline margins or more or less colored. Perigynia ascending, membranaceous, triangular, usually nerved, closely enveloping the achene, glabrous or hispidulous, tapering at the base, short-beaked or beakless, the orifice entire. Achenes triangular, apiculate. Stigmas 3.

78. *C. hendersonii* Bailey. Fig. 188. Culms 4 to 9 dm. high, sharply triangular, rough above; sterile shoots developing conspicuous culms; leaf-blades 3 to 15 mm. wide, spike 1.5 to 3 dm. long; pistillate spikes 2 to 4, erect, 12 to 25 mm. long, with 5 to 12 alternate ascending perigynia, the upper spikes approximate, the lower widely separate; scales broadly obovate, mucronate; perigynia narrowly obovoid, 5 to 6 mm. long, tapering into a straight scarcely differentiated beak.—Damp woods in the Coast Ranges from Sonoma Co. to Humboldt Co.; n. to B. C.

SECT. 23. TRIQUETRAE Carey. Cespitose, leafy toward base. Leaf-blades narrow, the sheaths not purplish tinged. Terminal spike linear, staminate. Lateral spikes 2 to 4, approximate or more or less separate or sometimes basal, 5- to 30-flowered in few ranks. Bracts sheathing, not purplish tinged, the lowest with a well-developed blade. Pistillate scales greenish or hyaline or reddish-brown tinged. Perigynia membranaceous, ascending, obovoid, short-pubescent or glabrous, triangular, tapering and more or less stipitate at base, abruptly contracted into the minute beak, the orifice obliquely cut, minutely bidentate. Achenes triangular, closely enveloped. Stigmas 3, early deciduous.

79. *C. flaccifolia* Mke. Culms 6 to 9 dm. high; leaf-blades about 3 mm. wide; staminate spike 1 to 2.5 cm. long, short-peduncled; pistillate spikes mostly 3, approximate or somewhat separate, sessile or short-peduncled, 1 to 2.5 cm. long, rather loosely 8- to 25-flowered; scales ovate, cuspidate; perigynia short-tapering at base, the beak 0.5 mm. long, bidentulate.—Dry plains in sw. Cal.

80. *C. whitneyi* Olney. Fig. 189. Culms 2.5 to 10 dm. high; leaf-blades 2.5 to 8 mm. wide; staminate spike peduncled, 5 to 30 mm. long; pistillate spikes 2 to 4, approximate or lower separate, erect, sessile or short-

187. *Carex californica* Bailey;  
a, inf. x 1; b, scale x  $7\frac{1}{2}$ ;  
c, perigy. x  $7\frac{1}{2}$ .

tracted into the minute beak, the orifice obliquely cut, minutely bidentate. Achenes triangular, closely enveloped. Stigmas 3, early deciduous.

188. *Carex hendersonii* Bailey; a, inf. x  $\frac{2}{3}$ ; b, scale x 4; c, perigy. x 4.

189. *Carex whitneyi* Olney; a, infl.  $\times 1$ ; b, scale  $\times 6$ ; c, perigy.  $\times 6$ .

erect, the upper little exsert-peduncled, approximate, the lower 1 or 2 often widely separate and long exsert-peduncled, 1 to 4.5 cm. long, the 5 to 30 perigynia ascending; scales ovate, short-cuspidate, brownish copper-color; perigynia 4 to 4.5 mm. long, softly short-pubescent, light green, obscurely several-nerved, the beak 0.3 mm. long.—Dry hillsides below 2000 ft. from Santa Barbara Co. to San Diego Co.; L. Cal.

SECT. 24. DEBILES Carey. Culms aphyllopodic, strongly purplish tinged at base, tufted, slender, leafy. Leaf-blades flat. Terminal spike normally staminate. Lateral spikes 2 to 5, elongate, narrowly linear, slender-peduncled, the lower often drooping. Bracts green-sheathing, the blades leaf-like. Perigynia appressed or ascending, lanceolate to ovoid, membranaceous, obsolete nerved, rather closely enveloping the achene, tapering to a well-developed conic beak, obliquely cut at orifice and strongly hyaline-tipped, at length bidentate. Achenes triangular, apiculate. Stigmas 3.

84. *C. méndocinénsis* Olney. MENDOCINO SEDGE. Fig. 191. Culms 3 to 8 dm. high, much exceeding leaves; leaves minutely pubescent, the blades 1.75 to 4 mm. wide; staminate spike 2 to 3.5 cm. long; pistillate spikes 2 or 3, slender, erect, 1.5 to 4 cm.

peduncled, 7 to 30 mm. long, closely 5 to 30-flowered; scales ovate, acute or short-cuspidate; perigynia round-tapering at base.—Sierra Nevada from Tulare Co. to Plumas Co., 4000 to 7000 ft.; n. to Ore.

81. *C. gynodynamis* Olney. Culms 2 to 9 dm. high, slender, brownish at base; leaf-blades 3 to 9 mm. wide; terminal spike usually staminate, 1 to 2 cm. long; lateral spikes 2 to 4, oblong-cylindric, 1 to 3.5 cm. long, closely 20 to 40-flowered, the upper approximate, usually overtopping the staminate spike, short-peduncled, the lower strongly separate, long-peduncled; scales ovate-orbicular, short-cuspidate or obtuse; perigynia ascending, the beak 0.75 mm. long.—Coast Ranges from San Mateo Co. to Humboldt Co.; n. to Ore.

82. *C. hirtissima* W. Boott. Culms 3 to 6 dm. high, erect, purplish red at base; leaf-blades 3 to 7 mm. wide; terminal spike staminate or gynaeandrous, peduncled, 1.5 to 2.5 cm. long; pistillate spikes 2 or 3, linear, 1 to 2.5 cm. long, more or less strongly separate, the lower on long-exserted peduncles, closely flowered with 20 to 30 ascending perigynia; scales ovate or obovate, cuspidate or mucronate, the margins broad, white-hyaline; perigynia ascending, the conic beak 1 mm. long.—Sierra Nevada from Nevada Co. to Mariposa Co., 3700 to 7000 ft.; Lake Co. Rare and local.

83. *C. triquetra* Boott. Fig. 190. Culms 3 to 6 dm. high, stiffish; leaf-blades 2.5 to 6 mm. wide, the sheaths cinnamon-brown tinged and purplish spotted ventrally; staminate spike 1 to 3 cm.

190. *Carex triquetra* Boott; a, infl.  $\times 1$ ; b, scale  $\times 8$ ; c, perigy.  $\times 8$ .

191. *Carex mendocinensis* Olney; a, infl.  $\times \frac{1}{2}$ ; b, scale  $\times 5$ ; c, perigy.  $\times 5$ .

5.5 mm. long, oblong-ovate, the beak 1.5 to 2 mm. long.—High montane, 7000 to 9500 ft., Sierra Nevada from Shasta Co. to Tulare Co.

89. *C. fissuricola* Mke. Culms 5 to 8 dm. high; leaf-blades 3 to 8 mm. wide; terminal spike sessile or short-peduncled, often slightly pistillate; lateral spikes 4 or 5, the upper contiguous and sessile or short-peduncled, the lower separate and strongly peduncled; perigynia narrowly ovate, 4.5 to 5 mm. long, abruptly beaked, the beak 1.5 mm. long.—Mountain meadows, 5500 to 10,000 ft., Sierra Nevada from Tulare Co. to Placer Co.; e. to Nev.

long, closely-flowered above, the 20 to 40 perigynia appressed-ascending; scales ovate, obtuse or short-cuspidate, cinnamon-brown; perigynia 3.5 to 5 mm. long, oblong-obovoid, somewhat flattened, lightly nerved, minutely puberulent, the beak 0.5 mm. long.—Along streams from Mendocino Co. to Humboldt Co.; n. to Ore.

SECT. 25. FRIGIDAE Fries. Culms phyllopodic, tufted, the leaves clustered near the base. Spikes staminate, pistillate, androgynous or gynaeandrous. Bracts green-sheathing, the blades developed or rudimentary. Scales dark-tinged, usually with light midvein and margins. Perigynia appressed or ascending, flat to flattened-triangular, not inflated, dark-tinged, beaked, the beak hyaline at orifice, more or less bidentate. Achenes triangular, short apiculate. Stigmas 3.

85. *C. lemmönii* W. Boott. Culms slender, 2 to 8 dm. high, smooth, exceeding leaves; leaf-blades 1.5 to 4 mm. wide, erect; staminate spike 6 to 25 mm. long, sessile or short-peduncled; pistillate spikes 2 to 4, linear-oblong, 0.5 to 2 cm. long, 5- to 30-flowered, the upper approximate, the lower separate and exsert-peduncled; perigynia with beak 1 mm. long, sparingly ciliate-serrulate.—High montane, 6000 to 8500 ft.: Sierra Nevada from Tehama Co. to Tulare Co.; San Bernardino Mts.

86. *C. luzulina* Olney. Culms 1.5 to 9 dm. high; leaf-blades 3 to 8 mm. wide, stiff; spikes 4 to 8, the upper clustered, the lower widely separated, on long-exserted peduncles, the lateral pistillate, 7 to 20 mm. long, 6 to 9 mm. wide; perigynia 4 to 5 mm. long, contracted into the short or in age conspicuous, sparingly ciliate-serrulate dark purplish-tipped beak.—Sonoma Co. to Humboldt Co.; also s. Ore.

87. *C. ablata* Bailey. Culms slender, smooth, 2.5 to 6 dm. high, much exceeding leaves; leaf-blades 3 to 4.5 mm. wide; spikes 3 to 7, the upper clustered and sessile or nearly so, the lower usually widely separate and on slender exserted peduncles, the terminal usually staminate, the lateral mostly pistillate, 8 to 30 mm. long; perigynia lanceolate, greenish, 3.5 to 5 mm. long, obscurely nerved, slightly ciliate-serrulate, rounded at base, the beak scarcely 1 mm. long, dark purplish-tipped.—Mountain meadows and bogs, Siskiyou Co.; n. to B. C., e. to Mont.

88. *C. luzulaefolia* W. Boott. Fig. 192. Culms 4 to 10 dm. high; leaf-blades 5 to 15 mm. wide; terminal spike peduncled, 1 to 2 cm. long, often with 1 or 2 sessile staminate spikes at its base; pistillate spikes 3 to 6, all or only the lower strongly exsert-peduncled, widely separate, the upper often equaling the staminate spikes, oblong-cylindric, 1.5 to 2.5 cm. long, the 20 to 50 perigynia appressed; perigynia 4 to

192. *Carex luzulaefolia* W. Boott; a, infl.  $\times \frac{1}{2}$ ; b, scale  $\times 2\frac{1}{2}$ ; c, perigy.  $\times 2\frac{1}{2}$ .

193. *Carex amplifolia* Boott; a, inf.  $\times \frac{1}{2}$ ; b, scale  $\times 5$ ; c, perigy.  $\times 5$ .

92. *C. raynoldsii* Dew. Fig. 194. Culms 2 to 7.5 dm. high; leaf-blades 3 to 8 mm. wide; terminal spike 1 to 2 cm. long, the lateral pistillate spikes 2 or 3, approximate or lowest separate, peduncled, erect, oblong, 1 to 2 cm. long, closely 15 to 40-flowered; perigynia oblong-oval, round in cross-section, 3.5 to 4.5 mm. long, prominently ribbed and slenderly nerved, rounded at base, the very short beak minutely bidentate.—Mountain meadows and bogs, Sierra Nevada from Tulare Co. to Siskiyou Co., 7000 to 8000 ft.; n. to Can.

93. *C. blanda* Boott. Fig. 195. Culms sharply triangular, slender, smooth, 4 to 8

SECT. 26. ANOMALAE Carey. Culms stout, leafy. Leaf-blades broad, flat, glabrous, not septate-nodulose. Terminal spike staminate, linear. Lateral spikes pistillate, linear-cylindric, scattered, closely many-flowered in several rows. Bracts leaf-like, sheathless. Perigynia ascending or in age spreading, obovoid, small, olive green, tapering at base, triangular, slightly inflated, thin, abruptly beaked, the beak conic. Achenes triangular, apiculate, more or less closely enveloped. Stigmas 3.

90. *C. amplifolia* Boott. Fig. 193. Long-stoloniferous, the culms 5 to 10 dm. high; leaf-blades 8 to 18 mm. wide, nearly smooth above; terminal spike 4 to 9 cm. long; pistillate spikes 3 to 6, the upper approximate, the lower more or less strongly separate, short-peduncled or nearly sessile, 3.5 to 14 cm. long; scales pointed; perigynia 3 mm. long, glabrous, nerveless except for keels, long-beaked, the beak often excurved.—Wet soil, Sierra Nevada from Tulare Co. to Butte Co., 4000 to 8000 ft.; Coast Ranges from San Mateo Co. to Siskiyou Co., 1500 to 4000 ft.; n. to B. C. and Ida.

SECT. 27. ATRATAE Kunth. Culms aphyllopodic or phyllopodic. Terminal spike gynaeandrous or staminate, the lateral 1 to 10 pistillate or with a few staminate flowers at base, from sessile, erect and closely approximate to long-peduncled, nodding and distant. Bracts sheathless or nearly so, dark-colored at the base, the blades short. Scales usually dark-tinged. Perigynia membranaceous or more or less coriaceous, straw-colored or greenish, often strongly dark-tinged, elliptic to broadly obovate, circular in cross-section to much flattened, papillose to punctulate, glabrous abruptly short-beaked or beakless, the orifice entire or bidentate. Achenes triangular, apiculate-tipped. Stigmas 3.

91. *C. spectabilis* Dew. Culms 2.5 to 5 dm. high, from densely matted tough rootstocks; leaf-blades 2 to 3.5 mm. wide; pistillate spikes 2 to 4, oblong, 1 to 2 cm. long, closely 15- to 30-flowered, not aggregated, the upper short-peduncled, the lower long-peduncled; scales purplish-black with white often excurrent midvein; perigynia flattened, ovoid, sessile, 4 mm. long, abruptly minutely beaked, the beak bidentate; achene short-stipitate.—High Sierra Nevada, 6000 to 11,000 ft., from Tulare Co. to Siskiyou Co.; n. to Alas., e. to Mont.

194. *Carex raynoldsii* Dewey; a, inf.  $\times 1$ ; b, scale  $\times 7$ ; c, perigy.  $\times 7$ .

195. *Carex bifida* Boott; *a*, infl. x 1; *b*, scale x 7; *c*, perigy. x 7.

dm. high, the basal sheaths purplish-tinged; leaf-blades 1.75 to 3.5 mm. wide; terminal spike 1.5 to 3 cm. long, staminate or with some perigynia; pistillate spikes 3 to 5, erect, short-peduncled or sessile, oblong, 8 to 18 mm. long, with 20 to 40 at length spreading perigynia; scales ovate, sharp-pointed; perigynia narrowly ovate, flattened triangular, about 10-nerved, 3 to 4.5 mm. long, the beak 0.5 to 1 mm. long, the teeth minute, rough and purplish-tinged within. — Tehachapi Range; Coast Ranges from San Luis Obispo Co. to Humboldt Co.; n. to southern Ore.

94. *C. buxbaumii* Wahl. BROWN SEDGE. Densely caespitose, but with long stolons; culms 2 to 9 dm. high, rough above, slender; leaf-blades 2 to 4 mm. wide, glaucous-green; spikes usually 3 or 4, erect, 8 to 40 mm. long, sessile or short-peduncled; scales awned, dark purplish-tinged, exceeding perigynia; perigynia 3 to 4 mm. long, glaucous-green, obovoid, lightly many-nerved, the apex minutely bidentate. — Bogs in the high Sierra Nevada of Tuolumne Co.; n. to Alas., e. to the Atlantic; Eurasia.

196. *Carex helleri* Mkze.; *a*, infl. x 1; *b*, scale x 7; *c*, perigy. x 7.

95. *C. helleri* Mkze. SIERRA SEDGE. Fig. 196. Very densely caespitose, the culms 0.5 to 3 dm. high; leaf-blades 2 to 3.5 mm. wide; spikes oblong, 10 to 20 mm. long, densely 25- to 50-flowered; scales acuminate or aristate, much narrower than perigynia; perigynia broadly oval to suborbicular, much flattened, 2.5 to 3.5 mm. long, nerveless, abruptly beaked, the beak 0.25 mm. long, bidentate; achenes short-stipitate. — High montane, 8500 to 13,600 ft.: Sierra Nevada from Tulare Co. to Eldorado Co.; White Mts.; e. to Nev.

96. *C. epapillōsa* Mkze. Culms 1.5 to 6 dm. high, stiff, sharply triangular, smooth; leaf-blades 3 to 8 mm. wide; spikes 3 to 6, approximate or a little separate, sessile or short-peduncled, oblong-ovoid, 1 to 2.5 cm. long, closely flowered; scales lance-ovate, sharp-pointed, narrower than but about equaling or exceeding perigynia; perigynia broadly oval or obovate, obscurely nerved. — Mountain meadows, high Sierra Nevada of Tuolumne Co.; e. to Wyo.

97. *C. heteronēura* W. Boott. Fig. 197. Culms 2.5 to 10 dm. high, slender, smooth or nearly so; leaf-blades 2 to 4 mm. wide; spikes 3 to 6, approximate or lower more or less strongly separate, sessile (the upper) to strongly peduncled (the lower), oblong, 0.7 to 2.5 cm. long, closely flowered with 15 to 40 appressed-ascending perigynia; scales acute, narrower than perigynia; perigynia sub-orbicular, strongly flattened, rounded at base and apex, the beak 0.25 mm. long, minutely bidentate. — High mon-

197. *Carex heteroneura* W. Boott; *a*, habit x 1; *b*, scale x 7½; *c*, perigy. x 7½.

tane, 7000 to 11,000 ft.: coastal S. Cal.; White Mts.; Sierra Nevada from Tulare Co. to Nevada Co.; e. to w. Nev.

98. *C. albo-nigra* Mke. Culms 1 to 3 dm. high; leaf-blades 2.5 to 5 mm. wide; spikes usually 3, closely approximate, sessile or very nearly so, linear-oblong, about 1 cm. long, closely flowered with 15 to 20 appressed-ascending perigynia; scales ovate, acutish, purplish-black usually with strongly developed white margins; perigynia obovate, strongly flattened, 3 to 3.5 mm. long, substipitate, abruptly beaked, the beak 0.25 mm. long, minutely bidentate; achenes narrower than perigynia, short-stipitate.—Dry mountain sides, high Sierra Nevada in Tulare Co.; e. to Ariz. and Col.

99. *C. merténsii* Prescott. Culms 3 to 10 dm. high, very sharply triangular, rough; leaf-blades 4 to 7 mm. wide; spikes 1 to 4 cm. long, the upper approximate, the lower more remote on slender peduncles; scales lance-ovate, acute; perigynia appressed, broadly oval, much flattened, purple-spotted, tapering at apex, minutely beaked, the beak 0.5 mm. long, entire; achenes strongly stipitate.—Mountains, Trinity Co.; a well marked and handsome species, abundant farther n.; extending to Alas. and Mont.

SECT. 28. ACUTAE Fries. Culms leafy below, aphyllopodic or phyllopodic. Terminal 1 to several spikes staminate (rarely gynæcandrous), linear, the others pistillate, linear to cylindric or oblong, closely many-flowered, sessile or peduncled. Bracts sheathless or rarely short-sheathing, leafy or squamiform, often bi-auriculate and darkened at base. Perigynia membranaceous to coriaceous, plano- or bi-convex or turgid, elliptic to obovate, punctulate, margined, beakless or abruptly minutely beaked, the orifice entire to deeply bidentate. Achenes normally lenticular. Stigmas normally 2.

100. *C. scopulorum* Holm. Culms 1 to 4 dm. high, stiff, sharply triangular, smooth; leaf-blades 3 to 7 mm. wide with revolute margins; terminal spike staminate or androgynous; lateral spikes 2 or 3, approximate, erect, sessile or short-stalked, pistillate or androgynous, 1 to 2.5 cm. long, 6 to 7 mm. wide; perigynia 2.5 to 3.5 mm. long, soon turgid, papillose, spreading, nerveless, with short but prominent entire beak.—Sierra Nevada at Whitney Mdws.; n. to Wash., e. to Col.

198. *Carex gymnoclada*  
Holm; a, infl.  $\times 1$ ; b, scale  
 $\times 7$ ; c, perig.  $\times 7$ .

101. *C. gymnoclada* Holm. Fig. 198. Culms sharply triangular, usually roughened above, developing some short blades the first year and in the flowering (second) year 2 to 4 erect blades, 2.5 to 4 mm. wide, flat with revolute margins; staminate spike short-peduncled, 5 to 15 mm. long; pistillate spikes 2 or 3, approximate, oblong or linear-oblong, 5 to 25 mm. long; perigynia appressed, obovoid, plano-convex, not turgid, 3 mm. long, often dark tinged, nerveless, granular, the beak straight, 0.25 mm. long.—High montane, 6000 to 9000 ft., Sierra Nevada from Tulare Co. to Siskiyou Co., thence w. to Trinity Co.; n. to Wash., e. to Col.

102. *C. nebraskensis* Dew. Fig. 199. Culms 2.5 to 10 dm. high, stout, rigid; leaf-blades pale green, 3 to 8 mm. wide, flat, the sheaths nodulose; staminate spikes 1 or 2, peduncled, 1.5 to 3.5 cm. long; pistillate spikes 2 to 5, oblong, sessile or short-peduncled, 1.5 to 6 cm. long, contiguous or the lower separate, with very many ascending perigynia; scales lanceolate, blackish; perigynia ascending, 3 to 3.5 mm. long, greenish straw color, compressed bi-convex, ribbed.—Meadows and swamps, 4000 to 9700 ft.: mts. of coastal S. Cal.; Sierra Nevada from Tulare Co. to Siskiyou Co.; Panamint Mts.; n. to B. C., e. to Kan.

103. *C. paucicostata* Mke. Culms slender, 2.5 to 4 dm. high; leaf-blades light green, 2 to 4 mm. wide, flat or channeled at base; staminate spike solitary; pistillate spikes 4 to 6, linear, 1 to 4 cm. long, the numerous perigynia appressed-ascending; scales oblong, obtuse or acutish, blackish with lighter center; perigynia 2 mm. long, glaucous-green, the upper empty part

inconspicuous, abruptly black apiculate tipped.—Wet places, mostly around lakes, Sierra Nevada from Tulare Co. to Nevada Co., 5000 to 9900 ft.

104. *C. hindsii* C. B. Clarke. Culms slender, 1 to 6 dm. high; blades 1.5 to 3 mm. wide, flat or channeled at base; staminate spike solitary, long-peduncled; pistillate spikes 4 to 6, linear or oblong-linear, 1.5 to 4.5 cm. long, the numerous perigynia appressed-ascending; scales oblong, obtuse or acutish, blackish with lighter center, much shorter than perigynia; perigynia 2.5 to 3.5 mm. long, the upper part empty, abruptly black apiculate tipped.—Wet places along the coast, Del Norte Co.; n. to the Aleutian Isls.

105. *C. kellöggii* W. Boott. Culms slender, 3 to 7 dm. high; leaf-blades light green, flat or channeled at base, 1.5 to 3 mm. wide; staminate spike usually solitary; pistillate spikes 3 to 5, sessile or nearly so, approximate, linear, 1.5 to 4 cm. long, often attenuate at base, the numerous perigynia appressed-ascending; scales obtuse or acutish with broad light-colored center; perigynia 2.5 mm. long, the beak abruptly black apiculate tipped.—Wet places, 4000 to 9400 ft., Sierra Nevada from Tulare Co. to Siskiyou Co.; n. to Alas., e. to Col.

106. *C. sitchénsis* Prescott. BLACK-HEADS. Culms 6 to 12 dm. high, stout, sharply triangular, strongly reddened at base; leaf-blades flat or channeled at base, 2 to 9 mm. wide; staminate spikes 2 to 5, slender; pistillate spikes 3 to 5, strongly separate, linear-cylindric, 3 to 9 cm. long, very many-flowered; scales lanceolate, sharp-pointed; perigynia ovate or oval, 3 to 3.5 mm. long, broadest near middle, not red-dotted, apiculate.—Near the coast from Santa Cruz Co. to Del Norte Co., thence e. to Butte Co.; n. to Alas. Very local with us.

107. *C. aquátilis* Wahl. WATER SEDGE. Culms 2 to 7 dm. high, reddened at base; leaf-blades 2 to 6 mm. wide; staminate spikes 1 or 2, slender; pistillate spikes 2 to 4, sessile or short-peduncled, not aggregated, linear, 1.5 to 6 cm. long; scales oblong-obovate to lanceolate, obtuse or acutish; perigynia elliptic-obovoid, 2.5 mm. long, broadest below apex, red-dotted, minutely beaked.—Swampy grounds, Warner Mts., Modoc Co.; n. to Alas., e. to Que.

108. *C. bárbaræ* Dew. Fig. 200. Culms 3 to 10 dm. high, stout, sharply triangular, serrulate at least in inflorescence; leaves 7 to 12, the sheaths brownish-puberulent, the blades light-green, thick, flat or channeled, 3.5 to 9 mm. wide, serrulate, the middle ones much reduced, filamentose; staminate spikes 1 or 2, narrowly linear; pistillate spikes 2 to 5, sessile or short-peduncled, oblong- or linear-cylindric, 2.5 to 8 cm. long, reddish-purple with lighter center; perigynia ascending, oval, obscurely nerved, 3 to 4.5 mm. long, at length brownish, often granular.—Mts. of coastal S. Cal., Sierra Nevada foothills, Great Valley, and Coast Ranges. One of the most characteristic Cal. species from about 20 to 4000 ft.; n. to Ore.

109. *C. schöttli* Dew. Culms 10 to 15 dm. high, sharply triangular, very rough above; leaf-blades flat with revolute margins, serrulate, the lower sheaths hispidulous dorsally; staminate spikes about 3, elongate-linear, 8 to 14 cm. long; pistillate spikes mostly 3, sessile or nearly so, elongate-linear, 11 to 14 cm. long; scales narrowly lanceolate, acute or obtusish, purplish-black with broad 3-ribbed lighter center; perigynia appressed, plano-convex,

199. *Carex nebraskensis* Dewey; *a*, infl. x 1; *b*, scale x 7; *c*, perigy. x 7.

200. *Carex barbarae* Dewey; a, infl. x  $\frac{2}{3}$ ; b, scale x 5; c, perigy. x 5.

obovate, 3 mm. long, greenish straw-colored, strongly several-nerved on both faces, the beak 0.25 mm. long.—Coastal S. Cal. and n. to Monterey Co., 20 to 2500 ft.

110. *C. sénta* Boott. Culms 4 to 9 dm. high, sharply triangular; leaves 6 to 12, the middle sheaths sparingly hispidulous dorsally and filamentose ventrally, the blades 3 to 5 mm. wide, the middle ones much reduced; terminal spike staminate, peduncled, 3 to 4.5 cm. long, with 1 or 2 smaller ones at base; pistillate spikes 1 to 3, sessile or short-peduncled, 2.5 to 5 cm. long; scales oblong-ovate or lanceolate, obtuse to acuminate, purplish-black with lighter center; perigynia ovate, conspicuously several-nerved on both faces, green or straw-colored, often dark-tinged and frequently strongly red-dotted, granular, the beak 0.25 mm. long.—Coastal counties from Alameda Co. to San Diego Co.; Sierra Nevada from Amador Co. to Tulare Co.; e. to Ariz.

111. *C. nudata* W. Boott. Culms slender, 3 to 8 dm. high, sharply triangular, strongly dark purplish at base; leaf-blades light green, flat with revolute margins, 2.5 to 3.5 mm. wide, smooth except toward apex, the basal sheaths rounded and hispidulous dorsally; staminate spike short-peduncled, 1.5 to 3 cm. long; lateral spikes 3 to 5, sessile or short-peduncled, 1 to 4 cm. long, 6 to 7 mm. wide; bracts conspicuously biauriculate; scales ovate, or oblong-ovate, obtuse or acutish, blackish with lighter midvein; perigynia lanceolate or ovate, compressed biconvex, 3 to 4 mm. long, finely 6 to 9-nerved on both faces, membranaceous, greenish straw-color or purplish-black tinged, smooth or slightly granular at apex, the upper portion empty, the beak 0.25 mm. long, entire.—Rocky beds of streams, 10 to 2000 ft.: Coast Ranges from Santa Clara Co. to Siskiyou Co.; Sierra Nevada from Calaveras Co. to Shasta Co.; n. to w. Ore.

112. *C. eurycarpa* Holm. Culms 4 to 9 dm. high, sharply triangular, roughened above; leaf-blades 3 to 4.5 mm. wide, the lower sheaths minutely hispidulous and rounded dorsally; staminate spike peduncled, 3 to 4 cm. long; lateral spikes 3 to 5, 2 to 4 cm. long; scales lanceolate, short-acuminate, purplish-brown with prominent light midvein; perigynia appressed, 2.75 mm. long, several-nerved on both faces, minutely roughened, greenish or straw-color, the beak 0.5 mm. long, emarginate.—Boggy meadows, Sierra Nevada from Mariposa Co. to Siskiyou Co.; n. to Wash.

113. *C. oxycarpa* Holm. Culms 4.5 to 9 dm. high, sharply triangular, slightly roughened above; leaf-blades 2 to 4 mm. wide, the lower sheaths hispidulous dorsally; terminal spike staminate, peduncled; lateral spikes 4 or 5, the upper 1 or 2 staminate, the lower 2 to 4 pistillate or androgynous, sessile or short-peduncled, 2.5 to 4.5 cm. long, 5 mm. wide; scales lanceolate, acute, purplish-black with light midvein; perigynia 3.5 mm. long, 3 to 5-striate on both faces, granular roughened, brownish, abruptly minutely apiculate, the orifice entire.—Wet meadows, n. Sierra Nevada from Butte Co. to Siskiyou Co.; n. to Wash. and Ida.

201. *Carex obnupta* Bailey;  
a, infl.  $\times \frac{1}{2}$ ; b, scale  $\times 4$ ;  
c, perigy.  $\times 4$ .

staminate spikes 2 or 3; pistillate spikes 2 to 4, oblong to linear-cylindric, 3 to 10 cm. long, strongly peduncled; scales narrowly ovate, blackish, sharp-pointed, concealing perigynia; perigynia coriaceous, 3 to 3.5 mm. long, abruptly minutely beaked, the beak entire.—Coastal counties from Monterey Co. to Del Norte Co. and local in the Sacramento Valley; n. to B. C.

SECT. 30. TRACHYCHLAENAE Drejer. Phyllopodic. Culms very stout, leafy below, the lower sheaths strongly filamentose ventrally. Spikes numerous, the upper 3 to 6 staminate, elongated, the lower 3 to 6 pistillate (or staminate at apex), linear-cylindric, densely very many-flowered, the lower at least long-peduncled. Lowest bract about equaling or exceeding the inflorescence, short-sheathing. Pistillate scales mucronate or aristate. Perigynia obovoid or oblong, glabrous, roughened or hispidulous, membranaceous, slightly inflated, apiculate-beaked, the orifice emarginate. Achene triangular, the sides flat or slightly concave. Stigmas 3.

116. *C. spissa* Bailey. Fig. 202. Root-stocks stout, woody; culms 1 to 2 m. high, obtusely triangular, smooth; leaf-blades

SECT. 29. CRYPTOCARPAE Tuckerm. Stoloniferous. Culms aphyllopodic or phyllopodic. Terminal 1 to 3 spikes staminate, linear, the others pistillate, linear or oblong, closely many-flowered, the lower or all peduncled and erect or very often pendulous. Bracts sheathless, the upper at least biauriculate at base. Scales 3-nerved, usually cuspidate or aristate, but in some species obtuse. Perigynia coriaceous or membranaceous, plano- or biconvex or turgid, elliptic to obovate, punctulate, margined, abruptly minutely beaked or beakless, the orifice entire or nearly so. Achenes lenticular, apiculate, constricted in the middle. Stigmas 2.

114. *C. lynchbyei* Hornem. Culms 3 to 9 dm. high; leaf-blades flat, 2 to 12 mm. wide; uppermost spike staminate, long-peduncled; lateral spikes 2 to 6, the upper 1 or 2 often staminate or androgynous, the lower pistillate, drooping, linear or oblong, 2 to 8 cm. long; perigynia oblong-oval, bi-convex 2.5 to 3 mm. long, very minutely beaked.—Humboldt Co. coast; n. to the Aleutian Isl's.; widely distributed in Arctic regions.

115. *C. obnupta* Bailey. Fig. 201. Culms 5 to 15 dm. high; leaf-blades 5 to 8 mm. wide, thick;

202. *Carex spissa* Bailey; a, infl.  $\times \frac{2}{3}$ ; b, scale  $\times 6$ ; c, perigy.  $\times 6$ .

203. *Carex yosemitana* Bailey; a, infl. x 1; b, scale x 7; c, perigy. x 7.

the perigynia appressed-ascending; scales ovate, acute to cuspidate, chestnut-brown tinged; perigynia ovoid, obtusely triangular, 4 to 5 mm. long.—Mountain meadows, Medicine Lake, Siskiyou Co.; n. to Wash.

glaucous-green, 7 to 14 mm. wide, flat with revolute strongly serrulate margins, the sheaths brownish tinged; pistillate spikes separate, erect, sessile or nearly so, 6 to 14 cm. long, the perigynia squarrose at maturity; scales narrowly ovate, serrulate-awned, light brownish; perigynia 3 to 4.5 mm. long, becoming somewhat inflated, very abruptly beaked, the beak 0.5 mm. long, the style very strongly bent and twisted; achenes elliptic-obovoid.—Banks of streams at low altitudes from Los Angeles Co. to San Diego Co.; s. to L. Cal.

SECT. 31. *HIRTAE* Tuckerm. Culms stout, leafy. Rootstocks with long stolons. Leaves septate-nodulose. Spikes 3 to 10, the upper 1 to 5 staminate, slender, the others pistillate, many-flowered, erect. Bracts leaf-like, equaling or exceeding the culm, often sheathing. Pistillate scales ovate or lanceolate, acute or aristate. Perigynia mostly ascending, coriaceous, ovoid or oblong-ovoid, somewhat inflated, nearly orbicular in cross-section, many-nerved, often hairy, round-tapering at base, tapering into the bidentate beak. Achenes triangular, often stipitate, the sides flat or deeply concave, apiculate. Stigmas 3.

117. *C. yosemitana* Bailey. Fig. 203. Cespitose from stout rootstocks; culms 3 to 9 dm. high; leaf-blades not rigid, 3 to 7 mm. wide; terminal spike linear, 12 to 30 mm. long, more or less peduncled, occasionally with a few perigynia; pistillate spikes 3 or 4, more or less separate, sessile or nearly so, oblong-cylindric, 1 to 4 cm. long, closely flowered, often staminate at apex; scales lance-ovate, sharp-pointed, ciliate, chestnut-brown; perigynia 2.5 to 3.5 mm. long, obovoid, or oblong-obovoid, obscurely nerved, abruptly short-beaked, the beak 0.5 mm. long.—Montane, 4000 to 8000 ft.: Sierra Nevada from Tuolumne Co. to Tulare Co.; San Jacinto Mts.

118. *C. oregonensis* Olney. OREGON SEDGE. Fig. 204. Rootstocks slender, woody, creeping; culms 1 to 5 dm. high, rigid, smooth; leaf-blades thick, rigid, 3 to 5 mm. wide, canaliculate, mostly exceeding culms; terminal 2 or 3 spikes staminate, linear, 8 to 25 mm. long; pistillate spikes 3 or 4, 1.5 to 5 cm. long, the lower more or less separate, closely erect, closely flowered above or loosely below,

204. *Carex oregonensis* Olney; a, infl. x 1; b, scale x 8; c, perigy. x 8.

205. *Carex lanuginosa* Michx.; a, infl.  $\times \frac{1}{2}$ ; b, scale  $\times 5$ ; c, perigy.  $\times 5$ .

119. *C. lanuginosa* Michx. WOOLLY SEDGE. Fig. 205. Culms 3 to 10 dm. high, sharp-angled and rough above; leaf-blades flat, 1.5 to 5 mm. wide, rough; staminate spikes 1 to 3, up to 3 cm. long, distant; pistillate spikes 1 to 3, oblong-cylindric, 1 to 5 cm. long, sessile or short-peduncled, closely flowered; scales lanceolate, acuminate or aristate, reddish-brown tinged; perigynia broadly ovoid, 2.5 to 3.5 mm. long, the nerves obscure.—Wet meadows or swamps in the valleys and mountains, 500 to 8000 ft.: coastal S. Cal.; w. Mohave Desert; upper San Joaquin Valley; Sierra Nevada from Tulare Co. to Siskiyou Co.; n. to B. C., e. to N. S.

120. *C. sheldoni* Mke. Culms very smooth below the spikes, 5 to 10 dm. high, not fibrillose at the base; leaf-blades 3.5 to 6 mm. wide, the sheaths dark-tinged at the mouth, the basal breaking and slightly filamentose; staminate spikes 2 or 3, distant; pistillate spikes usually 2, 2 to 5 cm. long, rather closely flowered; scales ovate-lanceolate, acuminate or cuspidate; perigynia 5 to 6 mm. long.—Swamps, Warner Mts., ne. Cal.; n. to Ore., e. to Ida.

SECT. 32. *EXTENSÆ* Fries. Culms slender but strict, obtusely triangular, leafy toward base. Leaves sparingly septate-nodulose, the blades narrow. Spikes 2 to 10, the terminal usually staminate, the others pistillate, suborbicular to oblong, densely flowered, 3 cm. or less long, the upper sessile and approximate, the lower remote, peduncled, erect. Bracts leafy, more or less sheathing. Pistillate scales ovate, mostly reddish, copper or chestnut tinged. Perigynia ascending, spreading or deflexed, membranaceous, smooth, many-nerved, somewhat inflated, obscurely triangular, rounded at base, contracted into a bidentate beak, the teeth very erect. Achenes triangular with flat sides. Stigmas 3.

121. *C. viridula* Michx. GREEN SEDGE. Densely caespitose, the culms 0.6 to 3 dm. high, smooth; leaf-blades 1 to 3 mm. wide, canaliculate; staminate spike sessile or short-peduncled; pistillate spikes 2 to 6, 4 to 12 mm. long; scales ovate, much shorter than perigynia, obtuse or acutish; perigynia 2 to 3 mm. long, the beak scarcely  $\frac{1}{2}$  length of body.—Swamps on the Mendocino coast; n. to Alas., e. to the Atlantic.

SECT. 33. *PHYSOCARPÆ* Drejer. Culms mostly tall and stout. Leaves septate-nodulose, not hairy. Spikes 2 to 10, the upper 1 to 5 staminate, the others normally pistillate, subglobose to linear-cylindric, generally closely many-flowered, erect, short-peduncled, more or less remote. Bracts leaf-like, much exceeding the inflorescence, normally sheathless. Perigynia ascending, spreading or even reflexed, membranaceous, smooth, from little to much inflated, suborbicular in cross-section, coarsely many-ribbed or nerveless, contracted into a beak, the beak entire to bidentate. Achenes much shorter than perigynia, triangular or lenticular. Stigmas 3 or 2.

122. *C. vesicaria* L. Fig. 206. Rootstocks short-creeping and stoloniferous; culms 3 to 10 dm. high, aphyllopodic, purplish-tinged at base; leaf-blades 2 to 7 mm. wide, the sheaths sparingly nodulose dorsally; staminate spikes 2 to 4, linear, 2 to 4 cm. long; pistillate spikes 1 to 3, sessile or short-peduncled, oblong-cylindric, 2.5 to 7.5 cm. long, more or less strongly separate; scales ovate-lanceolate, sharp-pointed; perigynia ovoid, yellowish-green or darker tinged.—Wet meadows and swamps: Coast Ranges from Marin Co. to Siskiyou Co., 20 to 2000 ft.; Sierra Nevada from Tulare Co. to Siskiyou Co.; n. to B. C., e. to the Atlantic. Very variable.

123. *C. exsiccata* Bailey. TALL SWAMP SEDGE. Fig. 207. Rootstocks short-creeping; culms 3 to 10 dm. high, rough above, aphyllopodic, purplish-tinged at base; leaf-blades 3 to 7 mm. wide, the sheaths sparingly nodulose

206. *Carex vesicaria* L.; a, infl.  $\times \frac{1}{2}$ ; b, scale  $\times 3$ ; c, perigy.  $\times 3$ .

207. *Carex exsiccata*  
Bailey; a, inf.  $\times \frac{2}{3}$ ;  
b, scale  $\times 4$ ; c, perigy.  
 $\times 4$ .

spikes 1 to 4, approximate or strongly separate, densely many-flowered, oblong or oblong-cylindric, 1 to 6 cm. long, the lower slender-peduncled; scales green, 3-nerved, rough-awned, narrower and mostly shorter than perigynia; perigynia 5 to 7 mm. long, ascending or at length spreading.—Swampy soil, Trinity Co.; n. to Alb., e. to the Atlantic.

126. *C. comosa* Boott. BRISTLE SEDGE. Fig. 209. Cespitose and not stoloniferous; culms 5 to 15 dm. high, strongly roughened to smooth; leaf-blades 6 to 16 mm. wide; staminate spike 3 to 7 cm. long, slender-peduncled; pistillate spikes 1 to 4, densely many-flowered, oblong-cylindric,

dorsally; staminate spikes 2 to 4, 2 to 4.5 cm. long, narrow; pistillate spikes 1 to 3, sessile or short-peduncled, more or less strongly separate, cylindric, 2 to 7.5 cm. long; scales lanceolate-ovate, sharp-pointed; perigynia lanceolate, olive green.—Wet places along the coast from Santa Cruz Co. to Humboldt Co.; n. to Alas., e. to Mont.

124. *C. rostrata* Stokes. BOTTLE SEDGE. Fig. 208. Cespitose, sending forth long horizontal stolons; culms phyllopodic, 3 to 12 dm. high; leaf-blades 2 to 12 mm. wide; staminate spikes 2 to 4, slender, 1 to 6 cm. long; pistillate spikes 2 to 5, remote, cylindric, sessile or short-peduncled, 1 to 15 cm. long; scales lanceolate, sharp-pointed; perigynia ovoid, 4 to 6 mm. long, greenish straw color or darker tinged.—Swampy places: abundant in the Sierra Nevada from Butte Co. to Tulare Co., 4000 to 6200 ft.; San Bernardino Mts.; San Francisco Bay region; n. to Alas., e. to the Atlantic.

#### SECT. 34. PSEUDO-CYPEREAE.

Tuckerm. Culms tall, generally stout, acutely angled, leafy below. Leaf-blades flat, septate-nodulose. Spikes 3 to 9, the upper 1 to 3 slender, staminate, the others normally pistillate, densely flowered, the upper approximate, the lower remote and strongly peduncled, often nodding. Bracts leaf-like, much exceeding the culms, mostly not sheathing. Pistillate scales aristate. Perigynia spreading or reflexed, membranaceous or stiff, triangular or circular in cross-section, 3 to 8 mm. long, closely many-ribbed, greenish straw-color, smooth, stipitate, contracted into a rigid beak, the teeth slender. Achenes triangular. Stigmas 3, short.

125. *C. hystericina* Muhl. PORCUPINE SEDGE. Cespitose and stoloniferous; culms 1.5 to 10 dm. high, rough above; leaf-blades 2 to 10 mm. wide; staminate spike 1 to 5 cm. long, slender-peduncled; pistillate

208. *Carex rostrata* Stokes; a, inf.  $\times \frac{2}{3}$ ; b, scale  $\times 5$ ; c, perigy.  $\times 5$ .

1 to 7.5 cm. long, the upper erect and short-peduncled, the lower slender-peduncled and at length nodding; scales narrow, mostly shorter than perigynia, very rough-awned; perigynia lanceolate, rigid, 5 to 7 mm. long, reflexed when mature.—Swamps near the coast: San Bernardino Valley; Santa Cruz Mts. to Lake Co.; n. to Wash., e. to the Atlantic.

#### PALMACEAE. PALM FAMILY

Commonly trees with fibrous roots and columnar unbranched trunks bearing a tuft of large leaves at summit. Leaves sharply plaited when young, eventually tearing more or less along the lines of the folds. Flowers minute, commonly monoecious, in ours perfect, borne in a large inflorescence inclosed by a spathe. Perianth in two circles, an outer 3-lobed calyx and an inner 3-parted corolla. Stamens 6, inserted on the corolla-tube. Carpels 3, separate or united, each 1-ovuled. Fruit a berry, drupe or nut.

##### 1. *WASHINGTONIA* Wendl. FAN PALM

Trees with fan-shaped much folded blades and long petioles armed with stout hooked spines along the margins. Pistil 1; ovary 3-celled; style and stigma 1. Fruit a berry. (In honor of President Washington.)

1. *W. filifera* Wendl. CALIFORNIA FAN PALM. Columnar tree 20 to 75 ft. high, the trunk 1 to 3 ft. in diameter; leaves 3 to 6 ft. long, with 40 to 60 folds, torn nearly to the middle, the divisions copiously fibrous; flowers borne in a branched panicle on long stems, the whole 8 to 12 ft. long; berries black, oval, 3 to 3½ lines long, with thin flesh surrounding a large seed; endosperm horny.—W. and n. sides of the Colorado Desert, on or above the old beach line of the one-time interior sea, always in moist spots or oases, from near sea-level to 3500 ft.

209. *Carex comosa* Boott; a, habit x ½; b, scale x 3; c, perigy. x 3.

#### ARACEAE. ARUM FAMILY

Perennial glabrous herbs with large leaves, perfect or usually unisexual flowers crowded on a spadix surrounded by a usually colored spathe. Ovary 1 to several-celled, ovules 1 to several in each cell. Fruit in ours a berry.

Spathe yellow; perianth present; ovary inferior.....1. *LYSICHITON*.  
Spathe white; perianth none; ovary superior.....2. *CALLA*.

##### 1. *LYSICHITON* Schott

Peduncle and basal leaves from a stout rootstock. Flowers perfect; perianth-segments 4, distinct, with 4 opposite stamens. Ovary 2-celled, 1 ovule in each cell; stigma depressed. Berry 2-seeded, sunk in the spadix. (Greek *lusis*, a loosing, and *chiton*, a tunic or covering, referring to the spathe.)

1. *L. kamtschatcense* (L.) Schott. SKUNK CABBAGE. Coarse herb; leaves yellow, oblong to elliptic, 1 to 4 ft. long and ½ to 1¼ ft. wide; peduncle stout, shorter than the leaves; flowering spadix 1 to 3 in. long.—Swamps along the coast: Santa Cruz Mts. to Humboldt Co.; n. to Alas. and Siberia.

##### 2. *CALLA* L.

Perennial herb with rootstocks, long-petioled cordate leaves and solitary scapes. Flowers perfect or the upper staminate. Stamens 6. Ovary 1-celled; ovules 5 to 9. Berries red. (Ancient name.)

1. *C. palustris* L. WATER ARUM. Plants about 1 ft. high.—Bogs, Glen Blair, Mendocino Co. (Zoe 5:58); B. C.; ne. N. Am.

### LEMNACEAE. DUCKWEED FAMILY

Minute floating or submerged aquatic perennials, without leaves. Plant body consisting of a leaf-like stem or "frond" which is densely green, disk-shaped, elongated or irregular. Basal margin of the frond with 1 or 2 clefts or reproductive pouches. Vegetative reproduction active, the daughter fronds arising from the reproductive pouches and attached to the parent frond by slender stalks (or stipes). Inflorescence, when present, consisting of a simple cluster of 2 staminate flowers and 1 pistillate flower, contained in the reproductive pouch, subtended by a sac-like spathe, and imitating a single flower. Staminate flower consisting of a single stamen and the pistillate flower of a single ovary with 1 to 7 ovules. Perianth none. Flowers and fruit scarce, in one genus unknown. The daughter fronds soon separate or remain connected for some time; they may at certain seasons sink to the bottom of the pond or ditch and undergo a resting period.

Fronds with roots; vegetative pouches 2, posteriorly placed.

Frond 5 to 15-nerved, with several roots.....1. *SPIRODELA*.

Frond 1 to 5-nerved, with a single root.....2. *LEMNA*.

Fronds without roots, thin, strap-shaped; vegetative pouch 1.....3. *WOLFFIELLA*.

#### 1. *SPIRODELA* Schleiden

Fronds with many fascicled roots. Roots with one vascular bundle. Reproductive pouches 2, with cleft-like openings in either margin of the basal portion of the frond. Inflorescence consisting of a cluster of 1 pistillate and 2 staminate flowers borne in the reproductive pouches and subtended by a sac-like spathe. Fruit round-lenticular, with winged margins. (Greek *speira*, a cord, and *delos*, evident.)

1. *S. polyrhiza* Schleiden. Fronds solitary or in colonies of 2 to 5, roundish obovate, 5 to 15-nerved,  $1\frac{1}{2}$  to 4 lines long, usually sterile.—S. Cal.; cosmopolitan.

#### 2. *LEMNA* L. DUCKWEED

Fronds disk-shaped, usually with a central nerve and with or without several lateral nerves, each with a single root which is commonly provided with a root cap. Reproductive pouches 2, appearing as clefts in either margin of the basal portion of the frond, each containing a cluster of 3 flowers surrounded by a spathe. Ovary with 1 to 7 ovules. Fruit ribbed. (Ancient Greek name.)

Frond with a long stipe, mostly submerged and forming large masses; papillae none.....  
3. *L. trisulca*.

Frond with a short stipe, floating on the surface.

Symmetrical or nearly so, papillate along the median line.

Oblong-ovate; fruit more or less lenticular.

Upper surface uniformly green; margin of the fruit without appendages; seed always 1.....2. *L. minor*.

Upper surface mottled with irregular brown streaks; margin of the fruit with rounded wing lobes; seeds 1 to several.....1. *L. gibba*.

Oblong to elliptical, small, green on both surfaces, with a row of papillae along the mid-nerve; fruit elongated.....5. *L. minima*

Unsymmetrical.

Obliquely obovate, obscurely 3 to 7-nerved, papillate along the median line.....  
1. *L. gibba*

Long oblong, thin, obscurely 1-nerved; papillae none.....4. *L. cyclostasa*.

1. *L. gibba* L. GIBBOUS DUCKWEED. Fronds 1 to 4 in a group, commonly 2, orbicular to obovate, slightly to very unsymmetrical, usually 3 to 5-nerved, 1 to 2 lines wide, 1 to  $2\frac{1}{2}$  lines long, thick, convex and slightly keeled above, flat to strongly gibbous beneath; base usually acute and commonly with narrow wing margins; pistil clavate; ovules 1 to 7; fruit symmetrical, purple-tinted, winged with rounded lobes at the upper margin on either side of the stigma.—Stagnant ponds; all continents except S. Am.

2. *L. minor* L. SMALLER DUCKWEED. Fronds solitary or few in a cluster, round to elliptic-obovate, green or purplish beneath, uniformly bright-green

above, convex on both sides, upper surface sometimes slightly keeled and with a row of papillae along the mid-nerve, the apical one usually quite prominent; pistil clavate; ovule 1; fruit not winged, projecting about  $\frac{1}{2}$  beyond the margin of the frond.—Stagnant pools, abundant. All continents except S. Am.

3. *L. trisúlca* L. IVY-LEAF DUCKWEED. Fronds forming dense masses, oblong to oblong-lanceolate, slightly unsymmetrical and frequently a little falcate,  $2\frac{1}{2}$  to 5 lines long and  $1\frac{1}{2}$  lines wide, the long stipe attached to the basal margin; floating fronds with shorter stipes and cavernous throughout the central portion; submerged fronds with long twisted stipes; seed prominently 12 to 15-ribbed.—Cold springs and running water, Sierra Nevada. All continents except S. Am.

4. *L. cyclóstasa* Chev. Fronds solitary or more commonly 2 to 8 cohering in a more or less curved chain, thin, oblong to obovate-oblong, usually somewhat falcate,  $\frac{1}{2}$  to  $\frac{3}{4}$  lines wide by 1 to  $1\frac{1}{4}$  lines long, without papillae; base of the frond usually unsymmetrical, tapering into a short stipe or frequently sessile; fruit long-ovate, pointed by the long, straight or rarely curved style; seed 12 to 29-ribbed.—Springs and pools; N. and S. Am.

5. *L. mínima* Phil. Fronds cohering in 2s, sometimes in 4s, or solitary, oblong to elliptical, symmetrical,  $\frac{1}{2}$  to  $1\frac{1}{4}$  lines wide,  $\frac{3}{4}$  to 2 lines long, rather thick, with a row of papillae along the mid-nerve; lower surface flat or slightly convex, upper surface slightly to prominently convex with thin margin entirely around the frond; frond cavernous in the middle portion only, commonly nerveless; seed oblong, pointed, about 16-ribbed.—Two growth stages: smaller fronds straw-yellow or pale green and strikingly convex on the upper surface; larger fronds thinner and green-colored.—Pools, Cal., e. to Wyo. and Fla.

### 3. WOLFFIÉLLA Hglm.

Fronds minute, thin, band-like or ligulate, somewhat curved, rootless. Reproductive pouch one, triangular, opening as a cleft in the basal margin of the frond. Flowers and fruit unknown. Stipe of the daughter frond attached on the margin of the reproductive pouch. (Diminutive of Wolffia.)

Fronds saber-shaped. . . . . 1. *W. oblonga*.  
Fronds ligulate. . . . . 2. *W. lingulata*.

1. *W. oblonga* Hglm. Fronds solitary or in pairs, rarely 3s, slightly falcate, tapering from the rounded base to the somewhat narrower rounded apex, sometimes oblong, rarely straight,  $1\frac{1}{2}$  to  $2\frac{1}{4}$  lines long.—S. Cal., Mex., S. Am.

2. *W. lingulata* Hglm. Fronds solitary or in pairs, ovate to oblong-ligulate,  $1\frac{1}{4}$  to  $3\frac{1}{4}$  lines long.—Kern Co.; San Bernardino Valley; Mex.

## PONTEDERIACEAE. PICKEREL WEED FAMILY

Aquatic herbs. Perianth with a tube, its limb 6-lobed or 6-parted. Stamens 3 or 6, inserted on the throat of the perianth. Ovary superior, 1 or 3-celled.

### 1. HÉTÉRANTHÈRA R. & P.

Ours submerged grass-like herbs, only the flowers reaching the surface. Spathe 1-flowered. Perianth with elongated filiform tube and rotate 6-parted limb; segments linear-lanceolate. Stamens 3. Ovary 1-celled with 3 parietal placentae. (Greek heteros, different, and anthera, anther, the stamens unequal in some species.)

1. *H. dubia* MacM. Leaves linear or ribbon-like, translucent; perianth small, pale yellow, its tube about 4 in. long.—Still water: Mendocino Co.; Ore. and e. to the Atlantic.

*Eichórnia* Kunth. Herbs with rootstock, floating or rooting in mud. Petioles wholly or partly inflated, the blades roundish to ovate. Perianth bluish purple. Stamens 6. Ovary 3-celled. E. CRÁSSIPES Solms. Water Hyacinth. Scapes 4 to 16 in. high; blades  $2\frac{1}{2}$  to 3 in. broad.—Nat. of trop. Am.; locally established as a weed at a few stations (Fresno, San Bernardino).

## JUNCACEAE. RUSH FAMILY

Annual or perennial herbs. Stems simple, terete or ancipital. Leaves alternate, sheathing, narrow, flat or terete. Flowers lily-like in structure, sedge-like in aspect, small, dry, perfect, disposed in terminal or sometimes apparently lateral heads, spikes, corymbs or panicles. Perianth with 6 distinct similar glume-like segments. Stamens 6 or sometimes 3. Ovary superior, 3 or sometimes 1-celled; stigmas 3, filiform; ovules 3 to many. Fruit a loculicidally 3-valved capsule. Embryo minute, inclosed in fleshy endosperm.—In both the genera *Luzula* and *Juncus*, individuals of the same species vary greatly in aspect owing to the tendency of the inflorescence to become either capitately-congested on the one hand or loosely paniculate on the other. The hue of the inflorescence is, however, very constant. The lowest bract of the inflorescence is here termed the involucreal bract.

Leaves stiff, terete or flat; stems usually with spongy pith; capsule 3 or 1-celled; seeds several to many.....1. *JUNCUS*.  
Leaves soft, flat; stems hollow; capsule 1-celled; seeds 1 to 3.....2. *LUZULA*.

1. *JUNCUS* L. RUSH

Plants of swamps or wet places; herbage glabrous. Stems simple (rarely branching), with spongy pith or sometimes hollow, leafy, or naked and scape-like. Leaves stiff, terete, channeled or flat, the blades arising from sheaths or the sheaths sometimes bladeless. Flowers greenish or brownish. Stamens 6, or when 3 opposite the outer perianth segments. Capsule 3-celled with central placentae or 1-celled with 3 parietal placentae, many-seeded. (Classical name for the Rush, perhaps from Latin *jungo*, to join, the stems used for binding.) Sheaths sometimes bearing a ligule at summit.

**A. Inflorescence apparently lateral; involucreal bract erect, appearing like a continuous prolongation of the stem; leaves all basal, reduced to sheaths or the inner sheaths sometimes blade-bearing and terete; ligules none; stems scape-like; perennials.**

Flowers 3 to 9 in head-like clusters, the clusters disposed in a panicle; inner sheaths blade-bearing; stems and blades stout and pungent.

Perianth segments brownish, scariously margined or winged, the inner obovate, emarginate, a line long; capsule subglobose, obtuse.....1. *J. acutus*.

Perianth segments greenish, not winged, the inner lanceolate, rarely ovate, acute, 3 lines long; capsule ovate, acute.....2. *J. cooperi*.

Flowers inserted singly on the racemose branches of the panicle, distinctly separated to somewhat crowded but never truly capitate; stems usually slender and rigid; sheaths bladeless except nos. 6 and 10.

Flowers many to numerous, in panicles or compound panicles.

Flowers large (2 lines long or more); perianth segments scarious-margined; capsule oblong-ovate.

Flowers dark brown; perianth segments with deep purple margins.....3. *J. lescurei*.

Flowers mostly greenish; perianth segments with whitish margins or only faintly purplish.

Sheaths quite bladeless.

Perianth greenish or dark, the bractlets scarious; common, widely distributed.....4. *J. balticus*.

Perianth and bractlets concolorous; S. Cal.....5. *J. textilis*.

Sheaths bearing scape-like blades.....6. *J. mexicanus*.

Flowers small (less than 1 line long); perianth segments not scarious-margined; capsule obovate or subglobose.

Stamens 6; capsule broadly subglobose, obtuse, apiculate.....7. *J. patens*.

Stamens 3; capsule narrow, clavate, obovate, obtuse or retuse.....8. *J. effusus*.

Flowers few (1 to 3); low alpine plants.

Inner sheaths bristle-tipped; capsule retuse; plants  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high.....9. *J. drummondii*.

Inner sheaths blade-bearing; capsule acute; plants  $\frac{1}{2}$  ft. high or less.....10. *J. parryi*.

**B. Inflorescence terminal; involucreal bract not a continuation of the stem (or if so conspicuously channeled along the upper side).**

## 1. LOW DWARF ANNUALS WITH FIBROUS ROOTS.

Stamens 6; flowers secund, remote; stems branching from the base; leaves cauline.

Plants 4 to 10 in. high; capsule oblong.....11. *J. bufonius*.

Plants  $1\frac{1}{2}$  to 2 in. high; capsule elliptic.....12. *J. sphaerocarpus*.

Stamens 3; flowers in small heads; stems short with several scape-like peduncles; leaves mostly basal; plants 1 to 3 in. high; capsule ovate, apiculate.....13. *J. triflorus*.

## 2. TALLER PERENNIALS; ROOTSTOCKS MOSTLY STOUT AND CREEPING.

a. *Leaves not transversely ribbed, usually flat.*

- Stems naked; flowers solitary in a diffuse (rarely compact) panicle; leaves very fine, with ligules.....14. *J. tenuis*.  
 Stems more or less leafy; flowers capitate or clustered; leaves flat or grass-like.  
 Stems low, mostly equaling the leaves; ligules none; styles usually short.  
 Involucral bract short; heads usually solitary; perianth equaling the capsule, its segments brown-margined.....15. *J. falcatus*.  
 Involucral bract elongated; heads 3 to 6; perianth shorter than the capsule; its segments broadly white-margined.....16. *J. obtusatus*.  
 Stems taller, exceeding the leaves; heads 2 to 6 or many; styles long exserted.  
 Ligules present; leaves narrow.  
 Anthers red-brown; leaves channeled.....17. *J. canaliculatus*.  
 Anthers white; leaves flat.....18. *J. longistylis*.  
 Ligules absent; leaves broad.....19. *J. latifolius*.

b. *Leaves transversely ribbed by internal septa.*

- Leaves narrow, terete or sub-terete, not equitant; ligules and septations usually conspicuous; stems usually slender.  
 Early leaves capillary and floating.....20. *J. supiniformis*.  
 Leaves all erect, not capillary or floating.  
 Heads large (except no. 22).  
 Perianth dark colored.  
 Heads usually few or solitary; perianth segments moderately pliable.  
 Very slender commonly low grass-like plants; heads very dark brown; high montane.  
 Heads solitary, wholly very dark brown; capsule obovoid, obtuse; styles included; high montane.....21. *J. mertensianus*.  
 Heads usually 2 or more, dark brown with whitish or scarious bractlets at base; capsule oblong, usually acutish; styles exserted.....22. *J. nevadensis*.  
 Tall plants with less slender stems; heads densely many-flowered; perianth dark brown; capsule narrowly oblong, very dark; coast valleys.....23. *J. bolanderi*.  
 Heads numerous in a dense or capitate cluster; perianth segments lanceolate, light brown, subspinescent or very rigid.....24. *J. torreyi*.  
 Perianth segments pale and scarious, often obtuse....25. *J. chlorocephalus*.  
 Heads small, numerous, in large compound panicles; plants very tall and slender.  
 Stems smooth.....26. *J. dubius*.  
 Stems markedly rugulose.....27. *J. rugulosus*.  
 Leaves equitant, usually flattened; septations inconspicuous; ligules usually inconspicuous or absent; stems rather stout, flattened, 2-edged.  
 Heads small, numerous, in large compound panicles; perianth segments linear-lanceolate; capsule narrow, attenuate.....28. *J. oxymiris*.  
 Heads larger, usually few; perianth segments lanceolate; capsule oblong, acute.  
 Leaves 2 to 4 lines wide; perianth segments light red dish brown; capsule abruptly acuminate.  
 Stamens 6; valleys and lower altitudes.....29. *J. xiphioides*.  
 Stamens 3; higher mountains or near the coast northward.....30. *J. ensifolius*.  
 Leaves  $\frac{1}{2}$  to  $1\frac{1}{2}$  (or 2) lines wide; perianth segments very dark; capsule long acuminate.....31. *J. phaeocephalus*.

210. *Juncus acutus* L.  
 var. *sphaerocarpus*  
 Engelm.; a, base of plant  
 x  $\frac{1}{4}$ ; b, infl. x  $\frac{1}{2}$ ; c,  
 perianth and capsule x 5.

1. *J. acutus* L. var. *sphaerocarpus* Engelm. Fig. 210. Stems terete or slightly compressed, 2 to 4 ft. high, stout, rigid and pungent; panicle compound with unequal branches, usually 3 to 6 in. long, erect and strict, usually exceeding the involucral bract; secondary bracts long acuminate, equaling or exceeding the flowers; clusters 2 to 4-flowered; perianth segments scarious-margined very broadly at apex, especially the inner, 1 line long, exceeding the stamens, the outer broadly lanceolate, acute, the inner obovate and deeply emarginate; capsule subglobose, narrower at base, rounded at summit, apiculate, brown, nearly 2 lines long; seeds acute at each end or slightly caudate, about  $\frac{1}{2}$  line long, very finely ribbed.—Along the coast from San Francisco to San Diego, thence e. into the Colorado Desert and s. to L. Cal.

211. *J. cooperi* Engelm.;  
perianth and capsule  $\times 6$ .

2. *J. cooperi* Engelm. DESERT RUSH. Fig. 211. Similar in habit to *J. acutus* but the flowers larger, the perianth segments lanceolate, sometimes oblong-lanceolate or ovate, the outer acute, the inner mucronate,  $2\frac{1}{2}$  to 3 lines long; capsule ovate, acute, slightly longer than the perianth, greenish; seeds larger, with broad white appendages at each end, or slightly margined on one side.—Salt marshes and alkaline flats, Colorado and Mohave deserts; e. to Nev.

3. *J. lescurii* Boland. SALT RUSH. Fig. 212. Stems 1 to 3 ft. high, stout, erect, terete; rootstock stoutish; panicle lateral, lax or compact, many-flowered; flowers commonly somewhat secund; perianth segments with green midribs and membranous mostly purplish brown margins, 2 to 3 lines long, outer segments lanceolate-acuminate, the inner ones a little shorter and sometimes less pointed; capsule oblong or ovoid, mucronate, triangular, shorter than the perianth; seeds ovoid, obtuse, scarcely apiculate, smoothish or faintly reticulate,  $\frac{1}{3}$  to  $\frac{1}{2}$  line long.—Salt-marshes or near sand dunes or beaches, Monterey Co. to Humboldt Co.; n. to Alas.

4. *J. balticus* Willd. WIRE RUSH. Fig. 213. Plants caespitose, grass-like, 1 to  $3\frac{1}{2}$  ft. high; stems strict, terete or sometimes compressed, mediumly stout, sulcately channeled; panicle lateral, lax, many-flowered, its branches

212. *Juncus lescurii* Boland.; a, infl.  
 $\times 1$ ; b, perianth and capsule  $\times 5$ .

of the panicle branches are widely spread throughout Cal., 100 to 2500 ft. Am., Eur. Var. *MON-TANUS* Engelm. Lower, the stems more slender, sometimes flattened; panicle very small. — Montane. Var. *EREM-ICUS* Jepson n. var. Capsule longer than the perianth.—Mo-

213. *Juncus balticus* Willd.;  
a, infl.  $\times 1$ ; b, perianth and  
capsule  $\times 8$ .

214. *Juncus textilis* Buch.; a, infl. x 1; b, perianth and capsule x 7.

rootstock creeping; sheaths rarely awn-tipped; panicle lateral, lax, many-flowered; perianth 1 line long, pale or brownish, its segments lanceolate or broadly subulate, spreading in fruit; stamens 6; anthers  $\frac{1}{4}$  line long, about  $\frac{1}{2}$  as long as the filaments; capsule sub-globose, slightly angled, obtuse, apiculate, a little shorter than the perianth; seeds apiculate with a minute white appendage or none.—

A common species, in marshy or springy ground, coastal region from Santa Barbara Co. to Del Norte Co.; n. to Wash.

216. *Juncus effusus* L.; a, infl. x  $\frac{2}{3}$ ; b, perianth and capsule x 9.

segments lanceolate, acute, equaling the capsule; capsule obovoid or even broadly clavate, obtuse or retuse, triangular; stamens 3, anthers equaling the filaments; seeds apiculate.—Common in springy spots or bogs, forming very dense or heavy clumps on hillsides or valley flats; Coast Ranges,

have Desert to Inyo Co. (Owens Lake, Jepson 5116, type).

5. *J. textilis* Buch. INDIAN RUSH. Fig. 214. Similar to *J. balticus*; stems much shorter, 3 to 6 ft. high, very finely channeled; panicle with longer branches; bractlets and perianth concolorous mostly; inner perianth segments obtuse.—S. Cal.

6. *J. mexicanus* Willd. Stems slender, grass-like, usually compressed, often contorted; basal sheaths usually bearing a scapiform blade; panicle small; outer perianth segments narrowly lanceolate; capsule ovate, long-beaked.—Death Valley region and s. through S. Cal. to Mex.

7. *J. patens* Mey. COMMON RUSH. Fig. 215. Stems slender, densely tufted,  $1\frac{1}{2}$  to 3 ft. high, erect, terete;

215. *Juncus patens* Mey.; perianth and capsule x 12.

8. *J. effusus* L. BOG RUSH. Fig. 216. Similar in habit to *J. patens* but stamens and perianth segments smaller and not so spreading; stems terete, 2 to 4 ft. high; inner sheaths tipped with a short awn; panicle slender, usually diffuse, many-flowered; perianth pale brown, 1 line long, the

Sierra Nevada and S. Cal.; also distributed widely throughout the north temperate regions of both the Old and the New World. Also called Sugar Grass. Var. *EXIGUUS* Fer. & Weig. Very slender; sheaths pale; flowers very small, pale.—Yosemite Park; Mt. Shasta. Var. *GRACILIS* Hook. Culms rigid, wiry, perianth segments with lateral dark-brown bands.—Mt. Sanhedrin and n. to B. C. Var. *BRUNNEUS* Engelm. Nigger Heads. Panicle usually very short and compact; perianth and capsule dark brown.—Coast form.

9. *J. drummondii* E. Mey. Fig. 217. Densely caespitose; stems slender, terete, 6 to 15 in. high; inner sheaths bristle-tipped; spathe  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long, equaling or exceeding the inflorescence; perianth segments 3 lines long, with brown margins, lanceolate, acute, the inner a little shorter; capsule brown, oblong, retuse, nearly equaling the perianth; seeds ovate, caudate at both ends, brown.—High montane, 7000 to 9000 ft., Sierra Nevada from Tulare Co. to Siskiyou Co.; n. to Alas.; also in the Rocky Mts. The bladeless leaf-sheaths in this species form short but dense tufts on the root-crown. The capsule-valves are distinctly retuse, a character which is especially noticeable after dehiscence. In *J. parryi* the valves are acute.

217. *Juncus drummondii* E. Mey.; a, habit x  $\frac{1}{2}$ ; b, perianth and capsule x 5; c, seed x 15.

218. *J. parryi* Engelm.; a, perianth and capsule x 5.

10. *J. parryi* Engelm. Fig. 218. Caespitose; stems filiform, 3 to 6 in. high; inner sheaths leaf-bearing, the leaves sulcate at base, terete above, much shorter than the stems; ligules none or obscure; spathe exceeding the inflorescence,  $\frac{3}{4}$  to 1 in. long; perianth segments 3 lines long, more or less tinged with brown, lanceolate-acuminate, or the inner obtuse; capsule oblong or narrowly oblong, acute, about equaling or a little exceeding the perianth; seeds as in *J. drummondii*.—Thin soil drift or alpine meadowlets on granite slopes, Sierra Nevada, 6000 to 12,500 ft.; n. to B. C.; e. to the Rocky Mts.

219. *Juncus bufonius* L.; a, habit x  $\frac{1}{2}$ ; b, perianth and capsule x  $4\frac{1}{2}$ .

11. *J. bufonius* L. TOAD RUSH. Fig. 219. Stems 1 to 6 (or rarely to 10 or 14) in. high, terete, branching from the base, leafy; leaves narrow, usually revolute and bristleform; inflorescence a dichotomous cyme; flowers solitary

and remote to closely secund or even sub-capitate; perianth segments  $1\frac{1}{2}$  to  $2\frac{1}{2}$  lines long, long acuminate, greenish with white scarious margins, exceeding the capsule; capsule oblong, obtuse or truncatish.—A common species in wet places or dried up pools, throughout Cal. Very variable in size and aspect. Widely spread over the whole earth. Var. *HALÓPHILUS* Fer. & Buch. Stems stout, short; inner perianth segments obtuse, little if at all exceeding the capsule.—Santa Cruz Isl.

12. *J. sphaerocarpus* Nees. Very similar to no. 11 but smaller; stems densely tufted,  $1\frac{1}{2}$  to 2 in. high; branches 2 to 4-flowered; perianth segments subequal, equaling or exceeding the perianth; capsule elliptic or "globose."—Moist flats in the valleys or mountains. Cal. e. to Ariz. and n. to Ida. Rarely collected with us.

220. *Juncus triflorus* Engelm.; a, habit x 1. b, Var. *stylösus* Engelm.; perianth and capsule x 9. c, Var. *brachystilus* Engelm.; perianth and capsule x 9. d, Var. *uniflorus* Engelm.; habit x 1; e, perianth and capsule x 10.

13. *J. triflorus* Engelm. DWARF RUSH. Fig. 220. Stem almost none, bearing several erect filiform scape-like peduncles 2 to 4 in. high; leaves an inch or less long, filiform; flowers usually 3 to 7 in a small head; perianth brownish, 1 to  $1\frac{1}{2}$  lines long; segments narrowly lanceolate, acuminate, nearly equal, a little exceeding the 3 stamens and the capsule; capsule obovate, obtuse, apiculate; style exserted with elongated stigmas.—Mts., 200 to 6200 ft., North Coast Ranges and Sierra Nevada. Infrequent or overlooked. N. to Ore. and Wash. Var. *STYLÖSUS* Engelm. Fig. 220b. Styles very long.—Mariposa Co. Var. *BRACHYSTILUS* Engelm. Fig. 220c. Styles short.—North Coast Ranges, n. to Wash. Var. *UNIFLÖRUS* Engelm. Fig. 220d, e. Plants very small ( $\frac{3}{4}$  to 1 in. high); scapes 1-flowered.—Valleys or mountain flats, 200 to 6000 ft.

221. *Juncus tenuis* Willd.; a, infl.  $\times 1$ ; b, perianth and capsule  $\times 7$ .

the stems,  $1\frac{1}{2}$  lines wide, not ribbed by transverse septa; flowers in dense many-flowered terminal heads, the heads usually solitary; involucrel bract about equaling the inflorescence; perianth segments 2 lines long, roughened, dark brown, with a broad green midvein; capsule triangularly ovate, obtuse, mucronate; seeds large ( $\frac{1}{2}$  line long), with a whitish or as if membranous coat. — Coast region in sand dunes or sandy soil, from Monterey Co. to Humboldt Co.; n. to Alas.; Japan, Austr.

16. *J. obtusatus* Engelm. Fig. 223. Stems subterete or a little compressed, 4 to 10 in. high, from a creeping rootstock, a little surpassing or about equaling the narrow (1 line broad) leaves;

222. *Juncus falcatus* E. Mey.; a, habit  $\times \frac{1}{4}$ ; b, infl.  $\times \frac{1}{2}$ ; c, perianth and capsule  $\times 3$ .

14. *J. tenuis* Willd. Fig. 221. Stems caespitose, slender, erect, 1 to 2 ft. high, leafy at base; leaves very fine, shorter than the stem; involucrel bract exceeding the loose panicle; perianth segments pale, narrowly lanceolate, acuminate,  $1\frac{1}{4}$  to 2 lines long, spreading in fruit and equaling or usually exceeding the ovate retuse greenish capsule; seeds with a white appendage at each end. — Dry valley flats, 50 to 4200 ft.; S. Cal. n. to Ore. A common species throughout the U. S. and W. Eur. Var. *CONGESTUS* Engelm. Inflorescence congested or subcapitate. — Cent. Cal. coast and middle altitudes in the Sierra Nevada.

15. *J. falcatus* E. Mey. Fig. 222. Stems subterete or a little compressed, 6 to 9 in. high, more or less leafy, terete; rootstock slender, creeping; leaves usually equaling or exceeding

223. *Juncus obtusatus* Engelm.; a, habit  $\times \frac{1}{2}$ ; b, infl.  $\times \frac{1}{2}$ ; c, perianth and capsule  $\times 3$ .

sheaths without ligules; involucre bract exceeding the inflorescence; heads 3 to 5-flowered, few in a simple panicle; perianth segments  $1\frac{1}{2}$  to 2 lines long, of equal length, the outer ovate, acute, brown margined, the inner very obtuse, white-scarious margined, shorter than the capsule; capsule oblong-ovate, obtuse or truncate, shortly apiculate.—Sandy banks of mountain streams: North Coast Ranges, 200 to 4000 ft.; Sierra Nevada, 4000 to 9600 ft. (Tuolumne Co. to Mariposa Co.); San Bernardino Mts.; n. to Wash.

17. *J. canaliculatus* Engelm. Stems stout, terete, 2 to  $3\frac{1}{2}$  ft. high; herbage pale; leaves concave or channeled, almost equaling the stem; ligules present; panicle open, with 8 to 30 heads; heads 3 to 8 (or 12)-flowered; perianth light greenish red,  $2\frac{1}{2}$  lines long, the inner segments distinctly longer; anthers red-brown; style long, the stigmas long exserted; capsule ovate, beaked.—Stony stream banks or damp soil, from the foothills to 7500 ft., cismontane S. Cal. and desert slope of the San Bernardino Mts.; Ariz., L. Cal.

224. *Juncus latifolius* Buch.; a, infl. x 1; b, perianth and capsule x 6.

18. *J. longistylis* Torr. Stems tall (1 to 2 ft. high), subterete or slightly compressed; leaves shorter than the stems, the sheaths with ligules; heads densely (usually 2 to 6)-flowered in a short sparingly branched panicle, exceeding the very short involucre bract; perianth pale, segments of equal length, narrow, acuminate, broadly scarious-margined, 2 lines long; styles long; capsule equaling the perianth, triangular ovate, obtuse, mucronate.—Crest and e. side of the Sierra Nevada from Mariposa Co. n.; N. Mex., Col., and Neb. n. to Sask.

19. *J. latifolius* Buch. Fig. 224. Similar to *J. longistylis*; leaves narrowly linear-lanceolate, 2 to  $3\frac{1}{2}$  lines broad, 2 to 5 in. long; ligules absent; heads 6 to 10-flowered, in a loose simple few-headed panicle.—Sierra

Nevada from Tulare Co. n. to Siskiyou Co.; also Ore. and Wash.

20. *J. supiniformis* Engelm. Early leaves elongated and capillary, floating, pale green, 1 to 2 ft. long; stems low, erect, terete, shorter than the subterete cauline leaves; panicle simple, its 3 to 6 small heads about 5-flowered; perianth segments brownish, narrowly lanceolate, acute, nerved,  $1\frac{1}{2}$  to 2 lines long.—In ponds, Mendocino and Humboldt Cos.; n. to Wash.

21. *J. mertensianus* Bong. Fig. 225. Stems very slender, compressed, from slender matted rootstocks, 3 to 6 (or 11) in. high; leaves very narrow, rather flattened, less than 1 line wide, finely but obscurely ribbed by transverse septa, the sheaths with ligules; heads solitary, densely many-flowered, dark brown; perianth 1 to  $1\frac{1}{2}$  lines long, the lanceolate narrowly acuminate segments equaling the obtuse obovoid capsule; anthers usually shorter than the filaments; seeds obliquely obovate, apiculate at apex, stipitate at base.—Higher mts., 4000 to 11,000 ft.: San Bernardino Mts.;

225. *Juncus mertensianus* Bong.; a, habit x  $\frac{1}{2}$ ; b, perianth and capsule x 5.

226. *Juncus nevadensis* Wats.; *a*, habit  $\times \frac{1}{2}$ ; *b*, detail of leaf with ligule  $\times 3$ ; *c*, perianth and capsule  $\times 6$ .

5 to 9 in a loose panicle; perianth segments less setaceous.—Lower Sacramento River.

24. *J. torreyi* Cov. Fig. 228. Tall coarse plants with slender creeping rootstocks; stems stout, terete,  $1\frac{1}{4}$  to 2 ft. or more high; leaves terete, straight and rigidly spreading, the transverse septa very distinct; ligules present; inflorescence terminal; flowers many in large dense heads which form a compact capitate cluster or condensed panicle, the cluster subtended by a long pointed sheath; perianth light brown, 4 to 5 lines long, its segments lanceolate-subulate, exceeding the narrow pointed golden capsule.—Damp places, S. Cal.; upper San Joaquin Valley, Inyo Co.;

Sierra Nevada, n. to Modoc Co., thence w. to Del Norte Co.; n. to Alas., e. to Col.

22. *J. nevadensis* Wats. Fig. 226. Resembling slender forms of *J. phaeocephalus*; stems very slender, somewhat compressed, from a slender creeping rootstock,  $\frac{1}{2}$  to 1 (or sometimes 2) ft. high; leaves teretish, very narrow ( $\frac{1}{4}$  to  $\frac{1}{2}$ , rarely 1 line), more or less distinctly knotted by internal transverse partitions; ligules present; heads small, 2 to 7 in a short open panicle, sparsely flowered; perianth segments very dark brown, lanceolate, acuminate,  $1\frac{1}{2}$  to 2 lines long; anthers longer than the filaments; stigmas long exserted; capsule oblong, abruptly acute and beaked, nearly equaling the perianth.—Higher mts., 5000 to 9000 ft.: Sierra Nevada; s. to the San Jacinto and San Bernardino mountains; n. to B. C. Marked by its very narrow and erect strongly septate leaves with prominent ligules.

23. *J. bolanderi* Engelm. Fig. 227. Stems slender, terete, 1 to  $2\frac{3}{4}$  ft. high, a little exceeding or about equaling the terete strongly knotted leaves; ligules conspicuous; heads subglobose, very dark, usually 2 or 3 in a close cluster, very many flowered; perianth segments reddish brown, narrowly lanceolate, acuminate and setaceous,  $1\frac{1}{2}$  lines long, exceeding the capsule; capsule clavate-oblong, obtuse, apiculate; seeds obovate, apiculate at each end.—Swamps, North Coast Ranges; sw. Ore. Var. *RIPARIUS* Jepson. Heads smaller, lighter-colored.

227. *Juncus bolanderi* Engelm.; *a*, infl.  $\times 1$ ; *b*, perianth and capsule  $\times 10$ .

228. *Juncus torreyi* Cov.; a, infl. x 1; b, perianth and capsule x 5.

n. to B. C., e. to the Atlantic. Well distinguished by its large dense heads, by its very narrow and rigid perianth segments and by its slender golden capsule.

25. *J. chlorocephalus* Engelm. Fig. 229. Stems low and slender (8 to 15 in. high), terete, from a slender rootstock; leaves narrow (less than a line wide), the sheaths with ligules; heads 1 or 2, many flowered; perianth pale and scarious; segments 2 lines long, obtuse or

acute; style exserted; capsule shorter than the perianth.—Sierra Nevada, 6400 to 8400 ft., from Nevada Co. to Mariposa Co.

26. *J. dubius* Engelm. Fig. 230. Stems very slender, compressed, 2 to 4 ft. high, from stout horizontal rootstocks; leaves narrow (1 line broad) but rigid,  $\frac{2}{3}$  to nearly as long as the stems, septate; panicle compound, diffuse,

230. *Juncus dubius* Engelm.; a, detail of leaf with ligule x 1; b, infl. x 1; c, perianth and capsule x 8.

229. *Juncus chlorocephalus* Engelm.; a, infl. x 1; b, perianth and capsule x 5.

3 to 12 in. long; heads 6 to 20-flowered, numerous; perianth brown or brownish,  $1\frac{1}{2}$  to 2 lines long, the segments lanceolate, acuminate; anthers elongated, rather exceeding the filaments; capsule narrowly oblong, acuminate, slightly longer than the perianth; seeds abruptly apiculate at each end, reticulate, brownish.—Montane, 3000 to 5000 ft.: Mariposa Co. to Sierra Co. The leaves suggest diminutive bamboo fishing rods.

27. *J. rugulosus* Engelm. Fig. 231. Very closely allied in habit and character to *J. dubius*; stems slender, sometimes stout,

b

a

231. *Juncus rugulosus* Engelm.; a, detail of stem  $\times 8$ ; b, perianth and capsule  $\times 8$ .

erect, from an elongated horizontal rootstock, often stoloniferous; leaves broad and flat, equitant ( $1\frac{1}{2}$  or) 2 to 3 lines wide, ligules not present, transverse partitions not conspicuous; involueral bract short; heads 5 to 10-flowered, set singly in a loose panicle; perianth segments brownish, linear-lanceolate, subulate, of equal length or the interior slightly longer; anthers 6, longer than the filaments; styles long exserted; capsule long attenuate, exceeding the perianth; seeds small, obovate, apiculate, light brown and finely reticulate.—Moist valleys and mountain flats, Coast Ranges and Sierra Nevada, 50 to 6000 ft.; n. to Ore.

29. *J. xiphioides* E. Mey. Fig 232. Stems flattened, 2-edged,  $1\frac{1}{2}$  to 3 ft. high; leaves equitant, more or less obviously septate,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  lines wide, 6 to 14 in. long; panicle  $2\frac{1}{2}$  to 7 in. long; heads 6 to 11-flowered, discrete or more or less congested; perianth segments lanceolate, subulate-acuminate; stamens 6; stigmas barely exserted; capsule narrowly cylindric, abruptly acute or somewhat beaked, equaling or exceeding the perianth; seeds narrowly ovoid, apiculate.—Coastal region, salt marshes and moist lands: S. Cal. to Humboldt Co. and n. to Ore. Var. *AURATUS* Engelm. Stems slender, lower; heads yellow.—Solano Co. to Santa Clara Co.

b

a

232. *Juncus xiphioides* E. Mey.; a, inf.  $\times 1$ ; b, perianth and capsule  $\times 8$ .

30. *J. ensifolius* Wikstr. Similar to *J. xiphioides*; stems 1 to 2 ft. high; heads fewer, dense, dark-colored, many-flowered, 3 to 4 lines broad; perianth larger, dark brown, equaling the acute capsule; stamens mostly 3 (sometimes 6).—Wet granitic gravel, Sierra Nevada, 4000 to 9600 ft., n. to Siskiyou Co., thence sw. to Mendocino Co.; n. to Alas.

31. *J. phaeocephalus* Engelm. Fig. 233. Stems  $\frac{2}{3}$  to  $1\frac{1}{2}$  ft. high, erect, leafy, ancipitally compressed, not winged, arising from stout elongated rootstocks; leaves  $\frac{1}{2}$  to  $1\frac{1}{2}$  lines wide, compressed, equitant, ribbed by transverse septa, sometimes very distinctly so; ligules none; flowers in terminal heads, the inflorescence usually barely exceeding the leaves; heads 1 to 3, solitary or 2 in a place; perianth dark brown,  $1\frac{1}{2}$  to 2 lines long; style long; stigmas exserted; capsule long acuminate, equaling or exceeding the perianth; seeds ovoid, the longitudinal ridges con-

a

233. *Juncus phaeocephalus* Engelm.; a, inf.  $\times 1$ ; b, perianth and capsule  $\times 8$ .

234. *Juncus phaeocephalus* var. *paniculatus* Engelm.; a, infl. x  $\frac{2}{3}$ ; b, perianth and capsule x 5.

ned by similar transverse ones.—Meadows and borders of swamps, coast region from Los Angeles Co. to Mendocino Co. and n. to Ore. Var. *PANICULATUS* Engelm. Fig. 234. Stems 1 to 3 ft. high from a stout rootstock; heads few-flowered, many to numerous in a loose compound panicle; perianth segments very dark; styles long-exserted. — Valleys and mountain flats, Coast Ranges, Sierra Nevada, and cismontane S. Cal.

## 2. *LUZULA* DC. WOOD-RUSH

Plants of dry or high ground in open or shady or sometimes moist places. Stems hollow, leafy, simple, slender. Leaves softer and flatter than in *Juncus*, grass-like and often hairy or villous. Flowers in umbels or panicles or crowded in dense clusters or spikes. Capsule 1-celled; seeds 1 to 3. (O. It. *luzziola*, a glow-worm.)

Flowers solitary at the ends of the branches of the inflorescence.

Pedicels divaricate.....1. *L. divaricata*.

Pedicels erect.....2. *L. parviflora*.

Flowers crowded in spikes or dense clusters.

Leaves flat.

Bracts and bractlets conspicuously fimbriate or ciliate.....3. *L. subcongesta*.

Bracts and bractlets not fimbriate.

Flowers in mostly rayed clusters.....

4. *L. campestris*.

Flowers in mostly solitary sessile spikes.

5. *L. subsessilis*.

Leaves channeled; flowers in a dense nodding spike-like panicle.....6. *L. spicata*.

1. *L. divaricata* Wats. Fig. 235. Stems 6 to 12 in. high, nearly naked, the leaves in a mostly basal tuft; herbage quite glabrous; inflorescence a diffuse cyme with divaricate branches and pedicels.—Sierra Nevada, 7000 to 11,000 ft.; Nev.

235. *Luzula divaricata* Wats.; a, habit x  $\frac{1}{4}$ ; b, perianth and capsule x 4.

2. *L. parviflora* Desv. Stems 1 to 2½ ft. high, usually rather leafy, densely leafy at base; leaves hairy at the sheaths; inflorescence lax, the branches of the cyme somewhat slender or racemose, distinctly though not strongly drooping; perianth segments greenish, acute, cuspidate, shorter than the acute shortly-beaked reddish capsule.—

Coniferous woods: Sierra Nevada; far North Coast Ranges;

236. *Luzula subcongesta*; a, lower portion of plant x  $\frac{2}{3}$ ; b, infl. x  $\frac{2}{3}$ ; c, perianth and capsule x 7.

237. *Luzula campestris* DC.; a. habit  $\times \frac{1}{4}$ ; b. infl.  $\times \frac{3}{4}$ ; c. perianth and capsule  $\times 4$ .

238. *L. subsessilis* Buch., infl.  $\times 1$ .

n. to Alas., e. to Lab.; Eur. Var. *FÁSTIGIATA* Buch. Inflorescence more or less corymbose; branches slender, only slightly or scarcely at all drooping.—Sierra Nevada from Mariposa Co. to Fresno Co., 6000 ft.

3. *L. subcongesta* Jepson. Fig. 236. Similar in habit to no. 2; pedicels very much shortened and the flowers in capitate clusters at the ends of the branches of the cyme; bracts and bractlets fimbriate; perianth dark reddish-brown, merely acute or membranously pointed; capsule dark or black.—Grassy spots amongst granite rocks, n. Sierra Nevada, 7000 to 8000 ft.

4. *L. campéstris* DC. COMMON WOOD-RUSH. Fig. 237. Stems erect, leafy, 8 to 15 in. high; herbage sparsely villous; leaf-blades 3 to 6 in. long, 2 to 3 lines wide, flat, a villous tuft at the throat, sparsely villous on the margins; bract foliaceous, shorter than or usually much exceeding the inflorescence; flowers spicate; spikes 3 to 4 lines long, erect, cymosely disposed, some on rays  $\frac{1}{4}$  to 1 (or 2) in. long, some subsessile; bractlets scarious, hyaline and ciliate above; perianth segments lanceolate, acuminate,  $1\frac{1}{2}$  lines long, tinged with dark brown; seed dark, with a whitish conical appendage at one end  $\frac{1}{4}$  to  $\frac{1}{2}$  as long.—Partially shaded spots, mt. and coast regions, 100 to 6000 ft.; N. Am., Eur., Asia. Var. *CONGESTA* Buch. Spikes several, congested into a pyramidal or conical head; perianth often dark-brown.—Coast, Monterey Co. to Humboldt Co. Var. *SUPÉTICA* Celak. Inflorescence congested; perianth almost black.—Mineral King; Eur.

5. *L. subséssilis* Buch. Fig. 238. Erect or ascending, 5 to 12 in. high; spikes solitary or rarely 2 in a place, sessile or nearly so.  $2\frac{1}{2}$  to 4 lines long.—Cent. Cal. coast; n. to B. C.

6. *L. spicàta* DC. Fig. 239. Densely tufted 4 to 12 in. high, without rootstocks; leaves narrowly linear, channelled; flowers in sessile clusters, forming a spike-like panicle; panicle nodding, sometimes interrupted,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long; perianth segments bristle-pointed, equaling or exceeding the bluntly acute capsule. — High mts., Sierra Nevada, 9000 to 12,500 ft.; n. to Alas., e. to N. Eng.; Eur., Asia.

239. *Luzula spicata* DC.; a. habit  $\times \frac{2}{3}$ ; b. perianth and capsule  $\times 7$ .

#### LILIACEAE. LILY FAMILY

Perennial herbs, the stems from bulbs or rootstocks, or rarely shrubs or trees. Leaves all basal and the stem a scape, or the stem more or less leafy and frequently branching. Flowers regular and perfect; perianth with 6 segments or lobes, the 3 outer and 3 inner petaloid and alike (or nearly) in shape and color, or sometimes strongly differentiated; when strongly differentiated by shape or color the outer 3 are called sepals and

the inner 3 petals. Stamens 6, sometimes 3 or 4. Ovary superior, 3-celled; styles 3, or 1 and entire or 3-cleft; stigmas 3, rarely 1. Fruit a capsule or berry.—*Maianthemum* has a 2-merous flower, *Scoliopus* a 1-celled ovary, *Veratrum* polygamous flowers, and *Smilax* dioecious flowers. Cauline leaves alternate, or sometimes whorled in *Fritillaria* and *Lilium*, netted-veined and whorled in *Trillium*. Our genera of Liliaceae as a whole are plants of grassy plains and foothills characterized by a two-season year, that is with a rainy or vegetative period regularly succeeded by a rainless or hibernation period. During the hibernation period the entire plant dries up or perishes except the below-ground corm or bulb. The most typical genera of the semi-arid or desert areas are *Hesperocallis*, *Chlorogalum*, *Bloomeria*, *Brodiaea* and *Calochortus*. The two latter genera have developed, especially in the upper Sonoran zone, a large number of species.

### A. Fruit a capsule.

#### 1. PERENNIAL HERBS.

Styles 3 and distinct (except no. 1); plants with rootstocks (except nos. 4 and 5); perianth segments distinct.

Leaves equitant.

Stamens with densely woolly filaments; flowers in a loose raceme..... 1. NARTHECIUM.

Stamens not woolly; flowers in a head or capitate raceme..... 2. TOFIELDIA.

Leaves not equitant.

Stem glabrous, the leaves mostly basal.

Perianth segments not glandular.

Leaves very dry and sedge-like, rough-edged; flowers not nodding.... 3. XEROPHYLLUM.

Leaves not sedge-like; flowers nodding..... 4. STENANTHIUM.

Perianth segments glandular near the base..... 5. ZYGADENUS.

Stem pubescent (at least above), very leafy..... 6. VERATRUM.

Style 1, entire, or 3-lobed or 3-parted, or none; plants with bulbs (except no. 7).

Stems from a tunicated bulb or corm, or rootstock in no. 7.

Flowers with bracts.

Flowers in racemes or panicles.

Perianth segments united below into a tube.

Flowers in a cluster on the ground; anthers basifixed..... 7. LEUCCOCHORUM.

Flowers borne on a more or less leafy stem.

Perianth segments ascending; anthers versatile..... 8. HESPEROCALLIS.

Perianth segments reflexed; anthers basifixed..... 9. ODONTOSTOMUM.

Perianth segments distinct, withering-persistent; leaves basal; anthers versatile.

Flowers in a raceme.

Raceme dense; perianth  $2\frac{1}{2}$  to 5 lines long..... 10. SCHOENOLIRION.

Raceme loose; perianth about 1 in. long..... 11. CAMASSIA.

Flowers in a panicle..... 12. CHLOROGALUM.

Flowers in umbels or heads.

Perianth segments distinct or nearly so; anthers versatile.

Filaments not appendaged, often dilated at base.

Umbel in the bud sheathed by a continuous spathe splitting into 2 or 3 bracts; bractlets none..... 13. ALLIUM.

Umbel in the bud covered by 3 distinct bracts; pedicels with minute bractlets..... 14. MULLA.

Filaments arising from a cup-like or winged appendage..... 15. BLOOMERIA.

Perianth segments united below into a tube; stamens with anthers 6 or 3; anthers basifixed or versatile..... 16. BRODIAEA.

Flowers without bracts; leaves 1 or few, basal or mostly so; anthers basifixed.

Perianth segments unlike, the inner very showy, usually with a glandular pit at base; leaves narrow..... 17. CALOCHORTUS.

Perianth segments alike or nearly so, colored alike, without glandular pits; leaves broad..... 18. ERYTHRONIUM.

Stems from a scaly bulb.

Perianth campanulate to funnelliform; anthers attached at base or below the middle; style 3-cleft or rarely entire..... 19. FRITILLARIA.

Perianth commonly funnelliform; anthers versatile; style entire..... 20. LILIUM.

#### 2. SHRUBS OR TREES.

Flowers rather large; fruit not winged..... 21. YUCCA.

Flowers minute; fruit 3-winged..... 22. NOLINA.

### B. Fruit a berry (except nos. 29 and 30); plants with rootstocks.

Flowers perfect; stems not prickly.

Leaves reduced to scales; branchlets filiform..... 23. ASPARAGUS.

- Leaves foliaceous.  
 Plants with leafy stems; stamens 6.  
 Stem branching; flowers few, drooping.  
 Flowers axillary; filaments short, flattened.....24. STREPTOPUS.  
 Flowers terminal; filaments thread-like.....25. DISPORUM.  
 Stem simple; flowers many or numerous in a terminal raceme or panicle...  
 26. SMILAOINA.  
 Plants with only 2 or 3, or at most few leaves.  
 Perianth segments and stamens 4; leaves 2 or 3.....27. MAIANTHEMUM.  
 Perianth segments 6.  
 Leaves basal, parallel-veined.  
 Stamens 6; leaves 5.....28. CLINTONIA.  
 Stamens 3; leaves 2.....29. SCOLIOPUS.  
 Leaves 3 in a single whorl at summit of stem, netted-veined; flower 1;  
 stamen 6.....30. TRILLIUM.  
 Flowers dioecious; stems prickly; leaves with climbing tendrils.....31. SMILAX.

### 1. NARTHÉCIUM Moeh. Bog ASPHODEL

Stems scape-like, with a dense tuft of basal leaves borne on a creeping rootstock. Leaves narrowly linear and equitant, the cauline few and small. Flowers yellowish-green, in a terminal raceme. Pedicels with a bractlet at the middle. Perianth with 6 distinct segments. Stamens 6, the filaments densely woolly, except at the very base. Ovary attenuate upward to the scarcely lobed stigma. Capsule loculicidal, with thin-chartaceous walls. Seeds numerous with a long bristle-like point at each end. (Narthez, Greek name of *Ferula*, the stems of which were used as rods; applied here on account of the scapose stems.)

1. *N. californicum* Baker. Stems 18 to 22 in. high; basal leaves iris-like, 4 to 10 in. long,  $1\frac{1}{2}$  to 2 lines wide, the cauline 2 or 3, 1 to 4 in. long; raceme loose,  $3\frac{1}{2}$  to 7 in. long; perianth segments oblong-linear, narrowed upward or acute, 3 to 4 lines long; anthers brick-red; ripe capsules salmon-color; seeds, including the points or tails, 5 lines long.—Marshy ground: North Coast Ranges from Mendocino Co. to Del Norte and Trinity Cos.; Sierra Nevada from Plumas Co. to Fresno Co.; sw. Ore.

### 2. TOFIÉLDIA Huds.

Stems simple, naked above, arising from a slender rootstock. Leaves linear, sedge-like, equitant, mostly in a basal tuft. Flowers small, white or greenish-white, ours borne by 3s in a head or dense capitate raceme. Pedicels (in ours) with a membranous 3-lobed involucre above the middle or at the summit. Perianth segments 6, distinct, spreading, persistent. Stamens 6. Ovary 3-lobed; styles 3, short, distinct. Capsule obovate, acute, beaked by the spreading persistent styles, septicidal. Seeds with a membranous coat, in ours tailed at one end. (Tofield, English botanist, of Doncaster, a correspondent of Hudson.)

1. *T. occidentalis* Wats. Stems  $\frac{1}{2}$  to 2 ft. high, glandular; leaves 2 to 12 in. long, 1 to 3 lines wide; racemes  $\frac{1}{2}$  to 1 in. long; perianth segments oblong,  $1\frac{1}{2}$  to 3 lines long; filaments lanceolate; capsule 3 to 4 lines long; seeds with a loose cellular coat, appendaged at the free end with a tail as long or somewhat longer than the body.—Mt. bogs, 3500 to 7500 ft.: North Coast Ranges from Mendocino Co. n. to Siskiyou Co., thence s. in the Sierra Nevada; n. to B. C.

### 3. XEROPHYLLUM Michx.

Stem simple, stout and leafy, ending above in a many-flowered raceme, and arising from a tuber-like woody rootstock bearing cord-like roots, the basal leaves in a dense tuft, numerous, narrowly linear and elongated, dry, rough-edged. Flowers white or cream-color, on slender white pedicels. Perianth segments 6, distinct, several-nerved, persistent. Stamens 6. Ovary 3-lobed; styles 3, distinct. Capsule chartaceous, loculicidal, or occasionally also septicidal. Seeds 2 to 4 in each cell. (Greek *xeros*, dry, and *phullon*, leaf, the foliage very hard and dry.)

1. *X. tenax* (Pursh) Nutt. ELK GRASS. FIRE-LILY. Fig. 240. Stem 2 to 6 ft. high; basal leaves  $1\frac{1}{4}$  to 3 ft. long, 1 to 3 lines wide; raceme dense,  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. long; pedicels 1 to 2 in. long, each with a scarious bract at base,

240. *Xerophyllum tenax* Nutt.; a, raceme  $\times \frac{1}{2}$ ; b, pistil  $\times 4$ .  
 1. *S. occidentale* Gray. Stem 6 to 11 in. high; leaves linear, tapering to base and apex, 4 to 7 in. long, 2 to 7 lines wide; perianth narrow-campanulate, 5 lines long, its tips recurved.—High montane in Trinity Co.; n. to Alb.

spreading in flower, past anthesis strictly erect, spreading again in fruit; perianth segments linear-oblong, 4 lines long, the stamens a little longer.—Dry ridges: Monterey and n. in the Coast Ranges to Del Norte Co., where it is very common; Sierra Nevada from Placer Co. n. to Siskiyou Co.; n. to B. C. and Mont. The plants commonly bloom only after 5 to 7 years of preparation. May-July. The fibres of the leaves were employed by the Hupas and other native tribes for making garments and for decorative work in baskets, while the bulbous root-stocks, when roasted, furnished a nourishing food. Also called Squaw-grass, Bear-grass, Turkey-beard, Bear-Lily, and Pine-Lily.

#### 4. *STENÁNTHIUM* Kunth.

Stem from a tunicated bulb, the narrow leaves mostly basal. Flowers (in ours) in a simple raceme, nodding. Perianth purplish green, its segments narrow, acuminate. Stamens 6, much shorter than and inserted on the base of the perianth segments; anthers reniform, 1-celled. Ovary ovoid; styles 3. Capsule septicidal, 3-beaked. Seeds winged. (Greek *stenos*, narrow, and *anthos*, flower.)

#### 5. *ZYGADÈNUS* Michx. *ZYGADENE*

Stem simple, scape-like, in ours from a tunicated bulb. Outer coats of the bulb mostly dark or black. Herbage glabrous and somewhat glaucous. Leaves linear, mostly basal. Flowers erect, greenish-white, in a raceme or panicle. Perianth nearly rotate, withering-persistent; segments ovate to oblong-lanceolate, with a green glandular spot at the narrow or shortly clawed base. Stamens 6, free from the segments. Styles 3, distinct, persistent. Capsule deeply 3-lobed. (Greek *zugon*, a yoke, and *aden*, a gland.)

Raceme narrow, simple; inner segments spathe-like, the margins abruptly infolded just above the claw.....1. *Z. venenosus*.  
 Raceme broader, more or less compound.

Perianth segments with central area slightly depressed, the border more or less undulate; lower flowers often staminate; bracts membranous.

Leaves narrow (3 to 5 lines wide); stamens longer than or equaling the perianth; anthers yellow.....2. *Z. paniculatus*.

Leaves  $\frac{3}{4}$  to 1 in. wide; stamens shorter than the perianth; anthers white.....3. *Z. exaltatus*.

Perianth segments plane; flowers generally all perfect.

Segments ovate-lanceolate, the outer only shortly clawed; bracts more or less green, conspicuous.....4. *Z. fremontii*.

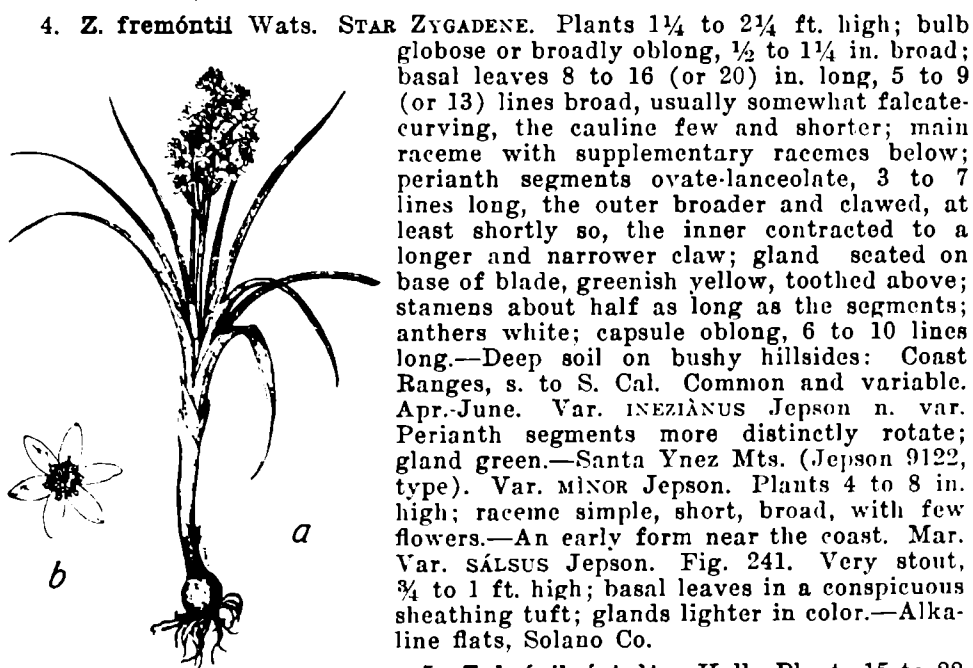

Segments broadly elliptic, all short-clawed; bracts membranous, very small.....5. *Z. brevibracteatus*.

1. *Z. venenosus* Wats. **DEATH CAMAS.** Plants  $\frac{3}{8}$  to 2 ft. high; bulb oblong-ovate,  $\frac{1}{2}$  to  $\frac{1}{2}$  (or  $\frac{3}{4}$ ) in. broad; leaves narrowly linear, 1 to 3 lines broad, carinate and usually folded, more or less scabrous; raceme commonly simple and narrow, 3 to 5 or 10 in. long, the bracts lanceolate, long-attenuate or even flagellate, much exceeding the buds and about as long as the pedicels; perianth segments deltoid-ovate to oblong,  $1\frac{1}{2}$  to 2 lines long, the outer broader and with a shorter claw or sessile; gland seated above the claw, furnished with a more or less evident circular ridge or thin crest, the crest on the lower side continuous with the spathe-like infolding of the basal margins of the blade; stamens about equaling the segments, somewhat adnate below; anthers white; capsule 4 to 5 (or 7) lines long.—Wet meadows: Coast

Ranges, mostly near the coast; Sierra Nevada, both e. and w. slopes; S. Cal.; n. to B. C. Var. *MICRANTHUS* Jepson. Raceme more open and broader (pedicels  $\frac{3}{4}$  to 1 in. long), the bracts relatively shorter; flowers usually larger, less delicate, ridge about the gland thickened, outer segments often not clawed.—North Coast Ranges and s. to Contra Costa Co. This sometimes approaches *Z. fremontii* in habit, but the gland is more sharply defined than in that species.

2. *Z. paniculatus* (Nutt.) Wats. SAND-CORN. Plants 8 to 16 in. high; leaves all sheathing; main raceme with short dense supplementary racemes below; bracts ovate-lanceolate; perianth segments deltoid-ovate, acute or acuminate, greenish thickened on the back at base, the claws very short or sometimes nearly none; gland seated above the claw, indefinitely margined, sometimes spreading nearly to the middle of the segment; stamens much exerted or at least equaling the segments; anthers yellow; capsule  $\frac{1}{2}$  to 1 in. long.—Sagebrush hills e. of the Sierra Nevada crest from Nevada Co. to Siskiyou Co.; Nev. to Wash. and Mont.

3. *Z. exaltatus* Eastw. Plants  $2\frac{3}{4}$  to  $3\frac{1}{2}$  ft. high; bulb oblong-ovoid, 2 to 3 in. long; basal leaves large ( $\frac{3}{4}$  to  $1\frac{1}{4}$  in. wide), in a conspicuous sheathing tuft; main raceme 8 to 12 in. long, with 3 to 5 supplementary racemes below, the lower bearing only staminate flowers; bracts ovate-lanceolate; perianth segments oblong-elliptic, with claws; gland extending the length of the claw, bordered on each side by a narrow non-glandular area and terminating upon the base of the blade in a somewhat darker rounded area toothed above; stamens shorter than the perianth; anthers dull white; capsule  $\frac{3}{4}$  in. long.—Sierra Nevada, from Calaveras Co. to Tulare Co., about 2000 to 4000 ft.

241. *Zygadenus fremontii* Wats.  
var. *salsus* Jepson; a, habit  $\times \frac{1}{4}$ ;  
b, fl.  $\times \frac{1}{2}$ .

4. *Z. fremontii* Wats. STAR ZYGADENE. Plants  $1\frac{1}{4}$  to  $2\frac{1}{4}$  ft. high; bulb globose or broadly oblong,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. broad; basal leaves 8 to 16 (or 20) in. long, 5 to 9 (or 13) lines broad, usually somewhat falcate-curving, the cauline few and shorter; main raceme with supplementary racemes below; perianth segments ovate-lanceolate, 3 to 7 lines long, the outer broader and clawed, at least shortly so, the inner contracted to a longer and narrower claw; gland seated on base of blade, greenish yellow, toothed above; stamens about half as long as the segments; anthers white; capsule oblong, 6 to 10 lines long.—Deep soil on bushy hillsides: Coast Ranges, s. to S. Cal. Common and variable. Apr.-June. Var. *INEZIÄNUS* Jepson n. var. Perianth segments more distinctly rotate; gland green.—Santa Ynez Mts. (Jepson 9122, type). Var. *MINOR* Jepson. Plants 4 to 8 in. high; raceme simple, short, broad, with few flowers.—An early form near the coast. Mar. Var. *SALSUS* Jepson. Fig. 241. Very stout,  $\frac{3}{4}$  to 1 ft. high; basal leaves in a conspicuous sheathing tuft; glands lighter in color.—Alkaline flats, Solano Co.

5. *Z. brevibracteatus* Hall. Plants 15 to 22 in. high; bulb round-ovoid, 1 to  $1\frac{1}{4}$  in. broad; basal leaves 6 to 8 in. long,  $\frac{1}{4}$  in. broad, linear, somewhat revolute and falcate-curving; raceme loose, its pedicels  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long, widely or horizontally divaricate; supplementary basal racemes 1 or 2, rigid, widely spreading; perianth segments 2 to 3 lines long, distinctly short-clawed, the outer rhomboidal-ovate, the inner a little narrower; gland green, extending just above the claw, its lower margin bounded by a sharp low ridge; stamens  $\frac{2}{3}$  the length of segments; capsule 7 to 8 lines long.—Sandy mesas, w. and s. borders of the Mohave Desert.

## 6. VERATRUM L.

Stem tall and leafy from a short thick rootstock, bearing coarse fibrous roots. Leaves broad, plaited, coarsely nerved. Stem and inflorescence pubescent. Flowers polygamous, greenish or cream-color, in a terminal panicle. Perianth of 6 distinct obovate-oblong segments, somewhat contracted at the base, adnate to the base of the ovary. Stamens 6, opposite the perianth segments and free from them, shorter by half and recurving; filaments subulate; anthers with confluent cells, cordate. Styles 3, persistent, mostly curved. Capsule 3-celled, 3-lobed. (Latin vere, truly, and ater, black, in reference to the color of the roots.)

Ovary glabrous.

Perianth segments not fringed; capsule oblong-ovoid,  $\frac{7}{8}$  to  $1\frac{1}{4}$  in. long.

Flowers dull white; common.....1. *V. californicum*.

Flowers green; rare.....2. *V. viride*.

Perianth segments deeply fringed; capsule depressed-globose with notched apex, much-lobed laterally, 4 lines long.....3. *V. fimbriatum*.

Ovary densely woolly; perianth segments erose or lightly fringed.....4. *V. insolitum*.

1. *V. californicum* Durand. CORN LILY. Stem very stout and leafy, suggesting a cornstalk, 3 to 5 or 6 ft. high; leaves ovate or elliptic-oblong, sheathing at base, 6 to 12 in. long or the uppermost lanceolate and shorter; panicle 1 to  $1\frac{1}{2}$  ft. long, the lower portion often sterile; bracts mostly membranous; pedicels 1 to 4 lines long; flowers dull white; perianth segments obovate, mostly obtuse, 5 to 9 lines long, greenish margined at base, greenish glands at base of segments 2, or one and Y-shaped, often denticulate or erose at apex; capsule walls firm-chartaceous; seeds broadly wing-margined.—Wet flats and about springs, a characteristic plant of meadows in the Sierra Nevada at 4500 to 8500 ft.; also in the North Coast Ranges and high mts. of S. Cal.: n. to Wash., e. to Col. and s. to Mex. Often reported as poisonous to stock and sometimes called False Hellebore. July-Aug.

2. *V. viride* Ait. Similar to no. 1 in habit; branches of the panicle more or less drooping; principal bracts foliaceous; perianth green, about 4 lines long.—Subalpine meadows, Siskiyou Co.; n. to Alas., e. to N. B., thence s. to Georgia.

3. *V. fimbriatum* Gray. Similar in habit to the preceding; leaves linear-lanceolate,  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. long, 1 to 2 or 4 in. wide; panicle  $\frac{1}{2}$  to  $1\frac{3}{4}$  ft. long, its branches widely spreading; pedicels 4 lines long; perianth segments rhombic-ovate, 2 to 5 lines long, the margin cleft into filiform segments, except at the broad base which bears two oblong more or less glandular spots reaching to the middle of the segment and separated by a furrow; capsule walls membranous; seeds green, scarcely margined.—Vicinity of the coast, Mendocino "White Plains" or pine barrens. July.

4. *V. insolitum* Jepson. Stems 4 to 5 ft. high; leaves elliptic, acute, 7 to 8 in. long, the uppermost lanceolate, 6 to 7 in. long or less; panicle 11 to 20 in. long, composed of elongated lanate-tomentose racemes; perianth segments white, 3 to 4 lines long, obovate, mostly obtuse, irregularly ciliate or erose or shallowly fimbriate, all with 2 dark glandular spots at base; ovary densely woolly; capsule unknown.—Red-clay hills, in chaparral, Del Norte Co. Also west fork Illinois River, s. Ore.

## 7. LEUCOCRINUM Nutt.

Leaves tufted on a very short rootstock, the roots cord-like. Flowers showy, pure white, fragrant, in a central cluster on the ground, the pedicels arising directly from the rootstock. Perianth persistent, salverform, its tube slender, very much elongated, its segments oblong-lanceolate. Stamens 6, inserted near the summit of the tube. Ovary ovate-oblong, seated below the ground at the base of the perianth-tube; style 1, persistent, elongated, tubular, the orifice slightly 3-lobed. Capsule triangular-obovate, loculicidal. Seeds angled, black. (Greek leucos, white, and krinon, a lily.)

1. *L. montanum* Nutt. SAND LILY. Leaves linear, many-nerved, 3 to 5 in. long,  $\frac{1}{2}$  to  $2\frac{1}{2}$  lines broad, the bases surrounded by scarious bracts; pedicels 2 to 6 lines long; perianth segments oblong, 7 to 9 lines long, the tube 2 to 5 in. long.—Mt. valleys, n. Sierra Nevada from Sierra Co. to Modoc and Siski-

you Cos., 4000 to 5000 ft. Plentiful in its special localities but the localities few. Ore. and Nev. to Neb.

### 8. *HÉSPEROCÁLLIS* Gray

Stem straight, simple, somewhat leafy, arising from a tunicated bulb. Leaves narrow. Flowers in a raceme, with conspicuous scarious bracts and pedicels jointed at the summit. Perianth white, withering-persistent, funnel-form, 6-cleft into narrowly obovate segments. Stamens 6, inserted on the throat. Style equaling the perianth or slightly exserted; stigma disk-shaped. Capsule subglobose, loculicidal. Seeds numerous, horizontal, flattened, in 2 rows in the cells, jet black. (Greek *hesperos*, western, and *kallos*, beauty.)

1. *H. undulata* Gray. DESERT LILY. Stem 1 to 2 ft. high, 4 to 18-flowered; basal leaves somewhat fleshy, carinate, wavy-margined, 1 to 2 ft. long and  $\frac{1}{4}$  to  $\frac{3}{4}$  in. wide, the margin more or less undulate; cauline leaves few, shorter; perianth  $2\frac{1}{4}$  to  $2\frac{3}{4}$  in. long, its tube half as long as the segments, the segments narrowly obovate, 4 to 6 lines wide, with a broad 5 to 7-lineate bluish-green band on the back; capsule 6 to 10 lines long, abruptly tipped with the persistent style base.—Sandy valleys or rocky hills: e. Mohave Desert; Colorado Desert; w. Ariz. Mar.-Apr.

### 9. *ODONTÓSTOMUM* Torr.

Stem flexuous, branching, from a depressed corm. Leaves linear, mostly basal, sheathing the stem. Flowers in bracted racemes. Perianth with a narrow tube, its segments 6, soon reflexed. Stamens 6, inserted on the throat and alternating with as many short staminodia; the stamen opposite the lower outer segment stands alone and faces the remaining 5, which approximate each other on the upper side of the flower. Style 1; stigmas 3. Ovules 2 in each cell but only 1 maturing. Capsule obovate, 3-lobed, loculicidal. (Greek *odous*, tooth, and *stoma*, mouth, on account of the erect subulate filaments at the throat of the flower.)

242. *Odontostomum hartwegii* Torr.; fl. x 3.

Mariposa Co. to Shasta Co.; local in the foothills of the middle and inner North Coast Ranges (Napa Co. and Tehama Co.). May.

1. *O. hartwegii* Torr. Fig. 242. Erect, 5 to 10 in. high; basal leaves 3 to 9 in. long, 2 to 5 lines wide, with caudate-attenuate apex; racemes 2 to 5 in. long; bracts and bractlets subulate; perianth-tube 2 to 3 lines long, the reflexed segments as long or a little longer, narrowly oblong, 5 or 6-nerved.—Dry hard soil, 400 to 1300 ft.: Sierra Nevada foothills from

### 10. *SCHOËNOLÍRION* Torr.

Stem simple, scapose, this and the linear-elongated leaves from a tunicated bulb. Raceme elongated, densely many-flowered, with 1 or 2 short supplementary racemes below. Flowers on very short pedicels jointed at the summit. Perianth white, becoming scarious, persistent; segments 6, distinct, oblong, 3-nerved. Stamens 6, adnate to the base of the perianth segments. Ovary ovate, short-stipitate, the cells 2-ovuled. Style persistent; stigma 3-cleft. Capsule loculicidal; seeds black. (Greek *schoinos*, a rush, and *lirion*, a lily.)

Outer bulb-coat fibrous; perianth segments linear-oblong, ..... 1. *S. album*.  
Outer bulb-coat membranous; perianth segments lanceolate, ..... 2. *S. bracteosum*.

1. *S. album* Dur. Scape  $\frac{3}{4}$  to 5 ft. high; leaves flat,  $\frac{1}{2}$  to 2 ft. long, 2 to 6 lines wide; perianth white, tinged or tipped with green, pink or lilac, its segments linear-oblong, obtuse,  $2\frac{1}{2}$  to 3 lines long; stamens about equaling the perianth; ovary slightly 6-lobed; style slightly 3-cleft; capsule globose-ovate, 3 lines long.—Mt. swamps, n. Sierra Nevada from Plumas Co. to Mt. Shasta, thence sw. to Mendocino Co.; 3500 to 7000 ft.; s. Ore. Apr.-July.

2. *S. bracteosum* (Wats.) Jepson. Habit similar to *S. album*; perianth segments dull white, lanceolate, acuminate, 4 to 5 lines long, the stamens

about half as long.—Bogs and stream banks, n. boundary of Del Norte Co. and adjacent Ore.

### 11. CAMÁSSIA Lindl.

Stem slender, scapose, arising from a tunicated bulb, the linear leaves basal. Flowers dark blue or nearly white, in a simple raceme. Bracts scarious. Pedicels jointed at the summit. Perianth segments 6, distinct, oblanceolate, nerved, somewhat spreading. Stamens 6, on the base of the perianth, shorter than the segments. Style filiform, slightly 3-cleft at apex, the lower part persistent. Capsule 3-lobed, loculicidally 3-valved. Seeds several in each cell. (Quamash or camass, the name used by the northwest Indians.)

Perianth segments 3 or sometimes 5-nerved; buds gibbous on one side. . . . . 1. *O. quamash*.  
Perianth segments usually 5 (or 7 to 9)-nerved; buds not gibbous. . . . . 2. *O. leichtlinii*.

1. *C. quamash* (Pursh) Greene. CAMASS. Scape stoutish, 1 to 2½ ft. high; raceme 5 to 25-flowered; flowers dark blue, rarely white; perianth segments unequal, spreading unequally in 2 sets of 3 each, nearly 6 to 10 lines long, each twisted separately after blooming; capsule obtusely angled, its valves pinnately veined.—Wet meadows or wet bottoms, Sierra Nevada, 4500 to 6500 ft.; high North Coast Ranges; n. to B. C. and e. to Utah.

2. *C. leichtlinii* (Baker) Wats. Similar to *C. quamash*; flowers dark blue to cream color; perianth segments 10 to 12 lines long, spreading regularly in a perfect star, withering and twisting over the capsule like a bon-bon, at length deciduous as a whole; capsule oblong-obovate, slightly notched at apex, its valves closely veined horizontally.—Wet flats or grassy plains, Marin and Napa Cos. to Humboldt Co., and e. to Sierra Co.; n. to B. C.

### 12. CHLOROGALUM Kunth.

Stem from a tunicated bulb, often tall, almost leafless, ending in a panicle of racemose branches. Leaves of the basal tuft long-linear. Bracts small and scarious. Pedicels jointed at the summit. Perianth white, purple or pinkish, persistent and at length twisted over the ovary; segments 6, distinct, spreading, ribbon-like, with 3 distinct but closely approximate nerves down the middle. Stamens 6, rather shorter than the segments and inserted on their bases. Style long-filiform, slightly 3-cleft at apex. Capsule broadly turbinate, 3-lobed, loculicidal, with 1 or 2 seeds in each cell. (Greek chloros, green, and gala, milk or juice.)

Perianth segments rotate-spreading, 8 to 10 lines long; bulb with a heavy coat of coarse fibers; leaves ½ to 1½ in. broad; pedicels 3 lines long or more. . . . .

Perianth segments somewhat spreading from above the base, 3 to 5 lines long; bulb with a membranous coat; leaves ¼ in. wide or less. . . . . 1. *O. pomeridianum*.

Pedicels shorter than the perianth; flowers white or pinkish.

Flowers white with yellowish-green lines; style included; ovary on a short stipe. . . . . 2. *O. angustifolium*.

Flowers white with rose-colored midnerve or pinkish; style exserted as ovary matures; ovary sessile. . . . . 3. *O. parviflorum*.

Pedicels as long or longer than the perianth; flowers blue or purplish; ovary sessile. . . . . 4. *O. purpureum*.

1. *C. pomeridianum* (Ker) Kunth. SOAP PLANT. Plants 2 to 10 ft. high, with ample spreading panicle; bulb 3 to 4 in. long and 1½ to 2 in. thick with a very dense coat of coarse brown fibers; basal leaves numerous, ¾ to 2½ ft. long, ½ to 1½ in. broad, carinate, strongly undulate; pedicels slender, about 3 to 6 lines long; perianth segments linear, 8 to 10 lines long, white, purple-veined, spreading widely; capsule 3 lines long, the valves pinnately nerved.—Dry open low hills and plains, Sierra Nevada foothills, Great Valley, Coast Ranges, s. to cismontane S. Cal. and n. to s. Ore. Absent from the Colorado and Mohave deserts and the arid region e. of the Sierra Nevada, and from the Redwood belt. July-Aug.

2. *C. angustifolium* Kell. Plants 1½ to 2 ft. high; bulb-coats membranous, light reddish-brown; basal leaves 4 to 12 in. long, 1 to 2 or 3 lines broad, becoming revolute; panicle with few ascending branches; pedicels about 2 lines long; perianth funnelform-campanulate, the segments oblong-linear, 4 to 5 lines long, white with yellowish-green veins; ovary on a short stipe.—Lower

foothills of the Sierra Nevada, Calaveras Co. n. to Shasta Co., thence s. in the inner Coast Range to Mendocino Co.

3. *C. parviflorum* Wats. Plants 1 to 2 ft. high; bulb 1 in. in diameter; basal leaves grass-like (2 to 3 lines broad); pedicels short, 1 or rarely 2 lines long; flowers pinkish or white with rose-colored midnerve; perianth segments oblong-lanceolate, spreading from above the base, 3 or sometimes 4 lines long; style exserted as ovary matures; ovary broad and obtuse, sessile.—Cismontane S. Cal. in Riverside and San Diego Cos., from the coast inland 24 to 35 miles.

4. *C. purpureum* Brandege. Plants 14 to 20 in. high; bulbs light-colored, ovoid,  $\frac{3}{4}$  to 1 in. in diameter; basal leaves narrowly linear, 1 to 2 lines wide, undulate; pedicels as long or longer than the (3 lines long) perianth; perianth segments spreading from above the base, oblong-ovate, blue or purplish with 3 darker midveins; stamens about equaling the segments; style sometimes slightly exserted in old flowers; ovary sessile.—W. Monterey Co. June.

### 13. *ALLIUM* L. WILD ONION

Stem scapose, from a tunicated or sometimes rhizome-like bulb or from a corm, with basal leaves, and bearing an umbel or head of flowers subtended by 2 or 3 thin whitish or scarious bracts. Herbage with the characteristic taste and odor of onions. Leaves narrow and plane, or convolute-filiform or terete. Perianth of 6 distinct or nearly distinct equal 1-nerved segments, campanulate or spreading. Stamens inserted on the base of the segments; filaments often dilated below. Ovules 2 (rarely several) in each cell; style filiform, persistent; stigma simple or 3-parted. Capsule obovate or globose, obtusely 3-lobed, often crested; seeds 1 or 2 in each cell, black, wrinkled. (Ancient Latin name of garlic.)

#### A. Scapae terete; leaves 1 to several, linear, filiform or terete.

##### 1. Plants with rootstocks and bulbs (corms in no. 3 and no. 20).

Rootstock crowned by the bulb, more or less persistent; bulb narrowly oblong or elongated ovoid, heavily sheathed with the bases of several leaves.

Scapes  $1\frac{1}{2}$  to 3 ft. high; bulbs white or light-colored, narrowly oblong,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. broad.....1. *A. validum*.

Scapes 8 to 12 in. high; bulbs generally deep red, elongated ovoid,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. broad.....2. *A. haematochiton*.

Rootstock slender, horizontal, bearing terminally one or few corms and giving rise to an erect scape; corm short-ovoid or round.....3. *A. unifolium*.

##### 2. Plants without rootstocks; bulb ovoid or globose; leaves deciduous above outer bulb-coats.

Bulb-coats with indistinct reticulation or none.

Leaves terete or sub-terete, solid; ovary crests conspicuous.

Scapes 12 to 20 in. high; bulbs pinkish; leaves 1 or 2.....4. *A. intactum*.

Scapes 2 to 8 in. high; bulbs reddish-brown; leaf solitary.

Leaves not coiled at tip; S. Cal.

Perianth segments lanceolate-attenuate; ovary crests emarginate.....5. *A. parryi*.

Perianth segments ovate-lanceolate; ovary crests more or less fimbriate.

Scapes mostly slender; perianth segments 3 to 5 lines long, usually recurved at tip, sometimes spreading; mostly of the desert slopes.....6. *A. fimbriatum*.

Scapes stout; perianth segments closely erect, straight at tip, 6 to 7 lines long; high San Gabriel Mts.....7. *A. peirsonii*.

Leaves coiled at tip; east side of the Sierra Nevada.....8. *A. atrorubens*.

Leaves plane.

Scapes 4 to 15 in. high; ovary crests conspicuous; perianth segments broadly ovate to lanceolate.

Flowers 5 to 6 lines long; ovary crests twice as long as the ovary.....9. *A. anserinum*.

Flowers 3 to 4 lines long; ovary crests shorter than the ovary.

Perianth segments acuminate, rose-color.

Scapes solitary.....10. *A. campanulatum*.

Scapes commonly in pairs.....11. *A. bisceptrum*.

Perianth segments acute, pinkish to white.....12. *A. sanbornii*.

Scapes  $\frac{1}{4}$  to  $2\frac{1}{2}$  in. high; ovary crests evident to obscure; perianth segments lanceolate to oblong, obtuse to acuminate.

Stamens shorter than the perianth; Sierra Nevada.....13. *A. tribracteatum*.

Stamens equaling or exceeding the perianth; S. Cal.....14. *A. burlewii*.

Bulb-coats with distinct reticulation.

Reticulation of bulb-coats undulate-horizontal.

Leaves 2; bulbs gray; ovary without crests.....15. *A. hyalinum*.

Leaves several; bulbs deep red; ovary broadly crested.....16. *A. amplexans*.

Reticulation of bulb-coats close, strongly serrate-horizontal.

Ovary crests minute, central.

Outer perianth segments only slightly wider than the inner.

Perianth commonly pink; pedicels equal,  $\frac{1}{4}$  to  $\frac{1}{2}$  in. long; interior....

17. *A. serratum*.

18. *A. dichlamydeum*.

Outer perianth segments twice as wide as the inner and slightly longer;

perianth rose-purple; pedicels unequal,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long.....

19. *A. peninsulare*.

Ovary crests broad, rounded; perianth segments glandular-denticulate.....

20. *A. bolanderi*.

Reticulation of bulb-coats coarse quadrate to hexagonal.

Perianth segments deep rose-color, acuminate, the margins undulate-serrulate;

pedicels  $\frac{1}{2}$  to 1 in. long.....21. *A. acuminatum*.

Perianth segments pinkish to rose-color, acute, the margins entire; pedicels  $\frac{1}{4}$  to

$\frac{1}{2}$  in. long.....22. *A. lacunosum*.

## B. Scape much flattened and 2-edged or narrowly winged; leaves usually 2 broadly linear or falcate.

Perianth segments narrowly lanceolate, long acuminate, or becoming filiform-subulate; stamens nearly equaling segments or exserted; ovary not crested; bulb-coats without reticulation; northern Sierra Nevada.....23. *A. platycaule*.

Perianth segments ovate-lanceolate, acute to acuminate; stamens  $\frac{1}{2}$  to  $\frac{3}{4}$  as long as, or sometimes equaling, the segments.

Ovary crests consisting of a curved ridge; bulb-coats mostly with faint reticulation; northern Sierra Nevada.

Filaments dilated at base but distinct.....24. *A. anceps*.

Filaments united by thin dilated bases into a sort of cup.....25. *A. modocense*.

Ovary with ridges of the lobes produced above into prominent crests; filaments distinct; bulb coats not reticulated; Coast Ranges.

Umbels loose (pedicels 6 to 13 lines long).....26. *A. falcifolium*.

Umbels more compact (pedicels 4 to 7 lines long).....27. *A. breweri*.

1. *A. validum* Wats. SWAMP ONION. Scape stout, 2-edged above, 3 to 6 lines in diameter,  $1\frac{1}{2}$  to 3 (or  $3\frac{1}{2}$ ) ft. high; bulb  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. thick and  $1\frac{1}{2}$  to 2 times as long, crowning a very stout rootstock; roots thick and coarse; bulb-coats white to light reddish-brown, prominently ribbed, continuous with the broad leaves, these 4 to 6 lines wide, 1 to 2 (or 3) ft. long; perianth segments 3 to 6 lines long, lanceolate-acuminate, rose-color to nearly white; stamens and style usually exserted; capsule large, subglobose, not crested.—Wet meadows, Sierra Nevada n. to Siskiyou Co., thence s. to Trinity Co.; 4000 to 9000 ft. Common. Also in Ore.

2. *A. haematóchiton* Wats. Scape stout, flexuous, 7 to 12 in. high; bulb elongated-ovoid,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. broad, its coats usually deep red, rarely pale pink; leaves many, abruptly narrowing or filiform above the broad sheaths; pedicels numerous,  $\frac{1}{4}$  to 1 in. long; perianth segments deep rose-color (or often nearly white) with darker midnerve, broadly ovate-acute, 3 to 4 lines long; filaments  $\frac{3}{4}$  as long as the perianth segments, narrowly subulate, with adnate deltoid bases; ovary white, truncate with very short rounded or undulate dark red crests.—Dry hills and mt. slopes from San Luis Obispo Co. to San Diego Co.

3. *A. unifolium* Kell. Scape stout, 1 to 2 ft. high, rising from a deeply seated short horizontal rootstock bearing one or a few corms, only the rootstock or base of scape rooting; reticulation of corm coats irregular to vertical undulate; leaves 4 or 3; bracts 2, large, acuminate, membranous; umbels 10 to 30-flowered, the pedicels 1 to  $1\frac{1}{2}$  in. long; flowers lavender-pink; segments broadly oblong-ovate, 5 to 7 lines long,  $\frac{1}{3}$  longer than the stamens and style; ovary lobes quadratish, creased or grooved down the middle.—Rich moist lands in the valleys or open hills: Coast Ranges, 20 to 400 ft., from Monterey Co. n. to Humboldt Co. Local.

4. *A. intáctum* Jepson. Scape 12 to 20 in. high, stiff, slightly flexuous or erect; bulb-coats numerous, pinkish, the reticulation vertical, minutely rectangular; leaves 1 or 2, terete, solid, sheathing the stem 3 to 6 in., the sheath entire (not split down); bracts 3, large, ovate-acuminate with attenuate tips; umbels round, densely flowered; pedicels slender,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long; perianth segments pink to rose-color with deeper midnerve, rather thin, lanceolate-acuminate, erose, 2 lines long; stamens equaling or exceeding the perianth; filaments opposite the inner segments with long narrow triangular bases adnate to the petal for almost half their length, the alternate filaments

243. *Allium parryi* Wats.;  
reticulations of bulb-coat  
x 20.

with short deltoid bases; style exserted, stigmas 3-parted; ovary with very thin walls and 6 conspicuous thin crests; crests as long as the ovary; capsule one-seeded.—Placer Co.

5. *A. parryi* Wats. Fig. 243. Scape 3 to 6 in. high; bulb coats reddish-brown, quadratish-reticulate; leaf solitary, as long as or slightly longer than the scape, the sheath entire, about  $\frac{1}{2}$  as long as the scape; pedicels 4 to 8 lines long; perianth segments lanceolate, acuminate, erect, 3 to 4 lines long, white to pale rose; stamens opposite the outer segments about  $\frac{3}{4}$  their length; ovary crests conspicuous, emarginate to erose.—San Bernardino Mts., 6500 ft.

6. *A. fimbriatum* Wats. Fig. 244. Scape 2 to 3 in. high, the leaves terete, narrow ( $\frac{1}{2}$  to 1 line broad), exceeding the scape; sheaths entire; pedicels 2 to 6 lines long; bracts 2, sometimes 3 or 4; perianth dark to pale rose, its segments ovate-lanceolate, 4 to 5 (or 6) lines long, erect but the tips more or less recurving; stamens  $\frac{1}{2}$  as long as the segments; ovary crests 2 to each lobe, fringed a little, finely toothed or fimbriate to nearly entire.—Ranges bordering the desert from San Diego Co. n. through the Mohave Desert. Var. *MOHAVENSE* Jepson. Perianth segments ovate, bluntish or rounded, 3 lines long, commonly pale pink; ovary crests sparingly toothed or emarginate.—Calico Mts. Var. *ABORIGINUM* Jepson. Umbels relatively loose, the pedicels 8 to 10 lines long; ovary crests long and thin, toothed.—Sierra Nevada from Fresno Co. to Tulare Co., and inner North Coast Range.

244. *Allium fimbriatum*  
Wats.; reticulations of  
bulb-coat x 20.

7. *A. peirsonii* Jepson. Scape stout, 3 to 4 in. high; leaf 1, terete or teretish, 1 to 2½ lines thick, 4 to 8½ in. long above the sheath (much exceeding the scape); flowers many in a compact umbel, the pedicels 3 to 4 (or 5) lines long; bracts 2; perianth reddish or light pink, 6 to 7 lines long, the segments straight; stamens about  $\frac{3}{4}$  the length of the perianth segments; ovary crests prominent, slender, often as long as the ovary, toothed at apex.—Rock slides, high cañons of the San Gabriel Mts., 5350 to 9400 ft.

8. *A. átrorubens* Wats. Three to 4 in. high; bulb-coats without distinct reticulation; pedicels 15 to 20, 6 to 7 lines long; bracts 2 or 3; leaves coiled at tip; flowers dark or lead-purple; perianth segments stiff, spreading, lanceolate, long-acuminate, 4 to 5 lines long; ovary crests 6, almost as long as the ovary.—E. side of the Sierra Nevada.

9. *A. anserinum* Jepson. Scape terete, 5 to 6 in. high; leaf one, flat; umbel about 20-flowered; pedicels about 4 lines long; perianth purplish or pinkish, its segments oblong-ovate, 5 to 6 lines long, spreading at tip; stamens about  $\frac{2}{3}$  as long as the perianth; ovary-cells with 2 crests; crests oblongish, much lacerate or lacinate, twice as long as the ovary; stigma slightly 3-cleft.—Modoc Co.

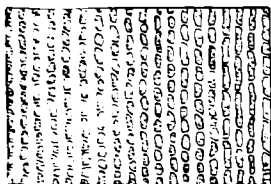

10. *A. campánulatum* Wats. Scape 4 to 7 or 11 in. high, erect, often flexuous; reticulation of bulb-coats none or sinuate-quadratish; leaves 2; umbel 10 to 50-flowered; pedicels 4 to 15 lines long; flowers somewhat campanulate, pink or rose-color; perianth segments broadly ovate, acute or short-acuminate, 3 to 4 lines long, nearly equal,  $\frac{1}{4}$  longer than the very slender stamens and style; filament bases nearly equal; ovary prominently crested, the crests somewhat horizontal.—Usually in dry places, Sierra Nevada, s. to Tehachapi, n. to Shasta Co., thence s. to e. Humboldt Co., 3000 to 6000 ft. Var. *BIDWELLIAE* Jepson. Perianth segments ovate at base, long-acuminate above.—Sierra Nevada and inner North Coast Range, 6000 to 9000 ft.; w. Nev. to Ore.

11. *A. biseptum* Wats. Scapes often stout, commonly in pairs (or 3s or 4s), but frequently solitary, 5 or 10 to 14 in. high; bulb-coats light-colored with indistinct reticulation; flowers few to many, rose-colored; perianth

segments 3 to 4 lines long, unequal, oblong-lanceolate, acuminate, exceeding the stamens, the inner more narrow, their bases hidden by the broad outer ones; filaments with unequal deltoid bases, those opposite the inner perianth segments with bases expanded and adnate, the alternate ones with mainly free bases; ovary crests 2 or 3 to each lobe, very thin, conspicuous, sometimes much toothed.—E. of the Sierra Nevada crest (from Tulare Co. to Placer Co. and n. to Modoc Co.), also local on the w. slope, and very local in the high inner Coast Ranges; San Bernardino Mts. Also in Nev.

12. *A. sanbornii* Wood. Fig. 245. Scape 10 to 14 in. high; outer bulb-coats light-colored, reticulation vertical, minutely white-dotted or undulated rectangular; pedicels 3 to 8 lines long, perianth segments white or pinkish (thin and lax in fruit),  $2\frac{1}{2}$  to 3 lines long, the outer broadly ovate-lanceolate, the inner narrower; stamens and style  $\frac{2}{3}$  the length of the segments ("exserted" in the type); filaments opposite inner segments with adnate bases  $1\frac{1}{2}$  to 2 times the height of the others; capsule thin-walled, 6-crested, the crests oblong or sometimes lanceolate, conspicuous.—Sierra Nevada from Yuba Co. to Mariposa Co., 1500 to 4000 ft.; Santa Lucia Mts. Rare. Var. *CONG-DONII* Jepson. Perianth segments elliptic-acuminate, very thin, erose; outer bulb-coat with vertical reticulation, not undulated.—Mariposa Co.

245. *Allium sanbornii*  
Wood; reticulations of  
bulb-coat x 10.

13. *A. tribracteatum* Torr. Scape rising above the ground only  $\frac{1}{4}$  to  $2\frac{1}{2}$  in., generally slender, channeled and more or less distinctly 4-angled, 2 angles often more prominent; bulb-coats white with minute more or less distinct oblong to hexagonal reticulation; bracts usually 3, short-obovate, acuminate; leaves 1 or 2, linear-lanceolate,  $1\frac{1}{2}$  to 5 times as high as the scape; perianth segments 2 to 4 lines long, narrowly ovate, acuminate to obtuse, silver-white to pinkish with brown or purple midnerve; filaments  $\frac{2}{3}$  to almost as long as the segments; ovary strongly and angularly 3-lobed, its crests varying from prominent to obscure or none, usually consisting of 2 rounded ridges, with a longitudinal channel between them.—Granite sand, Sierra Nevada, 8000 to 9500 ft., from Lassen Peak s. to Kern Co. Var. *PARVUM* Jepson. Perianth segments oblong, obtuse.—High Sierra Nevada (7500 to 10,500 ft.). Var. *ANDERSØNII* Wats. Perianth segments oblong, obtuse, 3 to 5 lines long; bracts 2, rose-purple, broadly ovate, acuminate.—Truckee River basin.

14. *A. burléwii* Davidson. Resembling no. 13; plants 1 to 2 in. high; bracts 3 to 5, ovate, acute, with connate bases; leaf solitary, twice the height of the inflorescence; perianth segments lanceolate-attenuate, 4 to 6 lines long; stamens equal to segments or slightly exserted; style exserted 1 to 2 lines.—Mts. of S. Cal., 6700 to 9000 ft.: San Jacinto Mts.; Mt. San Antonio; Mt. Pinos.

15. *A. hyalinum* Curran. Scape 6 to 14 in. high; bulb-coats gray, with horizontal, strongly undulate to serrate reticulation; leaves generally 1 or 2, linear, channeled; bracts ovate, acuminate; pedicels 6 to 11 lines long; perianth segments lanceolate to ovate, obtuse or acute, pale pink to white, becoming thin, hyaline and spreading; filaments subulate from a narrowly deltoid base, unequal,  $\frac{1}{2}$  to  $\frac{2}{3}$  the length of the perianth segments; capsule not crested.—Rocky slopes, Sierra Nevada, 500 to 2600 ft., from Eldorado Co. to Kern Co. Var. *PRAECOX* Jepson. Fig. 246. Scape stouter, leaves broader; pedicels mostly  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; reticulation of inner bulb-coats contorted-undulate; perianth segments acute, longer, with rose-purple midnerve.—San Bernardino to San Diego Co.; Santa Barbara Islands; n. L. Cal. Var. *HICKMANNII* Jepson. Like the species but scape shorter (3 to 6 in. high); leaves 2 to several, filiform; perianth segments less hyaline, the midnerve rose-pink.—Monterey.

246. *Allium hyalinum*  
Curran var. *praecox*  
Jepson; reticulations  
of bulb-coat x 10.

16. *A. ampléctens* Torr. Scape slender, 6 to 13 in. high; bulb-coats commonly reddish, with a delicate transversely sinuate or serrate reticulation, the vertical lines especially also minutely sinuous; leaves narrow and becoming convolute-filiform above the sheathing base; bracts 2, short, abruptly acute; umbel erect, usually dense; pedicels 25 to 35, 3 to 8 lines long; flowers white or nearly so, the oblanceolate acuminate segments 3 to 4 lines long, more or less exceeding the stamens and style; ovary crests low, broad.—Wet often rocky slopes at lower and middle altitudes (1000 to 4000 ft.): North Coast Ranges and Sierra Nevada; n. to Ore. (*A. attenuifolium* Kell.)

17. *A. serrátum* Wats. Fig. 247. Scape 8 to 15 in. high; bulb-coats horizontally serrate-reticulate, the reticulation close but distinct; bracts narrowly acuminate; perianth segments pink, broadly ovate-lanceolate, 4 to 6 lines long, acute or somewhat acuminate, nearly straight and rather rigid, the inner narrower, somewhat shorter and rarely serrulate; filaments all with a narrowly deltoid base; ovary lobes lightly grooved down the middle, ending above in 2 erect teeth.—Lower hills of the inner Coast Range from Solano Co. to the Mt. Hamilton Range, thence w. to the inner slope of the Santa Cruz Mts., 300 to 2000 ft.

247. *Allium serratum* Wats.; a, umbel  $\times 1$ ; b, long. sect. fl.  $\times 2$ .

Its umbels have more numerous flowers and its perianth is thinner than in *A. peninsulare*. After anthesis the tips of the perianth segments are bent in abruptly and connivent at the center, the whole perianth becoming bladderly inflated.

18. *A. dichlamýdeum* Greene. Lower than *A. peninsulare* but very similar; umbels very compact, the pedicels  $\frac{1}{4}$  to  $\frac{3}{4}$  in. long; perianth segments spreading almost equally, the outer narrowly to broadly elliptic, rounded or as if truncate but shortly acute, the inner for the most part nearly as broad.—Maritime, in a coastal belt from San Mateo Co. to Mendocino Co., extending inland only to the coast-like "island" of vegetation in ne. Contra Costa Co. Bracts 2, commonly united below into a cup; in *A. peninsulare* they are less united or distinct.

19. *A. peninsulare* Lemmon. Fig. 248. Habit and bulb-coats of *A. serratum*, the scapes usually more stocky; pedicels  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; perianth segments deep red-purple, 5 to 7 lines long, the outer 3 broadly ovate-lanceolate, somewhat spreading, twice the breadth and usually  $\frac{1}{4}$  longer than the 3 inner erect attenuate segments which form a sort of inner cup; filaments  $\frac{1}{2}$  to  $\frac{2}{3}$  the length of the segments, those opposite the inner segments with deltoid bases longer than the bases of those alternate; ovary crests central, very minute, narrowly 2-lobed.—Barren or openly wooded hills: cismon-

248. *Allium peninsulare* Lemmon; reticulations of bulb-coat  $\times 10$ .

249. *Allium peninsulare* Lemmon var. *crispum* Jepson; a, fl.  $\times 2$ ; b, pistil  $\times 6$ .

tane S. Cal.; Sierra Nevada from Kern Co. to Placer Co.; inner South Coast Range; also in n. L. Cal. Var. *CRISPUM* Jepson. Fig. 249. Margins of the inner perianth segments strongly undulate-crested, as if irregularly serrate; filaments broader, nearly sepaloid; ovary crests almost or quite none.—Inner South Coast Ranges from the Mt. Hamilton Range and San Juan River Valley s. to San Luis Obispo Co. and the foothills bordering the upper San Joaquin Valley. The crinkly

white edges of the inner segments are very striking in living flowers.

20. **A. boländeri** Wats. Fig. 250. Scape very slender, (3 or) 6 to 10 in. high; outer corm-coats dense, the reticulation undulate-serrate; bracts 2, 7 to 8 lines long, ovate-lanceolate, acuminate; pedicels 10 to 17, slender, 5 to 10 lines long; flowers rose-color or pinkish, the ovate very narrowly acuminate segments nearly straight, 4 to 5 lines long, twice longer than the stamens and style, inner segments glandular-denticulate; filaments filiform, adnate to the middle, those opposite the inner segments slightly longer; ovary crested by the rounded summits of the lobes.—Usually in dry soil, brushy hills and open woods, from Lake Co. to Siskiyou and Modoc Cos., 500 to 2700 ft.; s. Ore. Var. **STENANTHUM** Jepson. Taller with paler (white to pink) flowers and narrower segments.—E. and ne. Humboldt Co.

250. *Allium boländeri* Wats.; reticulations of corm-coat x 10.

251. *Allium acuminatum* Hook.; reticulations of bulb-coat x 5.

21. **A. acuminatum** Hook. Fig. 251. Scape 4 to 8 in. high; outer bulb-coats with a distinct coarse quadrate to hexagonal reticulation; umbel 12 to 30-flowered; its pedicels 6 to 12 lines long; flowers deep rose-color, 4 to 7 lines long; segments broadly lanceolate with acuminate recurved tips, a third longer than the stamens, undulate-serrulate above the base; filaments with lower third adnate and dilated; ovary with 6 blunt central crests.—Dry interior hills, Humboldt, Siskiyou and Modoc Cos.; n. to B. C., e. to Col.

22. **A. lacunosum** Wats. Fig. 252. Scape 3 to 6 in. high; bulb-coats light colored, thick and distinctly pitted by the quadrate or transversely oblong reticulation; umbels 10 to 20-flowered, the pedicels 3 to 5 lines long; bracts broadly ovate, tipped with a slender-subulate point; flowers small (3 lines long); perianth segments pinkish to rose-color with darker or red midnerve, oblong-lanceolate and acuminate, or oblong and acute, a little exceeding the stamens; filaments narrowly deltoid below; each ovary-cell with an obtuse thickened ridge toward the summit on each side, the ridges uniting to form a broad often slightly lobed crest.—Arid areas, mostly toward the interior, cent. and S. Cal. at widely scattered stations.

252. *Allium lacunosum* Wats.; reticulations of bulb-coat x 10.

23. **A. platycaulis** Wats. Scape 2 to 5 (or 6) in. high, 2 to 4 lines broad; bulb  $\frac{1}{2}$  to 1 in. broad; leaves  $\frac{1}{2}$  to 1 in. broad; flowers numerous, rose-color with tips pale greenish tinged, 4 to 7 lines long, on pedicels approximately 1 in. long; segments lanceolate, very narrowly long-acuminate; stamens conspicuously exerted; ovary lobes rounded, not crested.—High valleys, Sierra Nevada from Placer Co. to Modoc Co.

24. **A. anceps** Kell. Scape 5 to 6 in. high, 1 to  $1\frac{1}{2}$  lines broad; bulb-coats faintly and transversely rectangular-reticulated; leaves somewhat falcate,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  lines broad; flowers numerous, pale rose-color without dark midveins, 3 to 4 lines long, on pedicels 6 to 8 lines long; segments oblong or linear-lanceolate, acuminate, only slightly or not at all exceeding the stamens; ovary cells with a thin curving ridge at summit which is truncatish or notched above.—E. of the Sierra Nevada crest from Sierra Co. n. to Ore., e. to w. Nev. Var. **LEMMONII** Jepson. Perianth segments shortly lanceolate-acuminate,  $2\frac{1}{2}$  to 3 lines long; ovary cells with 2 low narrow parallel or somewhat sinuous ridges; stigma undivided.—N. Sierra Nevada.

25. **A. modocense** Jepson. Scape flattened,  $1\frac{1}{2}$  to 2 (or 4) in. high, prominently nerved, the 1 or 2 leaves twice as high; reticulation of the bulb-coat none or faintly and transversely quadratish; umbel 20 to 30-flowered, the

253. *Allium falcifolium* H. & A.; a, plant  $\times \frac{1}{4}$ ; b, flower  $\times 1\frac{1}{2}$ ; c, pistil  $\times 3\frac{1}{2}$ .

pedicels 6 to 8 lines long; bracts 2; perianth segments white with broad pink midveins, oblong-lanceolate, 5 to 7 lines long; filaments  $\frac{3}{4}$  as long as the segments, adnate by the lower  $\frac{1}{4}$  and united by the dilated bases into a low but distinct cup; ovary cells with 2 low thin ridges confluent above and thus forming a single curved obtuse crest.—Gravelly soil, 5000 to 7000 ft.: Modoc Co.

26. *A. falcifolium* H. & A. Fig. 253. Scape 2 to 3 or 4 in. high, conspicuously flattened (1 to 3 lines broad) and 2-winged, at least above; bulb-coats not reticulated; leaves 3 to 5 lines broad; bracts 2, nearly or quite as long as the flowers; flowers rose-colored, the lanceolate segments acute and erect or attenuate and slightly spreading above, often very minutely glandular-serrate, 4 to 7 lines long; stamens  $\frac{1}{2}$  to  $\frac{3}{4}$  the length of the segments; ovary 3-lobed, the lobes creased down the middle and produced above into narrow slightly toothed crests.

—Shallow soil on rock rifts or ledges: North Coast Ranges from Napa Co. to Siskiyou Co., 1500 to 6500 ft.; n. to Ore. Var. *DEMISsum* Jepson. Plants small, 1 to 2 in. high; leaves 2, greatly exceeding the scape; bracts 2; pedicels 3 to 6 lines long; flowers small, 3 lines long, deep red purple—High montane, loose rocky soil, 6000 to 8000 ft., w. Siskiyou Co.

27. *A. bréweri* Wats. Fig. 254. Very close to *A. falcifolium* but smaller; scape not 2-winged; leaves two, 2 to 5 lines broad; bracts 2, little exceeding the pedicels; umbel compact, the pedicels 4 to 7 lines long; perianth light rose color, its segments 5 to 6 lines long, mostly erect; stamens  $\frac{3}{8}$  as long as the segments; ovary crests consisting of a curved ridge, the apex of the crest or curved ridge short and "entire" or minutely denticulate.—Mountain summits of the Mt. Diablo, Mt. Hamilton and Santa Cruz ranges, 3500 to 4200 ft.

254. *Allium Breweri* Wats.; long. sect. fl.  $\times 2$ .

#### 14. *MUILLA* Wats.

Like *Allium*, but the herbage without the taste or odor of onions. Scape from a fibro-membranous coated corm and bearing an umbel subtended by 3 acuminate scarious bracts, which are distinct even in the bud, or slightly connate and overlapping at the base; pedicels not jointed at the summit, but subtended by small unequal membranous bractlets. Leaves very narrow, flat to terete. Flowers greenish or yellowish-white. Perianth sub-rotate, persistent, of 6 nearly equal segments; segments slightly united at base, oblong, with a dark 2-nerved mid-rib (alternate segments occasionally 3-nerved). Stamens inserted near the base. Ovules 8 to 10 in each cell; style clavate, persistent and at length splitting. Capsule globose, scarcely lobed, loculicidal. Seeds compressed and angled. (Anagram of *Allium*.)

Filaments filiform or subulate.

Perianth without glands. . . . . 1. *M. maritima*.

Inner perianth segments with pit-like glands. . . . . 2. *M. serotina*.

Filaments greatly dilated, retuse at apex. . . . . 3. *M. coronata*.

1. *M. maritima* (Torr.) Wats. Fig. 255a. Scape 3 to 9 (or 12) in. high, generally equal to or a little taller than the narrowly linear almost terete leaves; umbel 4 to 12-flowered; pedicels unequal,  $\frac{1}{4}$  to 1 in. long; perianth segments 2 to 3 lines long, acute to obtuse, the inner generally wider, with broad thickened brownish midnerve and thin greenish-white margins; fla-

255. a, *Muilla maritima* Wats.; stamen  $\times 16$ ; b, *M. coronata* Greene, stamen  $\times 16$ .

ments filiform to subulate; anthers yellow or lurid purple.—Alkaline fields, Sacramento Valley and Marin Co. to S. Cal.

2. *M. serotina* Greene. Scape 14 to 20 in. high; leaves fewer; umbel 10 to 20 (or 40)-flowered; perianth dull white, with very broad green veins to the segments.—Half-open foothills: upper San Joaquin Valley; more common in the mts. or towards the interior of S. Cal.

3. *M. coronata* Greene. Fig. 255b. Scape  $1\frac{1}{2}$  to 2 in. high; perianth segments with narrow white scarious border; filaments hyaline, broadly oblong, retuse at summit, the anther on a short inflexed slender cusp arising from the notch.—Antelope Valley, w. Mohave Desert.

## 15. BLOOMERIA Kell.

Stem scapose, from a fibrous-coated corm. Leaves linear, carinate. Umbel with many yellow flowers; pedicels jointed at the summit and subtended by membranous bracts. Perianth persistent, of 6 nearly equal distinct segments. Stamens 6, inserted on the base of and rather shorter than the segments; filaments filiform, margined at base by wing-like appendages. Capsule subglobose; seeds 2 to several in each cell, angular and wrinkled; style 1, persistent and splitting with the loculicidal capsule. (H. G. Bloomer, a pioneer botanist of San Francisco.)

Stamen appendages papillose; style as long or longer than the ovary.....1. *B. crocea*.  
Stamen appendages smooth, fleshy; style shorter than the ovary.....2. *B. clevelandii*.

1. *B. crocea* (Torr.) Cov. GOLDEN BLOOMERIA. Scape 6 to 14 in. high, minutely scabrous; leaves 2, 2 to 3 lines wide, one of them as long as the scape; pedicels 30 to 50,  $1\frac{1}{2}$  to 2 in. long; bracts several, subulate-lanceolate; perianth segments orange-yellow, linear-oblong, sub-rotate, 5 to 6 lines long, striped with 2 closely parallel dark lines; lower  $\frac{2}{3}$  or  $\frac{1}{2}$  of the stamen appendages adnate to the perianth, the upper free portion ending in a nectar-bearing often bicuspidate cup bearing the filament; capsule nearly 3 lines long.—South Coast Ranges, e. to the Sierra Nevada of Kern Co. and s. to coastal S. Cal. May-June.

2. *B. clevelandii* Wats. Scape stout, 3 to 12 in. high; leaves several, narrow (1 line wide or less); pedicels 20 to 30, slender, 1 to  $1\frac{1}{4}$  in. long; inner flowers of the umbel maturing slowly; perianth segments yellow with a green stripe, linear-elliptic, 3 to 4 lines long; stamen appendages oblong, entire, obtuse at the summit, adnate to the perianth segments, only  $\frac{1}{5}$  their length; capsule 2 to  $2\frac{1}{2}$  lines long.—Mesas, San Diego.

## 16. BRODIAEA Sm.

Stem scapose, arising from a corm, erect and straight, or sometimes elongated and twining. Leaves mostly few and grass-like. Flowers in a loose or capitate umbel. Pedicels jointed beneath the perianth. Perianth-tube various. Stamens 6, or the alternate stamens replaced by dilated sterile filaments or staminodia. Filaments slender or more frequently winged and produced beyond the anther in the form of thin appendages. Ovary on a short stipe or sessile. Capsule loculicidal, beaked by the style which splits with the valves. (James Brodie, Scotch botanist.)

A. Umbels loose; stamens 6; anthers versatile (basifixed in no. 7), ovate or ovate-lanceolate; ovary on a long or short stipe; pedicels nearly equal, rather lax; corms somewhat flattened; leaves  $\frac{1}{4}$  to  $\frac{1}{2}$  in. wide (except no. 4).—Subgenus TRITELIA.

Filaments filiform.

Flowers commonly blue or purple, sometimes pale or nearly white; ovary on a long slender stipe.

Pedicels 1 to  $1\frac{1}{2}$  times the perianth.

Stamens in one row; filaments deltoid; restricted range.....1. *B. bridgesii*.

Stamens in 2 rows; filaments not deltoid; mostly adobe or clay fields and hillsides, common and widely distributed.....2. *B. laza*.

- Pedicels 3 to 6 times the perianth; low wet ground mostly near the coast. . . . . 3. *B. peduncularis*.
- Flowers yellow; ovary equaling or longer than the stipe.  
 Filaments long, slender, sub-equal; leaves 1 to 2 lines wide. . . . . 4. *B. gracilis*.  
 Filaments short, about equaling anthers, in 2 rows; leaves  $\frac{1}{4}$  to  $\frac{1}{2}$  in. wide. . . . . 5. *B. crocea*.
- Filaments dilated.  
 Flowers yellow; filaments forked at apex, the anther borne on a cusp in the middle of the notch. . . . . 6. *B. tzioides*.  
 Flowers white; filaments with broadly triangular and slightly united bases. . . . . 7. *B. hyacinthina*.
- B. Umbels loose or mainly so; stamens 3, alternating with staminodia; anthers basifixed, sagittate; pedicels very unequal, firm; flowers blue to violet-purple or rose-color; corms not flattened; ovary short-stipitate; leaves narrowly linear to terete.**—Subgenus **HOOKERA**.
- Scapes almost wholly subterranean, the umbel sessile on the ground; staminodia yellowish. . . . . 8. *B. terrestris*.
- Scapes 3 to 20 in. high; staminodia white or purple.  
 Perianth segments linear, rotate, nearly twice as long as the tube; throat of tube strongly constricted; staminodia purple. . . . . 9. *B. minor*.  
 Perianth segments oblong, 1 to  $1\frac{1}{2}$  times as long as the tube; throat of tube little or not at all constricted; staminodia white.  
 Filaments winged on each side with an appendage half as long as the anthers. . . . . 10. *B. stellaris*.
- Filaments not winged.  
 Flowers rose-red; staminodia hugging the approximate anthers; filaments with a wing on the back. . . . . 11. *B. rosea*.  
 Flowers blue; anthers approximate in center around style; filaments not winged.  
 Staminodia erect or spreading.  
 Staminodia oblong-lanceolate, mostly acute; scape stout, 7 to 20 in. high. . . . . 12. *B. coronaria*.  
 Staminodia scale-like, triangular, acuminate; scape slender, 4 to 12 in. high. . . . . 13. *B. filifolia*.  
 Staminodia approximate in center.  
 Staminodia plane, about half as long as the spreading or recurving perianth segments. . . . . 14. *B. synandra*.  
 Staminodia involute, nearly as long as the erect perianth segments. . . . . 15. *B. californica*.
- C. Umbels capitate or congested; anthers basifixed, nearly sessile; staminodia always present; perianth-tube more or less inflated and angular, or saccate; ovary sessile or short-stipitate; leaves linear.**—Subgenus **DICHELOSTEMMA**.
- Stamens 6; inner filaments with 2 lanceolate appendages extended beyond the anthers; bracts elliptic, acute, very conspicuous, of a deep violet-purple or metallic color; capsule sessile. . . . . 16. *B. capitata*.
- Stamens commonly 3; bracts acuminate, not so conspicuous.  
 Flowers blue-purple; staminodia petaloid; pedicels 1 to 3 lines long; umbel capitate; capsule sessile.  
 Staminodia deeply parted with a minute cusp or reduced filament in the notch; umbel more or less produced into a short dense raceme. . . . . 17. *B. pulchella*.  
 Staminodia entire, forming a corona; umbel not produced-racemose. . . . . 18. *B. multiflora*.
- Flowers rose-red; pedicels  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; umbel less capitate; capsule triangular-ovate, acuminate, on a short stipe.  
 Staminodia anther-like; perianth 6 to 8 lines long, rose-red or pinkish; flowers erect or nearly so; scape twining. . . . . 19. *B. volubilis*.  
 Staminodia broadly deltoid, forming a conspicuous corona; perianth 1 to  $1\frac{1}{4}$  in. long; flowers pendulous.  
 Perianth-tube scarlet, its segments chrome-green. . . . . 20. *B. ida-maia*.  
 Perianth wholly rose-purple. . . . . 21. *B. venusta*.

1. ***B. bridgèsii*** Wats. Stems low (5 to 9 in. high); flowers pale lilac, aging bluish; perianth-tube long and very attenuate at base; filaments in 1 row, deltoid at base; ovary stipe  $8\frac{1}{2}$  to  $10\frac{1}{2}$  lines long.—Open woods, interior of Humboldt Co. to Shasta Co. and s. to Mariposa Co., 500 to 3000 ft.; also in s. Ore. Very similar to *B. laxa*.

2. ***B. láxa*** (Benth.) Wats. GRASS NUT. Fig. 256. Scape 1 to  $2\frac{1}{4}$  ft. high, rigid and stoutish, from a usually deep-seated edible corm; umbel 8 to 48-flowered; pedicels 1 or mostly 2 to  $3\frac{1}{2}$  in. long; perianth violet-purple, rarely white,  $1\frac{1}{4}$  to  $1\frac{3}{4}$  in. long, funnelform, clavate at base, its segments shorter than the tube; stamens 6, all anther-bearing; filaments inserted in 2 rows high on the perianth-tube, 2 lines long; anthers ovate-lanceolate with a 2-lobed

256. *Brodiaea laxa* Wats.; a, infl. x  $\frac{2}{3}$ ; b, long. sect. through perianth x  $\frac{2}{3}$ .

base,  $1\frac{1}{2}$  lines long; ovary on a slender stipe  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long.—Showy and beautiful species, common in adobe fields or on adobe hillsides: Coast Ranges from Santa Cruz and Santa Clara Cos. n. to Humboldt and Tehama Cos., thence s. in the Sierra Nevada foothills (500 to 4600 ft.) to Tulare Co. Apr.-June. Very variable in stature, size of umbels and color of flowers. Called Wally-Basket in Tuolumne Co. Ithuriel's Spear is a parlor name. Var. *CÁNDIDA* Jepson. Pedicels abruptly bent at summit so that the flowers all

face horizontally in one direction; flowers white, sometimes blue.—Sierra Nevada foothills, Fresno Co. to Kern Co. Var. *NÍMIA* Jepson n. var. Flowers 9 to 11 lines long, intense or deep blue; ovary very long-stiped.—Marin coast (Jepson 567, type). Var. *TRACYI* Jepson n. var. Flowers blue,  $1\frac{1}{4}$  to  $1\frac{1}{2}$  in. long, the perianth very narrow at base (almost stipe-like).—Humboldt coast (Big Lagoon, Tracy, Jepson 9412a, type).

3. *B. pedunculàris* (Lindl.) Wats. Scape erect,  $1\frac{1}{4}$  to 3 ft. high; umbel 3 to 15-flowered, the pedicels slender,  $2\frac{1}{2}$  to 4 or even 7 in. long; perianth pale rose-purple or white, 6 to 9 lines long, the segments longer than the tube, widely-spreading, an indigo band on the back; ovary yellow, its stipe  $1\frac{1}{2}$  to 3 lines long.—Low wet ground, mostly near the coast; Marin Co. to Humboldt Co., e. to Lake Co. June-July.

4. *B. gràcilis* Wats. Scape 2 to 10 in. high; leaves narrow (1 to 2 lines wide); bracts short, lanceolate; umbel 13 to 29-flowered; flowers dull or saffron yellow, 5 to 7 lines long, on pedicels 4 to 10 lines long; perianth segments with a brown streak outside, the narrow tube equaling or shorter than the segments; anthers blue, very small; filaments slender, elongated, sub-equal; ovary ovate, equaling stipe.—Granite sand spots on domes and granite ridges: Sierra Nevada, Mariposa and Tuolumne Cos. and Plumas Co., 8000 to 9000 ft.

5. *B. cròcea* (Wood) Wats. Fig. 257. Scape 4 to 12 in. high; leaves 2 to 6 lines broad; bracts linear, elongated; umbels 4 to 8 or 15-flowered; flowers golden or bright yellow, 7 to 9 lines long, on pedicels 3 to 9 lines long, the segments a little longer than the turbinate tube; filaments nearly

257. *Brodiaea crocea* Wats.; opened fl. x  $2\frac{1}{2}$ .

equaling anthers, in 2 rows; ovary obovate, shorter than the stipe, its angles with a very narrow band of short hairs or scales.—W. Siskiyou Co. and Del Norte Co., 5000 to 7000 ft.

6. *B. ixioides* (Ait. f.) Wats. GOLDEN BRODIAEA. Fig. 258. Scape  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high, usually scabrous; leaves 2, 7 to 14 in. long; umbel 16 to 40-flowered; pedicels  $\frac{3}{4}$  or mostly 1 to 4 in. long; flowers 6 to 9 (or 11) lines long, salmon-yellow, with a conspicuous black-purple vein on the outside running from the apex to the base of each segment; stamens yellow, alternately long and short, the filaments winged, slenderly 2-forked at the summit, the oblong anthers on a cusp in the notch; forks of the filament a little

258. *Brodiaea ixioides* Wats.; a, fl. x 1; b, opened fl. x 2.

exceeding or somewhat shorter than the anthers.—Higher foothills of the Sierra Nevada from Tuolumne Co. to Kern Co., 1300 to 5000 ft., common and often abundant; also in Monterey and San Benito Cos. and Tehama Co. Var. LÜGENS Jepson. Generally smaller and more slender; perianth 5 to 6 lines long, its tube dark brown, approaching black; filaments broadly winged, merely emarginate or retuse at apex, the alternate ones triangular-acuminate; anthers white or blue.—Sandy slopes, Sierra Nevada, 6000 to 8000 ft.; North Coast Ranges, towards the interior, 2400 ft.; Waterman Mt., San Gabriel Mts., 6100 ft.

7. *B. hyacinthina* (Lindl.) Baker. WHITE BRODIAEA. Fig. 259. Scape 1 to  $1\frac{3}{4}$  ft. high; umbel 10 to 40-flowered; pedicels  $\frac{1}{2}$  to 2 in. long; perianth open-campanulate, cleft below the middle, white or bluish white with green mid-veins, 5 to 7 lines long; filaments with broadly triangular and slightly united bases, attenuate above and tipped with an anther  $\frac{1}{2}$  line long; ovary short-stipitate, with 3 glandular pits toward the summit.—Common in low moist places: Sierra Nevada, Sacramento and San Joaquin valleys, and Coast Ranges from Monterey Co. to Siskiyou Co.; n. to Vancouver Isl.

8. *B. terrestris* Kell. Scape very short, scarcely or not at all rising above the surface of the ground; umbel 2 to 10 (or 20)-flowered, its pedicels slender, 3 to 8 in. long; perianth purple, 8 to 10 lines long, the limb rotate; anthers slightly longer than the filaments and shorter than the staminodia, these yellowish, erect, emarginate and with revolute edges.—Often in sandy soil. San Diego Co. to Humboldt Co., and near the coast, especially n.

259. *Brodiaea hyacinthina* Baker; a, infl. x  $\frac{2}{3}$ ; b, opened fl. x  $1\frac{1}{2}$ .

9. *B. minor* Wats. Scape 4 to 10 in. high; umbels 4 to 10-flowered, the pedicels  $\frac{3}{4}$  to 1 in. long, tending to spread horizontally after anthesis; perianth segments narrow (1 to  $1\frac{1}{2}$  lines broad), nearly twice as long as the tube, the throat constricted or very narrow above the ovary; staminodia purple, exceeding or equaling the stamens, 3-toothed at apex; anthers shortly cleft at apex.—N. Sierra Nevada from Butte Co. to Eldorado Co.

10. *B. stellaris* Wats. Scape very short (2 to 6 in. high) and pedicels long ( $1\frac{1}{2}$  to 4 in.); corm flat, without offsets; umbel 3 to 6-flowered; perianth 6 to 9 lines long, the greenish narrow tube nearly equaling the deep-purple rather narrow segments; anthers subsessile, 1 to  $1\frac{1}{2}$  lines long, deeply cleft at base and apex, shorter than the staminodia, the short filaments bearing two appendages or linear-oblong wings standing directly behind and  $\frac{1}{2}$  to  $\frac{2}{3}$  as long as the anthers; staminodia large, conspicuously white, retuse, apparently erect and not approximate around the style.—Mendocino Range (w. of Ukiah).

11. *B. rosea* (Greene) Baker. Fig. 260. Scape slender, 3 to 5 in. high; bulb depressed ovate with heavily fibrous coat, 6 to 12 lines broad; umbel 3 to 6 (or 10)-flowered, its pedicels  $\frac{1}{2}$  to 1 in. long; perianth 10 lines long, flesh pink (becoming rose-pink in age or in drying), the midveins darker; perianth segments oblong-ovate, acute; filaments narrow but backed by a deltoid-dilated wing; anthers hugging the style, deeply and narrowly notched both at base and apex; staminodia long-oblong, notched at the acutish apex, exceeding the anthers and closely approximate about them by their strongly involute margins.—Ne. Lake Co. (Indian Valley), on serpentine rocks.

260. *Brodiaea rosea* Baker; a, inside of fl.; b, stamen (side view); c, stamen (dorsal view); d, pistil.  $\times 2$ .

12. *B. coronaria* (Salisb.) Jepson. HARVEST BRODIAEA. Fig. 261. Scape stout, (5 or) 7 to 20 in. high; umbel 3 to 11-flowered, its pedicels 1 to  $3\frac{1}{2}$  in. long; perianth violet-purple,  $1\frac{1}{4}$  to  $1\frac{3}{4}$  in. long; segments narrowly oblong, longer than the tube, in age withering and becoming caudate; anthers 4 to 5 lines long, exceeding or at least equaling the oblong-lanceolate mostly acute staminodia; staminodia erect, the anthers approximate in center around style; ovary with strongly developed angles or shoulders.—Common on rolling plains, in the

261. *Brodiaea coronaria* Jepson; a, fl.; b, long. sect. fl.; c, pistil.  $\times 1$ .

foothills and mts., Coast Ranges and Sierra foothills, Sacramento and San Joaquin valleys, s. to cismontane S. Cal.; n. to Vancouver Isl., flowering in May and early June at the time of the hay harvest when the hills and fields are turning brown. Altitude 200 to 2500 ft., or up to 4500, or even 8000 ft. towards the s. Rarely occurs near the coast. Var. *MUNDULA* Jepson. Fifteen to 18 in. high; pedicels 3 to 6 or 8 lines long; umbels compact.—Soulsbyville, Tuolumne Co.

13. *B. filifolia* Wats. Scape 4 to 12 in. high, rather slender, especially when several arise from 1 corm; perianth dark blue, segments rotate; anthers sessile, nearly twice as long as the scale-like triangular narrowly acuminate staminodia.—San Bernardino Valley and foothills. Var. *ORCUTII* Jepson. Perianth violet to rose-purple; anthers generally longer than the filaments; staminodia absent, or very short, triangular and mostly adnate.—San Diego Co.

262. *B. synandra* Jepson; long. sect. perianth  $\times 1$ .

14. *B. synandra* (Hel.) Jepson. Fig. 262. Scape slender, 3 to 8 in. high; umbel 2 to 5-flowered; its pedicels 1 to  $2\frac{1}{2}$  in. long; perianth blue, 7 to 12 lines long, its tube oblong or even slightly inflated, 4 to 5 lines long, the segments 1 to 2 lines longer, rotately spreading or often strongly recurved, each with a mid-vein, green on back and running down to base of perianth; anthers 2 to  $2\frac{1}{2}$  lines long, standing close around the style; staminodia broadly ligulate or with somewhat involute margins, commonly 3-toothed at apex, usually closely covering the anthers and thus closing the throat; ovary with weakly developed shoulders.—Dry adobe or clay soil, often on gravelly or alkaline plains and low hills, Sacramento and San Joaquin valleys, Sierra Nevada foothills and Coast Ranges, s. to cismontane S. Cal. and n. to Ore. Altitude 200 to 2500 ft., sometimes occurring up to 3500 or 7000 ft., especially s. Not reported from Humboldt and Mendocino Cos. The anthers have an open or U-shaped notch at apex; in *B. coronaria* the anthers are merely cleft at apex. Var. *INSIGNIS* Jepson. Staminodia straw-color or whitish, ovate-lanceolate,  $3\frac{1}{2}$  to 4 lines long, longer than the stamens, and as long as the perianth-tube.—Shepherd Cove, Sequoia Park.

15. *B. californica* Lindl. Slender, 4 to 12 in. high; umbels 2 to 4-flowered (sometimes as few as 1 or as many as 12-flowered); perianth violet-purple, 1 to  $1\frac{1}{2}$  in. long, the tube  $\frac{1}{3}$  as long; band on back of segments yellowish-green; anthers long, approximate in center on filaments as long, and closely invested by the staminodia; staminodia white, involute, obtuse, shortly cleft, very slightly surpassing the anthers, commonly both very long, nearly as long as the perianth.—Alkaline flats: Sonoma and Napa Cos.; Sacramento Valley (Cana, Butte Co.)

16. *B. capitata* Benth. BLUE DICKS. Fig. 263. Scape erect,  $\frac{1}{2}$  to  $1\frac{1}{4}$  (or 2) ft. high, ending in a head-like umbel of 4 to 10 flowers, with about 4 dark purple or metallic bracts; flowers blue, 5 to 8 lines long; perianth segments elliptic-ovate, obtuse, a little longer than the tube; stamens with anthers 6; filaments opposite the inner perianth segments with a broad membranous wing extended beyond the anthers as two lanceolate appendages; stamens opposite outer perianth segments with filaments dilated toward the base only, their anthers less than  $\frac{1}{2}$  the size of those of the other set; appendages convergent

263. *Brodiaea capitata* Benth.; a, infl.  $\times 1$ ; b, long. sect. perianth  $\times 2$ .

264. *B. pulchella* Greene;  
a, long. sect. perianth;  
b, anther. x 2.

or connivent, forming a corona and more or less concealing the anthers.—Very common on hillsides and plains through the Coast Ranges, Great Valley, Sierra Nevada foothills and S. Cal. Not in the higher mountains, and rare in, though not wholly absent from, the deserts. S. Ore., Ariz., L. Cal.

17. *B. pulchella* (Salisb.) Greene. OOKOW. Fig. 264. Scape 2 to 3½ (or even 5) ft. high, often flexuous; umbel appearing capitate but really short-racemose, 6 to 16-flowered, subtended by 3 to 5 ovate subacuminate bracts; flowers lavender-purple or blue-purple, 7 to 8 lines long, in a dense head; perianth segments spreading, oblong, shorter or longer than the tube, which is slightly constricted at apex; anthers 3, sessile, the short filaments adnate to the corolla; staminodia petaloid, deeply cleft, surpassing the anthers, commonly bearing a short wholly sterile filament in the notch.

—Open hills in the Coast Ranges, Alameda Co. to Humboldt Co., thence e. to Shasta Co.; n. to Wash. Common in Humboldt Co., mostly infrequent in Alameda Co. Flowers later than *B. capitata*.

18. *B. multiflora* Benth. Scape 8 to 24 in. high, somewhat scabrous; umbel capitate, not produced, 8 to 24-flowered; flowers light purple; perianth-tube constricted upwards; staminodia entire, broad, obtuse, involute-cylindric, equaling or exceeding the anthers; stamens 3, rarely 6 in retarded flowers.—Sierra Nevada foothills, 500 to 3500 ft., from Mariposa Co. n. to Shasta Co., thence s. in the Coast Ranges to Humboldt Co.; Ore. June.

19. *B. volubilis* (Kell.) Baker. SNAKE LILY. TWINING BRODIAEA. Fig. 265. Scape roughish, 2 or 3 ft. high and lax, or twining over bushes and attaining a height of 7 or 8 ft.; leaves 1 or 1½ to 2¼ ft. long, 4 to 6 lines broad, carinate; umbel short and dense, 18 to 30-flowered; pedicels ½ to 1 in. long; perianth rose-red or pinkish, 6 to 8 lines long; tube 3 to 4 lines long and broad, 6-angled, the angles produced into sacs somewhat above the middle; segments rotate, their tips recurved; stamens 3, inserted on the throat opposite the inner segments, their filaments short, with lanceolate appendages nearly or quite as long as the anthers; staminodia 3, opposite the outer segments, ligulate, emarginate. — Mostly open-brush slopes, 500 to 2500 ft.: Sierra Nevada foothills from Butte Co. to Tulare Co.; inner Coast Ranges from Napa Co. to Lake Co.

20. *B. ida-maia* (Wood) Greene. FIRE-CRACKER PLANT. Scape slender, erect, 1 to 3 ft. high, bearing an umbel 6 to 12 (or 23)-flowered, its pedicels ¾ to 1½ in. long; flowers pendulous, erect after

265. *Brodiaea volubilis* Baker; a, infl. x 1; b, flower-bud x 2; c, long. sect. pistil x 2.

anthesis; leaves linear; perianth-tube scarlet, persistent, broadly tubular, slightly 6-saccate at the truncate base, slightly constricted above, 1 to 1½ in. long; segments chrome-green, short, erect or sometimes reflexed or revolute, erect in age, 2 to 3 lines long; stamens 3, inserted on the throat opposite the inner segments, their filaments very short and broad; anthers innate; staminodia 3, white; capsule triangular-ovate, acuminate, its stipe 2 or 3 lines long; seeds angular, black.—Wooded foothills and mountain slopes from Marin Co. to Shasta and Siskiyou Cos., 1000 to 4000 ft. July. A showy and curious species.

21. *B. venusta* (Greene) Jepson. Similar to *B. ida-maia* but the perianth rose-purple, constricted under the segments; staminodia pinkish, longer than the anthers.—Mendocino Range to s. Humboldt Co.

### 17. *CALOCHORTUS* Pursh. MARIPOSA LILY

Stem from a membranous-coated corm. Leaves narrow, the basal solitary or rarely 2, the cauline few. Flowers showy, white, yellow, lilac or bluish, borne terminally on the stem or branches or in an umbellate fascicle. Perianth deciduous, the segments distinct and often concave. Sepals lanceolate, greenish or colored. Petals for the most part broadly cuneate-obovate and usually bearing near the base a conspicuous gland, either on the surface or depressed in an excavation or pocket. Stamens 6, on the base of the segments. Ovary triquetrous; stigmas sessile, recurved, persistent. Capsule elliptical or oblong, membranaceous, 3-angled or winged, commonly septically dehiscent. Seeds numerous, in 2 rows in each cell, somewhat flattened.—The processes, or "hairs" of the glands, are in each species more or less distinctive in structure, usually markedly so, and furnish reliable differentiae. These characters were first described in the author's *Flora of California*. (Greek kalos, beautiful, and chortos, grass, in allusion to the flowers and grass-like leaves.)

**A. Flowers open-campanulate, these and the capsules erect; sepals ovate-lanceolate; petals 1 to 2 in. long; capsule ovoid-attenuate, or oblong to linear.**

1. *Gland surface densely hairy; basal leaves 1 or 2 to 4, linear, channeled, shorter than the stem (except in occasional dwarfs of nos. 3, 8 and 12).*

a. *Gland not depressed, without membrane or scales.*

Hairs of gland linear, entire.

Capsule ovoid-attenuate or oblong; gland oval, surrounded or surmounted by a dark blotch.

Capsule oblong, obtuse, flowers cream to lilac; gland surrounded by a dark purplish maroon blotch. . . . . 1. *C. catalinae*.

Capsule ovoid, attenuate.

Stems sinuous, often straggling over the ground. . . . . 2. *C. flexuosus*.

Stems straight or straightish, erect.

Flowers lilac or purplish to white, reddish brown about the gland. . . . . 3. *C. palmeri*.

Flowers white or bluish-purple tinged, the petals yellow at base, a purple spot above the gland. . . . . 4. *C. leichlinii*.

Capsule ovoid-linear or linear; petals ornately penciled or blotched; gland shape varying, oval, transverse oblong, lunate or doubly lunate.

Flowers yellow, rarely white; gland transverse, lunate, broadly linear or oblong. . . . . 5. *C. luteus*.

Flowers creamy white to purple, rarely yellow; petals usually oculated; gland oval, roundish or quadrate. . . . . 6. *C. venustus*.

Hairs of the gland with swollen and knobbed or fungoid-stellate tips; gland circular, oval or irregularly fan-shaped; sepals broadly scarious-margined; capsule linear, dense-walled.

Gland oval with definite outline or absent, its hairs with swollen stellate tips. . . . . 7. *C. splendens*.

Gland spreading with irregular outline, its hairs broadly clavate, knobbed. . . . . 8. *C. invenustus*.

b. *Gland depressed, surrounded by a more or less continuous lacinate membrane; capsule linear, dense-walled.*

Gland not circular.

Gland oval, its membrane generally not continuous; petals dingy white to lurid purple, not persistent. . . . . 9. *C. nuttallii*.

Gland obcordate, its membrane continuous; petals purple-lilac, persistent until maturity of fruit. . . . . 10. *C. macrocarpus*.

Gland circular, its membrane continuous.

Flowers yellow; stems tall.

    Anthers reddish brown; petal hairs clavate.....11. *C. clavatus*.

    Anthers yellow; petal hairs slender.....12. *C. concolor*.

    Flowers vermilion; stem very low.....13. *C. kennedyi*.

2. *Gland surface naked or with a few scattered hairs; gland circular to oblong, depressed in a pocket, bearing a dense border of linear hairs; hairs of the petals arising from a small dark spot, and of a different or darker hue than the main petal color; corm thickly covered with several coats of dark brown fibres; basal leaf one, broadly lanceolate-acuminate; cauline leaves broad, acuminate.*

Flowers orange-color to lemon-yellow; petals fringed or serrate.

    Petals broadly fan-shaped, the margins fringed or serrate.....14. *C. weedii*.

    Petals ovate, generally black-tipped, much shorter than the sepals, the margins long-fringed.....15. *C. obispoensis*.

Flowers lilac or lilac-purple; petals neither fringed nor serrate.....16. *C. plummerae*.

**B. Flowers closed-campanulate (or subglobose); flowers and capsules nodding; petals strongly incurved or arched, the gland deeply pocketed and transversely crested or bearded; basal leaf solitary.**

Petals yellow, the margins fimbriate; gland pocket hidden by long hairs borne in 2 or 3 more or less regular rows on the upper fold of the pocket.....17. *C. pulchellus*.

Petals white to pale pink or rose, the margins entire; gland lunate, pocketed, with 4 transverse imbricate scales.....18. *C. albus*.

**C. Flowers campanulate, erect or ascending, the capsules usually nodding; gland shallow to moderately pocketed, covered from below by a narrow fringed scale and crested above (except in *C. nudus*) by short hairs or scales; claw of petal below the scale often more or less glandular; basal leaf solitary, conspicuously long, surpassing the inflorescence.**

Petals obovate, mostly acute, hairy all over; gland proper (excluding the more or less glandular claw of petal below the scale) from moderately curved or lunate to horseshoe-shaped, but always concave on its lower margin; anthers lanceolate-acute.

    Petals yellow, or brownish, the hairs all yellow.....19. *C. monophyllus*.

    Petals white to purplish blue, the hairs on lower half usually blue, on upper half white.....20. *C. caeruleus*.

Petals fan- or wedge-shaped, truncatish or rounded, naked, or hairy only near the gland; gland proper straight or nearly so in no. 21, in nos. 22 to 24 saucer-shaped to bowl-shaped in outline and always convex on the lower margin; anthers linear to oblong (or narrowly elliptic), acute or obtuse.

    Petals white; capsules nodding.

        Petals naked; anthers linear; Sierra Nevada.....21. *C. nudus*.

        Petals hairy about the gland; anthers short-oblong; Bay region. 22. *C. umbellatus*.

    Petals lilac.

        Petals finely denticulate, hairy on lower third; capsules nodding. 23. *C. uniflorus*.

        Petals entire, a very few scattered hairs above the gland; capsules usually erect. 24. *C. greenii*.

1. ***C. catalinae* Wats.** Stem commonly branched, 1 to 2 ft. high; sepals green, shorter than the petals; petal cuneate, longer than wide, rounded at summit, white tinged with lilac, or lilac or light purple, a large ovate purplish maroon spot at base surrounding the gland; gland oblong, covered with dark hairs; anthers obtuse, pinkish, shorter than the filaments; capsule oblong, obtuse, 1 to 2 in. long, 4 to 5 lines wide; seeds very numerous, white, thin, minutely pitted, 2 lines in diameter.—Coast of S. Cal., local from Santa Barbara Co. to Los Angeles Co., and common on the Santa Barbara Islands. Very constant in coloration.

2. ***C. flexuosus* Wats.** Stem slender, remarkably sinuous, weak, commonly straggling over the ground; sepals greenish with a deep purple spot; petals with numerous striae, truncatish at apex, deep purple (rarely white), with variable bands or spots; gland and its hairs like *C. palmeri*.—Chuckawalla Mts.; Death Valley region; e. to Utah.

3. ***C. palmeri* Wats.** Stems 4 to 12 in. high, slightly branched, not bulbiferous at base; sepals purplish-striated, oblong, acuminate, the tip recurving; petals broadly cuneate, rounded at apex, sometimes apiculate, purple, purple-striated, reddish-brown about the gland, sparsely white-hairy except on upper part; gland oval to oblong, densely tufted; hairs a little 4-sided, and narrowly winged at the angles; anthers oblong, obtuse.—Local in moist alkaline spots: borders of the Mohave Desert near the bases of the San Gabriel and

San Bernardino mountains. May. Var. *PALUDICOLA* Jepson & Ames. Sepals yellowish inside with conspicuous oblong brown spots; petals rose to pale pink.—Meadows, Bear Valley, San Bernardino Mts., 6500 ft. Var. *DUNNII* Jepson & Ames. Stems 1 to 2 ft. high; sepals with white-scarious margins, sometimes with a black or reddish-brown blotch near the base; petals white with a brown transverse band crowning the gland.—Local in the interior arid mts. of San Diego Co.

4. *C. leichtlinii* Hook. Fig. 266. Stem erect, varying from 2 in. to nearly 2 ft. high, with an oblong bulblet at the base; basal leaf narrowly linear, exceeding the stem only in dwarf plants; sepals smoky blue outside, inside yellowish, scarious margined, shorter than the petals; petals obovate-cuneate, rounded at the summit, white (or less commonly purplish) with yellow base and a smoky blue or inky spot above the gland; petals  $\frac{7}{8}$  to  $1\frac{1}{4}$  in. long; gland small, oval, thickly covered with yellow linear hairs and with some loose hairs immediately around the gland; anthers oblong, obtuse, slightly sagittate or after dehiscence strongly so.—Common in the Sierra Nevada from Shasta Co. s. to Tulare Co., 5000 to 7500 ft. June-July.

266. *Calochortus leichtlinii* Hook.; a, petal  $\times 1$ ; b, gland  $\times 2$ ; c, stamen  $\times 2$ .

5. *C. luteus* Dougl. YELLOW MARIPOSA. Fig. 267a. Stem erect, slender, often branching,  $\frac{1}{2}$  to 1 or 2 ft. high; bulblets inclosed within basal sheath of stem; basal leaves linear, 1 to 3 lines wide; sepals yellowish within; petals fan-shaped, as long as broad,  $\frac{3}{4}$  to 2 in. long, yellow or orange, rarely white, with or usually without a central brown blotch but with horizontal series of vertical pencilings radiating from gland to center of petal; gland transverse, broadly linear or crescent-shaped or nearly half-moon shaped,

267. *Calochortus luteus* Dougl.; a, petal; b, var. *oculatus* Wats., petal; c, another petal form.  $\times 1$ .

usually not reaching quite to edges of petal, densely hairy, with ascending matted yellow hairs; hairs below middle of petal few and scattering; capsule linear-oblong,  $1\frac{1}{4}$  to  $1\frac{3}{4}$  in. long.—Foothills and low rolling gravelly or dry land, 150 to 2500 ft.: Coast Ranges from Mendocino Co. s. to San Luis Obispo Co.; borders of the Sacramento and San Joaquin valleys; Sierra Nevada foothills. May-June. The most abundant species; extremely variable in color and markings; commonly in the hardest gravel-packed soil. Var. *OCULATUS* Wats. Fig. 267b, c. Petals white or cream with a central round or

268. *C. luteus* var. *vestae* Jepson;  
petal  $\times 1$ .

transverse brown spot bordered with yellow.—North Coast Ranges to the Sierra foothills. Var. *vestae* Jepson. Fig. 268. Petals pure white above the purple brown eye-spot, heavily penciled between the eye-spot and the gland; gland very narrow, extending in a long arching curve from side to side of the petal and notched or as if interrupted at the summit of the arch (that is doubly crescent-shaped).—Blue adobe soil, interior Sonoma Co. to Humboldt Co.

6. *C. venustus* Dougl. WHITE MARIPOSA. Fig. 269. Stem erect, stiff, usually branching, 4 to 10 in. or up to 2 or 4 ft. high, 1 to 4-flowered; bulblet at base usually 1; petals broadly cuneate-obovate, 1 to  $1\frac{3}{4}$  in. broad, 1 to  $2\frac{1}{2}$  in. long, white, varying to pale rose-color or lilac, with a red-brown

eye-spot above the gland, frequently penciled toward the base, and often with a transversely oblong rose-colored blotch near the apex; gland roundish, or quadrate, densely matted with short hairs, a few scattered hairs near the gland; capsule linear, 2 to  $3\frac{1}{2}$  in. long.—Frequent in light sandy or alkaline soil. 150 to 2000 ft.: Coast Ranges from Mendocino Co. s. to Los Angeles

269. *Calochortus venustus* Dougl.; a, fl.; b, petal.  $\times 1$ .

Co.; borders of the Sacramento and San Joaquin Valleys; Sierra Nevada foothills and up to 2500 or even 5000 ft. June-July. Quite constant in the shape of the gland and infinitely variable in its color markings.

7. *C. splendens* Dougl. LILAC MARIPOSA. Fig. 270. Stem erect, 1 to 2 ft. high; sepals with a small purplish black spot at the base; petals fan-shaped, clear lilac with long scattered hairs on the lower third or fourth; petals  $1\frac{1}{4}$  to  $1\frac{3}{4}$  in. long; gland small, round or oval, situated very low on the base of the petal or sometimes absent; gland surface covered with broad hairs whose expanded fungoid stellate tips form a dense mass; capsule narrowly linear,  $1\frac{1}{2}$  to 2 in. long.—Contra Costa and Monterey Cos. s. to San Diego Co. Common on half-open or bushy hills or mesas. May.

8. *C. invenustus* Greene. Fig. 271. More slender and shorter than *C. splendens*; stems 8 to 12 in. high, bulblet-bearing at the base; petals smaller, the scattered hairs short; gland irregular, spreading, fan-shaped; gland hairs cylindrical or subelavate with knobbed sides, not expanded stellate.—Moist

270. *Calochortus splendens* Dougl.; *a*, gland  $\times 7$ ; *b*, hair from gland  $\times 18$ ; *c*, stamen  $\times 1$ .

271. *Calochortus invenustus* Greene; *a*, petal  $\times 2$ ; *b*, hair from gland  $\times 12$ ; *c*, stamen  $\times 2$ .

spots, plateau valleys in the mts. w. of the Mohave and Colorado deserts, 4000 to 6500 ft.; somewhat rare. May.

9. *C. nuttallii* Torr. SEGO LILY. Fig. 272. Stem 3 to 17 in. high, bulblet-bearing at base; basal leaf shorter than the stem or sometimes equaling it in dwarf forms; flowers solitary or in umbels; bracts with white-scarious margins; sepals shorter than the petals; petals cuneate-obovate, apiculate, slightly erose, 1 to  $1\frac{3}{4}$  in. long, white, sometimes shaded with lilac or with purple, often a darker purple spot near the gland, a few long linear hairs about the gland; gland oval, rarely circular, bordered by a more or less continuous lacinated membrane and covered with hairs more or less lacinate at the tips; anthers yellow, oblong-

272. *Calochortus nuttallii* Torr.; *a*, petal  $\times 2$ ; *b*, hair from gland  $\times 12$ ; *c*, stamen  $\times 2$ ; *d*, stamen after dehiscence of anther  $\times 2$ .

linear, obscurely sagittate at base, commonly tortuous after dehiscence, slightly longer than the filaments; capsule linear, 2 to  $2\frac{1}{2}$  in. long, attenuate at both ends.—Arid mts. or valleys, 4000 to 10,000 ft.; e. slope of the Sierra Nevada and s. to the high ranges bordering the deserts in S. Cal., e. to the Rocky Mts.

10. *C. macrocarpus* Dougl. Fig. 273. Stem bulbiferous at base, stout, erect, 1 to 2 ft. high; cauline leaves 3 to 5, narrow

273. *Calochortus macrocarpus* Dougl.; *a*, gland  $\times 5$ ; *b*, stamen  $\times \frac{3}{2}$ .

and convolute; sepals long-lanceolate, stiffly spreading, purple inside, equaling or slightly exceeding the petals; petals persistent until capsule has reached almost mature size, long obovate, prominently apiculate,  $1\frac{1}{2}$  to  $2\frac{1}{4}$  in. long and  $\frac{3}{4}$  in. wide, purple-lilac, lighter at base and sometimes with a deeper band below middle, a greenish median line on the back, the lower third of petal white and with scattered hairs above the gland; gland broadly A-shaped or oval with a notch on the lower side, bordered by a continuous doubly lacinate membrane and densely covered with broad hairs whose divided clavate tips form a compact mass; anthers purple or yellow, ovate-lanceolate, acutish, 4 to 7 lines long; capsule attenuate,  $1\frac{1}{2}$  to  $2\frac{1}{4}$  in. long; seeds round, flat,  $2\frac{1}{4}$  lines in diameter.—Dry sandy soil in the interior: Lassen and Modoc Cos.; n. to B. C.

11. *C. clavatus* Wats. Fig. 274. Stem very stout, stiff, strongly zigzag, branching, 1 to 3 ft. high; pedicels stout, 2 to 5 in. long; flowers bowl-shaped; sepals yellowish within, often purplish spotted, greenish without, with dry scarious margins,  $\frac{2}{3}$  the length of the petals; petals rich yellow, broadly fan-shaped, rather truncate,  $1\frac{1}{2}$  to 2 in. long,  $1\frac{1}{2}$  to  $2\frac{1}{4}$  in. wide, strongly arched, hairy below the middle or only near the gland, often with a narrow reddish brown or lilac band above the hairy zone, the claw often reddish brown; hairs of the petals scattered, yellow, purplish red at base, the tips narrowly clavate; gland circular, shallow, bordered by an annular membrane, its inner edge deeply twice incised; gland surface thickly covered with very broad hairs with much divided or coralline tips; anthers lance-oblong to linear, obtuse, purplish brown, shorter than the slender filaments; capsule linear, attenuate above and below, 3 in. long.—Dry rocky points, usually in volcanic soils: San Benito Co. to Los Angeles, infrequent. May. Var. *AVIUS* Jepson n. var. Sepals equaling or exceeding the petals; gland in a deeper pocket.—Eldorado Co. (Pleasant Valley, Purdy, type) to Mariposa Co.

12. *C. concolor* Purdy. GOLDEN-BOWL MARIPOSA. Fig. 275. Stem 2 ft. high, one to several-flowered; bulb large, reddish; pedicels stout, 1 to 3 (or 5) in. long; sepals yellowish within, purple banded, purplish-brown on the back; petals deep rich yellow tending toward orange, generally with a purplish band just above the lower third of the petal, broadly fan-shaped,  $1\frac{1}{2}$  to 2 in. long and as broad as long, slightly rounded at summit, the lower third or fourth thickly hairy with long erect yellow hairs; gland small, rounded oblong, covered by a deeply lacinate annular membrane, the linear divisions of the membrane converging in the center over the gland like an iris diaphragm; surface of the gland thickly covered with long

274. *Calochortus clavatus* Wats.; a, gland x 7; b, hair from gland x 12; c, stamen x  $\frac{2}{3}$ .

275. *Calochortus concolor* Purdy; a, gland x 7; b, stamen x 1.

276. *Calochortus kennedyi* Porter; a, gland x 12;  
b, stamen x 1.

narrowly linear mostly entire hairs; anthers yellow, linear, slightly exceeding the filaments; capsule strongly triquetrous, lance-linear, attenuate above.—Bushy often rocky hills, cismontane S. Cal. from San Diego Co. to San Bernardino.

13. *C. kennedyi* Porter. DESERT MARIPOSA. Fig. 276. Stem rather stout, 2 to 6 (rarely 8 to 14) in. high, 2 to 4-flowered; flowers in umbels; pedicels 1 to 4 in. long; sepals  $\frac{1}{2}$  to  $\frac{3}{4}$  the length of the petals, vermilion or orange inside, often spotted with brown near the base, brownish without, with white-scarious margins; petals cuneate, rather truncate,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, nearly as broad, flame-color, brilliant vermilion or rarely orange, naked above, a few scattered hairs below, sometimes with a black band or patch on the lower portion; gland very small, circular, bordered by a narrow black annular membrane with the inner ashy-gray edge lacinate, its surface thickly covered with short slender hairs, the hairs orange below, ashy above, once or twice dichotomously cleft; anthers brownish-purple; capsule  $1\frac{1}{2}$  to 2 in. long, 4 to 5 lines wide, attenuate above, the sides light-colored but often bordered at the angles with a stripe of purplish-brown.—Hard clay or gravelly soil: Mohave Desert, w. to Ventura Co., e. to southern Nev. and Ariz. Frequent. May. Var. *MUNZII* Jepson n. var. Flowers pale yellow.—Providence Mts. (Bonanza King Mine, P. A. Munz 4259, type).

14. *C. weedii* Wood. WEED'S MARIPOSA. Fig. 277. Stem 1 to  $2\frac{1}{2}$  ft. high, usually much branched, stout and flexuous, leafy, 1 to many-flowered, not bulbiferous; flowers 1 to  $1\frac{1}{4}$  in. long; sepals shorter than or often exceeding the petals, narrowly ovate-lanceolate, yellowish within, scarious-margined; petals broadly cuneate, rounded above, sometimes apiculate, orange-color to lemon yellow, nearly covered with long silky hairs each set in a small dark spot, or the upper fourth or fifth naked; upper margins of petals fringed or serrate; gland small, circular, enclosed by a dense ring of hairs and generally bearing a few scattered hairs on its surface; anthers oblong-linear, shorter or longer than the filaments; capsule narrowly oval, attenuate above,  $1\frac{1}{2}$  in. long.—Dry hills, San Diego Co.; L. Cal. June. Common on the coast. Var. *VESTUS* Purdy. Petals truncatish, reddish-brown, covered with golden hairs, the upper third with brown hairs, and the margin fringed with brown hairs; anthers oblong-lanceolate.—Santa Barbara and Ventura Cos.

15. *C. obispoensis* Lemmon. Habit of *C. weedii*; sepals  $\frac{1}{3}$  to  $\frac{1}{4}$  longer than the petals; petals ovate, acuminate, the tips generally black and fringed with long black hairs; gland circular to oblong, inclosed by a dense ring of very long orange hairs, the surface naked or bearing a very few scattered hairs; anthers oblong, obtuse, shorter than the filaments; capsule linear, 1 to  $1\frac{1}{2}$  in. long.—Cañons of the hills and mts., San Luis Obispo Co.

16. *C. plummerae* Greene. Habit of *C. weedii*; corms large, often 2, inclosed side by side in a dense fibrous coat; sepals lanceolate (white-scarious margined at

277. *Calochortus weedii* Wood; a, habit x  $\frac{1}{2}$ ; b, petal x 1; c, gland x 4; d, stamen x  $\frac{1}{2}$ .

base), elongated attenuate, exceeding the petals; petals cuneate, apiculate or rounded above, lilac or lilac-purple with orange-colored hairs on lower half, the hairs usually arising from deep purple spots; gland small, circular, pocketed, inclosed by a dense ring of long orange-colored hairs gathered together above the gland, its surface naked or sometimes bearing one or few solitary hairs; capsule narrowly linear,  $1\frac{1}{4}$  to  $3\frac{1}{4}$  in. long.—Dry slopes and mesas: Santa Monica Mts., through the San Gabriel and San Bernardino mountains to the San Jacinto Mts. Common.

278. *Calochortus pulchellus* Dougl.; a, flowering branchlet  $\times 1$ ; b, stamen  $\times 2$ .

ridge), its upper fold bearing 2 or 3 rows of appressed glandular yellow hairs crossing each other over the opening of the pocket; petals with scattered hairs above the gland or rarely almost glabrous; anthers oblong, acute, 2 lines long, usually a little shorter than the filaments; capsule elliptical, abruptly short-beaked, winged,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long.—Wooded hills: Mt. Diablo; North Coast Ranges from Marin and Solano Cos. to Humboldt and Tehama Cos. Apr.-May. Also called Golden Lily Bell and Fairy Lantern.

18. *C. albus* Dougl. WHITE GLOBE LILY. Fig. 279. Stem stout, glaucous, branching, 1 to 2 ft. high; basal leaf elongated lanceolate, acuminate, 1 to 2 ft. long,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. wide; bracts foliaceous, 3 to 5 in. long; sepals shorter than the petals, ovate, acuminate, greenish-white; petals white, purplish at base, ovate-orbicular, acutish, with scattering long silky yellow hairs above the gland, 1 to  $1\frac{1}{4}$  in. long; gland lunate, shallow, with 4 transverse scales, the scales upwardly imbricate, shortly fringed; anthers oblong, mucronate; capsule 1 to 2 in. long,  $\frac{1}{2}$  to 1 in. broad, abruptly short-beaked; seeds brown, pitted.—Wooded slopes and cañons: Coast Ranges near the coast from the Santa Cruz Mts. s;

17. *C. pulchellus* Dougl. GOLDEN LANTERN. Fig. 278. Stem flexuous, usually dichotomously branching,  $\frac{1}{2}$  to  $1\frac{3}{4}$  ft. high, 2 or 3 to 12-flowered; basal leaf  $\frac{1}{2}$  to  $\frac{3}{4}$  in. wide, equal to or taller than the stem, green, glossy, sometimes tinged with purple; bracts linear-lanceolate, equaling or exceeding the flowers; flowers sub-globose, nodding; sepals greenish or brownish-yellow, ovate-lanceolate to elliptic-ovate, abruptly acute, 10 to 15 lines long, slightly shorter than the sub-orbicular petals; petals golden yellow, strongly arched or incurved, their apices overlapping and the margins bluntly incised or fringed; gland in a deeply set pocket (visible from the outside as a convex

279. *Calochortus albus* Dougl.; a, flowering branch  $\times \frac{1}{2}$ ; b, petal  $\times \frac{1}{4}$ .

San Gabriel Mts.; Cuyamaca Mts. (rare southwards); Sierra Nevada from Butte Co. to Tuolumne Co. May. Also called Snow-drops, Indian Bells, and Satin Bells. Var. *RUBELLUS* Greene. Generally lower and more slender; flowers rose-pink; gland scarcely arched, from the outside resembling a blood-blister.—S. Sierra Nevada; and the Santa Lucia Mts.; Santa Cruz Mts. June. Passes into the species.

19. *C. monophyllus* (Lindl.) Lem. YELLOW STAR TULIP. Fig. 280. Stem flexuous, branching, 3 to 8 in. high; basal leaf 9 to 12 in. high, 3 to 4 lines wide; bracts linear-lanceolate, acuminate, 2 to 4 lines wide; sepals narrowly ovate, acuminate, mucronate, about equaling petals; sepals and petals yellow or more or less purplish brown; petals obovate, 5 to 8 (or 9) lines long; gland semicircular, borne in a shallow pocket (appearing on the outside as a ridge) covered from below by a narrow lacinate scale, and densely bordered or crested above with short yellow (or the innermost white) hairs; hairs and laciniae of gland papillate; claw below the scale naked, often glandular, sometimes red-brown; capsule orbicular, 6 to 9 lines long.—Lower Yellow Pine belt of the Sierra Nevada from Shasta Co. to Tuolumne Co. Frequent. Apr.

20. *C. caeruleus* (Kell.) Wats. BEA-  
VERTAIL GRASS. Stems short (1 to 7 in. high), the basal leaf 1 to 3 times as long; flowers 2 to 4 (or 10) in umbels; pedicels very slender; bracts small; petals rhombic-ovate,  $3\frac{1}{2}$  to 6 (or 7) lines long, white or pale blue, lilac-dotted and lined with blue, hairy, the margin fringed; gland narrow, transverse, curved, shallow, covered by an appressed somewhat fringed scale and crested by a row of short scales; these latter scales narrow, often hair-like, frequently lacinate or incised; capsule orbicular or nearly so, obtuse, 6 lines long.—Open woods, middle altitudes of the Sierra Nevada from Eldorado Co. to Shasta Co., and in the high North Coast Ranges from n. Lake Co. to Siskiyou Co. June. Var. *MAWEANUS* Jepson. Pussy Ears. Sepals commonly very blue; petals purplish blue to white, 7 to 11 lines long, the margin entire or nearly so; gland horseshoe-shaped or semicircular, narrow, more or less pocketed; crest usually rather dense.—Marin Co. to Humboldt Co.

21. *C. nudus* Wats. SIERRA STAR TULIP. Stem 2 to 6 in. high, flexuous, bearing a single umbel of 1 to 3 (or 9) flowers; basal leaf 3 to 10 in. long, 2 to 5 lines wide, light green; sepals oblong-elliptic, shorter than the petals; petals white or pale lilac-blue, cuneate or fan-shaped, acute, denticulate above, 4 to 7 lines long, generally without hairs, in some cases a very few slender hairs above the gland or a tuft of 2 or 3 short hairs at either end of the gland; scale transversely oblong, shortly fringed, appressed; crest none; claw below the scale somewhat glandular; anthers at first pale blue, linear, acute; capsule elliptic, generally nodding.—Open coniferous woods, high Sierra Nevada from Plumas Co. to Tulare Co. Also, apparently, in the San Gabriel Mts. June-July. The smallest-flowered *Calochortus*. Petals often with a flash of pink or purple above the gland. Var. *SHASTENSIS* Jepson. Stem 4 to 14 in. high, slender, flexuous, more or less erect; basal leaf shorter than, equal to, or longer than the stem; petals white, pale lilac blue or deep lilac, 6 to 10 lines long; capsule elliptic, generally erect, occasionally nodding.

280. *Calochortus monophyllus* Jepson; a, flowering branchlet x 1; b, petal x 2; c, stamen x 4.

—Moist meadows: Sierra Nevada from Eldorado Co. n. to Mt. Shasta; thence sw. to Trinity Co.

22. *C. umbellatus* Wood. Fig. 281. Stem 3 to 10 in. high, without bulblets, bearing 2 to 4 (or 12) flowers in 1 to 3 umbels subtended by leafy bracts, the pedicels long; herbage glaucous; sepals oblong, acuminate, greenish-white or slightly tinged with lilac; petals white or slightly lilac-tinged, cuneate or fan-shaped, slightly concave, 6 to 9 lines long; gland shallow, bowl-shaped in outline, covered from below by an appressed fringed scale and bordered by hairs on its upper side; petals otherwise naked save a hairy area (often with a purple spot below it) on each side of the gland; anthers short-oblong; capsule oblong-obtuse to orbicular, strongly nodding.—Low wooded or barren hills: region between San Ramon Valley and San Francisco Bay; Marin Co. to Mendocino Co. Mar.-Apr.

281. *Calochortus umbellatus* Wood; a, habit  $\times \frac{1}{3}$ ; b, petal  $\times 1\frac{1}{2}$ ; c, gland  $\times 4$ ; d, stamen  $\times 1\frac{1}{2}$ .

23. *C. uniflorus* H. & A. Low, 4 to 10 in. high, the stem very short (commonly rising only  $\frac{1}{4}$  to 1 in. out of the ground) and bearing 1 to 3 umbels with elongated flexuous pedicels ( $2\frac{1}{2}$  to 8 in. long); bulblets 1 to 4 beneath the surface; basal leaf 4 to 6 lines broad, exceeding the inflorescence; bracts linear-lanceolate, long and conspicuous; sepals ovate-lanceolate, greenish-lilac; petals lilac, cuneate, somewhat truncate, denticulate, 10 to 14 lines long, naked above, very sparingly hairy immediately above the gland; gland shallow, convexly crescent-shaped on lower side, truncate above, covered by an appressed lightly fringed scale and with a dense border of hairs above; anthers broadly linear; capsule elliptic.—Low wet valley lands: Mendocino and Lake Cos. to Monterey Co. Apr.-May.

24. *C. grœnei* Wats. Stem scape-like, 10 to 17 in. high, bearing a 1 to 5-flowered umbel; basal leaf shorter than or equaling the stem,  $\frac{1}{2}$  in. broad; bracts narrow; sepals greenish, lilac within,  $\frac{3}{4}$  the length of the petals; petals long fan-shaped, 1 to  $1\frac{1}{2}$  in. long, lilac, somewhat barred with yellow below, arched with a shallow gland pocket; pocket partly covered by a very narrow transverse fringed scale, and bordered above by a thick growth of hairs; fringe of the scale and lower hairs of the border above the gland closely papillate; lower half of petals above the gland with very sparse fine hairs 3 to 4 lines long; anthers oblong, obtuse, 2 lines long; capsule 1 in. long or somewhat shorter, orbicular to elliptic, attenuate into a stout beak, on stout flexuous or strictly erect pedicels.—Wet adobe, Siskiyou Co. to Modoc Co.

# 18. ERYTHRONIUM L. ADDER'S TONGUE

Stem short, simple, scapose, from a deep-seated and elongated membranous-coated corm. Leaves 2, basal or nearly so. (Before coming into flower, first or second year, the plants are stemless, producing simply one broad long-petioled leaf.) Flowers large, nodding, solitary, or several and racemose; perianth segments distinct with longitudinal nectar-bearing groove and 2 or 4 sac-like or bulbous processes at base, or only the inner segments so provided. Stamens 6, hypogynous, shorter than the perianth. Style 3-cleft with 3 stigmas, or entire and stigma 1. Capsule somewhat 3-angled, loculicidal. (Greek erythros, red, the color of the flowers in some species.)

Inner perianth segments without auricles or scales; flowers solitary or racemose.....

1. *E. purpurascens*.

Inner perianth segments with auricles and a median pair of sacs, each joined laterally to the auricle by a narrow ridge or saccate process.

- Scape bearing a solitary flower or when several the pedicels often very long or unequal.  
 Flowers purple; pedicels often very unequal, half to as long as the scape. . . . . 2. *E. hendersonii*.  
 Flowers mostly cream, yellow or pink.  
 Filaments filiform or very narrowly dilated.  
 Style and stigma entire. . . . . 3. *E. citrinum*.  
 Style 3-cleft or 3-lobed at apex.  
 Leaves bright solid green. . . . . 4. *E. grandiflorum*.  
 Leaves strongly mottled. . . . . 5. *E. californicum*.  
 Filaments ovately scarious-winged. . . . . 6. *E. revolutum*.  
 Scape none, the flowers 1 to 5 in an umbel sessile between the leaves, each flower thus raised on a scape-like pedicel. . . . . 7. *E. hartwegii*.

1. *E. purpurascens* Wats. Three to 6 (or 16) in. high, the scape bearing 1 to 8 flowers in a raceme, the flowers commonly approximate, rarely with very unequal pedicels and umbellate; leaves not mottled, undulate-margined, dark metallic green; flowers light yellow tinged purple after a few days, the linear segments 7 to 8 lines long, only slightly recurved; filaments filiform; style clavate, shorter than the stamens, its stigmas obscurely lobed.—Brushy or forested slopes, 4000 to 8000 ft.: Sierra Nevada from Mt. Lassen to Tulare Co.; rare s. of Plumas Co. June-July.

2. *E. hendersonii* Wats. Seven to 12 in. high, 1-flowered or with 2 to 4 flowers on pedicels half to as long as the scape; leaves mottled, long-oblong, obtuse or obtusish, or tapering from the middle upward; perianth purple, the segments very revolute,  $1\frac{1}{4}$  to  $1\frac{3}{8}$  in. long, the base of segments with a median pair of inflated or bulbous sacs, each connected with the auricles by a small sac or papilla; stigma 3-lobed.—Siskiyou Co.; sw. Ore.

3. *E. citrinum* Wats. Scape 1 to 3-flowered, 5 to 11 in. high; leaves "mottled," oblong, obtuse, or acute, more or less undulate, 3 to 6 or 10 in. long; flowers lemon-yellow, the oblong acuminate segments 1 to  $1\frac{1}{4}$  in. long; inner perianth segments bearing at base a median pair of saccate protuberances, each joined laterally by a smaller sac or process to the auricle; style clavate at apex; style and stigma quite entire.—Open pine woods, cent. Sierra Nevada and sw. Ore. Apr.

4. *E. grandiflorum* Pursh var. *parviflorum* Wats. Scape 1 to 2 or 5-flowered; leaves bright green, without spots; flowers egg-yellow, at higher altitudes lemon-yellow; inner perianth segments auricled and with 4 equal sacs at base, the sacs ridged, wrinkled or flattened and not very distinct from each other; style 3-cleft at apex or merely 3-lobed.—High montane in n. Humboldt Co. and in Siskiyou Co.; n. to B. C.

5. *E. californicum* Purdy. FAWN LILY. Like preceding but leaves strongly mottled; flowers creamy white or somewhat yellowish, or white; median sacs 2, the lateral ones reduced to a transverse ridge.—Brushy or open hill-slopes, 500 to 3500 ft.: n. Sonoma Co. to Humboldt and Trinity Cos. Mar.-Apr.

6. *E. revolutum* Sm. Like *E. californicum*; scapes 1 or 2 (to 4)-flowered, 7 to 12 in. high; leaves lightly mottled; flowers bright pink or pale lavender, sometimes white, aging to purple; filaments broadly dilated, almost conniving around the ovary.—Woods, often on borders of swamps: Mendocino and Humboldt Cos., 10 to 20 miles from the coast, 500 to 2500 ft.; n. to B. C.

7. *E. hartwegii* Wats. Flowers solitary or borne in a 2 to 5-flowered umbel sessile between the pair of basal leaves, each flower thus appearing to be raised on a scape of its own; scape-like pedicels 3 to 6 in. high; corms forming offsets freely at the end of filiform filaments originating from their base; leaves richly mottled; flowers white or cream with orange or yellow base; inner perianth segments with a median pair of compressed sacs and with prominent auricles; stigma 3-lobed or -parted.—Brushy hillsides: Sierra Nevada foothills from Tehama Co. to Mariposa Co. Apr. Our only species which has offsets.

#### 19. FRITILLARIA L.

Stem erect, simple, from a bulb of one or few thick fleshy scales. Cauline leaves alternate or whorled, narrow, sessile; basal leaves large, ovate or elliptic, borne only in the year or years before the flowering stalk appears. Flowers in racemes or solitary, dull purple, brownish, whitish or red. Peri-

anth campanulate to funnelform, deciduous, of 6 distinct segments, each segment usually with a shallow gland or nectar-bearing area above the base. Stamens 6, inserted on the base of the segments, included; filaments slender; anthers extrorse, more or less versatile. Ovary sessile or nearly so. Style 1, entire or 3-parted. Capsule membranous, 6-angled or winged, loculicidally 3-valved. Seeds numerous, in 2 rows in each cell. (Latin fritillus, a dice-box, on account of the shape of the flower.)

**A. Style entire (or 3-parted at the very apex in no. 3); perianth of uniform color, its glands obscure.**

- Flowers yellow; plants 3 to 9 in. high.....1. *F. pudica*.  
 Flowers pink or pink-purple.  
 Perianth  $\frac{3}{4}$  to 1 in. long; plants 10 to 30 in. high.....2. *F. brandegei*.  
 Perianth 1 to  $1\frac{1}{2}$  in. long; plants 6 to 12 in. high.....3. *F. pluriflora*.

**B. Style deeply 3-cleft; perianth-glands mostly obvious.**

- Stem leafy only on lower half, the larger leaves mostly basal; odor often obnoxious; perianth evenly shaded, not mottled or checkered (except no. 6).  
 Stem 3 to 12 in. high.  
 Flowers dull white.....4. *F. liliacea*.  
 Flowers not white.  
 Flowers dark brownish or greenish purple.....5. *F. biflora*.  
 Flowers shaded with pink, checkered purple.....6. *F. purdyi*.  
 Stems 12 to 20 in. high; flowers yellowish green.....7. *F. agrestis*.  
 Stem leafy above, the lower half or third naked.  
 Perianth evenly shaded, not mottled or checkered, at least not commonly.  
 Flowers more or less purplish or greenish, often lighter within; segments obovate oblong.....8. *F. parviflora*.  
 Flowers green; segments lanceolate.....9. *F. viridia*.  
 Perianth mottled or checkered.  
 Flowers scarlet; style cleft  $\frac{1}{2}$  to  $\frac{1}{2}$  its length.....10. *F. recurva*.  
 Flowers brownish purple; style cleft to below the middle.  
 Leaves ovate-lanceolate; perianth segments 1 to  $1\frac{1}{2}$  in. long.....  
 11. *F. lanceolata*.  
 Leaves linear; perianth segments  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long.  
 Stem slender or equally developed in proportion to the leaves; capsule acutely angled.....12. *F. atropurpurea*.  
 Stem stout, much thickened in proportion to the leaves; capsule with horn-like processes at the base and summit of each valve.....  
 13. *F. pinetorum*.

1. *F. pudica* (Pursh) Spreng. YELLOW FRITILLARY. Stem 3 to 9 in. high, 1 to 3-flowered; bulb-scales very small and rounded; leaves 3 to 8, narrowly oblanceolate, alternate, borne generally on upper half of stem; perianth yellow or orange, often purple tinged outside, the segments oblong-obtuse to obovate-oblong, 5 to 9 lines long, the glands at base very small; stigma very shortly 3-lobed; capsule obovoid-oblong,  $\frac{3}{8}$  in. long.—Sierra Co. to Siskiyou Co., mostly e. and n. of the Sierra Nevada crest, 5000 to 6000 ft.; n. to B. C., e. to Utah. Apr.-May. Flowers turning brick-red and recurving in age.

2. *F. brandegei* Eastw. Stem stout, glabrous, 10 to 30 (?) in. high, about 7-flowered; leaves on upper half of stem, in 2 whorls of 5 to 9, oblong-lanceolate, 3 to 4 in. long,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. wide; flowers pinkish or purplish, campanulate with obtuse base, borne on recurved rather thick pedicels; perianth segments  $\frac{3}{4}$  to 1 in. long, oblong-lanceolate, becoming involute and spreading; glands obscure; filaments subulate; style exceeding the stamens, entire, with stigma scarcely lobed; capsule winged, truncate.—In the Yellow Pine belt, Tule River basin, 5000 ft.

3. *F. pluriflora* Torr. ADOBE LILY. Stems 6 to 12 in. high, leafy chiefly at base, 1 to 7-flowered; bulb somewhat yellowish, its scales few (6 to 8),  $\frac{1}{2}$  to 1 in. long; leaves 4 to 10, oblong-lanceolate; perianth uniform pink-purple, the segments obovate-oblong, acutish, 1 to  $1\frac{1}{8}$  in. long; style 3-parted at apex; capsule as broad as long, truncate at apex, narrowed toward the base, strongly 3-lobed, each lobe with 2 longitudinal dorsal ridges or wings with intervening depression.—Adobe soil in the foothills bordering the Sacramento Valley: Solano, Yolo and Butte Cos.; also in Tulare Co. Feb.-Mar. Also called Pink Fritillary.

4. *F. liliacea* Lindl. WHITE FRITILLARY. Fig. 282. Stem 3 to 10 (or sometimes 12) in. high, often somewhat stout and succulent, 1 to 5-flowered; leaves of the basal tuft linear to oblong-lanceolate,  $\frac{1}{4}$  to  $\frac{3}{4}$  in. broad,  $1\frac{1}{4}$  to

4½ in. long, the cauline leaves few, linear-oblong or linear; flowers dull white; perianth segments oblong-ovate to obovate, 6 to 9 lines long; gland greenish, purplish-dotted, the greenish veins sometimes glandular nearly or quite to the apex of the segments; style cleft to about the middle; capsule stipitate, truncate at each end, ½ in. long and as broad, the back of each lobe slightly channeled and 2-ridged.—Open hilltops near the coast from Drakes Bay to Monterey Co. Mar.-Apr.

282. *F. liliacea*  
Lindl.; fl. x 1.

5. *F. biflora* Lindl. MISSION BELLS. Stem stout, 4 to 10 (rarely 12) in. high, 2 to 4 (rarely 1, less rarely as many as 7)-flowered; leaves 2 to 7, scattered or somewhat whorled below, oblong to ovate-lanceolate, 2 to 4 in. long, ¼ to 1¼ in. wide; perianth campanulate, 8 to 12 lines long, dark brownish or greenish-purple; segments oblong-lanceolate, with a longitudinal greenish glandular band extending from the base nearly to the apex; style cleft to about the middle; capsule nearly 1 in. broad, and not quite as high.—S. Cal. (cismontane region), n. to San Luis Obispo Co.; apparently localized also in the North Coast Ranges. Also called Chocolate Lily and Black Lily. Var. *INFLÉXA* Jepson. Longitudinal band much thickened at apex, especially on the inner perianth segments and inflexed in such a way as to form a channel at apex on the back of the segments.—Palisades region, Calistoga. Var. *INEZIÁNA* Jepson. Stem slender, 1 or 2-flowered; leaves linear-oblong to lanceolate, 2 to 3 in. long, 2 to 4 lines wide; perianth segments widely spreading, often faintly mottled with yellow; odor very disagreeable.—San Mateo Co. Intermediate between the species and *F. purdyi*. Also allied to *F. liliacea*.

6. *F. purdyi* Eastw. Stem 4 to 9 in. high, 1 to 7-flowered; basal leaves ovate to oblong, obtusish, 1¼ to 2¼ in. long, the upper linear; flowers white and purple mottled, shaded with pink; style cleft about to the middle.—Humboldt and Trinity Cos.

7. *F. agréstitis* Greene. STINK BELLS. Stem from very deep-seated bulb, 12 to 20 in. high, leafy on the lower half; leaves 8 to 12, oblong-oblanccolate to linear-lanceolate, alternate or the lower somewhat whorled; raceme 3 to 8-flowered, the flowers dull or yellowish-green, exactly campanulate, nodding on pedicels abruptly recurved at summit; perianth segments 1 to 1¼ in. long, 4 to 5 lines wide, yellowish green, with prominent or ligulate green band running nearly to the apex, distinctly glandular at base, and more or less glandular above; style cleft to about the middle.—Grain fields, region of the lower San Joaquin and Sacramento rivers. Odor very obnoxious.

8. *F. parviflora* Torr. BROWN BELLS. Stem 1¼ to 2½ ft. high; bulb with numerous rice-grain bulblets; leaves linear to linear-lanceolate, 2½ to 4 in. long, 3 to 4 lines wide, borne on the upper half of the stem, the lower ones 3 to 5 in a whorl, the upper whorled or alternate; raceme long, with 4 to 10 campanulate flowers on short recurved pedicels; perianth 4 to 6 lines long, purplish or greenish white, rarely faintly mottled; segments obovate-oblong, obtuse to acuminate, with oblong-lanceolate glands on lower third; style cleft ½ to ⅔ its length; ovary and capsule broadly winged.—Pine woods: Sierra Nevada from Yuba Co. to Tulare Co., 1500 to 3900 ft.; occasional in the inner Coast Range.

9. *F. virídia* Kell. Stem 8 to 20 in. high, 3 to 6-flowered; bulb ¼ to ½ in. in diameter, its scales round and thick; leaves lance-linear, subacute, 1½ to 2½ in. long in 1 or 2 whorls on the upper half of the stem; flowers pendent on short pedicels, pale green to almost black, campanulate, 5 to 7 lines long; perianth segments lanceolate, somewhat chartaceous; gland dark green, lanceolate, extending from the base and continued less distinctly to the apex, or quite obscure; apical tuft of hairs short, dense, white, glandular; anthers minutely but distinctly mucronate; style 3-cleft to about the middle; ovary cylindrical, acutely angled; capsule not seen.—San Carlos Range.

10. *F. recurva* Benth. SCARLET FRITILLARY. Stem stout, 18 to 30 in. high; bulb large and flattish, its scales numerous and thick, with rice-grain bulblets at base; leaves in 2 or 3 whorls near the middle of the stem, linear to

linear-lanceolate, 2 to 6 lines broad; flowers 3 or 4 (to 6); perianth campanulate-funnelform, 1 to  $1\frac{1}{2}$  in. long, scarlet-checked upon yellow, the scarlet becoming crimson and purple in old flowers, the segments recurving strongly at the tips; gland oblong, 3 lines long, slightly depressed; style slender, 3-cleft,  $\frac{1}{8}$  to  $\frac{1}{3}$  its length.—N. Sierra Nevada (Placer Co. n. to Modoc Co.); Coast Ranges (Mendocino Co. to Siskiyou Co.); n. to Ore. Var. *COCCINEA* Greene. Stems commonly more slender, 10 to 20 (or 30) in. high, 1 to 3 (or 5)-flowered; bulb small, higher than thick, its scales 2 to several; flowers scarlet, mottled with yellow; segments with tips generally not recurved.—Hoods Peak and Napa ranges n. to e. Mendocino Co.

11. *F. lanceolata* Pursh. CHECKER LILY. Fig. 283. Stem  $1\frac{1}{2}$  to 2 (or 3) ft. high; scales few or none, the lower portion of the solid bulb covered with numerous rice-grain bulb-lets; leaves 6 to 10 in 2 or 3 whorls on the upper part of the stem, ovate-lanceolate, 2 to 4 in. long; raceme 1 to 4, sometimes to 13-flowered; perianth deeply bowl-shaped, 1 to  $1\frac{1}{2}$  in. long, dark purple mottled with greenish yellow, the segments ovate to oblong, deeply concave, with a very large ovate-lanceolate gland in the middle of the concavity; gland deep green, sharply defined, often with minute black dots; style cleft to below the middle; capsule broadly winged,  $\frac{2}{3}$  in. long.—Near the coast, on oak-covered or brushy hills: San Mateo Co. to Humboldt Co.; n. to B. C. and Ida. Also called Rice-root Lily. Var. *FLORIBUNDA* Benth. Raceme 2 or 3 to several-flowered; perianth campanulate, purple or greenish, conspicuously spotted or checkered, 6 to 13 lines long; segments broadly oblong or narrowly ovate, crisped or erosulate-margined, the outer often broader; gland greenish, extending from the base  $\frac{1}{2}$  or  $\frac{2}{3}$  the way to the apex.—Shady woods, Coast Ranges from Santa Clara Co. to Lake Co. Var. *GRACILIS* Wats. Flowers smaller than the last, with narrow and more acuminate segments; stamens short and anthers often small.—Marin Co. to Napa Co. Var. *TRISTULIS* A. L. Grant. Perianth scarcely mottled, gland black-purple, not dotted.—Near the coast in Marin Co.

283. *Fritillaria lanceolata* Pursh; a, raceme  $\times 1$ ; b, perianth segment  $\times 1\frac{1}{2}$ .

12. *F. atropurpurea* Nutt. Stem  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high from a thick-scaled bulb; leaves 7 to 14, on the upper half of the stem, alternate or more or less whorled, narrowly linear, sessile, 2 to  $4\frac{1}{4}$  in. long; flowers open-campanulate, 1 to 4 (rarely 5 or 6) on recurved pedicels; segments purplish-brown, mottled with yellowish-green, narrowly rhombic or oblong and tapering to base and apex,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long; style cleft  $\frac{3}{4}$  its length; capsule acutely angled.—High montane, 6000 to 10,500 ft.: North Coast Ranges; Sierra Nevada; San Bernardino Mts.; n. to Ore. and Mont.

13. *F. pinetorum* Davidson. Stem stout or even somewhat fistulous, 5 to 14 in. high; bulb with numerous rice-grain bulb-lets; leaves 12 to 20, approximate in somewhat indefinite whorls, linear, noticeably narrow in contrast to the stoutness of the stem; flowers 3 to 8, on upright pedicels slightly flexuous

at first but becoming stout and stiff; segments dark greenish purple and yellow, mottled, broadly ovate-acuminate, obtuse at very apex, about  $\frac{1}{2}$  in. long; gland indefinite; filaments narrowly subulate; style 3-cleft half its length or more; capsule acutely angled with short horn-like processes at the base and summit of each valve.—Pine forests, 6000 to 9000 ft.: White Mts. and s. Sierra Nevada, s. to the San Gabriel Mts. and San Bernardino Mts.

## 20. *LILIUM* L. LILY

Stems simple, tall and leafy, from a scaly bulb or scaly rootstock. Leaves narrow, sessile. Flowers large and showy, solitary or 2 to many in a terminal raceme. Perianth most commonly funnelform; its segments 6, yellow, red or white, often dotted or spotted with brown, distinct, equal, spreading or recurved, with a nectar-bearing groove toward the base. Stamens 6, hypogynous, included; anthers versatile. Style one, long, deciduous; stigma 3-lobed. Capsule loculicidal; seeds numerous, flat, horizontal, in 2 rows in each cell. (Greek lilion, the classical name.) Lilies inhabiting dry slopes do not have jointed scales, while jointed scales characterize the wet land species.

### A. Plants of dry places with true bulbs (not rhizomatous); bulb-scales not jointed.

Flowers white (aging purplish or rose-purple) or pink.

Perianth pure white or minutely purple-dotted, aging purplish, 3 to 4 in. long, its segments slightly recurved at tip.....1. *L. washingtonianum*.

Perianth nearly white, brown-dotted, aging rose-purple,  $1\frac{1}{2}$  to 2 in. long, its segments recurving from the middle.....2. *L. rubescens*.

Perianth pink, its segments revolute to the stem.....3. *L. kelloggii*.

Flowers not white.

Perianth dark brownish-red to dingy purple.....4. *L. bolanderi*.

Perianth orange or yellow.

Leaves undulate; perianth segments  $2\frac{1}{2}$  to 4 in. long, recurved  $\frac{3}{4}$  their length....

5. *L. humboldtii*.

Leaves plane; perianth segments  $1\frac{1}{4}$  to 2 in. long, recurved  $\frac{2}{3}$  their length....

6. *L. columbianum*.

### B. Plants of bogs or wet places; bulb rhizomatous, its scales jointed.

Flowers red or orange.

Flowers dark red, purple-spotted within, tips of segments recurved; rhizome not branching.....7. *L. maritimum*.

Flowers orange-red or orange-yellow, dotted or spotted with dark purple.

Rhizome not branching.

Upper  $\frac{2}{3}$  of perianth segments at length recurving to the pedicel; scales 1 or 2-jointed.....8. *L. occidentale*.

Perianth segments recurving only at tip; scales 3 or 4-jointed.....9. *L. parvum*.

Rhizome commonly branching, its scales commonly 2-jointed; perianth segments fully revolute.....10. *L. pardalinum*.

Flowers clear lemon-yellow; rhizome not branching; its scales 3 or 4-jointed.....11. *L. parryi*.

284. *Lilium* bulbs. a, *L. washingtonianum* Kell.; b, *L. humboldtii* Roehl & Leichtl.; c, *L. pardalinum* Kell. x  $\frac{1}{2}$ .

1. *L. washingtonianum* Kell. WASHINGTON LILY. Fig. 284a. Stem 4 to 6 ft. tall, the bulb ovate, scales not jointed; flowers pure white, often minutely purple-dotted, aging purplish; perianth tubular-campanulate, 3 to 4 in. long, the segments spreading above, not closely approximate in a tube; stamens a little shorter; anthers yellow, 5 to 6 lines long; capsule obovate-oblong, trun-

cate, obtusely 6-angled or sometimes narrowly winged.—Cent. and n. Sierra Nevada, 3000 to 6000 ft., in the upper pine forests or in thickets, n. to Mt. Shasta, thence w. to ne. Humboldt Co.; Ore. Aug. Flowers delightfully fragrant with the odor of pinks.

2. *L. rubescens* Wats. CHAPARRAL LILY. Stem 2 to 5 ft. high; bulbs ovoid, rhizomatous, the scales not jointed; leaves broadly oblanceolate or obovate, mostly acute, 5 to 10 in a whorl, or the lower scattered; flowers several, nearly white, somewhat dotted with brown, aging to rose-purple; segments  $1\frac{1}{2}$  to 2 in. long, the upper  $\frac{1}{3}$  revolute; capsule obovoid with subtruncate apex and abruptly short-attenuate base, wing-angled,  $1\frac{1}{4}$  in. long.—Chaparral slopes in the Coast Ranges, Santa Cruz Co. to Siskiyou Co. Near the coast called Redwood Lily; towards the interior Chaparral or Chamise Lily.

3. *L. kellóggii* Purdy. Bulb like that of *L. rubescens*; flowers 1 to 15; perianth segments revolute to the stem, pink, dotted purplish-black or maroon, changing to deeper rosy purple, sometimes with a central line of yellow.—Inner margin of the Redwood belt, n. Mendocino Co. to Del Norte Co. Late June, July.

4. *L. bolánderi* Wats. Stem  $\frac{1}{2}$  to  $2\frac{1}{2}$  ft. high, 1 to 7-flowered; bulb ovate, of numerous lanceolate scales 1 to  $1\frac{1}{2}$  in. long; leaves in 3 (or rarely 4) whorls with 1 to 3 smaller alternate leaves below, oblanceolate to obovate, acute to obtusish, 1 to  $2\frac{1}{2}$  in. long,  $\frac{1}{4}$  to  $1\frac{1}{2}$  in. wide, glaucous beneath; flowers horizontal or somewhat nodding, dark brownish-red to lurid purple, becoming somewhat paler, spotted; segments  $1\frac{1}{4}$  to  $1\frac{3}{4}$  in. long, barely recurving.—Dry chaparral hillsides, inside the Redwood belt, Del Norte Co. to Siskiyou Co.; s. Ore. July.

5. *L. humboldtii* Roehl & Leichtl. HUMBOLDT'S LILY. Fig. 284b. Stem 3 to 5 ft. high, very stout, its leaves generally purplish and slightly undulate, in 4 to 6 whorls; bulb large, ovoid, more or less oblique, its scales not jointed; flowers large,  $2\frac{1}{2}$  to 4 in. long, orange-red, spotted with small maroon or purple spots, the segments strongly recurving.—Open woods in lower Yellow Pine and upper Chaparral belts of the Sierra Nevada and cis-montane S. Cal., 3000 to 6000 ft. Bulb-scales possessing a remarkably bitter principle. Var. *BLÓOMERIANUM* Jepson. Bulb scales several-jointed; claws of inner perianth segments somewhat crested.—Cuyamaca Mts. Var. *OCELLATUM* Kell. Bulb more globular, its scales several-jointed; leaves brighter green; purple spots of flower margined with red.—Mts. from Santa Barbara to Los Angeles; Santa Rosa Isl.

6. *L. columbianum* Hanson. OREGON LILY. Stem slender, 2 to 4 ft. high; bulb small ( $1\frac{1}{2}$  to 2 in. in diameter); upper leaves scattered, the lower in whorls; perianth segments  $1\frac{1}{2}$  to 2 in. long, strongly recurved, bright reddish orange, thickly spotted with purple.—Humboldt Co.; n. to Ore. and B. C.

7. *L. maritimum* Kell. COAST LILY. Stem 1 to 4 ft. high with alternate or rarely whorled leaves; bulb rhizomatous, its scales seldom more than one-jointed; leaves very dark green, narrowly oblanceolate or linear, 1 to 5 in. long and 2 to 7 lines wide; flowers 1 to 5, dark red, funnellform, horizontal on long pedicels; segments barely dotted at base,  $1\frac{1}{4}$  to  $1\frac{1}{2}$  in. long, the upper  $\frac{1}{2}$  somewhat recurved; stamens less than 1 in. long, exceeding the style; capsule subglobose to elliptic-oblong, 9 to 10 lines long.—Low meadows or bogs near the coast, Marin Co. to Ten Mile River, Mendocino Co.

8. *L. occidentale* Purdy. EUREKA LILY. Stem 2 ft. high in open ground or 4 to 6 ft. high in thickets; bulb like that of *L. maritimum*; leaves whorled on the middle of the stem, scattered below, lanceolate, acute; flowers from a few to 15, on strongly divaricate pedicels 3 to 9 in. long, nodding at summit; segments  $1\frac{1}{4}$  to  $2\frac{1}{2}$  in. long, recurved for  $\frac{2}{3}$  their length, varying from dark red to reddish yellow, fading purplish, the lower part commonly orange with purple-black spots; anthers oblong, 2 lines long, dark red.—Near the ocean, n. Humboldt Co. to s. Ore.

9. *L. párvum* Kell. SMALL TIGER LILY. Stem  $1\frac{1}{2}$  to 7 ft. high; rootstock thick and fleshy, not branching, the scales 3 or 4-jointed; leaves lanceolate, 3 to 5 in. long, in whorls or quite scattered; flowers 1 or 2 to very many, small (1 to  $1\frac{1}{4}$  in. long), on erect or ascending pedicels; perianth funnellform,

only the tips of the segments spreading, orange-yellow spotted with purple.—Wet places along streams or edges of swamps, Sierra Nevada n. to Mt. Shasta, 6000 to 9000 ft.; s. Ore.

10. *L. pardalinum* Kell. TIGER LILY. Fig. 284c. Stem 3 to 5 or even 7 ft. high; rootstock thick and fleshy, densely covered with 2-jointed closely overlapping scales, branching and eventually forming large mat-like clusters; leaves in whorls or alternate, linear-lanceolate; flowers 1 to many, racemose or the lower in whorls, on long spreading pedicels; segments 2 to 3 in. long, 6 to 9 lines wide, strongly revolute, bright orange-red with a lighter orange center and large purple spots on the lower half; capsule narrowly oblong, acutely angled,  $1\frac{1}{2}$  in. long.—Stream banks and moist hillside meadows: Coast Ranges, at low altitudes near the sea or in the high mts.; Sierra Nevada, 3000 to 4000 ft. Also called Leopard Lily. Bulb-scales sometimes 3-jointed in some forms of it. June-Aug.

11. *L. párryi* Wats. LEMON LILY. Stem slender, glabrous, 2 to 5 ft. high, 2 to 10-flowered; bulb like that of *L. parvum*, its scales numerous, thick, about 1 in. long; leaves usually scattered, sometimes the lower in a whorl, linear-oblancoale, 4 to 6 in. long, about 1 in. wide, mostly acuminate; flowers clear lemon yellow, sparingly and minutely purple-black dotted, on stout short pedicels; perianth segments 3 to 4 in. long, somewhat spreading above, or the tips recurved; stamens and style a little shorter; anthers oblong, brownish, 3 lines long; capsule narrowly oblong, acutish, nearly 2 in. long, 6 lines wide.—Moist situations, high mts.: San Diego Co. to San Bernardino and San Antonio mountains; e. to Ariz.

## 21. YÚCCA L. SPANISH BAYONET

Trees or shrubs with simple or branched stems. Leaves alternate, linear-lanceolate. Flowers large, in terminal panicles, the perianth segments distinct, nearly equal, withering-persistent. Stamens 6. Fruit a capsule, either dry and dehiscent, or somewhat fleshy and indehiscent. Seeds numerous, in 2 rows in each cell, flat, horizontal, with thin black coat.—The flowers are incapable of self-pollination, each *Yucca* species being dependent upon a particular moth or species of *Pronuba*. The female *Pronuba* works by night, collecting the pollen from the anthers and rolling it into a little ball; she then flies to the flower of another plant, deposits her eggs in the ovary, and then in a manner which corresponds to actions full of purpose and deliberation climbs to the style and thrusts the pollen ball down the stigmatic tube. The larva destroys about a dozen seeds, but even if several larva develop many perfect seeds are left. (An Indian name for the *Manihot*.)

Plants without evident trunk, the rosette of leaves on the ground; filaments glabrous; style slender with capitate stigma. . . . 1. *Y. whipplei*.  
Plants commonly with distinct trunk; filaments papillate; style short or none; stigmas 3, or 1 and 3-lobed.

Trunk tall, at summit branching freely; leaf-margin denticulate. . . . 2. *Y. brevifolia*.  
Trunk commonly short and simple or shortly branched; leaf-margin not serrate, fibrous-shredding.

Style  $\frac{1}{2}$  to  $1\frac{1}{2}$  lines long. . . . 3. *Y. mohavensis*.  
Style 6 to 10 lines long. . . . 4. *Y. baccata*.

1. *Y. whipplei* Torr. QUIXOTE PLANT. Flowering stem 8 to 14 ft. high, the leaves in a basal rosette; leaves narrow, 1 to  $1\frac{1}{4}$  ft. long; panicle 3 to 6 ft. long; flowers creamy-white,  $1\frac{1}{4}$  to  $1\frac{1}{2}$  in. long, the perianth segments thinnish; filaments much thickened; capsule short-cylindric or subglobose,  $1\frac{1}{4}$  to 2 in. long.—Chaparral belt of cismontane S. Cal.; n. in the Coast Ranges to San Benito Co. and the Sierra Nevada to Kings River. L. Cal. May-June.

2. *Y. brevifolia* Engelm. JOSHUA TREE. Fig. 285. Tree

285. *Yucca brevifolia* Engelm.; a, fl.; b, long. sect. fl.  $\times \frac{3}{4}$ .

commonly 16 to 30 ft. high with an open crown of arm-like branches, the columnar trunk 8 to 15 ft. high and 1 to 3½ ft. in diameter; bark dark brown, checked into small squarish plates; leaves 6 to 9 in. long, the margin denticulate, not shreddy; flowers greenish white, congested in a heavy panicle 8 to 14 in. long; perianth segments very thick and fleshy, 1½ to 2 in. long; stamens ½ length of the pistil, the filaments subglobose-dilated at the recurved apex; stigmas 3, obscurely 2-lobed; capsule oblong-ovate, slightly 3-angled, 2 to 4 in. long and 1½ to 2 in. broad; seeds with ruminated endosperm.—Mesas, Mohave Desert, widely distributed and forming extensive groves, n. to eastern Kern Co. and Inyo Co.; e. to Utah.

3. *Y. mohavensis* Sarg. SPANISH DAGGER. Trunk simple or shortly branched, 3 to 7 or 15 ft. high, or sometimes very short or almost none; leaves concave, light yellow-green, entire on the margin, 1¼ to 3 ft. long; flowers in a panicle 1 to 1½ ft. long; filaments narrowly dilated below (especially those opposite the inner segments), somewhat clavate at apex, nearly as long as the pistil; style very short; stigma 3-lobed, each lobe notched at apex; capsule cylindric, fleshy, 2½ to 4 in. long and 1 to 1½ in. thick, usually constricted about the middle; endosperm not ruminated.—Mohave Desert, s. through the San Jacinto and Santa Rosa mountains to n. L. Cal., extending w. to the San Bernardino Valley and the coast near San Diego; e. to Ariz. and Nev.

4. *Y. baccata* Torr. SPANISH BAYONET. Very similar to *Y. mohavensis*; leaf rosettes yellow-green, on the ground, rarely rising above it; leaves 1¼ to 2 ft. long; flowering stem 2 to 3¼ ft. high; flowers (2½ or) 3 to 4 in. long; base of filaments forming fleshy papillae; style much elongated; fruit conical.—E. Mohave Desert; e. to Col. and N. Mex.

## 22. *NOLINA* Michx.

Perennials with linear rigid leaves crowded in a rosette at the ground. Flowering stem stout, naked. Flowers polygamo-dioecious, much congested in a compound panicle; pedicels jointed near the base. Perianth whitish, persistent, its segments 6, distinct, elliptic to lanceolate. Stamens 6; filaments very short. Ovary deeply 3-lobed; ovules 2 in each cell, basal; style very short; stigmas 3, short, recurved. Capsule broadly 3-winged, membranous, tardily dehiscent, loculicidal or bursting irregularly; seeds often solitary. (P. C. Nolin, French agricultural essayist, middle of the 18th cent.)

Mature leaves serrulate; style present. . . . . 1. *N. parryi*.  
Mature leaves not serrulate; style none. . . . . 2. *N. bigelovii*.

1. *N. parryi* Wats. Stem 3 to 6 ft. high; leaves rather thick, concave, keeled, serrulate, ¾ to 1¼ in. wide, 2 to 3½ ft. long; bracts irregularly and remotely salient-laciniate; flowers 3 lines long; capsule orbicular in outline, notched at both ends, 6 to 7 lines broad.—Arid mt. slopes, 4000 to 6000 ft.: e. San Bernardino Mts., s. through the San Jacinto Mts. to San Diego Co.; Ariz.; L. Cal. May-June.

2. *N. bigelovii* (Torr.) Wats. Leaves scarcely concave or keeled, the margin shredding away in brown fibres; margins of bracts deeply and rather closely fringed; perianth 1 to 1½ lines long.—Mts., s. borders of the Colorado Desert; s. to L. Cal., e. to Ariz.

## 23. *ASPÁRAGUS* L.

Stem from a rootstock, very much branched and with filiform branchlets clustered in the axils of the scaly leaves. Flowers small, solitary or in umbels or racemes. Perianth segments alike, distinct or slightly united, the stamens inserted on their bases. Ovary 3-celled, with 2 ovules in each cell; style short, stigmas 3, recurved. Fruit a globose berry. (Ancient Greek name.)

1. *A. officinalis* L. ASPARAGUS. Stems tall and branching, 3 to 5 ft. high, when young stout, succulent and edible; clustered branchlets 4 to 8 lines long; flowers green, pendulous on jointed peduncles; perianth campanulate, 3 lines long, with included stamens; berry red, 4 lines in diameter.—Garden plant (nat. of Eur.) escaped to low lands about Alameda, San Bernardino and Los Angeles.

24. **STRÉPTOPUS** Michx. TWISTED-STALK

Stems branching from a creeping rootstock. Leaves alternate, ovate, sessile or clasping, taper-pointed, membranous. Flowers greenish-white, axillary, solitary or in pairs, drooping on slender filiform peduncles which are bent or contorted at the middle. Perianth campanulate, the lanceolate segments distinct, recurved-spreading, deciduous. Stamens 6; filaments short, flattened. Style 1; stigma slightly 3-lobed. Fruit a red ovoid or oval berry. (Greek streptos, twisted, and pous, foot or stalk.)

1. **S. ampléxifolius** (L.) DC. LIVER-BERRY. Stem  $1\frac{1}{4}$  to 3 ft. high; leaves ovate, clasping, glaucous beneath,  $2\frac{1}{2}$  to  $4\frac{1}{4}$  in. long; peduncles with a gland at the knee; flowers greenish-white, 5 to 6 lines long.—Margin of cold streamlets in the woods: Mendocino Co. to w. Siskiyou Co., thence e. and se. to Modoc and Plumas Cos., 1000 to 5500 ft.; n. to Alas., e. to the Atlantic; Eur., Asia.

25. **DÍSPORUM** Salisb.

Stem erect, branched above, leafy, arising from a short horizontal rootstock. Leaves ovate, sessile, thin, netted-veined. Flowers greenish or white, drooping on a terminal peduncle, solitary, or few in an umbel. Perianth campanulate, deciduous. Filaments filiform, attached within the anthers, above the base. Fruit a berry. (Greek dis, double, and spora, seed, some species with 2 ovules in each cell.)

Flowers greenish,  $\frac{1}{2}$  in. long or nearly; style glabrous, entire.

Leaves  $1\frac{1}{2}$  to 3 in. long.

Stamens equaling or exceeding the perianth; anthers not hispid; leaves mostly cordate at base. . . . . 1. *D. hookeri*.

Stamens generally slightly shorter than the perianth; anthers minutely hispid; upper leaves slightly cordate at base. . . . . 2. *D. trachyandrum*.

Leaves 1 to  $1\frac{1}{2}$  in. long; stamens  $\frac{1}{2}$  the length of perianth; anthers nearly sessile. . . . . 3. *D. parvifolium*.

Flowers whitish,  $\frac{3}{4}$  to 1 in. long; leaves 2 to 4 in. long; style densely short hairy, slightly 3-cleft at apex; leaves sub-cordate or rounded at base. . . . . 4. *D. smithii*.

286. *Disporum hookeri* Britt.; a, fl. branchlet; b, berry. x 1.

1. **D. hóokeri** (Torr.) Britt. FAIRY BELLS. Fig. 286. One to  $2\frac{1}{4}$  ft. high, thinly puberulent; leaves ovate, cordate at base, abruptly acute or attenuate,  $1\frac{1}{2}$  to 3 in. long, the uppermost somewhat oblique; perianth green, narrowly campanulate, 5 to 6 lines long, the tips of the segments spreading; stamens equaling or exceeding the perianth; berry obovoid to subglobose, obtuse, scarlet.—Shady woods back of the immediate coast, Coast Ranges from Santa Cruz Co. to Siskiyou Co.

2. **D. trachyándrum** (Torr.) Britt. Stem 1 to 2 ft. high, purplish and nearly glabrous below, pubescent above; leaves ovate to oblong-ovate, abruptly acute to acuminate, sessile, upper ones very slightly cordate at base, 1 to  $2\frac{1}{2}$  in. long; flowers greenish, campanulate with spreading segment tips, nearly  $\frac{1}{2}$  in. long, on

short drooping pedicels, solitary or in 2s or 3s; stamens slightly shorter than the perianth; anthers minutely hispid; ovary glabrous; style entire; berry obovate, scarlet.—In the Sierra Nevada, Tuolumne Co. to Siskiyou Co.; s. Ore.

3. **D. parvifólum** (Wats.) Britt. Rather stout, much branched, woolly-pubescent; leaves ovate to broadly lanceolate, the lower cordate and clasp-

ing. 1 to 1½ in. long, acuminate; flowers rather numerous, 4 lines long; segments slightly spreading, twice longer than the lanceolate acute nearly sessile anthers; ovary very small, slightly pubescent; style slightly exerted.—Siskiyou Mts. Our spms. have the stamens more or less exerted with filaments twice the length of the anthers.

4. *D. smithii* (Hook.) Piper. FAIRY LANTERN. One to 3 ft. high, soft-pubescent or almost glabrous; leaves round-ovate to ovate-lanceolate, rounded or subcordate (and often a little oblique) at base, at apex abruptly acute or attenuate, 2 to 4¾ in. long; perianth whitish, broad and cup-shaped at base, ¾ to 1 in. long, the tips of the segments erect; stamens ⅓ shorter than the perianth; berry yellow, oblong-obovate, attenuate above into a short beak.—Stream banks, Coast Range woods very near the coast: San Mateo Co. to Del Norte Co.; n. to B. C. Apr.

## 26. SMILACINA Desf.

Stem simple and leafy, from a horizontal rootstock, bearing a terminal raceme or panicle of small white flowers with minute bracts. Leaves sessile, many-nerved. Pedicels jointed at the summit. Perianth persistent, the segments distinct and spreading. Stamens inserted at the base of the segments; anthers versatile. Style 3-lobed at the summit, persistent; ovules 2 in each cell. Fruit a globose 1 to 3-seeded berry. Seeds sub-globose, with thin testa and horny endosperm. (Diminutive of *smilax*.)

Flowers in a simple raceme; stamens shorter than the perianth segments; filaments not dilated.

Leaves spirally arranged, often folded.....1. *S. stellata*.  
Leaves mostly 2-ranked, commonly flat.....2. *S. sessilifolia*.  
Flowers in a panicle; stamens much longer than the perianth segments; filaments dilated. . . 3. *S. amplexicaulis*.

1. *S. stellata* (L.) Desf. STAB-FLOWER. Stem ¾ to 2 ft. high; rootstock stout; herbage pale; leaves oblong-lanceolate to lanceolate, acuminate, often somewhat folded on the midrib, sessile and clasping, 3 to 5½ in. long; raceme open, 6 to 20-flowered; pedicels 2 to 6 lines long; perianth segments 2 to 3½ lines long; stamens ¾ as long as the perianth segments; style nearly equaling the ovary; berry at first with 6 dark-brown longitudinal stripes or bands on a greenish or whitish ground, eventually black.—Crests and e. side of the Sierra Nevada; desert ranges of Mono and Inyo Cos., s. to San Gabriel Mts.; e. to the Atlantic.

2. *S. sessilifolia* Nutt. SLIM SOLOMON. Similar to *S. stellata* and perhaps only a variety of it; rootstock slender; herbage bright green; upper part of stem commonly somewhat arcuately curving and the flat leaves disposed to be 2-ranked; leaves oblong-ovate to lanceolate; raceme commonly 3 to 9-flowered; stamens ½ to ¾ as long as the perianth segments; berry red, 1 to 4-seeded, 3 to 5 lines broad.—Common in shady woods and on moist brushy slopes: Coast Ranges, mostly near the coast; Sierra Nevada; n. to Wash.

3. *S. amplexicaulis* Nutt. FAT SOLOMON. Stem 1 to 3 ft. high, this and the under surface of the leaves with a minute fuzzy pubescence or rarely glabrous; rootstock stout, elongated; leaves oblong-ovate to lanceolate, 3 to 5½ in. long, acute at apex, sessile by a broad clasping base; panicle usually short-peduncled, oblong, 2 to 4 in. long; pedicels 1 line long or less; perianth segments less than 1 line long; filaments lanceolate or broadly subulate, much longer and often broader than the segments; style ½ to nearly as long as the ovary; berry light red, finely sprinkled with dark red dots, 2 to 2½ lines in diameter, usually 1-seeded.—Shady woods, Sierra Nevada and Coast Ranges; n. to B. C. Var. *GLABRA* Mcbr. Leaves broadly oblong; herbage glabrous and slightly glaucous.—High altitudes, Humboldt Co. and Sierra Nevada.

## 27. MAIÁNTHEMUM Webb.

Stem low, from a horizontal rootstock, bearing 2 or 3 broad leaves and a terminal raceme of white flowers, the pedicels solitary or 2 or 3 in a cluster.

Perianth segments 4. Stamens 4, with filiform filaments. Ovary 2-celled; stigma 2-lobed. Fruit a globose red berry. (Latin *maius*, May, and Greek *anthemon*, flower, in allusion to the flowering period.)

1. *M. bifolium* DC. var. *kamtschaticum* (Gmel.) Jepson. OREGON COLTS-FOOT. Stem simple, erect, 4 to 14 in. high, often stout; leaves ovate or triangular-cordate, 2 to 4½ in. long; basal leaf cordate, short-pointed, very large, very long-petioled, almost as tall as the flowering stem; raceme peduncled, ½ to 2 in. long; perianth segments oblong or broadest toward apex, slightly unequal, 1 to 1½ lines long, becoming deflexed; berry 3 lines in diameter.—Woods near the coast from Marin Co. to Humboldt Co.; n. to Alas; Asia.

## 28. CLINTONIA Raf.

Stem from a creeping rootstock and bearing at or from beneath the ground a few broad leaves and a scape-like peduncle. Flowers in an umbel or solitary. Perianth resembling a very small lily flower, campanulate, of 6 distinct deciduous segments. Stamens 6, with filiform filaments, inserted on the base of the segments; anthers fixed just above the base, extrorse. Ovary 2 or 3-celled; ovules 2 or 3 in each cell; style slender, slightly 2 or 3-lobed, deciduous. Fruit a smooth ovoid (in ours blue) berry. (De Witt Clinton, 1769-1828, naturalist, several times governor of New York.)

Peduncles much exceeding the leaves; flowers in an umbel.....1. *C. andrewsiana*.  
Peduncles shorter than the leaves; flowers solitary.....2. *C. uniflora*.

1. *C. andrewsiana* Torr. Leaves commonly 5, sometimes 6, narrowly or broadly elliptic, rather abruptly short-pointed, 7 to 13 in. long, 2 to 4½ in. broad; peduncle 15 to 20 in. high, bearing a terminal umbel of many flowers and with 2 to 4 supplementary clusters borne laterally, the lateral clusters 1 to 9-flowered or rarely none; flowers 5 to 8 lines long, rose-red or pink; filaments slightly pubescent below the middle.—Shady woods near the coast: Monterey Co. to Del Norte Co. The berries suggest small-sized old-fashioned bluing balls.

2. *C. uniflora* Kunth. BRIDE'S BONNET. Leaves 2 or 3, oblong to narrowly elliptic, 4 to 6 in. long, including the short petiole-like base, and ¾ to 2 in. wide, acute; peduncle 1-flowered, shorter than the leaves, commonly with 1 or 2 small bracts; flowers white, 9 to 11 lines long.—Coniferous forests, Sierra Nevada, 3500 to 6000 ft., at scattered stations from Tulare Co. to Lassen Co.; thence w. to Siskiyou and Humboldt Cos.; n. to B. C.

## 29. SCOLIOPUS Torr.

Stem very short, subterranean, bearing a pair of broad leaves and an umbel of greenish purple flowers, the peduncle almost obsolete, the sharply angular pedicels (which look like scapes) alone appearing above ground. Stamens 3, opposite the sepals, short, with greenish extrorse anthers. Ovary triquetrous, 1-celled; style short, its 3 long branches abruptly spreading horizontally. Capsule with a membranous wall which bursts irregularly. (Greek *skolios*, crooked, and *pous*, foot, in allusion to the tortuous pedicels.)

1. *S. bigelovii* Torr. SLINK-POD. Fig. 287. Leaves 2 (rarely 3), elliptic to oblong, acute, commonly mottled with dark

287. *Scoliopus bigelovii* Torr.; a, fl.  $\times 1$ ; b. habit  $\times \frac{1}{4}$ .

splotches. 4 to 9 in. long; flowers with a fetid odor and having something the appearance of orchids; pedicels 4 to 9 in. long, 3-angled, slightly winged, erect in flower, in fruit tortuous recurving or procumbent, the maturing capsule more or less hidden by forest litter; sepals ovate-lanceolate, 7 to 9 lines long, black-veined, abruptly spreading or recurved; petals linear-subulate, as long as the sepals, hardly 1 line wide, erect.—Deep cold shades of the Redwood forest, Santa Cruz Co. to Humboldt Co.; n. to southwestern Ore. Jan.-Mar.

### 30. *TRILLIUM* L. WAKE ROBIN

Stem simple, from a tuberous rootstock, naked below and bearing at the summit a whorl of 3 round-ovate netted-veined leaves and a single large flower. Perianth of 3 lanceolate herbaceous persistent sepals and 3 larger colored petals. Stamens 6, much shorter than the segments; anthers linear, on short filaments, adnate. Ovary 3 to 6-angled, 3-celled or 1-celled at summit. Styles 3, elongated, stigmatic down the inside. Fruit a fleshy reddish capsule. Seeds ovate. (Latin triplum, triple, on account of the 3-merous flowers.)

Flower sessile; leaves sessile.....1. *T. sessile*.  
 Flower raised on a peduncle.  
 Leaves sessile or nearly so; peduncle erect.....2. *T. ovatum*.  
 Leaves petioled; peduncle usually declined.....3. *T. rivale*.

1. *T. sessile* L. var. *gigantæum* H. & A. COMMON TRILLIUM. Stem stout, sometimes more than one from the same root, 1 to 1¾ ft. high; leaves round-ovate, 2½ to 5 in. long, commonly broader than long; petals obovate to oblanceolate, 1½ to 3 in. long, deep red or lilac, or varying to dull white; capsule long-oval to subglobose, obscurely 6-angled above, circumscissile around the platform-like base.—Brushy or wooded hill-slopes or cañons: Coast Ranges from Monterey Co. n to Siskiyou Co., but not in inner Coast Range; n. to Wash. Feb.-Mar. Var. *CHLOROPÉTALUM* Torr. Petals yellowish or greenish-yellow.—Monterey Co. to Siskiyou Co. and s. in the Sierra Nevada to Placer Co. The form with pure white petals (Rock Lily) is found from Napa Valley to Humboldt Co. Var. *ANGUSTIPÉTALUM* Torr. Leaves 3 to 7 in. long; petals narrowly linear, typically 1 to 3 (rarely 5) lines wide.—Sierra Nevada; San Luis Obispo Co.

2. *T. ovatum* Pursh. COAST TRILLIUM. Fig. 288. Stem 8 to 10 in. high; leaves ovate to round, sometimes disposed to be rhombic, abruptly acute, 2½ to 5½ in. long; petals oblong-lanceolate to ovate, 1 to 1½ in. long, white changing to deep rose-color; ovary incompletely partitioned above the middle; capsule broadly ovate, the angles projected into narrow wings.—Wooded cañons near the coast from Monterey Co. to Del Norte Co., thence e. to Siskiyou and Shasta Cos.; n. to B. C. and Ida. Mar.-Apr.

3. *T. rivale* Wats. Stem slender, 4 to 10 in. high; leaves ovate, truncatish to cordate at base, 1½ to 3 in. long; flower on a peduncle 1 to 3¾ in. long; petals white, dotted with purple at the center, about 1 in. long; capsule scarcely angled.—Rocky banks, Del Norte and Siskiyou Cos.; n. to southern Ore.

288. *Trillium ovatum* Pursh; a, fl. stem x ½; b, capsule x 1.

31. *SMILAX* L. GREENBRIER

Stems prickly or smooth, climbing by means of tendrils, arising from a tuberous rootstock. Leaves alternate, netted-veined, the petioles bearing near the base a pair of tendrils. Flowers small, greenish, dioecious, borne in axillary umbels. Perianth segments distinct. Staminate flower with 6 stamens. Pistillate flower usually with 1 to 6 abortive stamens; ovary with 1 or 2 ovules in each cell; style short or none; stigmas 1 or 3. Fruit a berry. (*Smilax*, a Greek name.)

1. *S. californica* Gray. Stem woody, climbing over shrubs and trees or trailing over the ground, 3 to 6 (or 14) ft. long; leaves ovate, sub-cordate, 2 to 4¼ in. long, on petioles ½ in. long; perianth 5 lines long, its segments 6; berries globose, black, 4 lines in diameter.—Butte Co. to Siskiyou Co., thence s. to Trinity Co.; n. to Ore.

## AMARYLLIDACEAE. AMARYLLIS FAMILY

Perennial herbs with basal leaves. Flowers perfect, regular, the inflorescence borne on a scape-like stem. Perianth 6-parted, the 6 stamens inserted on its tube. Ovary inferior, 3-celled; style 1. Fruit a several to many-seeded capsule.—*Amaryllis*, *Narcissus*, and *Hypoxis* species are extensively cultivated in Cal. gardens.

1. *AGAVE* L. MAGUEY

Perennial herbs with a basal rosette of leaves on a short or mostly subterranean trunk. Leaves in ours evergreen, fleshy, spine-tipped and margined by prickles. Flowering stem tall, arising from the center of the rosette. Flowers thick and fleshy. Stamens exserted. (Greek *agauos*, noble.)—*A. americana* L., Century Plant, is common in California gardens; in Mexico, just before flowering, an individual of this species yields for a long time one or two gallons a day of saccharine juice from which pulque, the national drink of Mexico, is made. *A. rigida* var. *sisalana* Engelm., of Mexico, yields Sisal Hemp.

Flowers about 4 in a cluster, the clusters racemously or subspicately arranged along the terminal axis; stamens inserted at the middle of the perianth-tube. 1. *A. utahensis*. Flowers many in terminal bunches on the branches of a panicle.

Trunk subterranean or essentially so; stamens inserted at the mouth of the tube.

Ovary fusiform, about twice as long as the perianth segments. . . . 2. *A. consociata*.

Ovary flask-shaped, longer than the perianth segments. . . . . 3. *A. deserti*.

Trunk rising above the ground; stamens inserted at the middle of the tube. . . . . 4. *A. shawii*.

1. *A. utahensis* Engelm. Trunk subterranean; flowering stem 5 to 8 ft. high; leaves thick, hard, 6 to 12 in. long, margined by white teeth and tipped by a spine 1 to 3 in. long; flowers yellow, 1 to 1¼ in. long; perianth abruptly expanded above the tube, its lobes 5 to 6 lines long, 3 times as long as the very short free portion of the tube; capsule 1 to 1½ in. long, dark brown.—Death Valley region; Providence Mts.; e. to Utah and Ariz.

2. *A. consociata* Trel. Plants usually forming very dense and commonly circular colonies 3 to 12 ft. broad; trunk none, the leaves densely clustered at the base; scape slender, 6 to 12 ft. high; leaves thick and fleshy, blue-green, 6 to 12 in. long, edged with straight or curved pale teeth and tipped with a slender black spine; inflorescence slender, rather sparse; flowers yellow, 1½ to 2¼ in. long; perianth lobes 7 to 8 lines long, the free portion of the tube only 1½ to 2 lines long; capsule 1¼ to 1¾ in. long, dark brown, abruptly short-pointed at apex.—San Jacinto Mts. to e. San Diego Co.; L. Cal.

3. *A. deserti* Engelm. Similar to *A. consociata*, the plants forming rather open and more or less circular colonies 5 to 15 ft. broad; scapes stout, 10 to 16 ft. high; leaves whitish-green, 10 to 15 in. long; inflorescence large, dense; capsules 1 to 1½ in. long, light brown, rounded at apex.—San Felipe region, e. San Diego Co.

4. *A. shawii* Engelm. Trunk 8 to 12 in. high, regularly leafy, the flowering stem 8 to 12 ft. high; leaves green, glossy, ovate or lanceolate-ovate, acuminate, 8 to 20 in. long, margined with garnet-red hooked prickles; clusters of the panicle congested; flowers greenish-yellow, 3½ to 4½ in. long; peri-

anth lobes 8 to 10 lines long, the free portion of the tube 7 to 9 lines long.—Sw. San Diego Co. near the coast at the boundary, thence into L. Cal.

### IRIDACEAE. IRIS FAMILY

Perennial herbs, ours low, glabrous, with stout stems and 2-ranked sword-like and sheathing leaves. Inflorescence terminal. Flowers perfect, with petal-like perianth of 6 divisions in 2 whorls. Stamens 3, on the base of the outer whorl. with extrorse anthers. Ovary inferior, 3-lobed, becoming a 3-celled capsule. Style 3-cleft or rarely entire; stigmas 3.

Stems terete: divisions of the perianth in two unlike whorls.....1. IRIS.  
Stems 2-edged or winged; divisions of the perianth alike.....2. SISYRINCHIUM.

#### 1. IRIS L. FLAG

Stems terete, from creeping stout rootstocks. Flowers in the axils of spathaceous bracts. Perianth-tube prolonged beyond the ovary; outer segments or sepals obovate above the claw, spreading or recurved; inner segments or petals narrower, erect. Style divided into 3 petal-like branches, each branch with 2 lobes or appendages at summit; stigma a small projecting shelf (stigmatic only on the upper surface) situated on the lower surface of the branch just below the lobes or appendages. Stamens with linear anthers lying close beneath the branches of the style, i.e., opposite them. Capsule oblong, 3-angled. Seeds flattened or turgid, in 2 rows in each cell. (Greek iris, the rainbow, the Greek species of the genus being celebrated for its brilliant colors.)

Rootstock  $\frac{1}{2}$  in. thick or more; dying leaves gray or yellow-brown; seeds globular or pyriform.

Plant sturdy; mature leaves as long or longer than stem, 4 to 6 lines wide.....

Plant slender; leaves shorter than stem, 2 to 4 lines wide.....2. *I. missouriensis*.  
Rootstock  $\frac{1}{4}$  in. thick or less; dying leaves red-brown; seeds roughly angled, or spherical in no. 3.

Stem  $1\frac{1}{4}$  to 2 ft. high; leaves  $3\frac{1}{2}$  to  $6\frac{1}{2}$  lines broad, strongly ribbed; pedicels about 1 in. long; perianth-tube commonly  $\frac{1}{2}$  in. long.....3. *I. douglasiana*.

Stem commonly less than 1 ft. high; leaves 3 lines broad or less, thickened, ribs less prominent.

Perianth-tube  $1\frac{1}{2}$  to  $3\frac{3}{4}$  in. long; pedicels  $\frac{1}{2}$  in. long.....4. *I. macrosiphon*.

Perianth-tube  $\frac{1}{4}$  in. long; pedicels  $\frac{1}{2}$  to 3 in. long.....5. *I. hartwegii*.

1. *I. longipétala* Herbert. COAST IRIS. Stem very stout, compressed, 1 to 2 ft. high; leaves 4 to 6 lines broad, equaling or rather exceeding the flower-peduncles, turning gray or yellow-brown when dying; pedicels  $\frac{1}{2}$  to  $3\frac{1}{2}$  in. long; bracts scarious at apex,  $2\frac{1}{2}$  to 4 in. long,  $\frac{3}{4}$  to  $1\frac{3}{8}$  in. broad (when spread out); sepals white, veined with violet, or violet above, 3 in. long,  $1\frac{1}{4}$  to 1 $\frac{3}{8}$  in. broad, narrowed to a short claw, the claw with a very prominent ventral ridge which disappears as a thin crest in the middle of the blade; petals light violet,  $2\frac{3}{4}$  in. long, 6 to 7 lines wide; capsule narrowed at each end, 2 in. long; seeds pyriform.—Wet heavy soil, usually forming dense colonies: coastal region from San Francisco Bay to Monterey Co. Apr.

2. *I. missoúriensis* Nutt. WESTERN BLUE FLAG. Stem 10 to 24 in. high, exceeding the leaves (or a few leaves scarcely longer), nearly naked except at base; rootstock short, thick; leaves 2 to 4 lines wide, turning gray or yellow-brown when dying; bracts usually opposite, commonly membranous and straw-color, or sometimes thin, herbaceous; pedicels (1 or) 2 to 4 in. long; sepals whitish or pale blue, veined with purple and often with a central yellowish spot; petals pale blue to white, 2 to  $2\frac{1}{2}$  in. long, the tube about  $\frac{1}{4}$  in. long; capsule  $1\frac{1}{2}$  to 3 in. long, grooved trough-wise on each face, cylindric in outline, or narrowed to both apex and base; seeds globular to pyriform.—Moist places, meadows or wet flats, high mts.: Sierra Nevada (mostly on the crest and east slope, rare on the west slope), s. to the San Bernardino Mts., e. to eastern Inyo Co., n. to Modoc Co., thence sw. at lower altitudes to the inner North Coast Range in Mendocino and Solano Cos. Throughout the Great Basin and n. to B. C. and Dak. July.

3. *I. douglasiana* Herbert. MOUNTAIN IRIS. Stem  $1\frac{1}{4}$  to 2 ft. high, much exceeded by the (3 to 9 lines wide) basal leaves, these reddish at base; bracts broader and less acuminate than in *I. macrosiphon*; flowers 2 or 3 in a

pair of bracts, mostly cream-color, lavender or azure, often purple or lilac, the pedicels commonly 1 ( $\frac{1}{2}$  to  $1\frac{1}{4}$ ) in. long; perianth-tube usually  $\frac{1}{2}$  sometimes to  $1\frac{1}{2}$  in. long; petals 2 to 3 in. long; capsule narrowly oblong, sharply angled,  $1\frac{3}{4}$  to 2 in. long; seeds spherical (or obovoid).—Common in the Redwood belt and on chaparral slopes in the Coast Ranges near the coast from Monterey Co. n.; rare in the n. Sierra Nevada; Ore. May-June. The color of the flowers is exceedingly variable, but the species may be known from the next by its longer pedicels, shorter perianth-tube and stouter habit. Var. *ALTÍSSIMA* Purdy. Three to  $3\frac{1}{4}$  ft. high.—Halfmoon Bay.

4. *I. macrosiphon* Torr. GROUND IRIS. Stems low and slender, nearly naked or commonly clothed with bract-like leaves, much shorter than the basal leaves which are 5 to 12 (or rarely 27) in. long and 1 to 2 lines broad; bracts lanceolate, long acuminate,  $2\frac{1}{2}$  to  $3\frac{1}{2}$  in. long; flowers 1 or 2, on pedicels 6 to 7 lines long, with slender tube  $1\frac{1}{2}$  to 3 in. long; perianth violet-purple or straw-yellow, generally veined or mottled; sepals oblong-obovate or obovate, their lower or middle portion blotched or veined with white, the margin above often undulate; petals oblanceolate, of a uniform color,  $1\frac{1}{2}$  to  $2\frac{1}{4}$  in. long; capsule short-oblong,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; seeds roughly angled.—Brushy slopes, 100 to 3000 ft., Coast Ranges from Santa Clara Co. n. to Del Norte Co.; thence se. to Butte Co. Also s. Ore. Var. *PÚRDYI* Jepson. Stem clothed with many bract-like leaves; perianth cream-color veined with purple.—Redwood region of Mendocino Co.

5. *I. hartwegii* Baker. SIERRA IRIS. Fig. 289. Stems many, very leafy, 6 to 12 in. high; leaves  $\frac{1}{4}$  in. wide or less; flowers commonly in pairs; pedicels  $\frac{1}{2}$  to  $3\frac{3}{4}$  in. long, partly enfolded in the long lanceolate-acuminate bracts, which are borne more or less separate from each other; petals yellow with lavender veins or pale lavender with deeper-colored veins and a yellow median portion; tube 3 to 5 lines long; sepals and petals  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long; capsule short-oblong, obtusely angled,  $\frac{3}{4}$  to 1 in. long; seeds coarsely wrinkled, cubical.—Dry open forest, 2500 to 6000 ft.: w. slope of the Sierra Nevada from Plumas Co. to Kern Co.; s. to cismontane S. Cal.

289. *Iris hartwegii* Baker;  
fl. x  $\frac{1}{2}$ .

## 2. SISYRÍNCHIUM L.

Stems slender, compressed and usually 2-edged or 2-winged, often geniculate, from fibrous roots, with grass-like or lanceolate leaves and fugacious relatively small flowers in umbels inclosed by 2 sheathing herbaceous bracts, with a scarious bractlet subtending each pedicel. Perianth 6-parted, the divisions alike, spreading. Stamens monadelphous, their anthers alternate with the 3 style branches or stigmas; stigmas thread-like. (Name of Theophrastus for a bulbous plant allied to *Iris*.)

290. *S. bellum*  
Wats.; fl. x 1.

Stems 2-margined; perianth 4 to 7 lines long; spathe bracts generally shorter than or equal to the flowers.

Flowers blue; filaments united to the top; anthers  $\frac{1}{2}$  to  $\frac{1}{3}$  as long as the filaments; style entire, stigmas short. . . . . 1. *S. bellum*.

Flowers yellow; filaments united only at base; anthers equal to the filaments; style deeply cleft. . . . . 2. *S. californicum*.

Stems not margined but compressed; perianth 6 to 10 lines long, reddish-purple; outer spathe bract commonly exceeding the flowers. . . . . 3. *S. grandiflorum*.

1. *S. bellum* Wats. BLUE-EYED GRASS. NIGGER-BABIES. Fig. 290. Stems erect, simple or somewhat branching, 10 to 20 in. high; leaves shorter than the stem, 1 to  $2\frac{1}{2}$  lines wide; spathes of 2 nearly equal bracts 10 to 16 lines long, inclosing 3 to 7 flowers; perianth purplish (or sometimes very pale) blue, yellow at base, the segments oblong-

obovate, conspicuously 4 to 6-nerved, 4 to 7 lines long, emarginate at apex, with a slender tooth in the notch, the inner narrower; anthers short, sagittate; style abruptly thickened or obclavate at apex (at least when young), divided at tip into 3 short stigmas; capsule globose, 2 to 3 lines long.—Moist grassy slopes, very common throughout Cal., rare in the deserts and arid areas e. of the Sierra Nevada. Mar.-May.

2. *S. californicum* (Ker) Dry. GOLDEN-EYED GRASS. Stems unbranched, 4 to 12 (or 15) in. high, broadly winged, exceeding the leaves; bracts rather unequal, inclosing 3 to 7 flowers; perianth bright yellow; segments 4 to 6 lines long, 5 to 7-nerved, obtuse or acutish; anthers versatile,  $1\frac{1}{2}$  lines long, about equaling the filaments; style cleft to below the middle; capsule obovate-oblong, 4 lines long.—Wet places, infrequent: cismontane S. Cal., Sierra Nevada and Coast Ranges; n. to Ore. Apr.

3. *S. grandiflorum* Dougl. Scapes 6 to 12 in. high, bright green, exceeding the long-sheathing leaves; spathe 1 to 4-flowered; bracts very unequal, the outer usually much exceeding the broadly campanulate flowers; perianth segments dark reddish-purple, rarely white, 6 to 10 lines long; filaments broad at base, 3 to 4 lines long, united  $\frac{1}{2}$  their length; anthers versatile, 2 lines long; style 6 to 7 lines long, cleft at apex, the branches thread-like, 1 line long or less; capsule depressed-globose, 6 to 8 lines long.—Moist places, hills and mountain slopes: Lassen and Modoc Cos. w. to Humboldt Co.; n. to B. C., e. to Ida. and Nev. Mar.-Apr.

### ORCHIDACEAE. ORCHID FAMILY

Perennial herbs with corms, bulbs, tuberous roots or rootstocks and sheathing leaves often reduced to scales. Flowers perfect, irregular, bracted, either solitary or in spikes or racemes. Sepals 3, alike. Petals 3, 2 alike; the third petal called the "lip" commonly dissimilar in color, size and shape, often enlarged, sac-like or spurred, in our genera most frequently brought into an inferior position (i.e., on the lower side of the flower), by twisting of the ovary. Filaments united with the single style forming a column; perfect anther 1 (in *Cypripedium* 2), situated on the apex of the column and just above or behind the stigma, which is a viscid surface facing the lip. Pollen agglutinated into 2 to 8 pear-shaped masses. Ovary inferior, commonly long and twisted, 1-celled. Fruit a 3-valved capsule. Seeds innumerable, minute.

Leaves foliaceous, i. e. the plants with green herbage.

Flowers solitary or several, showy; lip large and sac-like.

Leaves 2 to many, cauline; sepals and petals brown or greenish-yellow..... 1. *CYPRIPEDIUM*.

Leaf 1, basal; sepals and petals rose-purple..... 2. *CALYPSO*.

Flowers many, spicate or racemose; lip various, but not saccate (except in no. 5).

Perianth with a spur..... 3. *HABENARIA*.

Perianth spurless.

Flowers in a spike.

Spike dense and twisted; leaves uniformly green..... 4. *SPIRANTHES*.

Spike more slender; leaves with white or light-colored markings..... 5. *PERAMIMUM*.

Flowers in a raceme.

Bracts conspicuous, foliaceous (about 1 to 3 in. long); leaves many; sepals 7 to 9 lines long..... 6. *EPIPACTIS*.

Bracts small or minute; leaves few; sepals 1 to 2 lines long.

Leaves 2, near the middle of the stem..... 7. *LISTERA*.

Leaf 1, basal..... 8. *MICROSTYLIS*.

Leaves reduced and scale-like, the whole plant destitute of green herbage.

Plants white; perianth not gibbous or spurred; lip with saccate base and broad wing-like margins above..... 9. *CEPHALANTHERA*.

Plants reddish-brown or purple, rarely yellow; perianth gibbous over the ovary or spurred; lip without saccate base..... 10. *CORALLORRHIZA*.

#### 1. *CYPRIPEDIUM* L. LADY'S SLIPPER

Stems leafy, rough-pubescent, from tufted fibrous roots. Leaves 2 to many, large. Flowers few or solitary, large and showy, leafy bracted. Sepals spreading, in ours seeming as if only 2, the lateral completely or almost completely united into one under the lip, which is an inflated sac with the incurved margin auricled near the base. Column very short, incurved, terminating in a disk-like stigma. Fertile anthers 2, on short filaments, one on each side of the column below the stigma; sterile anther conspicuous, roundish or ovate,

situated on the upper side and over-arching the stigma. (Greek Cypris, Venus, and pedilon, shoe, the saccate lip a fit buskin for the goddess.)

Stem with several alternate leaves, 1 to 2 ft. high.

Petals linear-lanceolate,  $1\frac{1}{2}$  to 2 in. long.....1. *C. montanum*.

Petals oblong, 6 to 7 lines long.....2. *C. californicum*.

Stem with 2 opposite leaves, 2 to 10 in. high; sepals and petals lanceolate, 6 to 12 lines long.....3. *C. fasciculatum*.

1. *C. montanum* Dougl. Stem 1 to 2 ft. high, rough-pubescent with short glandular hairs; leaves elliptic- to narrowly-ovate, the largest 5 or 6 in. long and 3 in. broad; flowers 1 to 3, shortly pedicelled; sepals and wavy-twisted petals usually dark brown, linear-lanceolate,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long; lower sepals united almost to the apex, only the lanceolate-subulate tips free; lip 1 in. long, dull white, veined with purple; sterile anther ovate, 4 lines long, on a slender filament; capsule erect or nearly so, oblong, 10 lines long.—Dense woods: Coast Ranges from the Santa Cruz Mts. to Siskiyou Co., thence se. in the Sierra Nevada to Mariposa Co.; n. to Wash. and Ida.

2. *C. californicum* Gray. Stem stout, rough-pubescent, 1 to 2 ft. high; leaves ovate-lanceolate (or ovate), acute or acuminate, 3 to 6 in. long, the upper lanceolate and gradually reduced to foliaceous bracts of the long loose raceme; flowers 1 to 6, short-pedicelled, greenish-yellow; sepals ovate, acute, 6 to 8 lines long, the two lower united to the apex, equaling the oblong-linear acutish petals; lip obovoid, white or light rose-color, veined with purple, 8 to 10 lines long, pubescent within at the base; sterile anther rounded and arching, nearly sessile, 2 lines long, equaling the roughened stigma; capsule oblong, reflexed, 8 to 15 lines long.—Marin Co.; Del Norte Co. to Lassen Co.; s. Ore.

3. *C. fasciculatum* Kell. Stems slender, 2 to 10 in. high, pubescent, scariously sheathed at base; leaves 2, nearly opposite, ovate to nearly orbicular, 2 to 4 in. long, pale green, with 3 prominent ribs beneath; flowers solitary or 2 to several in a small terminal cluster; sepals and petals lanceolate, acuminate, 6 to 12 lines long, greenish-brown with brown veins; lower sepals wholly united or very nearly so; lip depressed-ovate, greenish-yellow with brown or purplish margin, 4 to 6 lines long; sterile anther oblong, obtuse, equaling the stigma.—Dry open hillsides: Santa Cruz Co.; Plumas Co. to Del Norte Co.; n. to Wash.

## 2. CALYPSO Salisb.

Low herb with a corm and coral-like roots. Stem scape-like, sheathed by a few scale-like leaves, a single petioled leaf at base and a single drooping terminal flower. Flowers large, showy. Sepals and petals similar, equal, distinct; lip sac-like, terminating in 2 short spurs protruding from beneath a winged margin; upper side of sac inside with 3 densely ciliate ridges running from the opening towards the spurs, with 2 short spurs below the expanded apex. Column broadly winged, almost oval, concave, and petal-like; anther hemispherical, borne just below the summit, opening by a lid. (The nymph Calypso in Homer.)

1. *C. bulbosa* (L.) Oakes. CALYPSO. Stem 4 to 5 in. high, the sheathing scales 1 to 2 in. long; leaf ovate, cordate or truncate at base,  $1\frac{1}{4}$  to  $2\frac{1}{4}$  in. long; petiole  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; sepals and petals rose-purple, sometimes pale, linear-lanceolate, 9 lines long; lip as long or slightly longer, ovate-inflated, reddish brown and mottled.—Bogs or in leaf-mold in redwood or pine forests from Marin Co. to Siskiyou and Del Norte Cos.; n. to Alas., e. across the continent.

## 3. HABENARIA Willd. REIN-ORCHIS

Stems erect, leafy at least at base, solitary from fleshy tuber-like roots. Flowers greenish, yellowish, or white, in a terminal spike or raceme. Sepals equal, the lateral mostly spreading, the petals a trifle smaller. Lip spreading or drooping, in ours entire, produced at base into a long slender spur. Column very short. Anther-sacs more or less divergent. (Latin habena, a thong or rein of a horse, on account of the shape of the spur in some species.)

- Stem leafy at base; leaves withering at or before anthesis; lip with a more or less distinct median ridge; upper petals straight.  
 Spur shorter than the ovary; spike with flowers openly spaced... 1. *H. unalaschensis*.  
 Spur equaling or exceeding the ovary.  
 Slender, the spike lax, attenuate at tip; flowers whitish..... 2. *H. elegans*.  
 Stout, the spike dense.  
 Spike narrowly cylindric, rounded in outline at tip; flowers greenish..... 3. *H. michaëli*.  
 Spike cylindric-conical; flowers white..... 4. *H. maritima*.  
 Stem leafy; leaves remaining until fruit is set; lip flat or concave without median ridge; upper petals inarched and overlapping at tip.  
 Flowers white; stem thickened; lip rhombic-lanceolate..... 5. *H. leucostachys*.  
 Flowers greenish; stem very slender; lip narrowly linear.  
 Spur slender, equaling or longer than lip..... 6. *H. sparsiflora*.  
 Spur short, sac-like, shorter than lip..... 7. *H. saccata*.

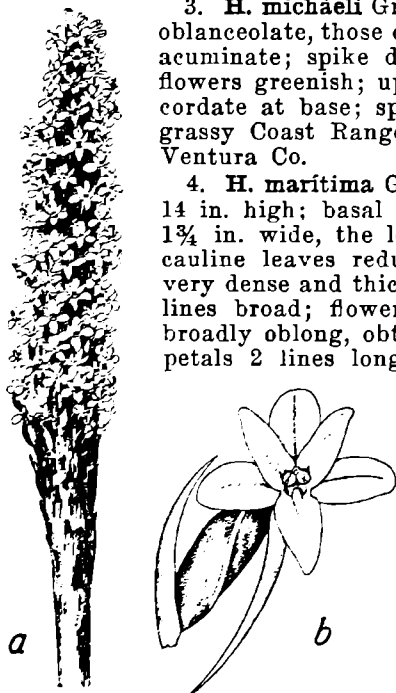

1. *H. unalaschensis* (Spreng.) Wats. Stem rigid, straight, erect, 1 to 2 (or rarely 3) ft. high; leaves 3 or 4, basal, drying up by flowering time, 6 to 8 in. long, the lowest oblong, the upper oblong-lanceolate, longer; flowers greenish or yellowish green, openly spaced on the long tapering spike and exceeding the ovate-lanceolate bracts; perianth segments 1 to 2 lines long; sepals translucent; upper sepal ovate-acute, somewhat deflexed between the greenish petals; lateral sepals and petals oblong-lanceolate; lip ovate, rounded at the apex, rather thick with a prominent ridge down the middle; spur thick, clavate, about equaling, or exceeding the lip, shorter than the ovary; capsule 6 to 8 lines long at maturity.—Dry soil, pine and fir forests: cismontane S. Cal., Sierra Nevada, n. to Siskiyou Co., thence s. to Humboldt Co., n. to Alas.

2. *H. elegans* (Lindl.) Jepson. Slender, strict, 10 to 14 in. high; basal leaves oblanceolate to lanceolate, 2 to 3½ in. long, those of the stem reduced and acuminate or often almost none; spike slender, laxly flowered, attenuate at apex, 5 to 7 in. long; flowers whitish; upper sepal lanceolate; lip oblong-ovate, obtuse, spur as long as or a little longer than the ovary.—S. Cal. and Coast Range woods mostly near the coast from Monterey Co. n. to Humboldt Co.: Sierra Nevada. Var. *ELATA* Jepson. Taller (to 2½ ft. high); spike stouter, elongated (10 to 13 in. long), slenderly attenuate.—Brushy hillslopes, Vaca Mts. to Alameda Co.

3. *H. michaëli* Greene. Stout, 10 to 14 in. high; basal leaves oblanceolate, those of the stem prominent, scale-like, lanceolate-acuminate; spike dense, elongated-oblong, 2½ to 6 in. long; flowers greenish; upper sepal ovate; lip triangular-ovate, subcordate at base; spur ½ to ½ longer than the ovary.—Open grassy Coast Range hills or under oaks, Humboldt Co. s. to Ventura Co.

4. *H. maritima* Greene. Fig. 291. Low and stout, 6 to 10 or 14 in. high; basal leaves oblong, acute, 3 to 6 in. long, 1 to 1¾ in. wide, the lowest narrowed to a broad petiole; upper cauline leaves reduced, appressed, lanceolate-subulate; spike very dense and thick, slightly conical, 1½ to 4 in. long, 7 to 13 lines broad; flowers white, with a heavy fragrance; sepals broadly oblong, obtuse, with a green midvein, 2¼ lines long; petals 2 lines long, broadest at the base, ligulate-attenuate above; lip narrowly ovate, with a prominent ridge toward the base; spur slender, longer than the ovary; column short and almost beakless.—Sea-cliffs or coast hills, San Francisco Co. to Humboldt Co.

5. *H. leucostachys* (Lindl.) Wats. SIERRA REIN-ORCHIS. Fig. 292. Stem thickened below, leafy, ¾ to 2½ ft. high; leaves linear or lanceolate, ¼ to 1½ in. broad; flowers white, rather large, in a dense or open spike 4 to 8 in. long; bracts linear-subulate, shorter than the flower; sepals oblong or oblong-ovate, 3 or 4-nerved, thin, 2 to 3 lines long; petals lanceolate, oblique at base; lip slender-

291. *Habenaria maritima* Greene; a, spike  $\times \frac{1}{2}$ ; b, fl.  $\times 2$ .

lanceolate from a roundish-dilated base, exceeding the sepals and petals; spur slender, 3 or 4 to 6 lines long, exceeding the lip; beak of the stigma prominent, ovate, more than half the length of the connective; capsule oblong, 6 to 9 lines long.—Common about springs and moist meadows: Sierra Nevada; North Coast Ranges; cismon-tane S. Cal.; White Mts.; n. to Alas. Var *VIRIDULA* Jepson. Lowest leaves elliptic to oblong; flowers greenish.—San Antonio Cañon, San Gabriel Mts.

292. *Habenaria leucostachys* Wats.; a, infl.  $\times \frac{1}{2}$ ; b, fl.  $\times 1\frac{1}{2}$ .

6. *H. sparsiflora* Wats. Stem very slender, 12 to 20 (or 30) in. high; leaves oblong-lanceolate; flowers greenish, somewhat scattered in the open spike, usually shorter than the bracts; lower sepals reflexed-spreading; lip rather narrowly linear; spur 3 to 4 lines long, equaling or rarely a little longer than the lip; petals deltoid-lanceolate, inarched with tips overlapping; capsule  $\frac{1}{2}$  in. long.—Frequent by stream sources, 4000 to 8000 ft.: high North Coast Ranges; Sierra Nevada; San Gabriel and San Bernardino mountains; n. to Ore.; e. to N. Mex. and Col.

7. *H. saccata* Greene. Stem slender,  $\frac{3}{4}$  to 2 ft. high; leaves lanceolate or the lowest oblong; raceme lax or medium, its bracts surpassing the green flowers; lip linear, much longer than the short and thick sac-like spur. — Warner Mts., Modoc Co., 5000 to 7500 ft.; n. to Alas.; e. to Col.

#### 4. *SPIRANTHES* Rich.

Stem from a cluster of tuberous roots, erect, leafy. Flowers white, spurless, in 1 to 3 ranks in a twisted spike. Sepals and petals all narrow, erect, in ours united into a short tube at base and more or less connivent into a hood above. Lip sessile or with a short claw, the broad lower portion embracing the column and bearing a protuberance on each side, the apical portion spreading and wavy-crisped. Column short, obliquely inserted on the ovary, bearing the stigma on the front and the sessile or short-stalked erect anther on the back. Capsule erect. (Greek *speira*, spiral, and *anthos*, flower, in allusion to the twisted inflorescence.)

Lip roundish at base, narrowed above the middle but strongly dilated at apex; protuberances ridge-like, minute.....1. *S. romanzoffiana*.  
Lip oblong at base, only slightly dilated at apex; protuberances nipple-like, prominent.....2. *S. porrifolia*.

1. *S. romanzoffiana* C. & S. Fig. 293a, b. Glabrous, 5 to 16 in. high; leaves oblong-lanceolate, 3 to 7 in. long; spike dense,  $1\frac{1}{2}$  to 5 in. long, the flowers dull or greenish white, in 3 ranks; bracts conspicuous, ovate, abruptly subulate-pointed, 5 to 6 lines long; perianth 3 to 6 lines long, curved; lip recurved.—Wet meadows, mostly in the higher mountains:

293. a, *Spiranthes romanzoffiana* C. & S.; infl.  $\times 1$ ; b, lip  $\times 4$ ; c, *S. porrifolia* Lindl.; lip  $\times 4$ .

Sierra Nevada (common), Coast Ranges, cismontane S. Cal. (rare); n. to Alas.; e. across the continent. July-Sept.

2. *S. porrifolia* Lindl. Fig. 293c. Flowers creamy or yellowish white.—Marshy meadows or springy spots, cismontane S. Cal., Coast Ranges, and Sierra Nevada; n. to Wash.

#### 5. *PERAMÍUM* Salisb. RATTLE-SNAKE PLANTAIN

Scape erect, bearing a few sheathing scale-like leaves, a terminal spike, and at base a cluster of petioled white-reticulated leaves. Rootstocks creeping, with fleshy roots. Flowers white, similar to *Spiranthes*. Lateral sepals free, the upper one united with the petals into an erect galea. Lip sac-shaped, sessile, entire and without callous thickenings at base. Anther without a lid. (Greek *pera*, a leathern pouch, referring to the lip.)

1. *P. decipiens* (Hook.) Piper. Plants 11 to 15 in. high, glandular-pubescent, especially the scapes and inflorescence; leaves thickish, rosulate, oblong-ovate, acute at both ends, reticulated with white or light-colored veins or markings,  $1\frac{1}{4}$  to  $2\frac{1}{2}$  in. long, on petioles  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long; flowers 3 to 4 lines long; spike 3 to 5 in. long.—Coniferous woods, Sierra Nevada from Mariposa Co. n. to Modoc Co., thence w. to Humboldt Co. and s. along the coast to Marin Co.; n. to B. C., e. to Quebec. Also in Ariz. (*Goodyera menziesii* Lindl.)

#### 6. *EPIPÁCTIS* Haller

Stem leafy from a creeping rootstock. Flowers in a raceme with foliaceous bracts. Sepals and petals nearly equal, spreading; lip strongly constricted at the middle, the lower portion deeply concave, the upper portion dilated. Anther 2-celled, sessile behind the broad truncate stigma, on a slender jointed base; the pollen-masses become attached above to the gland capping the small rounded beak of the stigma. Ovaries reflexed at maturity. (Greek *epipegnoo*, because used to curdle milk.)

1. *E. gigantea* Dougl. STREAM ORCHIS. Stout, 1 to 3 (or 4) ft. high, nearly glabrous; leaves ovate below, lanceolate above, acute or acuminate, 3 to 7 in. long; raceme minutely pubescent; flowers 3 to 10, on pedicels 2 lines long; sepals greenish, 7 lines long (exceeding the petals), the upper concave and somewhat carinate; petals rose-color, purple-veined, particularly the lip; lower portion of lip with short erect lobes or wings and with many callous tubercles near the base, the upper portion ovate-lanceolate, crested or ridged toward the base.—Moist stream banks: mts. throughout Cal.; n. to Wash., e. to Col. and Tex. May.

#### 7. *LÍSTERA* R. Br. TWAYBLADE

Stem low, bearing a pair of broad sessile opposite leaves at the middle, and arising from a cluster of fibrous creeping roots. Flowers small and greenish, in a loose raceme. Perianth spreading or reflexed; sepals and petals similar; lip free, longer than the sepals, flat and dilated, more or less deeply bifid. Column free, bearing the ovate anther naked (without lid) at the back of the summit. Pollen-masses 2, powdery, united to a very minute gland upon the rounded entire beak of the stigma. Capsule ovoid. (Martin Lister, 1638-1711, a celebrated English naturalist.)

Leaves orbicular or ovate; raceme pubescent.

Lip 4 to 5 lines long, distinctly obtuse-lobed at apex, clawed at base.....

Lip  $1\frac{1}{2}$  to 2 lines long, apex rounded with a shallow notch bearing an inconspicuous tooth, base sessile with a short subulate tooth on each side....  
Leaves deltoid-cordate; raceme glabrous; lip sharply cleft to the middle into 2 attenuate lobes.....

1. *L. convallarioides* Torr. Stem slender,  $\frac{1}{4}$  to 1 ft. high, pubescent above the leaves; leaves orbicular to broadly ovate, often abruptly acute, or obtuse at apex, 1 to 3 in. broad; flowers 6 to 12, greenish, on short pedicels; sepals and petals linear to linear-lanceolate, about 2 lines long; lip narrowly cuneate-obovate, 4 to 5 lines long, distinctly 2-lobed at the dilated apex, toothed on each side at base just above the short but slender claw, the basal papillae

very minute or none; capsule 4 lines long.—Moist shaded places in the mts., 3500 to 6000 ft.: San Jacinto Mts.; North Coast Ranges from Mendocino Co. to Siskiyou Co.; Sierra Nevada from Tuolumne Co. to Shasta Co.; n. to Alas.; e. to Newf.

2. *L. caurina* Piper. Stem very slender, 4 to 6 in. high, pubescent above the leaves; leaves ovate, acute or obtuse, sessile by a clasping base, 1 to  $1\frac{1}{2}$  in. long; bracts ovate, acute,  $\frac{1}{3}$  the length of the pedicels; flowers 5 to 15, greenish, very small, on pedicels 2 to 3 lines long; sepals and petals lanceolate to linear-lanceolate, 1 to  $1\frac{1}{2}$  lines long, spreading; lip  $1\frac{1}{2}$  to 2 lines long, cuneate, with an inconspicuous tooth in the shallow notch at the rounded apex and a short subulate tooth on each side at the base, a papilla at the base of each tooth; column short, not stout; capsule 3 lines long.—Damp woods, high mts.: Humboldt Co.; Ore. to Ida. and Alas.

3. *L. cordata* (L.) R. Br. Stem slender, 2 to 8 in. high; leaves deltoid-cordate,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. broad, mucronate; raceme glabrous; flowers 6 to 24, purplish or yellowish; sepals ovate, about 1 line long; petals broadly oblong,  $\frac{3}{4}$  line long; lip narrow, twice the length of the petals, cleft to the middle into two attenuate lobes, and bearing an orbicular ridge at its base and a subulate basal tooth on each side; column very short; capsule 2 lines long.—Humboldt Co.; n. to Alas., e. to N. Eng.; Eur., Asia.

### 8. *MICROSTYLIS* Nutt.

Low herbs with simple stems and a single leaf from a solid bulb. Flowers many, minute, greenish, in a raceme. Sepals oblong. Petals linear or filiform. Lip auricled or ovate at base, acute at apex, entire. Column with 2 teeth at summit, the erect anther between them. (Greek *micros*, small, and *stylis*, style, referring to the very small column.)

1. *M. monophyllos* (L.) Lindl. Plants slender, 4 to 5 in. high; leaf ovate, 1 to 2 in. long, narrowed at base to a petiole nearly as long; perianth segments 1 to  $1\frac{1}{2}$  lines long; pedicels as long as the ovary.—High montane (8000 ft.), wet places, rare in Cal.: South Fork Mdws., Santa Ana River, San Bernardino Mts.; e. N. Am.; Eurasia.

### 9. *CÉPHALANTHÈRA* Rich.

Stem from a creeping rootstock, bearing medium-sized flowers in a bracted spike. Leaves in ours reduced to scarious sheaths. Sepals and petals nearly equal, connivent, the latter somewhat united and galeate, not gibbous at base. Lip free, concave, contracted and somewhat jointed in the middle. Column slender, elongated. Anther shortly stipitate, so as to be nearly or quite above the level of the top of the stigma. Pollen-masses not connected nor attached to a gland. Stigma wholly beakless. (Greek *cephale*, head, and *anthera*, anther.)

1. *C. áustinae* (Gray) Hel. PHANTOM ORCHIS. Symbiotic saprophyte, the whole plant white, 10 to 20 in. high; rootstock upright with mycorrhizal rootlets; leaves 3 to 6, 1 to 2 in. long; flowers many to numerous; sepals and petals similar, oblong-lanceolate,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long; lip shorter, its middle lobe hinged, 3 to 5-ridged within, the ridges thin; upper sepal and the 2 petals approximate-curving and forming a hood over the column; column 2 lines long, about twice longer than the anther.—Dense mountain forests: Coast Ranges from Monterey Co. to Humboldt Co., and Sierra Nevada from Fresno Co. to Shasta Co.; n. to Ore. Very rare.

### 10. *CORÁLLORRHIZA* R. Br. CORAL-ROOT

Brownish or yellowish saprophytes or root-parasites, destitute of green herbage, and with branching toothed coral-like roots. Stems scape-like, the leaves reduced to scales, and bearing the flowers in a terminal raceme. Perianth segments oblong or lanceolate, nearly alike, ours 3-nerved, gibbous at base over the ovary, or the lateral sepals united at base with the foot of the column, forming a short spur which is adnate to the summit of the ovary. Lip 1 to 3-ridged. Column 2-edged, slightly incurved. Anther terminal,

opening by a lid. Pollen masses 4, soft-waxy. Capsules reflexed. (Greek korallion, coral, and rhiza, root.)

Perianth 3 to 4 lines long, the lateral sepals with a spur at base.

Spur wholly attached to the ovary; lip broad, 3-lobed, spotted. . . . . 1. *C. maculata*.

Spur free for its apical half; lip oblong, entire, or toothed at base, dark red. . . . . 2. *C. mertensiana*.

Perianth 6 to 8 lines long, gibbous at base; spur none; lip entire, purple-veined. . . . . 3. *C. striata*.

1. *C. maculata* Raf. Stems 8 to 13 in. high; raceme 2 to 7 in. long; sepals and petals brownish-purple, 3-nerved, 3 to 4 lines long; lateral sepals united at base with the foot of the column forming a short (1 line long) spur which is adnate to the ovary; lip white, conspicuously spotted with purple, broadly ovate and somewhat convex, 3-lobed by a deep cleft on each side; middle lobe denticulate at apex; capsule  $\frac{3}{4}$  in. long.—Mountain woods, mostly 3000 to 6000 ft.: cismontane S. Cal., n. through the Coast Ranges and Sierra Nevada to Siskiyou Co.; n. to B. C., e. to the Atlantic.

2. *C. mertensiana* Bong. Stems 6 to 20 in. high; raceme more open than in *C. maculata*, its axis lurid-purple; flowers reddish tinged or veined with purple; sepals and petals linear-lanceolate, 3 to 4 lines long; upper sepal erect, covering closely the two petals; lower sepals deflexed-spreading; spur 1 line long, the lower half free from the ovary; lip dark red, oblong, obtuse, entire or with a tooth on one or both sides near the base, clawed below, thin and concave, the ridges only slightly prominent; capsule 5 to 8 lines long, attenuate into the short slender pedicel.—Woods, Humboldt and Siskiyou Cos.; n. to Alas.

3. *C. striata* Lindl. Fig. 294. Stems many in a cluster, 8 to 20 in. high, with 3 or 4 sheathing leaves; raceme 2 to 8 in. long; sepals and petals somewhat flesh-colored, striately 3-nerved with purple or reddish brown lines, about 6 lines long, approximated on upper side of flower and curved over column in such a way as to form a sort of hood; lateral sepals oblique; lip quite entire, its edge a little upturned; spur none but the base of the perianth prominently gibbous over the ovary; capsule 6 to 9 lines long.—Woods along the coast from Santa Cruz Co. to Humboldt Co.; Sierra Nevada from Fresno Co. to Modoc and Siskiyou Cos.; n. to B. C., e. to Ont.

294. *Corallorrhiza striata* Lindl.; fl. x 2.

## DICOTYLEDONS

Leaves netted-veined. Stem increasing in diameter by an annual layer of wood inside the bark. Flowers with the parts in 4s or 5s, the perianth commonly differentiated into calyx and corolla, sometimes absent. Embryo with 2 cotyledons.

## CHORIPETALAE

Calyx usually present, sometimes petal-like. Corolla present or absent, when present consisting of distinct or nearly distinct petals.

### SALICACEAE. WILLOW FAMILY

Trees or shrubs of rapid growth, light wood and bitter bark. Leaves simple and alternate, with stipules. Flowers dioecious, borne in catkins, these falling off as a whole, the staminate after shedding the pollen, the pistillate after ripening of the fruit and dispersion of the seeds. Bracts of the catkin scale-like. Calyx and corolla none. Stamens 1 to many. Ovary 1-celled; stigmas 2 to 4. Fruit a 2 to 4-valved capsule, enclosing many seeds furnished with a tuft of hairs at base.

Scales entire or merely denticulate, persistent; flowers without disk; stamens usually 1 to 5; stigmas short; pods small, ovate or narrow. . . . . 1. *SALIX*.

Scales imbricate or lacerate, caducous; flowers with a broad disk; stamens usually numerous; stigmas elongated or conspicuously dilated; pods larger, nearly globose. . . . . 2. *POPULUS*.

1. **SALIX L. WILLOW**

Trees or shrubs with mostly narrow short-petioled leaves. Winter buds covered by a single scale. Catkins mostly erect, appearing before or with the leaves; scales entire or merely denticulate, persistent or at least not caducous. Staminate flowers with 1 to 9 stamens and 1 or 2 little glands. Pistillate flowers with a gland at the base of the ovary. Stigmas short. (Ancient Latin name of the willow.)

**A. Filaments of the stamens woolly or hairy below.**

Stamens 3 to 9; style short; stigmas roundish, subentire; scales pale or yellowish, in the pistillate catkin more or less deciduous by maturity; capsules pediceled; trees, mainly of lower altitudes.

Petioles with wart-like glands at summit; leaves lanceolate, long-pointed; stipules usually present, roundish; catkins in bud tapering, in flower usually straight, their scales erect. .... 1. *S. lasiandra*.

Petioles not glandular; stipules usually absent; catkins in bud cylindric.

Leaves broadly lanceolate, acute, usually glaucous beneath; staminate catkins curving; scales reflexed or spreading. .... 2. *S. laevigata*.

Leaves very narrow, nearly alike on both faces, finely serrulate, often curving towards apex. .... 3. *S. nigra*.

Stamens 2; scales pale, somewhat deciduous; catkins borne on short leafy branchlets, often clustered.

Filaments distinct; branchlets reddish brown or drab; leaves narrowly linear or lanceolate ( $1\frac{1}{2}$  to 4 or 6 lines wide); shrubs or small trees of stream beds at mostly lower altitudes.

Stigmas linear, 3 to 4 times longer than broad, raised on a distinct style; ovary sessile, densely silky; leaves silvery or green. .... 4. *S. sessilifolia*.

Stigmas oblong, roundish, or ovate, sessile or nearly so.

Capsule glabrous.

Ovary short-pediceled; leaves green, glabrous or nearly so; cismontane.

5. *S. melanopsis*.

Ovary sessile; leaves silky-pubescent below; mostly transmontane. ....

6. *S. exigua*.

Capsule pubescent or pilose; ovary short-pediceled; leaves silky when young, more or less glabrate when mature. .... 7. *S. argophylla*.

Filaments united at very base; pedicels long (about half as long as the ovary); leaves oblong-lanceolate, 2 to 4 lines wide, silky-pubescent; branchlets conspicuously glaucescent. .... 8. *S. geyeriana*.

**B. Filaments of the stamens glabrous or mainly so; stamens 2 (1 or 2 in no. 10).**

Style none; leaves obovate; catkin-scales black, with white hairs. .... 9. *S. scouleriana*.  
Style conspicuous or at least evident.

Filaments conspicuously united above the base (sometimes distinct in no. 14).

Trees or shrubs.

Capsule silky or pubescent.

Leaves with a white felt-like tomentum on under surface; catkins long and slender. .... 10. *S. sitchensis*.

Leaves glabrous; catkins short (oblong to elliptic). .... 11. *S. phylicifolia*.

Capsule essentially glabrous; peduncles of the catkins short (and mostly leafless) or none; style long.

Leaves dark green and glabrous above, whitish or pale blue and commonly puberulent beneath; capsules very shortly pedicelled ( $\frac{1}{2}$  line or less).

Capsule not beaked; hill and valley country, common. ....

12. *S. lasiolepis*.

Capsule warty-beaked; north coast, rare. .... 13. *S. piperi*.

Leaves glabrous, dark or yellowish green above, only slightly paler beneath; capsules with conspicuously long (1 to 2 lines) pedicels.

Branchlets brownish or greenish; leaves 2 to 4 in. long. ....

14. *S. cordata*.

Branchlets yellow; leaves 1 to 2 in. long. .... 15. *S. lutea*.

Stems trailing, forming mats on the ground (2 to 4 in. high); alpine. .... 16. *S. petrophila*.

Filaments free.

Leaves glabrous and slightly glaucous beneath; Sierra Nevada. .... 17. *S. lemmonii*.

Leaves pubescent beneath.

Leaves silky or villous-tomentose beneath.

Leaves entire, not glandular, long silky on both surfaces; high montane. .... 18. *S. glauca*.

Leaves minutely glandular-serrate; gray villous or glabrate; high montane. .... 19. *S. commutata*.

Leaves whitened beneath with a thin close felt; dry inner Coast Range. ....

20. *S. breweri*.

1. *S. lasiandra* Benth. **YELLOW WILLOW**. Fig. 295. Tree 20 to 45 ft. high, the trunk with brown roughly fissured bark; one-winter-old branchlets yel-

lowish; winter buds keeled on the back, short and blunt; young leaves lanceolate or oblanceolate, acuminate, glandular-serrulate, with small suborbicular stipules; mature leaves lanceolate with long tapering or very slender point, 4 to 7 in. long,  $\frac{5}{8}$  to  $1\frac{1}{4}$  in. wide; petioles 3 to 9 lines long, glandular at the upper end; stipules on vigorous shoots conspicuous, orbicular, 5 to 12 lines broad; staminate catkins  $1\frac{1}{4}$  to 3 in. long, usually straight, 5 to 6 lines thick; pistillate catkins  $1\frac{1}{4}$  to  $2\frac{1}{4}$  in. long,  $2\frac{1}{2}$  to 3 lines thick; scales erect, oblong-lanceolate, thin, nearly or quite glabrous on the back, hairy at base, the staminate yellow, the pistillate brown and mostly deciduous in fruit; stamens 4 to 9; ovary and capsule glabrous.—Banks of living streams in the Coast Range, Sacramento and San Joaquin valleys and Sierra Nevada foothills (but ascending to 4500 to 8500 southw.) and s. to S. Cal.; e. to N. Mex., n. to Yukon. Var. *LANCIFOLIA* Bebb. Branchlets more or less pubescent; leaves smaller, narrower, less serrulate; petioles less glandular.—Sierra Nevada from Plumas Co. to Fresno Co., 3500 to 8500 ft.; San Bernardino Mts.; Waltham Creek, Fresno Co.; Santa Cruz. (Var. *abramsii* Ball.)

2. *S. laevigata* Bebb. RED WILLOW. Fig. 296. Tree 20 to 50 ft. high, the trunk bark roughly fissured; one-winter-old branchlets reddish brown, glabrous; winter buds ovate, pointed; young leaves broadly oblong, acute at each end, disposed to be broadest above the middle, mucronate, entire, soon becoming serrulate; stipules minute and

296. *Salix laevigata* Bebb; a, leaf; b, staminate catkin; c, pistillate catkin.  $\times \frac{2}{3}$ .

295. *Salix lasiandra* Benth.; a, leaf  $\times \frac{1}{2}$ ; b, staminate catkin  $\times \frac{2}{3}$ ; c, pistillate catkin  $\times \frac{2}{3}$ .

caducous or none; mature leaves oblong-lanceolate to lanceolate, obtusish at base, acute at apex or sometimes long-pointed, serrulate, glabrous, green and shining above, pale or conspicuously glaucous beneath,  $2\frac{1}{2}$  to  $7\frac{1}{2}$  in. long,  $\frac{5}{8}$  to  $1\frac{1}{4}$  in. broad; petioles 1 to 5 lines long; staminate catkins commonly flexuous,  $1\frac{1}{2}$  to  $4\frac{1}{2}$  in. long, 4 or 5 lines thick; pistillate catkins  $\frac{3}{4}$  to 2 in. long, 2 lines thick; scales soon spreading or reflexed, elliptic, blunt, woolly at base, glabrous and pallid towards apex, 2 to 4-toothed, the staminate yellow, the pistillate gray and tardily deciduous; stamens 4 to 7 (sometimes 3); ovary and capsule glabrous.—Along living streams, valleys and foothills, 20 to 4500 ft., throughout cismontane Cal.; e. to Ariz. and Utah. Var. *ARAQUIFA* Ball. Small tree; one-winter-old branchlets tomentulose; catkins long and dense.—Dry gulches, Solano and Sonoma Cos. to San Diego Co.

3. *S. nigra* Marsh. var. *vallicola* Dudley. BLACK WILLOW. Tree

commonly 20 to 50 ft. high with rough dark bark; branchlets brittle at the base; mature leaves narrowly lanceolate, long-pointed, often falcate, serrulate, glabrous, green on both surfaces, 2 to 7 in. long, 2 to 4 (or 8) lines wide; petioles 1 line long; stipules early deciduous; scales of catkins obovate, yellow, hairy, erect; staminate catkins  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long; stamens 3 to 5; pistillate catkins  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, in fruit 1 to  $2\frac{1}{2}$  in. long, becoming rather lax; ovary scantily pubescent or hoary; capsule glabrous, reddish brown.—River banks, Sacramento and San Joaquin valleys and lower Sierra Nevada foothills and s. to S. Cal.; thence e. to Tex., s. to Mex. (*S. gooddingii* Ball. *S. nigra* Jepson.)

4. *S. sessilifolia* Nutt. var. *hindsiana* And. SANDBAR WILLOW. Shrub with slender stems 5 to 14 ft. high forming clumps in river bottoms; foliage silvery or becoming more or less green; leaves linear, usually tapering to the acute apex and to the narrow but short petiole-like base, entire, 1 to 3 in. long,  $2\frac{1}{2}$  to 5 lines broad, thinly villous on both surfaces and green, or densely villous and silky, especially on young or sterile shoots; no stipules; catkins terminal on leafy branchlets; staminate catkins  $\frac{1}{2}$  to 1 in. long, slender (2 lines thick), in bud usually cylindric, the scales with acute green tips; gland long and slender; pistillate catkins  $\frac{3}{4}$  to 1 in. long, 3 lines thick, often not dense; ovary sessile, densely silky; style present, stigmas deeply cleft into linear lobes; capsule densely silky, or glabrescent and brown.—Abundant in flood beds of streams of the Coast Ranges, Great Valley, and Sierra Nevada foothills. Passing, in Tulare Co., into the var. *LEUCODENDROIDES* Schn. Leaves 3 to  $6\frac{1}{2}$  in. long, finely but remotely denticulate; style very short; stigmas shorter than in the species.—Ventura Co. to San Diego Co.

5. *S. melanopsis* Nutt. var. *bolanderiana* Schn. LONGLEAF WILLOW. Shrub 5 to 15 ft. high with bright green foliage; leaves mostly glabrous, or sometimes minutely canescent, lanceolate or linear, tapering to apex and to a short petiole at base, remotely serrulate with cuspidate teeth, 2 to  $5\frac{1}{2}$  in. long,  $1\frac{1}{2}$  to 6 lines broad; catkins terminal on leafy branches; staminate catkins  $\frac{1}{2}$  to  $1\frac{1}{8}$  in. long, 2 lines thick; pistillate catkins  $\frac{1}{2}$  to 1 in. long; ovary pediceled or sometimes nearly sessile, glabrous; stigmas very short, sessile, cleft into short-ovate lobes; scales densely woolly, mostly ovate; fruiting catkin  $1\frac{1}{4}$  to  $2\frac{1}{2}$  in. long; capsule glabrous, the pedicels short ( $\frac{1}{8}$  to  $\frac{1}{4}$  as long).—Stream beds in valleys and foothills and into the mts. to 4000 or even 6300 ft.: Sierra Nevada from Kern Co. to Shasta Co.; Great Valley; Coast Ranges from Alameda Co. to Siskiyou Co. (*S. longifolia* Jepson.)

6. *S. exigua* Nutt. NARROW-LEAF WILLOW. Shrub, 8 to 16 ft. high; leaves narrowly linear to lanceolate or oblanceolate, glandular-serrulate or entire, bluish-green and pubescent or subglabrous above, pubescent or white-silky below,  $1\frac{1}{4}$  to 3 in. long, 1 to 2 lines wide; catkins similar to no. 5, the pistillate very slender; capsule glabrous, shortly pediceled, very obtuse at apex or even somewhat excavated, the short stigmas sessile; stigmas bifid into ovate or oblong lobes.—East side of the Sierra Nevada, s. to the Colorado Desert, thence w. to Ventura and San Diego Cos.; Nev. to Alb. Var. *PARISHIANA* Jepson n. comb. Often more silky; a very short style often evident.—Ojai Valley to San Bernardino and San Diego Co.; an ill-defined form. (*S. parishiana* Rowlee.)

7. *S. argophylla* Nutt. COYOTE WILLOW. Shrub 5 to 12 or 20 ft. high; leaves narrowly linear to lanceolate or oblanceolate, often falcate, denticulate or entire, 1 to  $2\frac{1}{2}$  in. long, 2 to 3 lines wide, at first silky, more or less glabrate; ovary hairy, short-pediceled; stigmas oblong or linear; capsules hairy.—Stream beds: Klamath River; South Coast Ranges; coastal S. Cal.; e. side of the Sierra Nevada; n. to Ida.

8. *S. geyeriana* And. var. *argentea* (Bebb) Schn. SILVER WILLOW. Slender shrub 6 to 16 ft. high with numerous stems from the base and very slender white-glaucous branchlets; leaves lanceolate, acute at base, acuminate at apex, entire, 1 to  $1\frac{1}{2}$  in. long, 2 to 5 lines wide, becoming green above, appressed silky beneath and imparting a silvery sheen, or glabrate and pale; petioles 1 to 3 lines long; catkins short-peduncled with 2 or 3 leafy bracts.

the staminate 4 to 6 lines long and 3 lines thick, the pistillate 3 to 4 lines long and  $1\frac{1}{2}$  to 2 lines thick; scales dark or yellowish, rounded; filaments united at base, densely long-hairy below; style (none or very short); ovary hoary; stigmas ovate, entire or emarginate; fruiting catkins  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long, about as thick; capsule 2 to 3 lines long, light brown, puberulent, the pedicels about half as long.—Sierra Nevada, 7000 to 9000 ft.: Volcano Creek, Tulare Co.; Lyell Fork near Mt. Lyell; Mono Co.; Twin Lakes, Alpine Co.; Plumas Co.; e. to Col., n. to Ida. (*S. macrocarpa* Nutt. var. *argentea* Bebb.)

9. *S. scouleriana* Barr. NUTTALL WILLOW. Shrub 2 to 15 ft. high or a small tree to 25 ft. high; branchlets with whitish or commonly with very dark bark; leaves broadly obovate or oblong-obovate, entire, rounded at apex or shortly acute, 1 to  $1\frac{1}{2}$  (or 4) in. long,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. broad, yellow-green and lustrous above, yellow-veined, glabrate or densely short-silky beneath; petioles 4 lines long; catkins appearing before the leaves, oblong or elliptic,  $\frac{1}{2}$  to 1 in. long, 5 to 7 lines thick, sessile; bracts obovate, rounded at apex, black or black tipped, covered with white hairs; stamens 2, conspicuously long-exserted, filaments glabrous; ovary white-silky; style none, stigmas broadly linear, sometimes notched at apex; capsule less silky than the ovary.—Montane, 4000 to 10,000 ft., San Bernardino Mts. and Sierra Nevada; along the immediate coast from Monterey Co. and Alameda Co. to Del Norte Co.; n. to Alas., e. to the Rocky Mts. (*S. flavescens* Nutt. *S. brachystachys* Nutt. *S. scouleriana* var. *crassijulis* And.)

10. *S. sitchensis* Sanson var. *coulteri* Jepson n. comb. VELVET WILLOW. Tree or shrub, 5 to 25 ft. high, the trunk 2 to 10 in. in diameter; leaves thickish, obovate to oblanceolate, rounded or shortly acute at apex, entire (obscurely serrulate on vigorous shoots), dark green and almost glabrous above, densely tomentose and lustrous silky beneath, 2 to 5 in. long, 1 to 3 in. broad; petioles 1 to 6 lines long; stipules small, early deciduous or on sterile shoots broad or orbicular, 4 to 6 lines long; staminate catkins  $1\frac{1}{4}$  to 2 in. long, 5 to 6 lines thick; stamen 1; pistillate catkins  $\frac{3}{4}$  to 2 in. long and 3 lines thick, or in fruit 3 to 5 in. long; bracts covered with long white silky hairs, the staminate rounded at apex, the pistillate shorter, broader and more acute; style elongated, stigmas short-oblong, entire or nearly so; capsule silky-tomentose.—Near the coast from Santa Barbara to Marin Co. and Humboldt Co., passing into the species northw. Var. *PARVIFOLIA* Jepson n. comb. Leaves oblanceolate, acute,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, 3 to 4 lines wide.—Mendocino Range. (*S. sitchensis* f. *parvifolia* Jepson.) Var. *RALPHIANA* Jepson n. comb. Leaves oblong-oblanceolate, obtuse; stamens 2; style elongated; stigmas very deeply cleft; otherwise similar to the species.—Tulare Co., about 6000 ft. (*S. sitchensis* f. *ralphiana* Jepson.) Var. *ANGUSTIFOLIA* Bebb. Leaves linear- to oblong-oblanceolate, acute, 1 to  $4\frac{1}{2}$  in. long; stamens 2; style short; fruiting catkins shorter than in the species ( $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long).—Montane, 7000 to 8700 ft., Sierra Nevada from Placer Co. to Madera Co. (*S. jepsonii* Schn.)

11. *S. phylicifolia* L. var. *monica* Jepson n. comb. MONO WILLOW. Pro-cumbent or erect branching shrub, 1 to 2 ft. high; branchlets dark red; leaves ovate, acute at apex, acutish at base, entire or obscurely and remotely serrulate, bright green above, slightly pale below, glabrous or nearly so,  $\frac{1}{3}$  to  $1\frac{1}{4}$  in. long, 3 to 6 lines broad; petioles 1 to 3 lines long; stipules none; scales roundish-ovate, hairy; catkins oblong or elliptic, densely flowered, sessile or subsessile, 3 to 6 lines long, bracts none or few and small; fruiting catkins 8 to 9 lines long; style medium sized, stigmas entire or 2-cleft; capsule pubescent, short-pedicled or subsessile, 2 lines long.—Sierra Nevada, local in Tuolumne and Mono Cos., 9000 to 11,000 ft.: Bloody Cañon; Mono Pass; Tuolumne Soda Sprs. This willow forms dense colonies 10 to 100 yards across; it is dominant on about 15 acres below Mt. Dana saddle. (*S. monica* Bebb. *S. planifolia* Pursh var. *monica* Schn.)

12. *S. lasiolepis* Benth. ARBOYO WILLOW. Shrub or tree 10 to 18 or rarely 25 ft. high, the trunk 3 to 7 in. in diameter with smooth bark; mature leaves oblong, obovate or linear, acute, obscurely serrulate, green and glabrous

above, white-pubescent or pale beneath,  $1\frac{1}{2}$  to 5 in. long,  $\frac{1}{8}$  to  $1\frac{1}{4}$  in. broad; petioles 1 to 8 lines long; catkins appearing before the leaves, sessile, densely silky tomentose in the bud, suberect; scales dark; staminate catkins  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, 5 to 6 lines thick; stamens 2, filaments glabrous, more or less united below; pistillate catkins  $\frac{3}{4}$  to 1 in. long, 3 to 4 lines thick, in fruit  $1\frac{1}{2}$  to  $2\frac{1}{4}$  in. long; style medium, stigmas 2; capsules glabrous or puberulent, short-pedicelled.—Beds of summer-dry arroyos and banks of living streams, valleys and foothills, 10 to 2000 ft., ascending to 4000 or 5000 ft. southw., the most common willow throughout cismontane Cal.; s. to L. Cal., e. to Ariz. (*S. bakeri* Seem.) Var. *BIGELÖVII* Bebb. Leaves broadly obovate or cuneate-oblong, obtuse entire,  $\frac{3}{4}$  to  $1\frac{3}{8}$  in. broad; catkins on short leafy peduncles.—San Francisco Bay region.

13. *S. piperi* Bebb. DUNE WILLOW. Shrub or small tree 5 to 20 ft. high; leaves broadly oblong or elliptic, abruptly acute to obtuse, serrulate to entire, green and glabrous above, lead-color or glaucous-hue beneath, glabrous beneath or when young soft-puberulent,  $2\frac{1}{2}$  to 4 in. long; catkins similar to no. 11; fruiting catkins  $1\frac{1}{2}$  to 4 in. long.—Sand-dunes along the north coast: Humboldt Bay; Dow's Prairie; Del Norte Co.; n. to Wash.

14. *S. cordata* Muhl. Shrub; leaves oblong-lanceolate, narrowed to the subcordate or truncate base and tapering into the pointed apex, entire or serrulate, glabrous, dark green above, paler or glaucous beneath, (1 or) 2 to 4 in. long,  $\frac{1}{2}$  to  $\frac{3}{4}$  (or  $1\frac{1}{2}$ ) in. broad; petioles 1 to 3 lines long; stipules orbicular, early deciduous or none; catkins subsessile or shortly peduncled, dense, 1 to  $1\frac{1}{2}$  in. long, 3 to 4 lines thick; scales narrow, dark or black, the lower part villous with long white hairs; stamens 2, filaments glabrous, elongated, free or more or less united; style long, stigmas short, bifid; fruiting catkins 1 to  $1\frac{3}{4}$  in. long; ovary and capsule glabrous; pedicels  $1\frac{1}{2}$  to 2 lines long.—Montane, 4000 to 7000 ft., Sierra Nevada: Yosemite Valley; Calaveras Co.; Siskiyou Co.; n. to Ore., e. to N. Eng. Rare in Cal. (*S. cordata* var. *mackenziana* Jepson.)

15. *S. lutea* Nutt. var. *watsonii* (Bebb) Jepson n. comb. Shrub 5 to 10 ft. high; branches smooth, glabrous, polished, yellow; leaves yellowish green, oblong and short-acuminate to oblong-lanceolate, serrulate or subentire, 1 to 2 in. long; stipules small or none; catkins  $\frac{1}{2}$  to 1 in. long, dense; capsule glabrous; pedicel  $\frac{1}{2}$  to  $1\frac{3}{4}$  lines long.—High montane, 6000 to 9000 ft.: San Jacinto Mt.; Panamint Range; n. Sierra Nevada (Sierra Co. acc. Bot. Cal. 1:86); e. to Utah. (*S. cordata* var. *watsonii* Bebb.) Var. *NIVARIA* Jepson n. var. Six to 10 ft. high; young leaves silky; branchlets very dark brown, minutely puberulent; styles long.—Near snow banks, Snow Creek, San Bernardino Mts. (Jepson 5575, type).

16. *S. petrophila* Rydb. ALPINE WILLOW. Stems with very short often tortuous branches forming a small depressed or prostrate plant body; flowering shoots 1 to 6 in. high; leaves oblong- or ovate-lanceolate, entire, scantily pilose, 3 to 8 lines long, 2 to 5 lines broad; catkins on erect leafy peduncles, densely flowered,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long, the pistillate 1 to 2 in. long; peduncles in fruit 1 to 2 in. long; glands 2 to each staminate flower; style long, stigmas 2-cleft; capsule white woolly or glabrescent and brown, subsessile, 2 to 3 lines long.—Sierra Nevada, 9000 to 11,000 ft.: Mt. Whitney, Mt. Brewer, Mt. Goddard, Mt. Lyell, Mt. Dana, Tower Peak, and other high peaks; n. to Alb., e. to N. Mex. (*S. petrophila* var. *kennedyi* Schn.) Not recorded from Mt. Shasta.

17. *S. lemmönii* Bebb. LEMMON'S WILLOW. Stems many from a clustered base forming a rounded shrub 4 to 12 ft. high; leaves lanceolate, acuminate at both ends, entire, green above, very pale glaucous below, glabrous or nearly so, 1 to 4 in. long, 3 to 5 lines broad; petioles 1 or 2 lines long; stipules small, soon deciduous; catkins elliptic, about  $\frac{1}{2}$  in. long on very short peduncles with 2 or 3 foliaceous bracts; scales pitch-black, usually rounded, villous; stamens 2, filaments slightly puberulent at base; style short, stigmas short-linear, bifid; fruiting catkins  $\frac{1}{2}$  to 1 in. long; ovary and capsule grayish tomentose or the latter glabrate; pedicels in fruit  $\frac{1}{2}$  to  $\frac{3}{4}$  line long.—Moist river bottoms and swampy meadows, 5000 to 9000 ft.

common, Sierra Nevada from Tulare Co. to Plumas Co. Var. *AUSTINAE* Schn. Branchlets with a glaucous bloom.—Plumas Co. (*S. austinae* Bebb.)

18. *S. glauca* L. var. *orestera* Jepson n. comb. Spreading many-stemmed shrub 2 to 4 (or 6) ft. high; leaves oblong-lanceolate, acute or taper-pointed, entire, green above, slightly glaucous beneath, pubescent or subglabrous, when young villous tomentose on both sides, 1 to 2½ in. long, 3 to 7 lines wide; petioles almost none to 3 lines long; stipules lanceolate or none; catkins ½ to ¾ (or 1½) in. long, on leafy-bracteate peduncles, the staminate peduncles very short or almost none; scales hairy, dark, turning reddish; ovary hoary-tomentulose; style long; stigmas entire (or 2-lobed); fruiting catkins ¾ to 1½ in. long; capsule brown, finely pubescent, 3 to 4 lines long, pediceled.—High montane slopes, 8000 to 11,500 ft.: Sierra Nevada from Tulare Co. to Sierra Co. (*S. orestera* Schn. *S. glauca* var. *villosa* Bebb, Jepson et al.)

19. *S. commutata* Bebb. SIERRA WILLOW. Shrub 2 to 5 ft. high; branchlets dark brown; leaves mostly oblong, acute at apex, obtuse at base, appressed-villous and gray (or the young parts densely white tomentose), often glabrescent and green, minutely (or microscopically) glandular serrate or sometimes entire, ¾ to 2½ in. long, 5 to 12 lines broad; margin of small leaves at base of both leafy and flowering shoots thickly studded with glands; stipules ovate, lanceolate or none; catkins on short leafy peduncles, the staminate ½ in., the pistillate ½ to 1 in. long (in fruit 1 to 1½ in. long); scales dark, villous; filaments glabrous; ovary hoary-tomentose, pediceled; style long; stigmas oblong, bifid or entire; capsule brown, finely pubescent, 2 to 3 lines long.—Sierra Nevada, 7000 to 10,500 ft.: House Mdw., North Fork Kings River; Mt. Goddard; Crescent Lake, Mariposa Co.; Perego Mdw., Yosemite Park; Tuolumne Soda Sprs.; Summit, Placer Co.; near Mt. Lola; Warner Mts.; also w. Nev.; n. to Alb. and Alas. (*S. eastwoodiae* Chl. *S. californica* Bebb not Lesq.) Var. *RUBICUNDA* Jepson n. var. Low shrub ¾ to 1½ ft. high; branchlets cherry-bark red; leaves ovate, glabrate, 6 to 10 lines long (but mature leaves not known); catkins 3 to 5 lines long; capsules glabrous.—High montane, 10,100 to 10,500 ft., in Tulare Co.: Mt. Whitney; Lost Creek; Sawtooth Range (Jepson 4992, type).

20. *S. bréweri* Bebb. BREWER WILLOW. Low spreading shrub 1 to 2 ft. high; mature leaves oblong to linear, shortly acute or obtuse, green and puberulent above, rugose beneath and whitened with a thin but dense felt-like covering, entire, 1 to 2 or 2½ in. long, 3 to 6 lines wide; petioles almost none; stipules of sterile shoots small, ovate, acute; catkins appearing before the leaves, dense, 6 to 9 lines long, 3 to 4 lines thick, sessile, with 2 or 3 small bracts at base; scales yellow, rounded at apex, rather densely pilose on both sides; stamens 2; filaments glabrous; anthers yellow; nectary filiform very long; ovary and capsule hoary; style elongated, stigmas 2-cleft.—Dry situations, inner Coast Range: Epperson, Colusa Co.; Mt. Hanna; Mt. St. Helena; Mt. Hamilton Range; Hepse dam Peak; San Carlos Range. Var. *DELNORTENSIS* Jepson n. comb. Leaves obovate; anthers violet.—Ne. Del Norte Co. (*S. delnortensis* Schn.)

## 2. PÓPULUS L. POPLAR

Trees with scaly buds and caducous stipules. Leaves rather long-petioled, broad. Winter buds covered by many scales. Catkins appearing before the leaves, in ours pendulous; scales fimbriate or lacerate, falling as soon as released by the flowering elongation of the catkin. Stamens inserted on the surface of a concave disk. Ovary seated on a collar-like disk; style short; stigmas 2 to 4, narrow and elongated, or conspicuously dilated. Capsule 2 to 4-valved. Coma of the small seeds long and conspicuous. (Classical Latin name of the Poplar.)

Stamens 40 to 80.

Leaves deltoid-orbicular, broader than long, yellowish green, alike on both faces; valley streams.....1. *P. fremontii*.

Leaves longer than broad, ovate, dark green above, rusty or silvery beneath; valley and mountain streams.....2. *P. trichocarpa*.

Stamens 6 to 12; leaves round-ovate, 1 to 2 in. long; high mountains.....3. *P. tremuloides*.

1. *P. fremontii* Wats. FREMONT COTTONWOOD. Fig. 297a. Handsome tree commonly 40 to 90 ft. high with massive crown, the trunk 1 to 5 ft. in diameter; bark white or whitish, on the main trunk 1 to 5 in. thick, roughly cracked; branchlets stoutish; leaves bright green, lustrous, triangular or roundish in outline, 2 to 4 in. broad, broader than long, the margin crenate except at the abruptly short-pointed apex and the truncate or subcordate base; scales regularly lacinate-fringed, shorter than the flowers; stigmas 3 or 4, roundish; pods ovate, roughish, 4 to 5 lines long, borne on pedicels 2 lines long; disk  $1\frac{1}{2}$  to 2 lines broad; seeds copiously provided with long white hairs which soon involve the catkin in a soft cottony mass.—Valleys and foothills, usually along living streams: Great Valley; Sierra Nevada foothills; inner North Coast Ranges but rare; South Coast Ranges; S. Cal.; thence e. to N. Mex. Also called Common Cottonwood. Var. *PUBESCENS* Sarg. Branchlets pubescent.—San Diego and ne. to southern Nev. Var. *ARIZÓNICA* Jepson n. comb. Branchlets slender; leaves long-pointed.—Mill Creek, San Bernardino Mts. (acc. Sargent); Ariz. (*P. arizonica* Sarg.). Var. *MACDOUGALLII* Jepson n. comb. Leaves bluish-green; disk  $1\frac{1}{2}$  lines broad.—Colorado Desert. (*P. macdougallii* Rose.)

2. *P. trichocarpa* T. & G. BLACK COTTONWOOD. Fig. 297b. Tree commonly 30 to 125 ft. high, with a broad head of upright branches; trunk 1 to 3 ft.

297. Leaves of *Populus*: a, *P. fremontii* Wats.,  $\times \frac{1}{2}$ ; b, *P. trichocarpa* T. & G.,  $\times \frac{1}{4}$ ; c, *P. tremuloides* Michx.,  $\times \frac{1}{2}$ .

in diameter; bark light or dark in color but usually with a yellowish cast, longitudinally fissured, the long, narrow and rather smooth-surfaced plates separated by cleanly channeled fissures; leaves broadly or narrowly ovate, finely serrate, truncate or heart-shaped at base, acute or tapering to a point at apex,  $2\frac{1}{2}$  to 7 (or 11) in. long, lustrous green above, rusty-brown beneath when young but at length whitish; stigmas 3, dilated and deeply lobed; pod nearly sessile; seeds with long lustrous white hairs.—Along living streams and rich bottoms in cañons and valleys, mostly 500 to 7500 ft., nearly throughout the state in the greater ranges; w. Nev.; n. to Alas. Var. *INGRATA* Jepson n. comb. Leaves lanceolate, 2 to  $4\frac{1}{2}$  in. long, 4 to 10 lines broad.—Santa Ana Cañon, San Bernardino Mts. (f. *ingrata* Jepson).

3. *P. tremuloides* Michx. ASPEN. Fig. 297c. Slender tree with branches gracefully pendulous towards the ends, 10 to 60 ft. high, the trunk 3 to 10 in. in diameter; bark smooth, greenish white, or on old trunks nearly black; leaves round-ovate, finely toothed or almost entire, abruptly tipped at apex with a short sharp point, 1 to 2 in. long; ovary conical; stigmas 2, very thick below, divided above into 2 slender spreading lobes; seeds minute,

brownish, bearing long white hairs.—Margins of streams or swampy meadows or on rocky drifts, 5000 to 10,000 ft.: Sierra Nevada; not on Mt. Shasta; local in Cañon Creek, Trinity Mts., and Fish Creek Cañon, Mt. San Geronio; s. to Mex., e. to Rocky Mts., n. to Brit. Am. It has a more extensive distribution than any other North American tree. The wood burns green.

### BETULACEAE. BIRCH FAMILY

Deciduous trees or shrubs with alternate simple petioled leaves and caducous stipules. Flowers monoecious, in catkins, flowering in late winter before the leaves appear. Staminate catkins elongated, pendulous, falling after flowering; flowers 3 in the axil of each scale; calyx present. Pistillate catkins relatively short; calyx none; ovary 2-celled, one ovule in each cell; styles 2. Fruit a 1-celled 1-seeded nutlet.

Scales of the catkin consisting of a bract and 4 bractlets united, in the woody cone obscurely 5-lobed at apex; pistillate catkins developing into oval or ovoid woody cones which are drooping or spreading and eventually fall whole; stamens 2, 3 or 4 (or 1 to 7).....1. *ALNUS*.

Scales of the catkin consisting of a bract and 2 bractlets united, in the fruiting catkin plainly 3-lobed at apex; pistillate catkins solitary, cylindrical and erect in fruit, falling to pieces when mature; stamens 2.....2. *BETULA*

#### 1. *ALNUS* Hill. ALDER

Catkins 2 to 8 in a cluster, usually borne on a forked peduncle, sometimes sessile. Scales consisting of a bract and 4 bractlets united. Staminate catkins pendulous; calyx 4 (5 or 6)-parted; stamens 1 to 6. Pistillate catkins erect, spike-like, ripening into woody cones, the scales persistent on the axis; flowers 2 in the axil of each scale. Cones spreading or pendulous when mature. Nutlet with a narrow acute margin. (The Latin name.)

Catkins appearing in the early autumn as rather conspicuous naked buds and flowering in the late winter or early spring before the leaves appear; peduncles of the pistillate catkins naked, their branches  $\frac{1}{2}$  in. long or less; stamens 1 to 4.

Trees 30 to 80 ft. high; mostly of low altitudes.

Leaf-margin plane, with small scattered glandular teeth; bracts of staminate catkin obtuse; stamens 2, sometimes 3, 1, or 4.....1. *A. rhombifolia*.

Leaf-margin coarsely toothed, the entire margin with a narrow underrturned edge; bracts of staminate catkin acute or acutish; stamens 4, rarely 3.....2. *A. rubra*.

Shrubs 8 to 15 ft. high; leaf-margin coarsely toothed and again finely toothed; stamens 4 or 2; high montane.....3. *A. tenuifolia*.

Catkins appearing in the spring from scaly buds at the same time as the leaves; peduncles of the pistillate catkins leafy (at least at base), their branches  $\frac{1}{2}$  to 1 in. long; stamens 5 or 6; leaf-margin sharply or lacinately toothed; high montane shrub...4. *A. viridis*.

1. *A. rhombifolia* Nutt. WHITE ALDER. Tree 30 to 115 ft. high; bark whitish or gray-brown; leaves oblong-ovate or -rhombic, tapering more or less to base and apex, 2 to 4 in. long; cones ovoid, 5 to 9 lines long.—Banks of rivers and living streams: Coastal S. Cal.; Sierra Nevada cañons; Great Valley; Coast Ranges except in the narrow coast strip occupied by Red Alder; n. to Wash.

2. *A. rubra* Bong. RED ALDER. Fig. 298. Tree 30 to 90 ft. high; bark very white or white-mottled; leaves 2 to 6 in. long, elliptic ovate, often rusty beneath, the coarse teeth again finely toothed; cones oblong-ovoid,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long.—Deep cool cañons or moist flats along the coast: Santa Inez Mts. to Del Norte Co.; n. to Alas. Abundant from Marin Co. to Humboldt Co., where it forms pure groves of singular beauty in marshy bottoms near the sea. Also called Oregon Alder.

3. *A. tenuifolia* Nutt. MOUNTAIN ALDER. Shrub or small tree, 8 to 14 ft. high; leaves roundish to ovate, thickish, at base truncate rounded (or even subcordate) to cuneate, coarsely toothed and again finely serrate, 1 to 3 in. long; staminate catkins 3 or

298. *Alnus rubra* Bong.; a, fl. branchlet; b, cluster of winter "cones."  $\times \frac{1}{4}$ .

4 in a cluster, 3 in. long; pistillate catkins 3 to 8 in a cluster, sessile or with peduncles almost 2 lines long; cones small, 3 to 7 lines long.—Thickets on wet hillsides or in moist hollows, 5000 to 7000 ft.: Sierra Nevada from Lake Tahoe to Mt. Shasta, thence w. to Trinity Summit and the Siskiyou; n. to Yukon Terr., e. to Rocky Mts.; also in L. Cal.

4. *A. viridis* DC. var. *sinuata* Regel. THIN-LEAF ALDER. Slender shrub 6 to 10 ft. high; leaves broadly ovate, thin, gummy when young, bright green, unequally and sharply or laciniately toothed,  $2\frac{1}{4}$  to 3 in. long; catkins appearing in spring at the same time as the leaves, the peduncles of the pistillate leafy at base, their branches  $\frac{1}{2}$  to 1 in. long; stamens exceeding the sepals, the filaments long.—High montane, 6500 to 7000 ft.: Trinity Summit to Mt. Shasta; n. to Alas.; Siberia.

## 2. *BÉTULA* L. BIRCH

Scales of the catkins consisting of a bract and 2 bractlets united. Flowers 3 in each axil or sometimes 2 in the pistillate catkin. Staminate catkins 1 to 3 in a cluster, sessile or short-peduncled, pendulous; calyx 4 (or 2)-lobed; stamens 2, each filament with 2 distinct anther-cells. Pistillate catkins solitary on the peduncle and erect. Cones erect, long and slender, the scales falling away from the axis (on the tree) when the fruit is mature. Nutlet seed-like, with a broad thin wing. (Latin name of the birch.)

Leaves 1 to 2 in. long; lobes of bracts broad, usually parallel, acutish..... 1. *B. fontinalis*.  
Leaves  $\frac{1}{2}$  to 1 in. long; lobes of bracts narrow, divergent, obtusish..... 2. *B. glandulosa*.

1. *B. fontinalis* Sarg. WATER BIRCH. Slender tree 10 to 25 ft. high with red-brown smooth bark; leaves round-ovate, sharply serrate, mostly acute at apex, almost or quite glabrous, 1 to 2 in. long; petioles 4 to 5 lines long; staminate catkins 2 to  $2\frac{1}{2}$  in. long; pistillate catkins  $1\frac{1}{2}$  in. long in fruit, 3 or 4 lines in diameter.—Cañon streams, 2500 to 8000 ft., Sierra Nevada from Bubbs Creek and Inyo Co. to Mt. Shasta, thence w. to Humboldt Co.; n. to B. C. (*B. occidentalis* Jepson.) Var. *INOPINA* Jepson n. comb. Branchlets rather densely hairy; fruiting catkins 1 in. long.—Sw. Siskiyou Co. (*B. occidentalis* f. *inopina* Jepson.).

2. *B. glandulosa* Michx. SCRUB BIRCH. Shrub 1 to 4 ft. high with glandular-warty twigs; leaves roundish, serrate except at base,  $\frac{1}{2}$  to 1 in. long; staminate catkins commonly solitary; pistillate catkins 4 to 9 lines long.—High montane, Lassen and Modoc Cos.; n. to arctic circle.

## CORYLACEAE. HAZEL FAMILY

Shrubs or bushes with alternate simple leaves. Staminate catkins pendent, worm-like, from scaly buds; staminate flowers solitary in the axil of each scale, without perianth; stamens (in ours) seemingly 8, really 4, each anther cell and its stalk representing the half of a forked filament. Pistillate catkins reduced to small clusters set in scaly buds; pistillate flowers 2 to each scale, each flower with 2 minute laciniate-fringed bractlets; perianth minute, adnate to the 2-celled ovary and without limb; style short; stigmas slender, elongated. Bractlets in fruit much enlarged, forming a foliaceous involucre about the nut.

### 1. *CÓRYLUS* L. HAZEL

Leaves broad, thin, serrulate or incised. Flowers appearing before the leaves. Involucre tubular. (Ancient Greek name.)

299. *Corylus rostrata* var. *californica*  
A. DC.; fr. branchlet  $\times \frac{1}{2}$ .

1. *C. rostrata* Ait. var. *californica* A. DC. CALIFORNIA HAZEL. Fig. 299. Commonly 6 to 10 (rarely 20) ft. high; leaves obovate to roundish, rounded at apex or shortly acute, sometimes obscurely 3-lobed above the middle, short-villous beneath (velvety to the touch),  $1\frac{1}{2}$  to 4 in. long; involucre at base sometimes densely, sometimes sparingly hispid or almost glabrous, prolonged beyond the nut into a laciniately fringed tube  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; nut ovoid, bony, 6 lines long.—Along streams in cool cañons or on moist slopes: Coast Ranges, 20 to 2500 ft., from the Santa Cruz Mts. and Napa Co. to Humboldt Co. and Del Norte Co.; Sierra Nevada, 2500 to 6000 ft. from the Kaweah River to Yosemite and Mt. Shasta; n. to B. C. Not as yet seen in Vaca Mts., inner South Coast Range or Santa Lucia Mts. (*C. californica* Rose.) Var. *TRACYI* Jepson n. var. Leaves subglabrous beneath or sparingly pubescent (not velvety); involucre tube (beyond nut) very short, 2 to 4 (rarely 8) lines long.—Humboldt Co. (Grouse Mt., Tracy 4842, type) to Siskiyou Co. and s. in the Sierra Nevada.

## FAGACEAE. OAK FAMILY

Trees or shrubs with alternate simple leaves and promptly deciduous stipules. Flowers monoecious, apetalous, appearing with the leaves in the deciduous kinds. Staminate flowers in catkins; calyx parted into several lobes; stamens 4 to 12. Pistillate flowers 1 to 3 in an involucre of imbricated scales, the involucres solitary or few in extremely reduced or short catkins, or sometimes 1 or 2 at base of staminate catkins; ovary adherent to the calyx, 3-celled, 6-ovuled, only one ovule maturing, the remaining ovules and the other two cells abortive. Fruit a nut borne singly in a scaly cup or 1 to 3 in a spiny bur.

Fruit an acorn; catkins simple.

Catkins unisexual, the staminate drooping.....1. *QUERUS*.

Catkins erect, all with staminate flowers, pistillate flowers at base of some of them...

2. *LITHOCARPUS*.

Fruit a spiny bur; catkins erect, often branching, unisexual, or with pistillate flowers at base of some of the staminate catkins.....3. *CASTANOPSIS*.

1. *QUERCUS* L. OAK

Trees or shrubs of slow growth, hard wood and usually contorted branches. Flowers greenish or yellowish. Staminate catkins pendulous, one or several from the lowest axils of the season's shoot. Pistillate flowers borne in the upper axils of the season's shoot, the ovary with 3 to 5 styles or stigmas. Fruit an acorn, the nut set in a scaly cup. Abortive ovules often discernible in the ripe or nearly ripe acorn. (Latin name of the oak.)

**A. White Oaks.**—Bark commonly white or whitish, wood light-colored; stamens mostly 6 to 9; stigmas sessile or nearly so; abortive ovules mostly towards base of nut.

1. *Acorns* maturing the first autumn; nut glabrous on the inner surface.

Deciduous species.

Branchlets pendulous; acorn cups deep, the nut long and slender; leaves pinnately parted with coarsely 2 to 3-toothed lobes; trunk bark dark brown, deeply cuboid-checked; valleys.....1. *Q. lobata*.

Branchlets not pendulous; acorn cups shallow; trunk bark white, shallowly checked but smoothish.

Leaves dark lustrous green above, rusty or pale beneath, 5 to 7-parted; nut subglobose or oblong-cylindric; mossy trees; mainly North Coast Ranges...

2. *Q. garryana*.

Leaves bluish green above, pale beneath, oblong, coarsely toothed or entire; nut oval, often swollen at or below middle; interior dry foothills.....

3. *Q. douglasii*.

Evergreen species.

Small tree; leaves blue-green, oblong, mainly entire; nut subcylindric; S. Cal.....

4. *Q. engelmannii*.

Shrubs; cups saucer-shaped.

Branches rigid; leaves  $\frac{3}{4}$  to 1 in. long; chaparral areas.

Leaves brittle, plane, light green, oblong, spiny-dentate or entire; nuts oval to cylindric, blunt or pointed.....5. *Q. dumosa*.

Leaves tougher, dark green, convex above, regularly dentate; nuts short cylindric or subglobose, very obtuse.....6. *Q. durata*.

Branches slender, pliable; leaves 3 to  $4\frac{1}{2}$  in. long, strongly parallel-nerved, toothed, chestnut-like; local in Siskiyou and vicinity...7. *Q. sadleriana*.

2. *Acorns maturing the second autumn; nut tomentose or hairy within.*

Trees; acorn cup usually very large and thick.

Leaves 2 to 3½ in. long, dense woolly when young, with prominent regular parallel nerves; islands off south coast.....8. *Q. tomentella*.

Leaves commonly 1 to 2 in. long, entire or spinose-toothed, dull green above, lead-color beneath or with a golden fuzz when young; cup typically like a yellow turban; mts.....9. *Q. chrysolepis*.

Shrubs; acorn cup sub-turbinate or low bowl-shaped, thin; leaves ½ to 1½ in. long.

Branches slender and pliable, forming broom-like tufts at top of stems; leaves mostly entire, no golden fuzz; high montane.....10. *Q. vaccinifolia*.

Branches rigid, spreading; leaves dentate-prickly, olivaceous above, pale beneath; S. and L. Cal.....11. *Q. palmeri*.

**B. Black Oaks.**—Bark dark or black, wood dark or reddish; stamens 4 to 6; stigmas on long styles; abortive ovules mostly towards top of nut; nut tomentose within.

Acorns maturing the first autumn; nut slender-ovate; leaves roundish or elliptic, convex above; coast valleys and hills.....12. *Q. agrifolia*.

Acorns maturing the second autumn.

Leaves oblong, obtuse or tapering to the acute apex, plane, pale yellowish below; nut slender ovate, often streaked longitudinally; interior valleys and hills.....13. *Q. wislizenii*.

Leaves pinnately parted or toothed, always bristle-tipped; nut oblong, obtuse; mts. Deciduous tree; leaf divisions generally coarsely toothed; common.....14. *Q. kelloggii*.

Semi-evergreen tree; leaf divisions smaller, generally entire; rare.....15. *Q. morehus*.

1. *Q. lobata* Neé. VALLEY OAK. Fig. 300. Graceful tree, commonly 40 to 125 ft. tall; trunk 2 to 10 ft. in diameter; bark thick, cuboid-checked; leaves 3 to 4 (rarely 6) in. long; 2 to 3 in. broad, green above, paler beneath, yellow-veined, parted to the middle or nearly to the midrib into 3 to 5 pairs of lobes; lobes most commonly broadened towards the end, less frequently pointed, coarsely 2 or 3-toothed at apex or sometimes entire; cup drab-brown, deeply hemispherical, very warty, ½ to ¾ in. deep; nut long conical, at first bright green, later mahogany or chestnut-brown, 1½ to 2¼ in. long, ½ to ¾ in. in diameter.—Rich soils of the Sacramento and San Joaquin valleys, Sierra foothills and Coast Range valleys, but not in valleys facing the sea; s. to San Fernando Valley. The most characteristic tree of well-watered valley floors, the round-topped crown typically broader than high, its spreading branches finally ending in long cord-like branchlets which sometimes sweep the ground (whence "Weeping Oak"). Called Water Oak, White Oak and Mush Oak by settlers and Roble by the Spanish-Californians. Var. *WALTERI* Jepson. Leaves roundish in outline, sinuses very narrow; nuts very thick.—Kaweah River basin, 2700 to 4000 ft. Var. *TURBINATA* Jepson. Leaves large and thicker than in the species; nuts turbinate.—Little Lake Valley, Mendocino Co. Var. *ARGILLARUM* Jepson n. comb. Pendulous branchlets mostly none; bark smoother, often whitish; leaves deeply and narrowly lobed, often persistent through the winter.—Clay hills, w. Solano Co. (f. *argillarum* Jepson). Var. *INSPERATA* Jepson n. comb. Leaves narrow (¾ to 1¼ in. wide); cups shallow, strongly tuberculate; nuts smaller than in the species.—Kaweah River foothills. (f. *insperata* Jepson).

300. *Quercus lobata* Neé; a, leaf x ½; b, acorn x 1.

301. *Quercus garryana* Dougl.; a, leaf  $\times \frac{1}{2}$ ; b, acorn  $\times 1$ .

varying to obovoid or subcylindric, although always rounded at apex,  $\frac{3}{4}$  to 1 in. long,  $\frac{3}{8}$  to  $\frac{3}{4}$  in. thick, its surface polished and shining.—Rich mt. slopes: Santa Cruz Mts. and Mt. Tamalpais to Mendocino and Humboldt Cos.; far n. to B. C. Wood used for shipbuilding and interior finish in Oregon. Also called Garry Oak and Post Oak. Var. BREWERI Jepson. Brewer Oak. Scrub form; leaves 1 to 2 in. long.—High altitudes from the Yollo Bolly Mts. to the Siskiyou Mts. Var. SEMOTA Jepson. Kaweah Oak. Shrub; leaves 3 to 4 in. long.—Chaparral belt of the s. Sierra Nevada.

3. *Q. douglasii* H. & A. BLUE OAK. Fig. 302. Tree 20 to 60 ft. high, the white trunk bark shallowly checked into small thin scales, this characteristic roughness extending well out to the smaller branches; leaves minutely pubescent, bluish green above,

302. *Quercus douglasii* H. & A.; a, b, leaves  $\times \frac{1}{2}$ ; c, acorn  $\times 1$ .

303. *Quercus engelmannii* Greene; a, acorn  $\times 1$ ; b, leaf  $\times \frac{1}{2}$ .

pale beneath, 1 to 3 in. long,  $\frac{1}{2}$  to 3 in. wide, mostly oblong to obovate, entire, or coarsely and often unequally few-toothed, or shallowly lobed; cup 4 to 6 lines broad, of less diameter than the nut and very shallow, the scales developing small wart-like processes; nut  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, 6 to 10 lines thick, dark or light brown, oval in outline but variable, often much swollen just below or at the middle or only on one side, or again narrow and tapering to apex.—Dry or rocky foothills, common, forming open stands: Sierra Nevada foothills; inner Coast Ranges; approaching the ocean only in Monterey Co., where the Redwood Belt is narrowest. Often called Mountain Oak and Iron Oak by settlers.

4. *Q. engelmannii* Greene. MESA OAK. Fig. 303. Spreading or round-crowned tree 15 to 50 ft. high with trunk  $\frac{1}{2}$  to 3 ft. in diameter; leaves blue-green, oblong, obtuse, entire or sometimes toothed,  $\frac{3}{4}$  to 3 (most commonly  $1\frac{1}{4}$  to  $1\frac{3}{4}$ ) in. long,  $\frac{5}{8}$  to 1 in. wide; acorns ripe in first autumn; cup  $\frac{3}{4}$  in. broad, shallow or sometimes bowl-shaped, with warty scales, inclosing nearly  $\frac{1}{2}$  the nut which is subcylindrical,  $\frac{1}{2}$  in. long and about as thick, or 1 in. long, relatively less thick and sometimes acute.—Coastal S. Cal.: foothills of the San Gabriel Mts. near Pasadena; mts. of San Diego Co. in a zone about 15 to 40 miles back of the sea; s. to L. Cal.

5. *Q. dumosa* Nutt. SCRUB OAK. Fig. 304. Shrub 2 to 8 ft. high, with tough rigid branches and branchlets; leaves typically oblong to elliptic or roundish, entire or more commonly irregularly spinose-serrate, or sinuate-lobed with sharply cut or angular sinuses,  $\frac{3}{4}$  to 1 in. long; cup shallowly or deeply saucer-shaped to turbinate, 5 to 8 lines broad, 2 to 5 lines deep, often rusty, the scales tuberculate, sometimes so regularly as to suggest a quilted cushion; nut oval to cylindric, rounded or pointed at apex,  $\frac{3}{4}$  to  $1\frac{1}{8}$  in. long.—Common chaparral shrub in the mts. of S. Cal., ranging northw. through both the Coast Ranges and Sierra Nevada, more or less abundant in the middle and southerly parts of those ranges, rarer in the north. It is highly variable in leaf texture and outline and in acorn character, both of cup and nut. Var. *TURBINELLA* Jepson. Grey Oak. Leaves pale, brittle; cups small, turbinate; nuts slender, pointed.—San Carlos Range, s. to L. Cal. Var. *ALVORDIANA* Jepson. Leaves similar to var. *turbinella*; nuts slender, very long ( $1\frac{1}{4}$  in.).—Inner South Coast Range from the San Carlos Range to the San Emigdio Mts. Var. *ELEGANTULA* Jepson n. comb. Shrub 10 to 15 ft. high; leaves narrow, regularly and mostly sharply toothed from base to apex, but variable.—S. Cal. (Monrovia; Fallbrook). (*Q. macdonaldii* var. *elegantula* Greene.) Var. *MACDONALDII* Jepson n. comb. Small tree 15 to 35 (or 50) ft. high; leaves oblong to spatulate-oblong,  $1\frac{1}{4}$  to  $2\frac{3}{4}$  in. long, sharply but not deeply lobed and mostly above the base.—Santa Cruz Isl.; Santa Catalina Isl. (*Q. macdonaldii* Greene.)

304. *Quercus dumosa* Nutt.;  
a, acorn; b, leaf. x 1.

6. *Q. durata* Jepson. LEATHER OAK. Low spreading shrub with rigid branches, 2 to 5 ft. high; younger branches and leaves densely tomentose; leaves oval, dentate with prickly equal teeth, above convex, the margin more or less revolute; cup bowl-shaped, 8 to 9 lines broad, 4 to 5 lines high, the scales tuberculate; nut short, thick, cylindric, rounded at apex, 7 to 9 lines long.—Monterey Co. to Napa Co.

7. *Q. sadleriana* R. Br. Campst. DEER OAK. Shrub mostly 2 or 3 but even 8 ft. high with several stems from the base; leaves persistent through the winter and until after the new leaves appear in the next summer, oblong-ovate, 3 to  $4\frac{1}{2}$  in. long, the lateral nerves prominent, regular and parallel; stipules oblanceolate,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long, fur-like on account of their dense covering of rusty hairs and persisting as long or even longer than the leaves; acorns ripe in first autumn; cup inclosing about  $\frac{1}{2}$  of the nut which is oval and about  $\frac{3}{4}$  in. long.—High montane, 5000 to 7000 ft.: Trinity Summit to the Siskiyou Mts.; sw. Ore. Most restricted in range of any Californian oak.

8. *Q. tomentella* Engelm. ISLAND OAK. Round-headed tree 25 to 40 ft. high; leaves elliptic to oblong, tomentose or glabrate and light green above in age, strongly parallel-nerved beneath, 2 to  $3\frac{1}{2}$  in. long; cup 1 to  $1\frac{1}{2}$  in. wide,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. deep, its scales imbedded in a dense tomentum but the tips free; nut subglobose, bluntish, 1 in. long.—Santa Cruz, Santa Rosa, Santa Catalina and San Clemente islands of the Santa Barbara group; also Guadalupe Isl. It is a strictly insular species.

9. *Q. chrysólepis* Liebm. MAUL OAK. CAÑON OAK. Fig. 305a, c, d. Tree 20 to 60 ft. high with roundish or often spreading crown; trunk bark whitish,

rather smooth; leaves 1 to 2 (sometimes even 4) in. long, thick, green above, yellow beneath with a fine fuzz or powder, or eventually lead-color or dull white. ovate or oblong - ovate, acute at apex, entire, or with entire and toothed leaves frequently found on the same twig; typical cup thick and rounded with a fine fuzzy or felt-like tomentum concealing the scales, the whole suggesting a yellow turban; nut ovate, globose, or cylindric, rounded at apex or sharply pointed, 1 to  $1\frac{1}{4}$  in. long,  $\frac{3}{4}$  to 1 in. thick. — Mountain ridges, slopes and cañons almost throughout Cal., extremely variable in habit and in the acorns. It

305. *Quercus chrysolepis* Liebm.; a, c, typical leaves; d, acorn; b, var. *nana* Jepson, leaf; e, var. *hansenii* Jepson, acorn; f, var. *grandis* Jepson, acorn. x 1.

has a wider distribution and grows under more varied conditions than any other species of this family in Cal., but does not occur in the foothills. Called also Goldecup Oak, Mountain Live Oak, White Live Oak, Pin Oak and Hickory Oak. It furnishes the most valuable wood amongst our species, being strong, tough and close-grained. Var. *NANA* Jepson n. comb. Fig. 305b. Leaves ovate, acute, small ( $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long).—Scrub form in the chaparral. (f. *nana* Jepson.) Var. *HANSENII* Jepson n. comb. Fig. 305e. Low tree; nut slender-cylindric.—Amador Co. (f. *hansenii* Jepson.) Var. *GRANDIS* Jepson n. comb. Fig. 305f. Tree 60 to 110 ft., high, usually with very tall trunks; cup rather thin, the pubescence thin, not concealing the scales.—Deep cañons, Mendocino Co. (f. *grandis* Jepson.) Var. *PENDULA* Jepson n. comb. Branchlets pendulous; leaves oblong- to broad-lanceolate, deep shining green above.—Upper San Benito River. (f. *pendula* Jepson.)

10. *Q. vaccinifolia* Engelm. HUCKLEBERRY OAK. Fig. 306. Low evergreen shrub; branches slender and pliable, forming broom-like tufts at top of stems; leaves very small, mostly entire, no golden fuzz; acorn-cup thin; nut globose-ovate, 4 to 6 lines long.—High montane, 5000 to

306. *Quercus vaccinifolia* Engelm.; a, leaf; b, acorn. x 1.

10,000 ft., often gregarious: Sierra Nevada; Trinity Mts. to the Siskiyou Mts.

11. *Q. palmeri* Engelm. PALMER OAK. Rigidly branched shrub 5 to 15 ft. high; leaves typically elliptic to roundish ovate or nearly orbicular, wavy-spinose,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, undulate, coriaceous and stiff, olivaceous above, pale or whitish beneath; young leaves sparingly pubescent on the upper surface and with a dense but thin yellowish or later white felt on the lower surface; cup thinnish, subturbinate but shallow, 5 to 7 lines broad, 3 to 5 lines deep; nut ovate,  $\frac{3}{4}$  to 1 in. long, the shell tomentose within; seed-leaves purple, separable.—Mts. of S. Cal. from the Santa Rosa Mts. to Jacumba; s. to L. Cal.

307. *Quercus agrifolia* Neé;  
a, leaf; b, acorn. x 1.

12. *Q. agrifolia* Neé. COAST LIVE OAK. Fig. 307. Low broad-headed tree 20 to 70 ft. high; trunk bark smooth and beech-like or irregularly fissured; leaves roundish, elliptic, sometimes ovate or oblong, usually with spine-tipped teeth or sometimes entire, commonly 1 or 2 in. long but varying from  $\frac{1}{2}$  to 4 in., usually convex above; cup broadly turbinate, 4 to 7 lines deep, usually embracing only the base of the nut; nut slender, pointed, 1 to  $1\frac{1}{2}$  in. long, 5 to 7 lines thick.—Abundant on rich valley floors, rocky hills and steep cañon sides from cismontane S. Cal. through the Coast Ranges as far north as Mt. Diablo and Napa and Sonoma Cos. Also L. Cal. Var. FRUTESCENS Engelm. Scrub form in the chaparral, 3 to 6 ft. high.—Berkeley Hills and elsewhere.

13. *Q. wislizenii* A. DC. INTERIOR LIVE OAK. Fig. 308. Round-headed tree most commonly 30 to 75 ft. high; trunk 1 to 3 ft. in diameter with a thick brittle bark which is very smooth or sometimes roughly fissured; leaves typically oblong (varying to elliptic, ovate or ovate-lanceolate), either tapering to apex or rounded, 1 to  $2\frac{1}{2}$  (or  $4\frac{3}{8}$ ) in. long, glabrous, green and shining above, pale yellowish green below, the margin entire or spiny-toothed; cup deeply cup-shaped to hemispherical, embracing  $\frac{1}{4}$  to  $\frac{1}{2}$  the nut, 6 to 7 lines broad, its scales thin, red-brown; nut cylindric and tapering to the apex or conical, often longitudinally banded with dark lines converging at the summit,  $1\frac{1}{4}$  to  $1\frac{5}{8}$  in. long.—Hill slopes or moist valley levels, 200 to 5000 ft.: Great Valley; Sierra Nevada foothills from Kern Co. to Shasta Co., thence s. in the inner Coast Ranges to the Vaca Mts. and to Ukiah Valley. Var. FRUTESCENS Engelm. Scrub form in the chaparral usually 4 to 6 ft. high; branchlets very rigid; leaves small, thick.—Coast Range summits and ridges w. to the ocean and s. to S. Cal. and L. Cal. Var. EXTIMA Jepson n. comb. Acorns very small, the nut 8 to 9 lines long, 3 lines thick.—Kaweah River, 4000 ft. (f. *extima* Jepson.)

308. *Quercus wislizenii* A. DC.; a, b, leaves; c, acorn. x 1.

14. *Q. kelloggii* Newb. CALIFORNIA BLACK OAK. Fig. 309. Graceful tree with broad rounded crown, 30 to 80 ft. high; trunk bark dark, checked into small plates; leaves deeply and mostly sinuately parted, with about 3 lobes on each side ending in 1 to 3 or more coarse bristle-tipped teeth, lustrous

309. *Quercus kelloggii* Newb.; a, leaf  $\times \frac{1}{2}$ ; b, acorn  $\times 1$ .

green above, lighter beneath, often white with a fine tomentum when young, 4 to 10 in. long,  $2\frac{1}{2}$  to 6 in. wide; cup large,  $\frac{1}{2}$  to 1 in. deep,  $\frac{3}{4}$  to  $1\frac{1}{8}$  in. broad, its scales thin, with a membranous and sometimes ragged margin; nut oblong, rounded at apex, deeply set in the cup, 1 to  $1\frac{1}{4}$  in. long and  $\frac{3}{4}$  in. thick, covered at first with a fine fuzz. — Mountain slopes and gravelly valleys, 1500 to 6500 ft., or sometimes ascending to 8000 ft. or descending to 200 ft.: high mts. of S. Cal.; Sierra Nevada; Coast Ranges, but not near the sea; n. to southwestern Ore.

15. *Q. morehus* Kell.

ORACLE OAK. Tree 25

to 50 ft. high; leaves oblong to elliptic,  $2\frac{1}{2}$  to 4 in. long, sinuately but rather shallowly lobed, the lobes pointing upward and spinose-tipped; cups similar to those of *Q. wislizenii* or more cup-shaped; nuts cylindric, about 1 in. long, 6 to 7 lines thick, minutely pubescent. — Occurring only at scattered stations, the individuals usually few, 200 to about 5000 ft.: Sierra Nevada from Eldorado to Tulare Co.; Coast Ranges from Trinity Co. to Alameda Co.; San Bernardino Mts.

2. **LITHOCÁRPUS** Bl.

TAN OAK

Trees or shrubs with evergreen leaves and erect catkins. Staminate flowers one in a place, densely disposed in elongated simple erect catkins; stamens 8 to 10, four times as long as the 5-parted calyx. Pistillate flowers 1 in an involucre the involucre few at the base of some of the staminate catkins;

310. *Lithocarpus densiflora* Rehd.; a, fl. branchlet  $\times \frac{1}{4}$ ; b, acorn  $\times 1$ .

calyx often with rudimentary stamens; ovary 3-celled. Fruit an acorn, the cup with slender spreading scales. (Greek lithos, rock, and karpos, fruit, referring to the acorn.)

1. *L. densiflora* (H. & A.) Rehd. TAN OAK. Fig. 310. Large tree 50 to 150 ft. high; leaves oblong, acute, strongly parallel-nerved beneath, the nerves ending in the teeth of the margin,  $2\frac{1}{2}$  to  $4\frac{1}{2}$  in. long, 1 to  $1\frac{3}{4}$  in. wide; catkins slender, 2 to 4 in. long; acorns ripe in second autumn; cup  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. broad; nut globose or short thick cylindric, 1 to  $1\frac{1}{2}$  in. long, covered with a deciduous close woolly coat.—Fertile mt. slopes and ridges, Santa Ynez Mts. to Siskiyou Co., thence s. to Mariposa Co. It is associated with the Redwood, or in Mendocino and Humboldt Cos. it becomes most highly developed in the "Bald Hills" country just inside the Redwood Belt. (*Pasania densiflora* H. & A.) Var. *ECHINOIDES* Abrams. Scrub Tan Oak. Low shrub 1 to 10 ft. high, its thick leaves 1 to 2 in. long, entire, and with inconspicuous nerves.—Siskiyou region.

### 3. *CASTANÓPSIS* Spach. CHINQUAPIN

Trees or shrubs with evergreen leaves and branchlets lengthening by a terminal bud. Catkins slender, erect. Staminate flowers in clusters of 3, disposed on elongated sometimes branching catkins; calyx 5 or 6-parted; stamens 6 to 12; ovary rudiment present. Pistillate flowers 1 to 3 in an involucre, the involucre on shorter catkins or sometimes scattered at the base of the staminate catkins; calyx 6-cleft with abortive stamens on its lobes; ovary 3-celled with 2 ovules in each cell; styles 3. Fruit maturing in the second season, the spiny involucre inclosing 1 to 3 nuts. Nuts ovoid or globose, more or less angled, usually 1-seeded. (Greek kastanea, chestnut, and opis, resemblance.)

Tree with thick rough bark, less commonly a shrub; leaves  $2\frac{1}{2}$  to  $5\frac{1}{2}$  in. long, usually long-pointed.....1. *C. chrysophylla*.  
Shrub, low and spreading, with thin bark; leaves  $1\frac{1}{2}$  to 3 in. long, usually obtuse.....2. *C. sempervirens*.

1. *C. chrysophylla* A. DC. GIANT CHINQUAPIN. Tree 50 to 115 ft. high with the very thick trunk bark broken into longitudinal furrows; leaves oblong, tapering to base and also to apex (commonly abruptly long-pointed), entire, dark green on the upper surface, at first golden with a fine tomentum below, later light olive-yellow,  $2\frac{1}{2}$  to  $5\frac{1}{2}$  in. long,  $\frac{3}{4}$  to  $1\frac{3}{4}$  in. wide, the nerves straightish, forking well inside the margins; burs chestnut-like, irregularly 4-valved, containing 1 or sometimes 2 subtriangular nuts 4 or 5 lines long with hard shell and sweet kernel.—Mendocino and Humboldt Cos.; n. to Ore. Var. *MINOR* Benth. Golden Chinquapin. Fig. 311. Shrub 3 to 15 ft. high; leaves trough-like (partly folded along the midrib), very golden below, 2 to 3 in. long.—Rocky ridges and slopes: Monterey to Humboldt Co., mostly near the coast.

2. *C. sempervirens* Dudley. BUSH CHINQUAPIN. Spreading shrub 1 to 8 ft. high with smooth brown bark; leaves mostly plane, oblong, acutish at base, acute or obtuse at apex, or sometimes tapering

311. *Castanopsis chrysophylla* var. *minor* Benth.;  
fl. branchlet x  $\frac{1}{2}$ .

upwards from near the base and therefore lanceolate-oblong,  $1\frac{1}{2}$  to 3 in. long and 5 to 11 lines wide.—Dry mt. slopes or rocky ridges; high mts. of S. Cal. and Sierra Nevada, 3000 to 8000 ft.; Coast Ranges, 1500 to 4000 ft., but not near the sea.

### JUGLANDACEAE. WALNUT FAMILY

Deciduous trees with pinnately compound leaves without stipules. Flowers monoecious, appearing after the leaves. Staminate flowers numerous in pendulous lateral catkins. Pistillate flowers few on short erect terminal catkins. Ovary 1 to 3-celled, inferior. Fruit a nut with a dry husk; seed one, deeply 2-lobed.

#### 1. JÜGLANS L. WALNUT

Bark strong-scented. Branchlets hollow, divided into little chambers by pithy partitions. Buds nearly naked. Staminate flower with an irregularly 3 to 6-lobed calyx and numerous stamens. Pistillate flower with a 4-lobed calyx. Seed so lobed as to fit the irregularities of the nut. (Latin Jovis, Jupiter, and glans, nut.)

Leaflets lanceolate; fruits  $1\frac{1}{2}$  to  $1\frac{3}{4}$  in. in diameter, the nuts smoothish....1. *J. hindsii*.  
Leaflets oblong-ovate to oblong-lanceolate; fruits  $\frac{3}{4}$  to 1 (or  $1\frac{1}{4}$ ) in. in diameter, the nuts with longitudinal channels.....2. *J. californica*.

1. *J. hindsii* Jepson. CALIFORNIA BLACK WALNUT. Tree 30 to 60 ft. high with erect unbranched trunk 10 to 40 ft. high; crown usually as high as broad; leaflets ( $2\frac{1}{2}$  or) 3 to 5 in. long.—Central California, on old Indian camp-sites: Walnut Creek; Walnut Grove; Napa Range above Wooden Valley; Gordon Valley.

2. *J. californica* Wats. SOUTHERN CALIFORNIA BLACK WALNUT. Shrub or tree, the stems several from the base or the stem low-branching, forming a wide-spreading crown, much broader than high; leaflets  $1\frac{1}{4}$  to  $2\frac{1}{2}$  in. long.—Coastal S. Cal. from Santa Barbara Co. to the Santa Ana Mts. and e. to the foothill cañons of the San Bernardino Mts. (south slope).

### MYRICACEAE. SWEET-GALE FAMILY

Shrubs or small trees. Leaves simple, alternate, fragrant, resinous-dotted, without stipules. Flowers in oblong or cylindrical catkins, unisexual, solitary (or sometimes 2) and sessile in the axils of scaly bracts; perianth none. Staminate flower with 4 to 16 stamens; pistillate flower surrounded at base by 2 to 4 small bractlets; ovary superior, 1-celled, 1-ovuled; stigmas 1 to 4, filiform, sessile. Fruit a nutlet. Seed without endosperm.

#### 1. MYRICA L. WAX MYRTLE

The only genus. (Greek murike, the ancient name of the Tamarisk.)

Evergreen; staminate and pistillate flowers on same shrub; Coast Ranges. 1. *M. californica*.  
Deciduous; staminate and pistillate flowers on different shrubs; Sierra Nevada.....  
2. *M. hartwegii*.

1. *M. californica* Cham. WAX MYRTLE. Thickly branched shrub or small tree, 8 to 30 ft. high; leaves thickish, dark green, glossy, oblong, or oblanceolate-oblong, tapering above to an acute apex, narrowed below to a petiole,  $2\frac{1}{4}$  to 5 in. long, remotely serrate or almost entire; catkins 2 to 9 (or 12) lines long, the pistillate in the upper, the staminate in the lower, axils; catkins with pistillate flowers above and staminate at base often occur between; stamens 5 to 16, united by their filaments into a cluster longer than the scale; fruit berry-like but really a small globose nut coated with resinous-waxy grains, 2 lines in diameter, the bractlets at the base minute.—Sand-dunes, moist flats or hillsides, Redwood forest slopes, or rocky declivities near the ocean; Santa Monica Mts. to the Santa Cruz Mts. and Del Norte Co.; n. to Wash. Mar.-Apr.

2. *M. hartwegii* Wats. SIERRA SWEET BAY. Shrub 3 to 5 ft. high; leaves narrowly obovate or oblong, remotely serrulate, puberulent, petioled, (1 or) 2 to  $3\frac{1}{2}$  in. long; staminate catkins 1 in. long, the scales ovate-deltoid with scarious margin above the shortly clawed base; stamens 2 to 4, shorter than the scales; pistillate catkins globose, 1 to  $1\frac{1}{2}$  lines long, in fruit 5 to 7 lines long, sprinkled with resin globules; bractlets adnate to the sides of the

nutlet, enlarged and much thickened in fruit, acutely tipped, 1 line long; nutlet laterally compressed, shorter than the bractlets, not waxy.—Sierra Nevada, 1000 to 4000 ft.: Northfork (Madera Co.); Big Creek near Wawona; Rosasco, Tuolumne Co.; Eldorado Co., and n. to about Yuba Co. May-June. The foliage has an agreeable spicy fragrance.

### URTICACEAE. NETTLE FAMILY

Herbs with simple leaves. Flowers small (ours less than 1 line long), greenish, unisexual, clustered, the clusters disposed in catkin-like axillary spikes or loose axillary heads. Petals none. Staminate calyx with 4 distinct or nearly distinct sepals and as many opposite stamens, the filaments coiled or bent inward in the bud so that when released, they fly upwards like a spring, scattering the pollen. Pistillate calyx 2 to 4-toothed or -cleft, or of nearly distinct segments. Ovary superior, 1-celled, with 1 orthotropous erect ovule; style and stigma 1. Embryo straight. Endosperm oily. Fruit an achene, always inclosed or covered by the calyx.

Leaves opposite, toothed, stipulate; hairs stinging; achene flattened.

Pistillate calyx 4-parted, the segments almost distinct, the inner ones largest.....

1. URTICA.

Pistillate calyx saccate, 2 to 4-toothed at orifice.....2. HESPEROONIDÆ.

Leaves alternate, entire, without stipules; hairs not stinging; achene ovoid; pistillate calyx tubular, 4-cleft.....3. PARIETARIA.

#### 1. URTICA L. NETTLE

Annual or perennial herbs with stinging hairs. Leaves opposite, petioled, 3 to 7-nerved, with stipules. Flowers in ours monoecious, clustered, the clusters in axillary, often branching spikes. Staminate flower with 4 sepals, 4 stamens and a cup-shaped rudiment of a pistil. Pistillate calyx with the sepals unequal, the exterior smaller than the inner and at length inclosing the flattened achene; ovary with sessile tufted or almost feathery stigma. Endosperm scanty. (Latin name of the nettle.)

Pistillate and staminate flowers in separate spike-like inflorescences; perennial.

Herbage gray; leaves ovate to lanceolate.....1. *U. gracilis*.

Herbage dark green; leaves broadly ovate, cordate at base.....

2. *U. californica*.

Pistillate and staminate flowers mixed in the same cluster; herbage dark green; annual.....3. *U. urens*.

1. *U. gracilis* Ait. var. *holosericea* Jepson. Fig. 312. Stem erect, unbranched, 4 to 10 ft. high; leaves long ovate to lanceolate, commonly green and with scattered bristles above, gray below with a short dense pubescence, coarsely serrate, 3 to 5 in. long; petioles  $\frac{1}{2}$  to 2 in. long; stipules narrowly oblong, mostly acutish, 2 to 6 lines long; flowers (as also in next) sessile in small clusters (glomerules), the clusters in dense simple or somewhat paniculately branched spikes; pistillate spikes  $\frac{1}{2}$  to 2 in. long, the staminate in axils below the pistillate and often twice as long; inner sepals not or scarcely exceeding achene; achene elliptic but acutish at apex and often at base, smooth. — Along creeks, about damp spots in the hills or mts., in moist valleys or in marshes, 10 to 9800 ft.: common and often abundant throughout Cal. except in the desert regions; n. to Wash. Var.

312. *Urtica gracilis* var. *holosericea* Jepson; a, fl. stem  $\times 1$ ; b, staminate fl.  $\times 6$ ; c, pistillate fl.  $\times 8$ ; d, achene  $\times 8$ .

**GREENEI** Jepson n. comb. Herbage yellowish green; achene with very short and obscure stipe.—W. Siskiyou Co. (*f. greenei* Jepson.) **Var. DENSE** Jepson n. comb. Herbage very gray; leaves on flowering portion of stem reduced, the paniculate spikes equaling or exceeding them, very numerous and forming a dense uninterrupted compound panicle.—Howell Mt.; lower Sacramento River. (*f. densa* Jepson.)

2. **U. californica** Greene. **COAST NETTLE**. Stem often branched from the base, 2 to 3 ft. high, producing stolons; stems and petioles hispid and somewhat pubescent; leaves broadly ovate, deeply cordate, coarsely serrate, subglabrous above, shortly pubescent below and often gray, 3 to 4 in. long and nearly as broad, or the lower 4 to 7 in. long; petioles 1 to 3 in. long; stipules oblong to elliptical, obtuse, 3 to 6 lines long; spikes simple or paniculately branched, mostly exceeding petioles; inner sepals equaling ovateish achene.—Lowlands near the coast from San Mateo Co. to Marin Co.; n. to Alas.

3. **U. urens** L. **SMALL NETTLE**. Fig. 313. Erect and simple or branching from the base, 1 to 1½ ft. high, leafy to the top, very sparingly hispid; leaves elliptic or ovate, coarsely lacinate-serrate, 3 to 5-nerved, ½ to 1½ in. long, slender petioled; stipules short, about 1 line long; flowers more or less pediceled in glomerules, the glomerules in an oblong rather dense spike often shorter than the petioles; fruiting calyx with hispid-ciliate margins.—South Coast Ranges and coastal S. Cal.; nat. from Eur.

313. *Urtica urens* L.; a, fl. stem x 1; b, staminate fl. x 5; c, pistillate fl. x 5.

## 2. HESPEROCNIDE Torr.

Annual herbs similar to *Urtica*. Stipules minute. Staminate calyx with 4 almost distinct sepals. Pistillate calyx consisting of a membranous flattened oblong-ovate sac with a minutely 2 to 4-toothed orifice. (Greek *hespera*, west or western, and *knide*, a nettle.)

1. **H. tenella** Torr. Slender, erect or straggling, 1 or 2 ft. high; stems and petioles bristly with scattered hairs, the blades very sparsely hispid; leaves thin, ovate, serrately incised, ½ to 1½ (or 2) in. long on slender petioles; flowers densely glomerate in the axils, the clusters shorter than the petioles; pistillate calyx thin, hispid with hooked hairs, in fruit ½ to less than 1 line long; achene with minutely roughened surface.—Coast Ranges from Napa Valley to S. Cal.; Sierra Nevada foothills in Tulare Co.

## 3. PARIETARIA L. PELLITORY

Ours low unarmed annuals with alternate entire 3-nerved leaves without stipules. Flowers perfect and pistillate in axillary clusters, involucre by small leafy bracts. Staminate calyx 4-parted. Pistillate calyx tubular-ventricose, 4-lobed. Achene ovoid, inclosed by the persistent calyx. (The ancient Latin name of the Italian species, because growing on walls.)

1. **P. debilis** Forst. Stems very slender, several from the base, diffuse, 4 to 10 in. long; herbage pilose or hispid, especially the stems and margins of leaves; leaves ovate to ovate-lanceolate, rounded at base or abruptly cuneate, often shortly attenuate to the obtuse apex, minutely papillate, 3 to 12 lines long, or the lowest very small, on petioles 1 to 3 lines long; clusters few-flowered.—Moist shady places: S. Cal. and n. to Inyo Co.; N. Am., S. Am., Asia, Austr.

## ULMACEAE. ELM FAMILY

Trees or shrubs with alternate simple leaves and fugacious stipules. Flowers perfect or polygamous. Calyx small. Corolla none. Ovary 1-celled; style or stigma 1. Fruit a samara or drupe.

## 1. CÉLTIS L. HACKBERRY

Flowers greenish. Calyx 5 or 6-parted, the staminate in cymose clusters at the base of the season's shoot, the pistillate solitary or in pairs in the leaf axils and peduncled. Calyx 5 (or 6)-parted. Staminate flower with 5 (or 6) stamens. Perfect flowers with pistil and 5 (or 6) stamens. Ovary 1-ovuled. Fruit a drupe. (Name of Pliny for a Lotus.)

1. *C. mississippiensis* Bosc. var. *reticulata* Sarg. WESTERN HACKBERRY. Small spreading tree 8 to 30 ft. high; leaves ovate, unequal-sided at the cordate base, serrulate, scaberulous, 1 to 3 in. long on petioles 1 to 3 lines long; flowers 2 lines long; drupe berry-like, bluish, globose, 3 lines long, on peduncles 2 to 4 lines long.—Mt. ranges bordering the deserts: Independence; Caliente Creek, Kern Co.; cañon n. of Banning; Thing's Valley, Laguna Mt., San Diego Co.; e. to Col. and Tex., s. to Mex.

## LORANTHACEAE. MISTLETOE FAMILY

Evergreen plants, parasitic on trees. Branches dichotomous. Leaves opposite, simple and entire, or often reduced to connate scales. Flowers dioecious (in ours), greenish and inconspicuous, regular, apetalous. Calyx 2 to 5-lobed. Stamens as many as the calyx-lobes and inserted upon them; anthers 1 or 2-celled. Ovary inferior, 1-celled. Fruit a berry with glutinous endocarp. Embryo straight, in copious endosperm.

Berry sessile; flowers globose; leaves foliaceous or scale-like. . . . . 1. PHORADENDRON.  
Berry on a recurved pedicel; flowers mostly compressed; leaves scale-like and connate. . . . . 2. ARCEUTHIOBIUM.

## 1. PHORADÉNDRON Nutt. MISTLETOE

Parasitic on mostly deciduous trees, the stems much branched and swollen at the nodes. Leaves foliaceous and coriaceous, or scale-like. Flowers sunk in the joints of the jointed spikes, usually several to each scale. Staminate calyx commonly 3-lobed, the anthers 2-celled, sessile on the base of the lobes. Pistillate calyx adherent to the ovary, the 3 teeth persistent on the globose semitransparent mucilaginous sessile berry. (Greek phor, a thief, and dendron, a tree.)

Joints of pistillate spike several-flowered; leaves foliaceous; anthers transverse, opening by pores.

Mature leaves essentially glabrous, 1 to 3½ in. long; var. *macrophyllum* of. . . . . 1. *P. flavescens*.

Mature leaves villose-pubescent ½ to 1½ in. long. . . . . 2. *P. villosum*.

Joints of the pistillate spike 2-flowered.

Leaves foliaceous. . . . . 3. *P. bolleanum*.

Leaves scale-like.

Pistillate spike 1 (or rarely 2)-jointed; anthers transverse, opening by pores; stems glabrous; berries white. . . . . 4. *P. juniperinum*.

Pistillate spike 3 to 4-jointed; anthers oblong, opening by longitudinal slits; stems canescent; berries red. . . . . 5. *P. californicum*.

1. *P. flavescens* Nutt. var. *macrophyllum* Engelm. Stems very woody, forming bushes 2 to 8 ft. in diameter; branches with long internodes, villose-pubescent when young to puberulent in age; herbage yellowish green; leaves obovate to elliptic, densely villose-pubescent when young, essentially glabrous at maturity, conspicuously veined with 3 to 5 prominent nerves, 1 to 3½ in. long, short-petioled; spikes 3 to 7-jointed, ½ to 1 in. long, the pistillate elongating to 1½ or 2 in. in fruit; spikes canescently short-villose; berries white, 2 to 3 lines in diameter.—Sacramento and San Joaquin valleys to S. Cal.; e. to Tex. Parasitic on soft-wood trees: *Aesculus californica*, *Populus fremontii*, *Salix* species. (*P. longispicum* Trel.)

2. *P. villosum* Nutt. COMMON MISTLETOE. Stems woody, forming bushes 1 to 4 ft. in diameter; branches with comparatively short internodes, densely villose and somewhat glandular-pubescent; herbage green; leaves

oblong to oblanceolate or obovate, inconspicuously 3 to 5-nerved, villose-pubescent, short-petioled,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; spikes short, not exceeding 1 in. in length when in fruit, often several at a node and thus fascicled; berries pinkish-white,  $1\frac{1}{2}$  to 2 lines long.—Foothills of the Coast Ranges and Sierra Nevada and s. to S. Cal.; e. to Ariz., n. to Ore. Parasitic chiefly on oaks.

3. *P. bolleanum* (Seem.) Eichler. Stems with short internodes, much branched; herbage glabrous; leaves small, narrowly oblong to spatulate or almost linear,  $\frac{1}{2}$  to 1 in. long, glabrous, nerveless; spikes very short, usually with only 1 joint, the staminate several (6 to 12)-flowered, the pistillate 2-flowered; berries (on account of their whiteness and translucency) pearl-like,  $1\frac{3}{4}$  to 2 lines in diameter.—Coast Ranges and Sierra Nevada to S. Cal.; s. to Mex. On Cupressus species. (*P. pauciflorum* Torr.)

4. *P. juniperinum* Engelm. Stems stout, erect, much branched, sometimes pendulous in age; herbage glabrous; internodes short; leaves reduced to scales; spikes usually 1-jointed; staminate spikes 6 to 8-flowered, the pistillate 2-flowered; berries waxy white,  $1\frac{1}{2}$  lines in diameter.—Sierra Nevada to S. Cal.; e. to N. Mex. Parasitic on Juniperus species. Var. *LIBOCEDRI* Engelm. Stems more slender, erect at first, pendulous in age.—Sierra Nevada, s. to the high mts. of coastal S. Cal. Parasitic on Libocedrus decurrens. (*P. libocedri* Howell.)

5. *P. californicum* Nutt. MESQUITE MISTLETOE. Stems terete, with long very slender branches, these disposed to be pendulous; herbage grayish canescent; leaves reduced to scales; staminate spikes consisting of 2 or 3 (to 5) joints, each with 2 to 6 flowers; pistillate spikes consisting of 3 or 4 joints, each bearing 2 flowers; berries globose, reddish, 2 lines in diameter.—Mohave and Colorado deserts; e. to Ariz. Parasitic on Prosopis juliflora and pubescens. Larrea tridentata, and Acacia greggii. Var. *LEUCOCARPUM* Jepson n. comb. Berries white.—Twentynine Palms; Andreas Cañon. (f. leucocarpum Trel.)

## 2. *ARCEUTHOBium* Marsch-Bieb. PINE MISTLETOE

Plants yellow or brown, leafless, fragile-jointed, parasitic on coniferous trees. Stems quadrangular or angled. Leaves reduced to connate scales. Flowers solitary or several in each axil, crowded into apparent spikes, opening in autumn. Staminate flower:—calyx mostly 3-parted, compressed; stamens 3, the anthers sessile near the center of the calyx-lobes, roundish, 1-celled, opening by a circular slit. Pistillate flower:—calyx 2-cleft, the teeth laterally disposed, the ovary ripening the next autumn after flowering and exerted on the recurved pedicel. Berry circumscissile near the base, when fully ripe explosively dehiscent at a touch or when teased, the glutinous seed being expelled to a distance of several feet. (Greek arkeuthos, juniper, and bios, life.)—By studies of infection cultures J. R. Weir has shown that form, size and color of the plant and compactness of individual colonies varies with age or, more especially, with change of host and geographic location (Bot. Gaz. 66:1).

Plants minute. 5 to 12 lines long. . . . . 1. *A. douglasii*.  
Plants normally  $1\frac{1}{4}$  to 6 in. long.

Staminate flowers all terminal, on peduncle-like joints. . . . . 2. *A. americanum*.  
Staminate flowers in the axils of the scales of a simple or compound spike. . . . .

3. *A. campylopodum*.

1. *A. douglasii* Engelm. Plant dwarfish, 5 to 12 lines long, usually thickly scattered as solitary inflorescences along the branch of the host (not fascicled in dense clusters); staminate plant smaller than the pistillate, sparingly branched; pistillate plant with 1 to 4 pairs of short lateral branches; fruit small, glaucous, purplish, 1 to 2 lines long, slightly laterally compressed and thus forming a slight ridge on each side when mature.—S. Cal. (on *Pseudotsuga macrocarpa*); n. Lake Co. and Mt. Shasta (on *Pseudotsuga taxifolia*); e. to Col., n. to Wash.

2. *A. americanum* Nutt. Plants slender, much branched,  $1\frac{3}{4}$  to  $4\frac{3}{4}$  in. long, often 3 to 5 branches arising from a single joint; staminate flowers on

the ends of very short peduncle-like joints, when in anthesis appearing as if in whorls of 2 to 5 flowers at the joints or in the axils of the branches; pistillate flowers borne in the axils of the scales of a spike, the joints of the spike elongating in fruit; fruit glaucous, bluish-purple,  $1\frac{1}{2}$  to 2 lines long.—Sierra Nevada (on *Pinus contorta* var. *murrayana*): House Mdw., North Fork Kings River; Little Yosemite; Truckee; n. to Ore.

3. *A. campylopodium* Engelm. Plant robust,  $1\frac{1}{4}$  to 6 in. long; flowers arranged oppositely in a 4-ranked spike, 2 flowers to each very short joint; staminate spikes robust, usually yellow with orange flowers,  $2\frac{1}{2}$  to 10 lines long, about  $1\frac{1}{2}$  lines wide; perianth segments usually 3, unlike (the 2 lateral more or less boat-shaped, the other broadly lanceolate, obtuse); pistillate spikes somewhat smaller,  $2\frac{1}{2}$  to 5 lines long,  $\frac{3}{4}$  to 1 line wide, either simple or compound, with several 2 and 3-jointed opposite spikelets, the joints elongating in fruit; fruit glaucous, bluish-purple, slightly compressed, with a longitudinal ridge on each side, 2 to  $2\frac{1}{2}$  lines long, ovoid.—Almost throughout Cal. in the foothills and mts., chiefly on *Pinus* species, occasionally on *Abies concolor*. Var. *CRYPTOPODUM* Jepson n. comb. Staminate inflorescence slender,  $\frac{1}{2}$  to  $\frac{3}{4}$  line wide, the larger spikes 7 to 15-flowered; pistillate plant somewhat smaller, about the same color as the staminate.—Mt. San Jacinto (on *Pinus lambertiana*); Humboldt Co. coast (on *Abies grandis*). (*A. cryptopodium* Engelm.) Var. *DIVARICATUM* Jepson n. comb. Staminate plants with slender main branches, their spikes slender, short, 1 to  $2\frac{1}{2}$  lines long,  $\frac{1}{2}$  line wide, the larger spikes 3 to 5-flowered; pistillate plants with stout main branches, their spikes slender, 2 to 9-flowered,  $1\frac{1}{2}$  to  $3\frac{1}{2}$  lines long,  $\frac{3}{4}$  line wide.—Desert slopes or ranges in the Mohave Desert; e. to N. Mex. On *Pinus cembroides* var. *monophylla*. (*A. divaricatum* Engelm.)

#### SANTALACEAE. SANDALWOOD FAMILY

Herbs or shrubs, usually root parasites. Leaves simple, entire. Flowers small, in ours perfect, mostly greenish. Corolla none. Calyx valvate, 4 or 5-cleft, the lower part of the tube adherent to the ovary. Stamens 3 to 6, inserted opposite the calyx lobes and between the lobes of the disk. Ovary 1-celled; style one; stigma capitate; ovules 2 to 4, suspended from the top of a free central placenta. Fruit indehiscent, nut-like, 1-seeded. Seeds without testa. Embryo small, axile at one end of the abundant endosperm.

##### 1. *COMÁNDRA* Nutt. BASTARD TOAD-FLAX

Perennial herbs with rootstocks, striate stems and glabrous herbage. Leaves alternate, nearly sessile, the lowest scale-like. Flowers greenish white, in small terminal or axillary cymose clusters. Calyx campanulate or urnshaped, 5-cleft. Anthers borne on filaments and also attached to calyx-lobes by a tuft of thread-like hairs. Placenta filiform, contorted. Fruit nut-like, crowned by the persistent calyx-lobes, the cavity filled by a globular seed. (Greek kome, hair, and ander, man, referring to the hairy appendages of the stamens.)

1. *C. umbellata* Nutt. Stems many from a somewhat woody base, 5 to 12 in. high; leaves green or pallid, oblong, acute at base and apex,  $\frac{1}{2}$  to 1 in. long, shortly petioled; flowers  $2\frac{1}{2}$  lines long; fruit globose, the size of a pea, the persistent calyx-lobes forming a sort of neck.—Mt. slopes, 5000 to 6000 ft.: Sierra Nevada; n. to B. C., e. to the Atlantic. July-Aug. Parasitic on the roots of shrubs.

#### ARISTOLOCHACEAE. BIRTHWORT FAMILY

Perennial herbs or twining shrubs. Leaves simple, alternate, petioled, cordate. Flowers perfect, apetalous, with a petal-like synsepalous 3-lobed calyx. Stamens 6 to 12 with extrorse anthers. Styles 6 or 1. Ovary inferior, 6-celled. Fruit a fleshy or dry capsule. Seeds in 1 or 2 rows on the inner angle of each cell, with a minute embryo in copious endosperm.

Calyx regular, persistent; capsule irregularly dehiscent.....1. *ASARUM*.  
Calyx irregular, deciduous; capsule septically dehiscent.....2. *ARISTOLOCHIA*.

1. *ASARUM* L.

Nearly acaulescent herbs with fragrant slender creeping rootstocks bearing 2 or 3 scale-like bracts, then 1 or 2 reniform or cordate leaves on long closely approximate petioles and a short-peduncled flower close to the ground in the axil of the lower leaf. Calyx regular, campanulate, the limb 3-parted, the lobes spreading or recurved. Stamens 12, nearly free from the styles, at first reflexed, the alternate ones shorter; filaments more or less distinct, the connective usually continued beyond the anther into a point. Styles 6, more or less united. Capsule globose, fleshy, commonly bursting irregularly. Seeds large, thick, 2 rows in each cell. (Derivation obscure.)

Rootstock stolon-like, remotely scaly; styles united, equaling the stamens.

Calyx-lobes 1 in. long or more.....1. *A. caudatum*.  
Calyx-lobes 4 to 6 lines long.....2. *A. lemmonii*.  
Rootstock rather closely scaly; styles nearly distinct.....3. *A. hartwegi*.

1. *A. caudatum* Lindl. WILD GINGER. Leaves cordate-reniform, shortly acute or obtusish, pubescent below and above on the veins, 2 to 6 in. broad, on petioles 3 to 7 in. long; peduncles 6 to 12 lines long; calyx-lobes triangular or oblong, attenuate into a tail which is 1 to 2¼ in. long; filaments stout, the free apex of the connective much shorter than the anther; styles united, equaling the stamens.—Deep shade of Coast Range woods, in Cal. following rather closely the Redwood belt from the Santa Cruz Mts. to Del Norte Co.; n. to B. C.

2. *A. lemmonii* Wats. Leaves thin, rounded at summit; flowers mostly glabrous; calyx-lobes only 4 to 6 lines long, obtuse or acute; connective only slightly produced beyond the anther.—N. Sierra Nevada in Plumas and Sierra Cos.

3. *A. hartwegi* Wats. Leaves 2 to 5 in. broad, strikingly mottled, pubescent below, glabrous above or sometimes pubescent along the lateral veins; flowers on pedicels ½ in. long; calyx long, hairy outside, the tube 6 to 8 lines long, the lanceolate attenuate lobes twice as long; connective as long or twice as long as anther.—Montane, 4000 to 7000 ft.: Sierra Nevada from Tulare Co. to Siskiyou Co., thence to Humboldt Co.; n. to Ore.

2. *ARISTOLOCHIA* L.

## PIPE VINE

Twining shrubs with sparingly branched stems and axillary pendulous flowers. Calyx tubular, strongly curved and pipe-shaped. Anthers 6, rarely 7 or 8, sessile, disposed in pairs and adnate to the short simple style. Stigma 3 to 6-lobed or angled. Capsule 6-angled and 6-valved, septicidally dehiscent. Seeds horizontal, in one row in each cell, numerous. (Greek *aristos*, best, *locheia*, parturition, from its supposed efficacy in child-birth.)

1. *A. californica* Torr. DUTCHMAN'S PIPE. Fig. 314. Deciduous woody climber, twining 5 to 12 ft. high on shrubs, the herbage more or less pubescent, sometimes silky; leaves

314. *Aristolochia californica* Torr.; a, fl. branch x ½; b, pistil and stamens x 3.

ovate, cordate,  $1\frac{1}{2}$  to 3 (or  $5\frac{1}{2}$ ) in. long, on petioles 1 or 2 in. long or less; calyx greenish, veined with purple,  $\frac{1}{8}$  to  $1\frac{1}{2}$  in. long; inside of tube near the base with a broad dull purple band; limb 2-lipped, the upper of 2 broad obtuse lobes, the lower entire; ovary clavate; stigma 3-lobed; capsule broadly oblong-obovate, abruptly contracted to a slender base, 6-winged, the body 2 to  $2\frac{1}{2}$  in. long.—Low wooded hills: Coast Ranges from Monterey Co. to Shasta Co., thence s. in the Sierra Nevada foothills to Sacramento Co., Mar.-Apr.

### SAURURACEAE. LIZARD-TAIL FAMILY

Ours perennial herbs, with nodose scape-like stems and alternate entire petioled leaves. Flowers perfect, bracteate, in a dense terminal spike. Perianth none. Stamens in ours 5 to 8. Ovary 1-celled, with 1 to 5 stigmas. Fruit a capsule or berry.

#### 1. ANEMOPSIS Hook.

Stoloniferous herb with aromatic rootstock and astringent somewhat spicy herbage. Leaves mostly basal. Spike conical, surrounded at base by a persistent showy involucre of 5 to 8 bracts; each flower (except the lowest) also subtended by a small white bract. Ovary sunk in the rachis of the spike; stigmas 2 or 3. Capsule dehiscent at the apex. (Greek anemone, and opsis, appearance, the inflorescence resembling the flower of Anemone.)

1. *A. californica* (Nutt.) Hook. YERBA MANSA. Fig. 315. Stems hollow,  $\frac{1}{2}$  to 2 ft. high, with a broadly ovate or elliptic clasping leaf above the middle and a fascicle of 1 to 3 small petioled leaves in the axil; basal leaves elliptic-oblong, rounded above, often somewhat narrowed toward the cordate base, 2 to 8 in. long, on petioles 1 to 8 in. long; spikes  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; involucre bracts white (or reddish beneath), oblong,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; floral bracts obovate, clawed,  $2\frac{1}{2}$  to 3 lines long; ovules 6 to 10 on each placenta.—Common in saline and rather wet lowlands: lower Sacramento Valley; San Joaquin Valley; South Coast Ranges; Inyo Co.; S. Cal.; e. to Utah and Tex., s. to Mex. An infusion of the root is used by Spanish-Californians, both as a liniment for skin troubles and as a tea for disorders of the blood.

RAFFLESIACEAE. PILOSTYLES THURBERI Gray, a small leafless parasite with minute flowers, will probably be found on Dalea in the Colorado Desert.

### PÓLYGONACEAE. BUCKWHEAT FAMILY

Ours herbs or low bushes with simple leaves. Flowers small, regular, mostly perfect, without corolla, and rarely solitary. Calyx 5 to 6-cleft or -parted. Stamens 3 to 9, more or less attached to the calyx. Ovary superior, 1-celled, 1-ovuled and bearing 2 or 3 styles or stigmas. Fruit an achene, mostly triangular in ours, sometimes lenticular.

Leaves alternate or basal, always with sheathing stipules; involucre none.

Sepals 5, equal and erect in fruit; stigmas capitate.....1. POLYGONUM.

Sepals unequal, the inner row erect and enlarging in fruit, the outer row reflexed; stigmas tufted.....2. RUMEX.

Leaves not reniform; sepals 6.....3. OXYRIA.

Leaves reniform; sepals 4.....4. PTEROSTEGIA.

Leaves opposite or basal, without sheathing stipules.

Flower or flowers subtended by one or several distinct bracts, or none.

Bract enlarged in fruit, 1-flowered, 2-lobed, 2-saccate on the back.....5. PHYLLOGONUM.

Bracts not saccate or enlarged in fruit, or bracts none.

Bracts none; stamens 9.....5. PHYLLOGONUM.

315. *Anemopsis californica* Hook.; a, upper portion of fl. stem  $\times \frac{1}{4}$ ; b, detail of fl.  $\times 8$ .

- Bracts present.  
 Flowers in clusters; bracts woolly.  
   Calyx glabrous; stamens 3.....6. NEMACALIS.  
   Calyx woolly; stamens 5 to 9.....7. HOLLISTERIA.  
 Flowers solitary; bracts naked; stamens 3.....8. LASTARRIAEA.  
 Flowers borne in a tubular or turbinate involucre.  
   Involucral teeth spine- or bristle-tipped.  
     Involucre mostly 5 or 6-toothed, usually 1-flowered; stamens 3, 6, or 9;  
       involucral lobes usually tipped with hooked spines.....9. CHORIZANTHE.  
     Involucre 4 or 5-cleft (usually deeply), 2 to many-flowered; stamens 9;  
       involucral lobes ending in straight bristles.....10. OXYTHECA.  
     Involucre 3 to 8-toothed, the teeth not bristle-tipped.....11. ERIOGONUM.

### 1. POLYGONUM L. KNOTWEED

Herbs, some water plants, some woody at base. Leaves entire, alternate, with scarious sheathing stipules ("sheaths"), these entire, ciliate or lacerate. Inflorescence various, the flowers on jointed pedicels. Calyx red, white, or sometimes greenish, usually 5-cleft or -parted, the divisions erect in fruit. Stamens 3 to 9. Styles 2 or 3. Achene lenticular or triangular, inclosed in the fruiting calyx. Embryo curved, lying in a groove at an angle of the endosperm. (Greek *polus*, many, and *gonu*, knee, on account of the nodose zigzag stem of many species.)

#### A. Leaves not cordate.

1. *Flowers in axillary clusters or in spikes, racemes or panicles.*  
 Leaves mostly broad or ample, not jointed to the petiole.  
   Alpine or subalpine perennials with thick rootstocks; stamens 8; achene triquetrous.  
   Flowers in a single dense terminal raceme; stem simple; herbage glabrous.—  
     Subgenus BISTORTA.....1. *P. bistortoides*.  
   Flowers in clusters or panicles; calyx articulated with the pedicel.—Subgenus  
     ACONOGON.  
   Flowers numerous in panicles.....2. *P. alpinum*.  
   Flowers 2 to 4 in axillary clusters.....3. *P. davisiae*.  
 Low valleys or at middle altitudes; flowers in spikes (usually geminate or paniculate), with small scarious bracts; calyx appressed to the triquetrous or lenticular achene; stamens 4 to 8, filaments filiform; sheaths cylindrical, truncate, entire.—Subgenus PERSICARIA.  
   Spikes 1 or 2; flowers red; stamens 5, exserted; achene lenticular; aquatic or marsh perennials.  
     Leaves elliptical or oblong; spikes oblong or ovate,  $\frac{1}{2}$  to 1 in. long.....4. *P. amphibium*.  
     Leaves ovate-lanceolate; spikes more elongated, 1 to 3 in. long.....5. *P. muhlenbergii*.  
   Spikes several to many, in 2s or more or less paniculate; stamens 6 to 8, included; achene either lenticular or triangular; stream borders or marshy places.  
     Sheaths naked in age; spikes often drooping; sepals white or flesh-color; stamens 6; annual.....6. *P. lapathifolium*.  
     Sheaths truncate or truncatish, fringed with bristles; spikes erect.  
       Calyx not punctate.  
       Internodes strongly swollen above the nodes.....7. *P. fusiforme*.  
       Internodes not swollen.  
       Herbage mostly glabrous; annual.....8. *P. persicaria*.  
       Herbage strigillose; perennial.....9. *P. hydropiperoides*.  
       Calyx punctate; perennial.....10. *P. acre*.  
 Leaves mostly narrow and lanceolate, jointed upon a short petiole adnate to the short sheath of the scarious stipules; flowers in axillary clusters, the clusters either more or less separated or crowded into a terminal leafy spike; stamens mostly 8, the filaments or some of them often dilated at base; achene triquetrous.—Subgenus AVICULARIA.  
 Perennial and more or less suffrutescent.  
   Leaves revolute; flowers several in a cluster, crowded at the ends of the branches.....11. *P. paronychia*.  
   Leaves plane; flowers 1 to 3 in each axil, less crowded.  
     Leaves linear; dry foothills.....12. *P. bolanderi*.  
     Leaves oblong or obovate; alpine.....13. *P. shastense*.  
 Annuals.  
   Plants prostrate; branches leafy to the ends.....14. *P. aviculare*.  
   Plants erect or ascending.  
     Flowers in axillary clusters; leaves little reduced upwards.  
       Leaves mostly linear-oblong to lanceolate or oblanceolate.  
       Stems branching above; achenes dull.....15. *P. ramosissimum*.  
       Stems branching at base; achenes shining.....16. *P. sawatchense*.  
       Leaves ovate to elliptic; achenes shining.....17. *P. minimum*.  
   Flowers in very loose spikes; leaves much reduced upwards; plants  $\frac{1}{2}$  to 1  $\frac{1}{2}$  ft. high.  
     Flowers deflexed; achenes black, shining.....18. *P. douglasii*.

Flowers erect; achenes brownish, dull. . . . . 19. *P. spargulariaeforme*.  
 Flowers in dense terminal leafy spikes; plants  $\frac{1}{2}$  to 4 in. high. . . . .  
 20. *P. imbricatum*.

2. *Flowers strictly solitary in the axils of the leaves or bracts.*

Internodes in ours very short and the branches spike-like; stamens 8; achene triquetrous; leaves very narrow, not jointed to the lacerate stipule; ours slender wiry brittle annuals.—Subgenus *DURAVIA*.

Sheaths conspicuously lacerate.

Stems flowering above the base; sheaths lacerate into more or less bristle-like segments. . . . . 21. *P. californicum*.

Stems flowering from very base; stipules cottony. . . . . 22. *P. parryi*.

Sheaths 2-parted, the segments sharply but shortly toothed. . . . . 23. *P. bidwelliae*.

**B. Leaves cordate.**

Flowers in loose panicle racemes; stamens 8; achene triquetrous; twining plants.—Subgenus *BILDERDYKIA*. . . . . 24. *P. convolvulus*.

1. *P. bistortoides* Pursh. Stems several from a thick horizontal rootstock, 1 to 2 $\frac{1}{4}$  ft. high, the leaves mostly basal, those above reduced and bract-like; leaves erect, oblong to linear-oblong, 4 to 8 in. long, the petioles half to as long; raceme dense, spike-like,  $\frac{3}{4}$  to 1 $\frac{1}{2}$  in. long; flowers white, on slender pedicels, 2 to 4 lines long.—High wet meadows, Sierra Nevada, San Bernardino Mts. and North Coast Ranges; e. to the Rocky Mts. and far n.

2. *P. alpinum* All. Stems stout, erect, 2 to 7 ft. high, arising from a fleshy rootstock, 1 to 2 in. in diameter; herbage glabrous or nearly so; leaves ovate, acuminate, 3 to 6 in. long, the short petiole narrowly wing-margined to the base; panicles terminal, loose, nearly or quite leafless, 3 to 7 in. long; flowers white.—Subalpine, Yosemite to Mt. Shasta and w. to Marble Mt.

3. *P. davisiae* Brew. Stems simple or sparingly branched, 5 to 11 in. high, several from the crown of a thick taproot 1 or 2 in. in diameter; leaves ovate or oblong-ovate, minutely pubescent, often glaucous,  $\frac{3}{4}$  to 1 $\frac{1}{2}$  in. long, subsessile or shortly petioled; flowers purplish green or yellowish, 2 to 4 in loose terminal or axillary clusters; achene half exserted from the persistent calyx.—High mts., 6000 to 8000 ft.: n. Sierra Nevada from Alpine Co. to Shasta Co.; North Coast Ranges from Lake Co. to Siskiyou Co.

4. *P. amphibium* L. *WATER PERSICARIA*. Aquatic glabrous perennial with stout stems not branching above the rooting base; leaves floating, elliptical to oblong or oblong-lanceolate, truncate or rounded at base, 2 to 7 in. long on petioles  $\frac{7}{8}$  to 2 $\frac{1}{2}$  in. long; sheaths leaf-bearing at about the middle; spike terminal, dense, ovate or oblong,  $\frac{1}{2}$  to 1 in. long, on a commonly short peduncle; calyx bright rose-color, 1 $\frac{1}{2}$  to 3 lines long, the 5 stamens and 2-cleft style exserted; achene lenticular.—Ponds and lakes in S. Cal.; Sierra Nevada; n. to B. C., e. to Atlantic; Eur., Asia. Often terrestrial and almost equally successful as a land or water plant. Var. *HARTWEGII* Bissel. Sheaths rough-hairy, ciliate, usually with an abruptly spreading herbaceous margin.—Upper Sacramento Valley and n. Sierra Nevada; e. to the Atlantic.

5. *P. muhlenbergii* Wats. Perennial, aquatic or in half dry places; stems decumbent or suberect, 2 to 3 (or 6) ft. high; leaves and upper portion of the simple stem usually appressed-hirsutulose or scabrous, the peduncle glandular with short hairs; leaves thin, ovate-lanceolate to lanceolate, acuminate or even attenuate, usually rounded at base, 3 to 8 in. long, the petioles 1 to 3 $\frac{1}{2}$  in. long; spikes 1 to 4 in. long, often in pairs; calyx rose-color or pink, 5-parted to the middle; stamens 5, exserted; style 2-cleft; achene lenticular.—Lakes and sluggish streams from the coast to the Sacramento Valley; throughout N. Am.

6. *P. lapathifolium* L. *COMMON KNOTWEED*. *WILLOW-WEED*. Annual, commonly stout, 1 to 4 ft. high, branching; herbage glabrous except a very scanty glandular pubescence on the peduncles and a scabrous pubescence on the leaf-margins or the leaves beneath sometimes resin-dotted; leaves broadly lanceolate, mostly long-acuminate, cuneate at base, 4 to 5 in. long, short-petioled; spikes axillary and terminal, oblong and erect or linear and nodding, 1 in. long or more; bracts ovate, acute; calyx white or flesh-color;

stamens 6, included; achene lenticular or rarely triangular.—Common along streams or in marshy lands, often whitening great areas; nat. from Eur. Aug.-Sept. Var. *INCANUM* Koch. Small, slender; leaves whitish beneath.—Berkeley, etc.

7. *P. fusiforme* Greene. Stems several or many from the base, dark red, assurgent, 2 to 3 ft. high, the internodes fusiform-thickened above the nodes; leaves linear-lanceolate, acuminate at both ends, glabrous or strigulose on midrib,  $2\frac{1}{2}$  to 4 in. long, subsessile; sheaths strigulose outside and at first shortly ciliate at summit; bracts obtuse, shortly ciliate; racemes dense. 1 to  $1\frac{1}{2}$  in. long, usually paniculate; calyx red in bud, mostly white in anthesis, its segments 5 (or 4); stamens "4" to 7; achene "lenticular" or triquetrous, black, shining.—Colorado River Valley.

8. *P. persicaria* L. LADY'S THUMB. Annual; resembling *P. lapathifolium* but sheaths strigose and the upper sheaths and the truncatish bracts ciliate; leaves subsessile; spikes shorter and erect; calyx red or white, not glandular; stamens generally 6, included.—Widely distributed in N. Am.; nat. from Eur.

9. *P. hydropiperoides* Michx. Perennial; stems 1 to 3 ft. high, branching; sheaths hairy; spikes slender or filiform, often interrupted below; calyx small, flesh-color or whitish, not dotted; stamens 8.—Monterey coast; Tulare Co.; coastal S. Cal.

10. *P. âcre* H.B.K. DOTTED SMART-WEED. Perennial, rooting and decumbent at base, erect and branching above, 2 to 5 ft. high, glabrous or the margin of the leaves scabrous; leaves ovate-lanceolate to linear-lanceolate, acuminate, attenuate to a very short petiole, 2 to 3 in. long; sheaths mostly bristly-ciliate, the short truncate bracts mostly naked; spikes loose and slender, 1 to 3 in. long, erect on long peduncles or panicle; calyx greenish, conspicuously glandular-dotted; stamens 8; achene lenticular or triangular.—Common in low and especially marshy ground or in moist mt. mdws.: e. to the Atlantic; trop. Am. Sept.

11. *P. paronychia* C. & S. Stems from large woody rootstocks, suffrutescent, prostrate or ascending, 1 to 3 ft. long; branches leafy above, below clothed with old sheaths; sheaths large, 4 to 6 lines long, brown and 5-nerved, the margin freely lacerate above, persistent, the segments becoming hair-like in age; leaves linear-lanceolate, 5 to 8 (or 11) lines long, acute, the margin revolute; flowers about 3 in an axil, on short pedicels, densely crowded at the ends of the branches in short more or less leafy spikes; sepals white or rose-color, oblong-ovate, the green midvein with pinnately toothed outline; stamens 8, the 3 inner dilated at base.—Sand-hills along the coast: Monterey Co. to Del Norte Co.; n. to B. C.

12. *P. bolânderi* Brew. Stems many, erect, 5 to 10 in. high, arising from a woody taproot or from prostrate woody branches; leaves narrowly linear to subulate, acute or cuspidate, 2 to 8 lines long, not revolute; sheaths persistent, 2-lobed on each side, the lower lobes finely lacerate; flowers white or rose-color, 1 or occasionally 2 in the axils on the branchlets; stamens 8 or 9.—Rocky outcroppings: Napa and Hood's Peak ranges; n. Humboldt Co. July-Sept.

13. *P. shastense* Brew. Stems mostly simple, 2 to 6 in. long, several from the branching crown of a very thick perennial root; leaves oblong or obovate, 3 to 4 in. long; stipules broad, silvery; flowers red or white, 2 or 3 in the axils; stamens 8.—High Sierra Nevada, 7000 to 9000 ft.; n. to Mt. Mazama, Ore.

14. *P. âviculâre* L. WIRE GRASS. YARD GRASS. Annual; stems wiry, minutely striate, prostrate or ascending, often several ft. long, flowering from the base; herbage glabrous and green; leaves oblong, acute, 3 to 6 lines long; flowers on very short pedicels, 2 lines broad when expanded; calyx cleft, the oblong lobes white with a green center; stamens 8, the 3 inner with dilated bases; styles 3, very short; achene ovoid, dark brown, minutely granular.—Nat. from Eur.; common in hard, especially beaten soils, and sometimes

in cultivated lands; flowering through the dry season and until after the rains break. Var. *LITTORALE* Koch. Leaves thick, often obtuse.—Maritime form.

15. *P. ramosissimum* Michx. Annual, with the aspect of *P. aviculare* but erect and 1 to 2 ft. high; leaves oblong to lanceolate,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, somewhat reduced above; calyx greenish or yellowish; stamens 3 to 6; achene black, dull.—Rare in Cal.: Pasadena; Yosemite; n. to Saskat., e. to the Atlantic.

16. *P. sawatchense* Small. Stems erect, mostly branched at base, 5 to 9 in. high; leaves oblanceolate, acute, mucronate, 4 to 9 lines long; flower clusters in all the axils from base to apex; stamens 6 to 8; style almost none.—E. side of the Sierra Nevada in Nevada Co.; e. to Col., n. to Wash.

17. *P. minimum* Wats. Annual; stems usually several from the base, 2 to 4 (or 6) in. long, ascending; herbage glabrous, scaberulous at the nodes; leaves ovate or elliptic, 2 to 6 lines long, apiculate, evenly distributed or somewhat crowded at ends of branches; flowers in all the axils, greenish white; stamens 5 to 8; achene slightly exserted, black, smooth, shining.—Montane, 4000 to 7000 ft.: Sierra Nevada from Mariposa Co. to Nevada Co.; Siskiyou Co.; e. to Utah, n. to Alas.

18. *P. douglasii* Greene. Annual, mostly sparingly branched and strictly erect, 8 to 21 in. high; leaves linear-oblong or lanceolate, acute, thinnish, 1 to  $1\frac{1}{4}$  in. long; sheaths lacerate; flowers reddish, 2 lines long, scattered, on deflexed pedicels; achene triquetrous, jet-black, smooth and shining.—High mts., 4000 to 8000 ft.: S. Cal.; Sierra Nevada; e. to Tex. and Me. Var. *LATIFOLIUM* Greene. Leaves oblong; flowers mostly crowded towards the ends of the branches.—Pacific Coast. Var. *AUSTINAE* Jones. Leaves ovate to lanceolate, 3 to 6 lines long; calyx green with whitish margins, 1 line long; achene black, smooth and shining.—Modoc Co., n. to Ida.

19. *P. spergulariaeforme* Meisn. Annual, much branched and somewhat diffuse, or sparingly branched and more strictly erect, 4 to 13 in. high; sheaths with a short mostly scarious base and lacerate summit; leaves linear or oblanceolate, 1-nerved, acute,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; spikes 4 inches long or less, very slender, the flowers much scattered below, crowded above; calyx rose-color or white; stamens 8, included, the filaments hardly dilated at base; style as long as the ovary, 3-parted.—Dry hills: Humboldt Co. to Siskiyou Co.; n. to B. C. Oct.

20. *P. imbricatum* Nutt. Annual; stem branching from the base or sometimes simple, erect, 1 to 3 in. high, the upper leaves scarcely smaller but crowded and with flowers crowded in their axils; leaves linear, acute, 3 to 5 lines long; stipules 2-cleft, the lower segments of each pair more or less united; flowers greenish white, very shortly pediceled; stamens 5; styles nearly obsolete; achene brown, dull, smooth.—High montane, 6000 to 8000 ft., Yosemite Park to Donner Lake; e. to Col., n. to Wash. Var. *WATSONII* Small. Terminal portion of the stem or branches crowded with leaves and flowers; leaves linear to lanceolate,  $\frac{1}{2}$  to 1 in. long or the uppermost 1 to 3 lines long; flowers whitish or rose-color, 1 or 2 in each axil; stamens 3 to 5; styles evident; achene dark or black, the surface lightly lincate or very shallowly alveolate.—Alpine or subalpine, 9000 to 10,000 ft.: Mt. San Jacinto; South Yollo Bolly; Sierra Nevada; e. to Col., n. to B. C.

21. *P. californicum* Meisn. Slender wiry glabrous annual, 3 to 7 in. high, diffusely branched, the ultimate branches elongated and floriferous; leaves linear to filiform, cuspidate, 3 to 8 lines long, the back with strong midrib and revolute-ribbed on each margin; spikes often loose below, usually dense above with the sheaths overlapping; bracts lanceolate or subulate, 1 to 3 lines long; sheaths split to the middle or to the base into setaceous divisions; sepals white with rose-colored midvein; achene brown.—Dry foothills, Sierra Nevada and North Coast Ranges; n. to Wash. July.

22. *P. parryi* Greene. Dwarf compact annual, commonly branching from the base, 1 to 2 in. high; stems rigid and brittle, spike-like, because densely

crowded with leaves and flowers even to the base; leaves narrowly linear, acute, cuspidate, 1 to 4 lines long; stipules so extremely lacerate as to appear cottony, and often hiding the flowers; achene triangular, chestnut-color.—Curamaca Mts., n. Sierra Nevada; higher North Coast Ranges; n. to Wash. June-July.

23. *P. bidwelliae* Wats. Annual; stems divergently branched, 1 to 4 in. high; leaves linear, 3 to 5 lines long, with a strong midrib and two marginal nerves on back; stipules ovate, sharply serrate or at length lacerate, imbricated on the spikes; calyx rose-color.—Chico; not otherwise known.

24. *P. convolvulus* L. BLACK BINDWEED. Twining or trailing annual, the stems 1 to several ft. long; herbage glabrous, pale green; leaves 1 to 2 in. long, ovate, sagittate at base, acuminate at apex; flowers in axillary clusters or disposed in a raceme; calyx 5-cleft, in fruit minutely scurfy, closely investing the black achene.—Nat. from Eur.: Sisson; Ft. Bidwell; Yosemite; San Francisco.

## 2. RUMEX L.

Weed-like herbs, ours perennial except one. Leaves mostly basal, those on the stem alternate, the petioles with somewhat sheathing stipules. Flowers mostly greenish, sometimes reddish or yellowish, pediceled and borne in usually crowded whorls along the branches of the panicle. Calyx of 6 nearly distinct sepals, the 3 outer spreading or reflexed, the 3 inner larger, continuing to grow after flowering and hugging the achene, 1 or more of them in many of our species bearing a wart or callous grain on the back. Fruits, therefore, more conspicuous than the flowers. Stamens 6. Styles 3, short; stigmas tufted (wind-pollinated) and maturing before the stamens. Achene triangular. (Old Latin name used by Pliny.)

Flowers perfect or some staminate on the same plant; inner sepals commonly reticulated, in fruit becoming much longer than the achene; pedicels jointed; roots yellow, scented, bitter.—LAPATHUM DC. (Docks).

Inner fruiting sepals entire (or nearly so) and

Without callous grains; pedicels not very prominently jointed.

Leaves rounded to acute at base.

Inner fruiting sepals broader than long.....1. *R. venosus*.

Inner fruiting sepals longer than broad.....2. *R. hymenosepalus*.

Leaves cordate at base.....3. *R. occidentalis*.

With callous grains (or 1 or 2 of the sepals naked), 1 to 2½ lines long; pedicels prominently jointed near the base.

Leaves strongly undulate, elliptical to oblong-lanceolate; fruiting sepals with

a broad wing bordering the callous grain.....4. *R. crispus*.

Leaves slightly undulate; callous grain nearly covering fruiting sepals, leaving only a narrow wing.

Leaves linear, spatulate or oblong; callous grain toothed.....5. *R. berlandieri*.

Leaves oblong or ovate; callous grain not toothed.....6. *R. conglomeratus*.

Leaves plane, mostly lanceolate; fruiting sepals triangular, usually much

larger than the callous grain.....7. *R. salicifolius*.

Inner fruiting sepals with very prominent slender teeth or bristles; callous grains

1 to 3.

Perennial; flowering branches elongated and

Spreading at wide angles; pedicels jointed near the middle.....8. *R. pulcher*.

Suberect; pedicels jointed near the base.....9. *R. obtusifolius*.

Annual; flowering branches usually short, the whorls mostly spicate-crowded;

pedicels jointed near the base.....10. *R. persicarioides*.

Flowers dioecious; callous grains none or minute; roots red, scentless.—ACETOSA DC.

(Sorrels).

Leaves not lobed; sepals longer than achene; pedicels jointed.....11. *R. paucifolius*.

Leaves hastate; sepals shorter than achene; pedicels not jointed.....12. *R. acetosella*.

1. *R. venosus* Pursh. Stems erect, ¾ to 1½ ft. high, from a running rootstock; leaves ovate or lanceolate, 2½ to 4 (or 6) lines long, on short petioles, with conspicuous dilated stipules; panicle nearly sessile, short, dense in fruit; inner fruiting sepals entire, without grains, round-cordate, 6 to 8 lines long and 8 to 14 lines broad.—Dry sandy valleys: Honey Lake Valley, Lassen Co.; Nev. to Wash. and Mo.

2. *R. hymenosepalus* Torr. CANAIGRE. Stem 1 to 2 ft. high, nearly simple, arising from a cluster of 2 to 12 tuberous or dahlia-like roots and ending above in a dense panicle ½ to 1 ft. long; leaves oblong or tapering to each end, slightly succulent, somewhat wavy-margined, ½ to 1 ft. long; sheath-

ing stipules conspicuous; pedicels jointed near the middle,  $\frac{1}{2}$  to nearly as long as the fruit; inner sepals membranous and rosy in fruit, ovate, cordate at base, naked, 4 to 6 lines long.—Dry sandy washes and sandy plains from Kern Co. and San Luis Obispo Co. to S. Cal.; e. to N. Mex. Roots used in tanning leather. The stem is used as a substitute for rhubarb, whence the names Wild Rhubarb, Pie Dock, and Sour Dock.

3. *R. occidentalis* Wats. WESTERN DOCK. Erect, glabrous, stout, and nearly simple, 3 to 6 ft. high; leaves somewhat fleshy, oblong-ovate or ovate-lanceolate, truncate or cordate at base, 6 to 16 in. long, the petioles of the basal leaves longer than the blade; panicle strict, mostly very dense, 1 to 2 ft. long, leafless or with a few small leaves below, rosy in fruit; pedicels 3 to 6 lines long, the joint below the middle obscure; inner fruiting sepals round-ovate, subcordate, naked, or rarely with a callous grain, 2 to 3 lines long.—Marshes in the valleys and marshy spots in the hills: San Francisco Bay region to Lassen Co. and Mt. Shasta; n. to Alas., e. to Lab. and Tex. Stems from a taproot, as also in nos. 4 to 8.

4. *R. crispus* L. CURLY DOCK. Stem stoutish,  $1\frac{1}{2}$  to 4 ft. high; leaves bluish-green, very wavy-margined, elliptical to oblong-lanceolate, 3 to 10 in. long, the petioles 1 or 2 in. long; flowering branches strict with few leaves, the whorls dense, mostly crowded and red-brown in fruit; pedicels twice as long as the fruit, tumidly jointed near the base; inner fruiting sepals broadly ovate, 2 to  $2\frac{1}{2}$  lines long, all with smooth callous grains, rarely 1 or 2 naked.—Very common weed in low and neglected lands in valleys and in the mts. to middle altitudes; nat. from Eur. The half-fleshy root has astringent and tonic properties. Blade more or less decurrent on the petiole, as in no. 6.

5. *R. berlandieri* Meisn. MEXICAN DOCK. Stem rather stout and succulent, simple, 1 to 2 ft. high, from a deep taproot; herbage not glaucous, darker green than in *R. salicifolius*; leaves linear to spatulate or narrowly oblong, 3 to 4 in. long, petioled; panicles leafless except for the main axis, the whorls dense, remote except above; pedicels prominently jointed below the middle; inner fruiting sepals ovate-triangular, erose or with 2 to 4 minute teeth on each side at base,  $1\frac{1}{2}$  to 2 lines long; callous grains mostly unequal, irregularly toothed on each side next to the sepal.—Colorado Desert; e. to Tex., s. to Mex.

6. *R. conglomeratus* Murr. GREEN DOCK. Stems slender, 3 to 5 ft. high, arising from a short mostly vertical rootstock which often crowns one or several fusiform roots; leaves ovate or mostly oblong, slightly undulate, 2 to 4 in. long, reduced above; flowering branches slender, erect, very long ( $\frac{1}{2}$  to  $1\frac{1}{2}$  ft.), naked or with a lanceolate or ovate leaf subtending some or all of the remote whorls; pedicels as long as, or rather shorter than the fruit, tumidly jointed near the base and geniculate; fruit about 1 line long, the inner sepals oblong with callous grains mostly 3 and smooth.—Low moist valley lands throughout the state and in the mountains to middle altitudes; nat. from Eur.

7. *R. salicifolius* Weinm. WILLOW DOCK. Low spreading or erect, 1 to  $2\frac{1}{2}$  ft. high; leaves plane, glaucous, linear-oblong to oblong-lanceolate, acute at both ends, 4 to 6 in. long, short-petioled; flowering branches short (2 or less commonly 4 in. long), the lateral mostly divaricate; whorls dense, crowded, leafless, or 1 or 2 lower whorls remote and leafy; pedicels rather shorter than the fruit, jointed near the base and recurved but not geniculate; inner fruiting sepals triangular or triangular-ovate, pink-red, 1 to 2 lines long, the white callous grain only 1, or the grains 1, 2 or 3, even in the same panicle.—Wet places in valley lands and in the foothills, ascending to high altitudes in the mountains; distributed nearly throughout Cal., 20 to 6000 ft.; n. to B. C. Var. *MONTIGENITUS* Jepson. Flowering branches short and panicle more compact; inner fruiting sepals without callous grains or a calyx here and there with the grains subulate or small.—High montane (6000 to 11,000 ft.): Yollo Bolly Mts.; Sierra Nevada; s. to San Jacinto Mts.

**S. R. pùlcher L. FIDDLE DOCK.** Stem slender but rigid, widely parted into zigzag branches; leaves oblong or fiddle-shaped, 3 to  $5\frac{1}{2}$  in. long, petioled; flowering branches simple, divaricate, sparsely leafy, the dense whorls remote or at least distinct, red-brown in fruit; pedicels about equaling the fruit, tumidly jointed in the middle; inner fruiting sepals with 5 to 10 awn-like teeth on each side; callous grains 1 to 3.—Common weed of valley waysides and vacant lots in towns; also in meadows and moist places in the foothills and mts.: nat. from Eur.

**9. R. obtùsifolius L. BITTER DOCK.** Tall, slender, 3 ft. high or more; leaves ovate-oblong to oblong-lanceolate, somewhat undulate, acute or obtuse, truncate or cordate at base, 6 in. long or less, long-petioled; flowering branches in a rather strict panicle, leafless or with a few little-reduced leaves at the base; whorls loose, not crowded, the lower remote; pedicels slender, 1 to 2 times as long as the fruit, tumidly jointed toward the base; inner fruiting sepals ovate-deltoid,  $1\frac{1}{2}$  to 3 lines long, with 3 to 5 thin triangular or subulate teeth on each side; grain 1 only or with 2 other small ones.—European weed in low lands about San Francisco Bay.

**10. R. persicàrioides L. GOLDEN DOCK.** Stems soft and fistulous (at least below), prostrate or erect, seldom more than 1 ft. high; herbage yellowish green, minutely pubescent; leaves oblong or lanceolate, truncate or subcordate at base, acute at apex, a little undulate, 2 to 4 in. long, rather short-petioled; flowering branches with scattered subequal leaves, the whorls mostly crowded or the lower remote; pedicels very unequal, tumidly jointed at base; inner fruiting sepals  $\frac{3}{4}$  to  $1\frac{1}{2}$  lines long, acutely produced at apex with 2 or 3 awn-like teeth on each side; callous grains 3; fruit almost bur-like.—Wet places by lakes or streams or in marshy lands: Los Angeles Co. to Alameda Co. and Siskiyou Co.; n. to B. C., e. to the Atlantic.

**11. R. paucifolius Nutt.** Stems 9 to 15 in. high, in clusters from the crown of a taproot; leaves mostly basal, linear to narrowly ovate or oblong, entire, 1 to 3 in. long, drawn down to petioles 1 to 2 times as long; flowers on slender leafless branches; pedicels jointed toward the base; inner fruiting sepals round-cordate, finely reticulated, 1 to  $1\frac{1}{2}$  lines long, much longer than the achene.—Sierra Nevada, 3500 to 9500 ft.; n. to B. C., e. to Col.

**12. R. acëtosélla L. SHEEP SORREL.** Stems tufted,  $\frac{1}{2}$  to 2 ft. high, arising from running rootstocks; lower leaves hastate, the upper reduced or the branches leafless and ending in the reddish (pistillate) or yellowish (staminate) panicle; pedicels as long or twice as long as the flowers, not jointed; staminate flowers 1 line long or less, the pistillate rather smaller; achene granular.—Throughout the state, in places very common; nat. from Eur. The green leaves are very acid.

### 3. OXYRIA Hill

Alpine perennial herb. Leaves somewhat fleshy, round-reniform, long-petioled, mostly basal. Stems erect, bearing a panicle of small green perfect flowers. Calyx of 4 nearly distinct sepals, the 2 inner erect (appressed in fruit), the 2 outer spreading. Stamens 6. Stigmas 2. Achene thin and compressed, surrounded by a broad wing and thus orbicular in outline. (Greek oxus, sour, on account of the acid leaves.)

**1. O. dígyna (L.) Hill. MOUNTAIN SORREL.** Stems simple, scape-like, 3 to 11 in. high, several from a large chaffy rootstock; flowers on slender pedicels; achene  $1\frac{1}{2}$  lines in diameter, very much larger than the sepals, entire or emarginate at each end.—Alpine, among cold wet rocks, 8000 to 12,000 ft.: Sierra Nevada, s. to Mt. San Jacinto and n. to Mt. Shasta and Warner Mts.; n. to the arctic circle and around the northern hemisphere.

### 4. PTEROSTÉGIA F. & M.

Annuals with very slender and weak stems and opposite leaves. Flowers solitary and nearly sessile in the axils, longer than the subtending bract. Bract rounded and more or less 2-lobed, dentate on the margin, in fruit

enlarged, scarious and reticulated, loosely inclosing the achene and developing 2 sac-like protuberances on the back. Calyx 6 (or 5)-parted; stamens as many or fewer than the lobes. (Greek pteron, a wing, and stega, a covering, in reference to the bract.)

1. *P. drymarioides* F. & M. Stems commonly several from the base, usually with a branch at each node, diffuse or straggling, a few inches to 1¼ ft. long; leaves roundish or broader than long and notched once or twice at apex or even cleft, or distinctly fan-shaped or obcordate, 2 to 6 (or 10) lines broad, narrowed at base to a slender but mostly short petiole; flowers reddish, less than 1 line long; calyx-segments oblong-lanceolate.—Foothills, under trees in open woods, or in the shade of rock outcroppings, throughout Cal.: n. to Ore., s. to L. Cal. Apr.-May.

#### 5. *PHYLLÓGONUM* Cov.

Prostrate annual with the leaves basal and in 3s at the nodes. Flowers yellow, pediceled, borne in close fascicles at the nodes, without involucre or bracts. Calyx deeply cleft into 6 divisions. Stamens 9. (Greek phyllon, leaf, and gonu, knee, on account of the leafy, not bracteate, nodes.)

1. *P. luteolum* Cov. Stems several from the base, 3 to 5 in. long with 3 to 5 branches at the nodes; herbage yellowish, nearly glabrous; leaves obovate, drawn down to a petiole; calyx ¾ to 1 line long.—Death Valley region.

#### 6. *NEMACAÚLIS* Nutt.

Annual with very slender stems and mostly basal white-woolly leaves. Flowers crowded in subglobose heads; heads sessile in the forks and along the branches, each flower subtended by an herbaceous bract. Calyx 6-cleft. Stamens 3. Achene short-ovoid. (Greek nema, thread, and kaulos, stem, referring to the slender stems.)

1. *N. denudata* Nutt. Stems prostrate or ascending, 6 to 14 in. long, glabrate, reddish; leaves spatulate, narrowed to a petiolar base, ½ to 1½ in. long; bracts oblong, forming a whorl at the nodes; bracts of the flower-clusters obovate, 1 line long, glabrous below, white-woolly above, the outer flowerless, the inner smaller; flowers yellowish, glabrous, ½ line long.—Sea-beaches, sand-dunes and sandy soil: San Pedro to San Diego; w. edge of the Colorado Desert; L. Cal.

#### 7. *HOLLISTÈRIA* S. Wats.

White-woolly annual herbs. Leaves alternate, cuspidate, with a small lanceolate pair at base like stipules. Involucres solitary and sessile in the axils, composed of 3 almost distinct linear bracts, 2-flowered. Flowers unequally pediceled, with a minute scarious bractlet at base. Calyx 6-cleft to the middle. Stamens 5 to 9, included. Achene glabrous. (Col. W. W. Hollister, pioneer Californian.)

1. *H. lanata* Wats. Stems several or many from the base, prostrate, 3 to 7 in. long; basal and lowest stem leaves oblanceolate, narrowed to a petiole. 1 to 1¾ in. long, glabrate; stem leaves ovate, sessile, cuspidate, 3 to 7 lines long, white-woolly; calyx 1 line long, very woolly outside, its lanceolate lobes green with a scarious margin.—S. Monterey Co. e. to the upper San Joaquin Valley.

#### 8. *LASTÁRRIA* Remy.

Small fragile annual, diffusely branched from the base. Leaves linear, in a basal tuft and in whorls along the stem, the upper ones and the bracts with hooked awns. Flowers solitary, sessile in the forks and terminal, concealed by the involucre-like whorl of bracts. Calyx simulating an involucre, tubular, 5 to 6-cleft, the teeth with hooked awns. Stamens 3, inserted on the throat, the filaments with a small membranous tooth on each side. (J. V. Lastarria, 1817-1888, Chilean publicist and writer.)

1. *L. chilensis* Remy. Stems 2 to 10 in. long; herbage slightly hairy; floral bracts crowding the ends of the branchlets, scattered below; calyx 1 to 2 lines long.—Dry sandy soil: Contra Costa and Monterey Cos. to S. Cal., thence n. to Mono Co.; L. Cal.; nat. from Chile. May-June.

### 9. CHORIZANTHE R. Br.

Low dichotomously branched annual herbs of summer. Leaves mostly in a basal rosette which disappears early in the dry season, the cauline leaves commonly reduced to opposite, ternate or unilateral bracts. Involucres commonly 1, sometimes 2 to 6-flowered, cylindric, urnshaped or triangular, always sessile, mostly 3 to 6-angled or -costate, 3 to 6-toothed or -cleft; teeth divaricate, cuspidate or awned, the awns commonly with a hooked tip. Flowers pediceled or nearly sessile, without bractlets, included within the involucre or the calyx protruding. Calyx 6-parted or -cleft, colored, never herbaceous. Stamens usually 9, 6 or 3. Ovary glabrous. Our species are of the deserts or arid foothills. (Greek chorizo, to divide, and anthos, flower, on account of the parted calyx.)

#### A. Bracts entire.

- Involucres urnshaped or the tube cylindric and slightly contracted below the teeth; teeth equal or the 3 alternate shorter, bordered by a scarious membrane; stamens 6 or 9, inserted at base or lower part of calyx-tube.
- Involucre bordered by a broad membrane, the teeth excurrent from it.  
 Membrane white, the 6 involucreal teeth equal.....1. *C. membranacea*.  
 Membrane purple, 3 of the involucreal teeth usually inconspicuous or minute.....2. *C. nortonii*.
- Involucreal teeth bordered by a narrow membrane but distinct.  
 Calyx-lobes bifid, erect; Sierra foothills.....3. *C. stellulata*.  
 Calyx-lobes not bifid; Coast Ranges along the coast.  
 Membrane of involucreal lobes not continuous around sinuses.  
 Mostly prostrate or diffuse; heads scattered at intervals along the stems on short peduncles; involucreal lobes with moderate scarious borders.....4. *C. pungens*.  
 Erect; heads mostly terminal on the cymose forks; involucreal lobes with showy white borders.....5. *C. nivea*.  
 Membrane of involucreal lobes continuous around sinuses; erect.....6. *C. douglasii*.
- Involucres cylindric (except nos. 18 and 19), not scarious margined, the teeth 6, sometimes 5, 4, or 3.
- Involucreal tube cylindric, usually 6-ribbed; stamens 3, 6 or 9, inserted at base or lower part of calyx-tube.
- Plants commonly but not always erect.  
 Joints excessively fragile; calyx-lobes equal; plant yellowish.....7. *C. brevicornu*.  
 Joints less fragile.  
 Calyx-lobes not fringed.  
 Calyx-lobes entire; plant reddish.  
 Calyx-lobes equal; rare.....8. *C. breweri*.  
 Calyx-lobes unequal; common.....9. *C. staticoides*.  
 Calyx-lobes erosulate, very unequal.....10. *C. valida*.  
 Calyx-lobes, at least the inner, fringed.  
 Lobes very unequal, the inner fringed.....11. *C. palmeri*.  
 Lobes equal, all fringed.....12. *C. fimbriata*.
- Plants prostrate or procumbently spreading.  
 Involucreal teeth subequal or 3 long and 3 short; coastal S. Cal.  
 Plants low, spreading horizontally; flowers white.....13. *C. parryi*.  
 Plants procumbent; flowers yellow.....14. *C. procumbens*.  
 Involucreal teeth very unequal.  
 Involucre 6-ribbed.  
 One tooth very long and 5 very short; stamens 6 or 9.....15. *C. uniaristata*.  
 Teeth very unequal; stamens 3.....16. *C. clevelandii*.  
 Involucre 4 or 5-ribbed; stamens 9.....17. *C. spinosa*.
- Involucreal tube 3-angled, or cylindric but not ribbed or angled, in either case usually transversely corrugated; calyx tubular, shortly 6-cleft; stamens 6 or 9, inserted on the calyx-throat.
- Involucreal tube 3-angled, its teeth stout, divergent.  
 Teeth equal or in equal sets.  
 Teeth 3; cauline leaves usually none.....18. *C. orcuttiana*.  
 Teeth 6, the alternate 3 very short and inconspicuous; cauline leaves in pairs.....19. *C. polygonoides*.  
 Teeth 3, very unequal, foliaceous, ovate to lanceolate; very spiny.....20. *C. rigida*.
- Involucreal tube cylindric, not ribbed or angled.  
 Involucreal lobes 3, equal, the tube strongly corrugated.....21. *C. corrugata*.  
 Involucreal teeth or lobes 5, one foliaceous and much larger than the other 4, the tube obscurely corrugated.....22. *C. watsonii*.

**B. Bracts 3-lobed.**

Involucre without spurs, sometimes the angles gibbous at base.

Involucres 4-angled, 4-toothed.

Bracts minute; involucre teeth equal.....23. *C. vortriedei*.

Bracts very conspicuous and foliaceous, orbicular-perfoliate; teeth unequal.....24. *C. perfoliata*.

Involucres cylindric, not 4-angled.

Involucral tube smooth, its teeth 3, unequal; bracts unilateral, 3-lobed, foliaceous and conspicuous.....25. *C. californica*.

Involucral tube sulcate, its teeth 5, equal; bracts small.....26. *C. insignis*.

Involucre with spurs at base.

Spurs 6, spine-like; involucre teeth uncinat.....27. *C. leptoceras*.

Spurs 3, saccate, each about as large as involucre tube; involucre teeth straight.....28. *C. thurberi*.

1. *C. membranacea* Benth. Fig. 316. Erect,  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high, mostly simple below, once to thrice dichotomous above, the involucre in solitary capitate clusters along the branches or mostly terminal; herbage lanate, floccose in age, the upper surface of the leaves glabrate; leaves linear, sessile, or gradually narrowed into a short petiole,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; involucre urnshaped,  $1\frac{1}{2}$  to 2 lines long, wholly white-scarious between the awned teeth, or some involucre, especially solitary ones in the lower forks, wholly destitute of membranous border; awns slender, uncinat, and strongly divergent; flowers 2 or 3, unequally pediceled, of these 1 or 2 undeveloped or obsolete; calyx woolly, its segments obovate or spatulate, the inner narrower, all clawed, united only at very base;

316. *Chorizanthe membranacea* Benth.; involucre x 5.

stamens 9.—Foothills, mostly towards the interior, 250 to 4500 ft.: Monterey Co. to Tehama Co.; Sierra Nevada. May-June.

2. *C. nortoni* Greene. Fig. 317. Mostly 1-stemmed, 2 or 3-forked, or sometimes many-stemmed from base, 4 to 7 in. high, the involucre congested in terminal heads; leaves oblanceolate, 1 to  $1\frac{3}{4}$  in. long; lower bracts foliaceous, the upper reduced; herbage hairy; involucre reddish, cylindric-urnshaped, 6-ribbed, margined by a broad scarious purple 6-lobed border; lobes unequal, the 3 larger triangular in outline, the 3 alternate often small or obsolete, all ending in a short uncinat awn; some earlier involucre solitary in the forks and these destitute of scarious margin; calyx rose-color, little exerted, its short oblong lobes equal, undulate-erosulate; stamens 6 or 9.—Mts. bounding the Salinas Valley, Monterey Co. June. Involucres often reticulate between the ribs.

317. *Chorizanthe nortoni* Greene; involucre x 5.

3. *C. stellulata* Benth. Stem erect, trichotomously branched, mostly above the base, 4 to 6 in. high, the involucre in cymose clusters or somewhat capitate; herbage hairy; leaves linear, acute, sessile, 5 to 8 lines long, in a rosette at base and in whorls at the nodes or reduced above; involucre cylindric-urnshaped, 6-ribbed, 2 lines long, reticulate between the ribs; involucre teeth 6, nearly equal, with scarious margins, the tips uncinat or straight; calyx lobes bifid or usually so.—Sierra Nevada foothills from Shasta Co. to Tulare Co.

318. *Chorizanthe pungens* Benth.; involucre x 5.

4. *C. pungens* Benth. Fig. 318. Stems prostrate or at first erect, more or less dichotomous, 2 to 15 in. long, the involucre in head-like clusters on very short lateral branchlets or terminal; herbage villous pubescent; leaves basal and in pairs at the lower nodes, spatulate or oblanceolate, narrowed to a petiole,  $\frac{1}{2}$  to 2 (or 4) in. long, reduced above to bracts; involucre cylindric-urnshaped, hairy, 1 to  $1\frac{1}{2}$  lines long, subtended by subulate or acicular pungent bracts;

involucral tube sharply 6-angled or -ribbed, unequally 6-toothed, the alternate teeth shorter, all uncinat and more or less scarious-margined towards the base; calyx white, its lobes equal, oblong, erose-denticulate, hairy on the outside; stamens 9 or 6.—Sand-dunes and sandy valleys along the coast from Marin Co. to Santa Barbara Co. Var. *DIFFUSA* Parry. Leaves all basal; scarious border of the involucral teeth pink.—Valleys, Santa Cruz to Monterey. Var. *CUSPIDATA* Parry. Involucral teeth without scarious margins or the margins scant, otherwise identical with the species.—San Francisco Co. to Sonoma Co. Var. *ROBUSTA* Jepson. Stems erect, branched above,  $\frac{1}{2}$  to 2 ft. high; heads large, dense, mostly terminal or subterminal; involucral teeth with narrow margins or none.—San Francisco Bay region to Monterey Bay.

5. *C. nivea* Jepson. Erect; head-like clusters borne on dichotomous cymes; all the involucral teeth with scarious white margins, the alternate teeth smaller; calyx white, its lobes with yellow tips.—Mts. near San Luis Obispo; Monterey.

6. *C. douglásii* Benth. Stem erect, tri- or di-chotomously branching, 4 to 6 in. high; basal leaves spatulate, shortly petioled, the cauline oblong to linear; bracts subulate; herbage somewhat hairy pubescent; involucre hairy, condensed in terminal heads, urnshaped-cylindric,  $1\frac{1}{2}$  lines long, sharply ribbed, reticulate between the ribs; involucral teeth spreading, membranous margined below the short hooked awn, the membrane continuous in the sinus between the teeth; calyx rather deeply cleft, its lobes equal, oblong-ovate, obtuse, erosulate.—Monterey Co.

7. *C. brevicornu* Torr. Fig. 319. Stems several from the base, erect, repeatedly and shortly dichotomous, yellowish, 3 to 8 in. high, excessively fragile; herbage minutely pubescent; leaves in a basal tuft, linear-oblongate, narrowed to a petiole,  $\frac{1}{2}$  to 2 in. long; involucre in the forks and along the branchlets, 1-flowered, cylindric, 2 to  $2\frac{1}{2}$  lines long, acutely 3-angled or 3-ribbed, with 3 smaller ribs between, minutely corrugated between the ribs; teeth 6, hooked, the 3 alternate smaller; flowers white, glabrous, sessile; calyx-tube long and slender, its lobes oblong, nearly equal, truncatish and erosulate at apex, barely exserted; stamens 3, at base.—Arid stony hills, Colorado and Mohave deserts n. to Inyo Co.; e. to Nev. and Ariz. More fragile than any other species, the specimens usually disjuncting completely when dry.

319. *Chorizanthe brevicornu* Torr.  
involucre x 5.

8. *C. bréweri* Wats. Similar to *C. staticoides* but more diffuse; herbage canescent but reddish; involucre acutely 6-ribbed and reticulated, constricted a little below the spreading teeth, the alternate teeth somewhat smaller; calyx white, exserted, its lobes oblong to elliptic, obtuse, entire, subequal, at least when fully developed. — Hillsides, San Luis Obispo Co.

9. *C. staticoides* Benth. *TURK'S RUG*. Stems 1 or several from the base, erect or ascending, cymosely dichotomous, 4 to 10 (or 18) in. high, fragile at the joints; involucre sessile, congested at the end of the branchlets or solitary in the forks; herbage characteristically reddish, soft-pubescent or grayish, in age subglabrate, the under surface of the leaves white-woolly; leaves obovate to elliptic, 3 to 9 lines long, the petioles 1 to 3 times as long; involucre cylindric, 6-ribbed, 2 to  $2\frac{1}{2}$  lines long, the teeth spreading, hooked at tip, 3 much larger than the 3 alternate or the latter obsolete; calyx white, rose-pink or deep rose, exserted, the segments narrowly oblong, mostly entire, hairy on the back, the inner smaller and shorter; stamens 9 or 6.—Dry sandy plains and foothills: coastal S. Cal. to Monterey Co., thence e. to the upper San Joaquin Valley. Not known in the Mohave or Colorado deserts. Var. *NUDICAULIS* Jepson. Herbage commonly greenish; flowers white.—Mt. slopes along the coast from Santa Barbara to Echo Mt.

10. *C. válida* Wats. Erect, 4 to 6 in. high, once or twice di- or tri-chotomously branched; leaves spatulate; involucral teeth or lobes not margined but awned; awns mostly straight; inflorescence similar to the preceding:

flowers pedicellate, partly exserted; calyx-segments oblong, erose-denticulate, hirsute along the back on the midvein, very unequal (the alternate only  $\frac{1}{2}$  as long).—Sonoma Co.

11. *C. pálmeri* Wats. Stem erect (or sometimes prostrate), trichotomous, 5 to 12 in. high, the ends of the simple or dichotomous branches bearing head-like clusters of erect compactly crowded involucre, the forks usually with solitary involucre; herbage pubescent; leaves in a basal tuft, oblong-spatulate,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; bracts of the flower clusters setaceous; involucre cylindric or a little contracted upward,  $1\frac{1}{2}$  to 2 lines long, 6-ribbed, 6-toothed, the larger 3 unequal, the smaller 3 nearly equal, all tipped with mostly straight spines; flowers rose-color, exserted, very shortly pedicel; calyx shortly cleft, the outer lobes roundish, entire, the inner shorter, shortly lacinate-fringed; stamens 9.—Dry hills, Monterey and San Luis Obispo Cos.

12. *C. fimbriata* Nutt. Stem erect or diffuse, trichotomous at first node, then dichotomously branching, 4 to 10 (or 15) in. high, the involucre solitary in the forks or clustered along the terminal branchlets; herbage reddish, lightly pubescent; leaves basal, spatulate or obovate, narrowed to a petiole, 1 to 2 in. long; bracts subulate or acicular; involucre cylindrical, 2 to 3 lines long, 6-ribbed, ending in 6 spreading spine-tipped teeth, the alternate teeth smaller; teeth uncinat (or straight); calyx white, exserted, its lobes ovate-lanceolate, equal, irregularly fringed on each side, mostly below the middle; stamens 6.—Palm Sprs.: Mt. San Jacinto; San Diego Co. May-July. Var. *LACINIATA* Jepson. Habit, foliage, involucre and pubescence that of the species; calyx rose-color, its lobes lacinate-fringed throughout.—San Diego Co.

13. *C. párryi* Wats. Stems several from the base, spreading horizontally and repeatedly forking, forming low flat-topped plants 3 to 15 in. broad, the involucre clustered at the ends of the branchlets; leaves oblong, narrowed to a short petiole, 4 to 9 lines long; involucre 1 line long, cylindric but somewhat contracted below the spreading teeth, the tube acutely 6-angled; teeth uncinat, 3 large alternating with 3 small; calyx white, its segments erosulate, the inner half as large as the outer; stamens 9.—Sandy or gravelly plains, San Bernardino Valley. Var. *FERNANDINA* Jepson n. comb. Stems longer and laxer; awns of the involucre (or some of them) straight; calyx lobes nearly equal, the inner narrower.—Washes, Los Angeles to San Fernando Valley. (*C. fernandina* Wats.)

14. *C. procumbens* Nutt. Stems procumbent, several from the base, elongated and sparingly branched, 3 to 13 in. long, the involucre in small clusters along and towards the ends of the branchlets; herbage soft-pubescent; leaves spatulate or oblanceolate, in a basal tuft and at the lower nodes; bracts lanceolate; involucre 6-ribbed, with mostly 6 equal spreading teeth, or the 3 alternate shorter; calyx yellow, the inner lobes much smaller than the outer.—Coastal S. Cal.

15. *C. uniáristata* T. & G. Stems prostrate, 2 to 6 in. long, with a short soft pubescence; leaves broadly spatulate, the bracts oblanceolate and cuspidate or nearly acicular towards ends of branches; involucre numerous and rather loosely cymose on the branches or sometimes densely clustered, cylindric-urnshaped, 6-ribbed,  $1\frac{1}{2}$  to 2 lines long; involucre teeth awned, one awn long and straight, the others very short and hooked; flowers cream-color; outer calyx-lobes obovate, entire, the inner half as long, oblong, crenate; stamens 6 or 9.—Foothills, Mt. Diablo to San Luis Obispo Co., thence e. to the Sierra Nevada in Kern Co.

16. *C. cleveándii* Parry. Stems prostrate, branched from the base, 4 to 10 in. long; herbage hairy pubescent; basal leaves ovate-spatulate, cauline leaves narrow and pungent; involucre 6-ribbed, with unequal divergent uncinat teeth; outer calyx-lobes broadly oblong, truncate, crosulate or denticulate, the inner about half as long as the outer; stamens 3.—Region of Clear Lake. Closely allied to *C. uniáristata*.

17. *C. spinosa* Wats. Stems several from the base, prostrate, forming a loose spiny mat 8 to 16 in. broad; herbage puberulent; basal leaves oval or

obovate, narrowed to a petiole with a broad or clasping base; bracts lanceolate, setaceous, conspicuous, their axils bearing clusters of 3 or 4 involucre: involucre short-cylindric, 4 or 5-costate, the teeth very unequal, usually with 1 long tooth, 1 or 2 minute ones and 1 or 2 of intermediate size, all straight-awned; flowers 2 or 3, pediceled, usually only 1 developed; calyx white, the 3 outer lobes orbicular with a short narrow claw, the 3 inner ovate, smaller, minute; stamens 9.—Mohave Desert, Muroc Sta.

18. *C. orcuttiiana* Parry. Stems several from the base, prostrate, 1 to 4 in. long, sparingly dichotomous; herbage thinly pubescent; leaves spatulate or narrowly oblanceolate, mostly in a basal tuft; involucre scattered along the branches and terminal; involucre tube nearly 1 line long, cylindric but 3-angled, 3-toothed, not or only obscurely reticulated, its stout teeth nearly or quite horizontally spreading and as long as the tube; flowers usually 1, pediceled: "calyx-lobes equal, its tube narrowly turbinate; stamens 9 or fewer."—Point Loma, San Diego. Quite like *C. polygonoides* in habit but its involucre very different.

19. *C. polygonoides* T. & G. Dichotomously branched, forming mats 5 to 10 in. across; basal leaves oblanceolate, contracted to a petiole,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; bracts in pairs, oblanceolate or obovate, resembling the leaves of the basal rosette and becoming smaller towards the ends of the branches; involucre obpyramidal, strongly 3-angled, corrugated between the ribs, without scarious margin, solitary or in 2s or 3s, the tube 1 to  $1\frac{1}{2}$  lines long, the 3 larger lobes as long and with alternating short and inconspicuous ones at base.—Widely but sparsely scattered from Modoc Co. to San Diego Co.

20. *C. rigida* T. & G. Stem erect, 1 to 3 in. high, simple or very shortly branched, densely packed with short involucre-bearing branchlets, or sometimes diffusely spreading and forming a spiny mat 6 to 11 in. broad; leaves on the primary stem or branches round-ovate to obovate, 4 to 12 lines long, on petioles 1 to  $1\frac{1}{2}$  times as long, those of the branchlets lanceolate or subulate, spine-tipped, becoming hard and rigid, the involucre in clusters in their axils; involucre tube short, about 1 line long and as broad, strongly and acutely 3-angled and strongly reticulated between the angles, its lobes 3, foliaceous, ovate to lanceolate, spreading, unequal, 3-ribbed and reticulate on back, spine-tipped, 1 to 8 lines long; flower pediceled, yellowish; calyx-tube narrow, abruptly expanded into the short throat and limb, its lobes oblong, short, very hairy on back, scarcely exerted; stamens 9, inserted at throat.—Arid rocky hills: Colorado Desert; e. Mohave Desert; Inyo Co.; s. Nev. to Ariz. and L. Cal. Apr.-May. One of the most characteristic desert annuals on the driest stony hills where there is little or no other vegetation.

21. *C. corrugata* (Torr.) T. & G. Fig. 320. Stems several from the base, erect or ascending, 1 to 4 in. high, slightly villous; leaves roundish ovate, woolly or glabrate above, 2 to 9 lines long, on slender petioles; bracts subulate, small; involucre solitary in the forks and along the branches but numerous; involucre tube cylindrical, not angled or ridged but strongly corrugated, 1 to  $1\frac{1}{2}$  lines long; involucre lobes 3, equal, ovate, as long as the tube, woolly above, reticulate below, short-awned, uncinat; calyx white, included; "stamens 6 or 9, on middle of tube."—E. Mohave Desert; Colorado Desert; L. Cal.

320. *Chorizanthe corrugata* T. & G.; involucre x 6.

22. *C. watsonii* T. & G. Stems erect or ascending, several from the base, dichotomous, 1 to 4 in. high; herbage canescent; leaves basal, narrowly oblanceolate; bracts in pairs, at length setaceous; involucre solitary in the forks and clustered towards the ends of the branchlets, canescent; involucre tube slender cylindric, not ribbed, obscurely corrugated, 2 to 3 lines long, its teeth 5, one foliaceous and usually much larger than the other four, especially on involucre solitary in the forks; flower pediceled, included; calyx yellow, hairy externally; stamens 9, inserted at mouth of tube.—Santa Ana Cañon, San Bernardino Mts. (F. W. Peirson);

Mohave Desert, n. to Inyo and Lassen Cos.; Nev. to Wash. Foliaceous lobe of the involucre 3 to 4 lines long.

23. *C. vortrièdeli* Bdg. Stem divaricately trichotomous at the first node, then dichotomous, 4 to 7 in. long, the internodes relatively long and the involucre solitary in the forks; herbage glabrous or a little glandular; leaves in a basal rosette, spatulate,  $\frac{1}{4}$  to 1 in. long; bracts small, perfoliate, 3 (or 4) -lobed, the lobes triangular or oblong; involucre 1½ lines long, the tube 4-sided or 4-angled, the angles at base somewhat gibbous or ridge-like; involucre teeth 4, short, ovate or triangular, cuspidate; flowers 2, long-pedicelled; calyx yellowish-green, 5-cleft, each short yellowish division bearing two white oblong lobes; stamens 9, inserted at base; seed black, globose, apiculate.—Local species, s. Santa Lucia Mts. In aspect it suggests a starved form of *C. perfoliata*, but it is a distinctive species, particularly in its peculiar calyx.

24. *C. perfoliata* Gray. Stem branching at or near the base, diffuse with numerous branchlets, 8 to 13 in. high; leaves spatulate, 1 to 2 in. long; herbage sparingly pubescent or a little glandular; bracts perfoliate, orbicular or 3-lobed, spine-tipped at the angles; involucre strongly and acutely 4-angled, 2 or in age 3 or 4 lines long, mostly one at each node, wrinkled between the ribs, the 4 divergent teeth spine-tipped; angles or ribs sometimes swollen into a small gibbous projection at base; calyx pedicelled; stamens 6.—Mt. Hamilton Range to the head of the San Joaquin Valley and the central Mohave Desert. In habit remarkably similar to *C. californica*.

25. *C. californica* (Benth.) Gray. Stem branching at or near the base, rather sparingly forked into slender spreading branches, 4 to 14 in. high; herbage glandular hirsute; basal leaves ovate or broadly oblanceolate, narrowed to a short petiole,  $\frac{3}{4}$  to 1½ in. long; bracts broader than long, divergently 3-lobed, the lobes spine-tipped, 4 to 8 lines long; involucre in 3s at each node, 1-flowered, 1½ to 2 lines long, subcylindric, not ribbed, smooth (but more or less hairy), with stout spreading spine-tipped teeth; teeth mostly 3, unequal, sometimes with 4 in 2 unequal pairs or only 2; calyx white, the tube slender, a little exerted in anthesis, its lobes broadly oblong, very obtuse.—San Luis Obispo Co. to San Diego Co., mainly near the coast. Var. *SUKSDÓRFII* Mebr. Bracts very large; involucre tube urceolate, somewhat angular.—Sand-dunes, Surf, Santa Barbara Co.

26. *C. insignis* Curran. Stem erect, divergently dichotomous, glandular, reddish, 3 to 4 in. high, the involucre solitary and second along the branches; leaves in a basal tuft, linear-spatulate, glabrous, 3 to 6 lines long; bracts 3-lobed, the lobes oblong, those of the upper ones lanceolate-setaceous; involucre cylindric or obconic, slightly corrugate, lightly 5-sulcate, 1½ lines long, armed with 5 horizontally divergent spines; spines equal, straight, as long as the involucre tube; flowers 4 to 6 in each involucre, pedicelled; calyx rose-color, hairy, exerted; "stamens 9."—Central Monterey Co.

321. *Chorizanthe leptoceras* Wats.; involucre  $\times 6$ .

27. *C. leptoceras* (Gray) Wats. Fig. 321. Stems 2 or 3 from the base, very slender, divaricately dichotomous, 3 to 11 in. long; herbage glabrous except a little pubescence on the bracts and involucre; leaves basal, oblanceolate,  $\frac{1}{2}$  to 1 in. long; bracts 3-lobed, 1½ to 2½ lines broad; involucre in capitate clusters in the forks and terminal on the branchlets, the proper tube short, soon flaring into 6 lanceolate long-awned ciliate teeth and armed at base with 6 uncinat spine-like spurs; flowers 2 or 3; calyx campanulate, its spatulate lobes almost distinct; stamens

6.—Dry sandy plains, s. bases of the San Gabriel and San Bernardino mountains.

28. *C. thürberi* (Gray) Wats. Fig. 322. Stems 1 or several from the base, di- or tri-chotomously forking, 2 to 8 in. high; herbage glandular-hispidulose near the base, sparingly so above; leaves in a basal rosette, elliptic to oblong,

3 to 4 lines long; bracts small, 3-lobed and spine-tipped; involucre chartaceous, 2-flowered, solitary in the axils of the bracts, 2 lines long, cylindric, 5-toothed and 3-horned; teeth erect, tipped with a short straight spine; horns near base saccate, spreading, short, thick, each tipped with a short straight spine; flowers pedicelled; calyx deeply parted, hairy on the outside; stamens 9 or 6.—Arid valleys, Colorado and Mohave deserts to Inyo Co.: s. Sierra Nevada; San Carlos Range; s. Nev. and Ariz.

# 10. OXYTHECA Nutt.

322. *Chorizanthe thurberi*  
Wats.; involucre x 6.

Slender annuals with the internodes more or less covered with stipitate glands and a repeatedly dichotomous inflorescence. Leaves in a rosette at base. Bracts more or less connate, often in 3s. Involucres 2 to several-flowered, more or less pedicellate, mostly turbinate, 4 or 5-cleft, each lobe bearing a bristle or awn. Flowers mostly exserted. Calyx glandular or pubescent on the outside. Stamens 9. Achene commonly lenticular. (Greek oxus, sharp, and theke, case, in allusion to the spiny involucre.)

Involucres lobed.

Involucres 5-lobed; bracts united only at base.

Involucres deeply parted into linear to obovate lobes.

Plants prostrate; involucres sessile.....1. *O. luteola*.

Plants erect; involucres pedicelled.

Calyx-lobes entire.....2. *O. caryophylloides*.

Calyx-lobes cleft.....3. *O. trilobata*.

Involucre a shallowly-lobed concave disk; calyx-lobes fimbriate...4. *O. emarginata*.

Involucres acutely 4-lobed; plants erect.

Bracts completely united into a round concave perfoliate disk; involucres sessile or nearly so.....5. *O. perfoliata*.

Bracts united only at base; involucres mostly pedicelled.

Leaves revolute.....6. *O. dendroidea*.

Leaves plane.....7. *O. watsonii*.

Involucral tube short, not lobed, its margin with 14 to 36 bristles.....8. *O. narishii*.

1. *O. luteola* Parry. Stems prostrate, several from the base, branching, 2 to 5 in. long; herbage usually yellowish; leaves basal and in pairs at the lower nodes, rounded, 1 to 2 lines long, the petioles mostly longer; bracts linear, acerose, in 2s or 3s; involucres in the forks and along the branchlets, parted almost to the base into 5 unequal divisions, the divisions linear, acerose or bristle-tipped, 1 to 3 lines long; flowers 7 to 11; calyx-tube subglobose, woolly, the glabrous yellow lobes spreading from its orifice.—Local species, Lancaster, Mohave Desert.

2. *O. caryophylloides* Parry. Stem erect but diffusely branching above the base, 7 to 10 in. high, the involucres numerous along the branchlets and terminal, on pedicels 1 to 4 lines long; herbage glabrous or nearly so; leaves basal, obovate to oblong-spatulate, contracted to a petiole,  $\frac{1}{4}$  to 2 in. long; bracts foliaceous, 3-parted into oblong divisions; involucres deeply parted into 5 nearly equal divisions, the divisions oblong, or a little widened upward, and abruptly awned; flowers 2 or 3; calyx short, greenish, obscurely lobed.—San Antonio, San Bernardino and San Jacinto mountains, 4000 to 7000 ft.

3. *O. trilobata* Gray. Stems one, sometimes several from the base, once trichotomous, then dichotomous, 4 to 14 in. high, the branches spreading; leaves in a basal tuft, spatulate,  $\frac{1}{3}$  to 2 in. long, a little hairy; herbage sparingly glandular; bracts 3-lobed, the lobes acerose; involucres glabrous, glaucous, deeply 5-parted, borne on slender pedicels; pedicels solitary in the forks and axils of the bracts; involucre deeply lobed, 2 to 3 lines long, its lobes oblong or spatulate, tipped with a bristle; calyx segments 3-cleft into lanceolate acuminate lobes slightly erosulate on the sides.—Dry valleys: San Bernardino Valley to San Diego Co.

4. *O. emarginata* Hall. Stem erect, tri- and di-chotomous, 2 to 6 in. high, the involucre in the forks and terminal on pedicels 1 to 6 lines long; herbage reddish, sparingly and minutely glandular; leaves in a basal rosette, oblanceolate, 4 to 8 lines long; bracts mostly 3-lobed; involucre obpyramidal, 2 to 3 lines high, shallowly 5-lobed, the lobes rounded, scarious-margined, awn-tipped; flowers 4; calyx 6-parted, its segments oblanceolate, fimbriate at apex.—Ridges about Tahquitz Peak, San Jacinto Mts. July.

5. *O. perfoliata* T. & G. Stem erect but short, parting at the first node into 2 or 3 horizontally spreading branches 2 to 4 in. long; herbage slate-color or reddish, glabrous except a glandular band on lower half of internodes; leaves of the basal rosette oblong-oblanceolate, green, 6 to 12 lines long; bracts at first node 3 or 4, small, united only at base, the upper bracts very conspicuous, orbicular- or deltoid-perfoliate, spine-tipped at the angles, 4 to 9 lines broad, glaucous; involucre narrowly turbinate, 3 to 4 lines long, deeply and acutely 4-lobed, each lobe bristle-tipped; calyx whitish,  $\frac{3}{4}$  line long, the outer segments minutely white-scaly.—Mohave Desert, n. to Lassen Co.; Nev. to Ariz.

6. *O. dendroidea* Nutt. Stem erect, tri- and di-chotomously branching above the base, 7 to 14 in. high, hispidulose-glandular, the involucre nearly sessile or shortly pediceled along the branchlets, or those in the forks mostly on pedicels 1 to 4 lines long; leaves linear to oblanceolate, revolute, acute, thinly hirsute,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; involucre narrowly turbinate,  $\frac{1}{2}$  to 2 lines long, 4-lobed, the lobes with very unequal awns or sometimes the awns obsolete; flowers about 3; calyx pale rose or whitish, rough pubescent, very shortly lobed.—Crooked Creek, Owens Valley; Lassen Co.; n. to Wash., e. to Wyo.

7. *O. watsonii* T. & G. Stem erect, dichotomously branching above the base, 6 to 9 in. high, glaucous; leaves spatulate,  $\frac{1}{2}$  to 1 in. long; bracts awned, reflexed; involucre turbinate, 4-lobed, with elongated awns,  $1\frac{1}{2}$  lines long, borne on pedicels 2 to 5 lines long; flowers  $\frac{1}{2}$  line long, white, puberulent.—Cushenbury Sprs., Mohave Desert; e. to Nev.

8. *O. parishii* Parry. Fig. 323. Stem erect, diffusely but sparingly tri- and di-chotomous above the base, 8 to 14 in. high, glabrous and glaucous except a hispidulose-glandular band on the lower part of the internodes and on the pedicels; leaves basal, spatulate-obovate,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; bracts small, 3-cleft; involucre on axillary and terminal pedicels ( $\frac{1}{4}$  to  $1\frac{1}{4}$  in. long), the tube turbinate, short (1 line long), but developing from its margin a circle of 14 to 36 excurrent bristles 2 to 3 lines long; flowers 5 to 14, pediceled; calyx 6-cleft nearly to base, its lobes linear-oblong, almost distinct, pubescent on back; stamens 9.—Montane 4500 to 6500 ft.: San Gabriel and San Bernardino mountains; n. to Mt. Pinos.

323. *Oxytheca parishii* Parry; involucre  $\times 5$ .

# 11. ERIÓGONUM Michx.

Annual or perennial herbs or small shrubs with basal or alternate or whorled leaves without stipules, those of the inflorescence commonly reduced to bracts. Flowers perfect, borne in an involucre, more or less exserted on their stalklets and commonly reflexed or recurved in age, intermixed with narrow scarious bractlets. Involucre 4 to 8-toothed or -lobed, several to many-flowered, borne in heads, peduncled umbels, or solitary along the branches (either sessile or on "pedicels"), or terminal on scape-like stems. Calyx 6-parted or -cleft, colored, persistent about the achene. Stamens 9,

inserted on the base of the calyx. Styles 3; stigmas minute, capitate. Achene triangular, except in a few species. Embryo straight, in the axis of scanty endosperm; cotyledons foliaceous. (Greek erion, wool, and gonu, knee or joint, the nodes hairy in some species.)

**A. Calyx not stipe-like at base; involucre turbinate or campanulate, 4 or 5-toothed or lobed, not angled, always borne on scattered pedicels, never congested in heads; annuals (nos. 11 and 12 perennials); mostly deserts or arid plains.—Subgenus GANYSMA.**

Plants with leaves at the nodes in the axils of at least the lower bracts as well as in a basal rosette; involucre 4-lobed or -toothed.

Involucre not cottony.

Inner and outer calyx-lobes very unlike.

Perianth segments not hooded, all slightly short-clawed. . . . . 1. *E. angulosum*.

Outer perianth segments hooded, all the segments slightly dilated at base. . . . . 2. *E. bidentatum*.

Inner and outer calyx-lobes nearly alike. . . . . 3. *E. gracillimum*.

Involucre conspicuously cottony. . . . . 4. *E. gossypinum*.

Plants with the leaves all in a basal rosette (except nos. 5 and 9), rarely in the axils of the lower bracts; inflorescence with small bracts at the nodes, the bracts in 3s, triangular or oblong, and often more or less connate at base.

Involucre 4-lobed or -toothed, few (usually 1 to 3)-flowered.

Calyx nearly glabrous. . . . . 5. *E. spergulinum*.

Calyx at least in fruit with hooked bristles.

Involucre 2-flowered; achene exserted. . . . . 6. *E. hirtiflorum*.

Involucre 4 to 6-flowered; achene not exserted. . . . . 7. *E. inerme*.

Calyx hairy or glandular-hispid, its hairs not hooked.

Calyx segments notched or 3-toothed at apex. . . . . 8. *E. apiculatum*.

Calyx segments entire.

Leaves tomentulose or glabrate. . . . . 9. *E. ordii*.

Leaves hairy pubescent.

Calyx pinkish. . . . . 10. *E. parishii*.

Calyx yellow. . . . . 11. *E. trichopodium*.

Involucre 5-lobed or -toothed, several-flowered.

Calyx hairy or pubescent (see also no. 16).

Stems usually inflated; leaves hairy-pubescent. . . . . 12. *E. inflatum*.

Stems not inflated or rarely.

Calyx segments not saccate-dilated.

Leaves obovate or rounded; involucre glandular. . . . . 13. *E. pusillum*.

Leaves reniform; involucre not glandular. . . . . 14. *E. reniforme*.

Outer calyx segments saccate-dilated on each side. . . . . 15. *E. thomasi*.

Calyx glabrous (except no. 16).

Pedicels erect. . . . . 16. *E. thurberi*.

Pedicels not erect.

Outer calyx segments obovate; involucre on nodding pedicels.

Calyx attenuate at base. . . . . 17. *E. cernuum*.

Calyx not attenuate at base. . . . . 18. *E. nutans*.

Outer calyx segments cordate at base.

Involucre on divaricately spreading pedicels 1 to 4 lines long. . . . . 19. *E. watsonii*.

Involucre on deflexed pedicels 1 line long or less. . . . . 20. *E. deflexum*.

**B. Calyx not stipe-like at base; involucre cylindric or cylindric-turbinate, 5-toothed, 5 (or 6)-nerved or angled, always sessile, solitary or congested in heads; annuals, perennial herbs, or shrubs; mostly deserts or dry foothills.—Subgenus OREGONIUM.**

1. *Involucre solitary, usually scattered.*

Annuals; leaves mostly in a rosette at base.

Flowering branches mostly elongated.

Calyx glabrous; involucre (except the terminal) hugging the branches.

Plant compactly branching; outer calyx segments fan-shaped with strongly incurved sides. . . . . 21. *E. nidularium*.

Plant diffusely or strictly branched.

Involucre narrowly turbinate, glabrous or nearly so, the teeth prominent.

Petioles not winged; stems and leaves white-woolly. . . . . 22. *E. gracile*.

Petioles conspicuously winged; stems and leaves less tomentose. . . . . 23. *E. citharaeforme*.

Involucre cylindric, almost truncate, the teeth minute.

Stems, leaves and involucre white-woolly. . . . . 24. *E. virgatum*.

Stems glabrous, rarely a little woolly below.

Involucre 1  $\frac{1}{4}$  to 2  $\frac{1}{2}$  lines long. . . . . 25. *E. molestum*.

Involucre  $\frac{1}{2}$  to 1  $\frac{1}{2}$  lines long.

Involucre 1 to 1  $\frac{1}{2}$  lines long, usually fluted and often obscurely constricted a little at tip. . . . . 26. *E. vimineum*.

Involucre  $\frac{1}{2}$  to  $\frac{3}{4}$  line long, not fluted. . . . . 27. *E. baileyi*.

- Calyx densely hairy; involucre spreading a little from the branches..... 28. *E. dasyanthemum*.
- Flowering branches not elongated.  
Repeatedly and shortly forked; flowers yellow..... 29. *E. mohavense*.  
Bearing an irregularly compound umbel..... 30. *E. truncatum*.
- Perennials with densely leafy short woody stems.  
Inflorescence racemose.  
Leaves roundish, densely imbricated on the caudex..... 31. *E. saxatile*.  
Leaves not roundish.  
Involucres scattered on the few elongated branches.  
Involucres scattered, 2 to 3 lines long..... 32. *E. elongatum*.  
Involucres scattered or sometimes approximate towards the ends of the branches, 1 to 1½ lines long..... 33. *E. wrightii*.  
Involucres secund and crowded on the short branchlets..... 34. *E. nodosum*.
- Inflorescence cymose or paniculate.  
Peduncles bearing a divaricately branched panicle.  
Involucral teeth glabrous..... 35. *E. heermannii*.  
Involucral teeth pubescent..... 36. *E. plumatella*.  
Peduncles bearing corymbose cymes..... 37. *E. microthecum*.
2. *Involucres 2 to several in heads, rarely solitary; perennials.*  
Calyx-lobes similar or nearly so, nearly equal.  
Not caespitose.  
Shrubs, at least woody at base; stems very leafy, commonly fascicled.  
Heads or involucre in a dense compound cyme; insular species.  
Leaves linear..... 38. *E. arborescens*.  
Leaves elliptic or oblong..... 39. *E. giganteum*.  
Heads not in a compound cyme; mainland species or mostly.  
Heads terminal on the 2-forked peduncles or racemously disposed on the forks; leaves mostly ovate or roundish.  
Calyx silky; filaments glabrous; leaves ashy beneath..... 40. *E. cinereum*.  
Calyx glabrous; filaments hairy at base; leaves white-lanate beneath..... 41. *E. parvifolium*.  
Heads umbellate, sometimes solitary and terminal; filaments glabrous or nearly so; leaves oblong or linear.... 42. *E. fasciculatum*.  
Herbaceous or mostly so, leafy only at base; heads umbellate or usually so.  
Stems not fistulose; heads 1 or few; seashore..... 43. *E. latifolium*.  
Stems fistulose; heads several to many.  
Leaves spreading, oblong or ovate, obtuse, ½ to 2 in. long..... 44. *E. nudum*.  
Leaves erect, ovate to ovate-lanceolate, acute, 1 to 3 (or 5) in. long... 45. *E. elatum*.  
Stems with trumpet-inflated lower internodes; involucre solitary, racemose. 46. *E. indicum*.
- Caespitose.  
Involucres very angular, 5-toothed..... 47. *E. kennedyi*.  
Involucres not angular, in age bladdery, 6 to 8-toothed.... 48. *E. ochrocephalum*.
- Calyx-lobes dissimilar, the outer somewhat cordate at base, attached only by the lower third of the midvein; stems scape-like.  
Stems bearing a single head..... 49. *E. ovalifolium*.  
Stems bearing a simple or irregularly compound umbel..... 50. *E. proliferum*.
- C. Calyx stipe-like at base; involucre turbinate, 4 to 8-toothed or lobed, either solitary or borne in umbels, the umbels sometimes congested in heads; flowering stems scape-like; perennial herbs; mountains from middle altitudes to alpine.—Subgenus *EUERIOGONUM*.
1. *Involucres with reflexed lobes, the lobes often long.*  
Calyx hairy.  
Peduncles scape-like, bearing a solitary involucre, rarely an umbel.  
Calyx yellow.  
Peduncles naked..... 51. *E. caespitosum*.  
Peduncles bearing a whorl of bracts at the middle..... 52. *E. douglasii*.  
Calyx whitish..... 53. *E. sphaerocephalum*.  
Peduncle bearing a 3-rayed umbel..... 54. *E. tripodum*.
- Calyx glabrous.  
Peduncles bearing a solitary involucre..... 55. *E. siskiyouense*.  
Peduncles bearing a simple or compound umbel.  
Peduncles scape-like, erect or nearly so.  
Leaves mostly spreading, ½ to 1 in. long; umbel simple or compound.  
Leaves more or less tomentose..... 56. *E. umbellatum*.  
Leaves glabrous..... 57. *E. torreyanum*.  
Leaves erect, 1 to 3 in. long; umbel compound..... 58. *E. compositum*.  
Peduncles decumbent..... 59. *E. lobbii*.
2. *Involucres with short erect teeth.*  
Involucre in heads or umbels.  
Calyx villous or hairy.  
Leaves glabrous..... 60. *E. pyrolaeifolium*.  
Leaves hairy..... 61. *E. latensis*.

- Calyx glabrous.  
 Bracts mostly linear, abundant.....62. *E. ursinum*.  
 Bracts small, inconspicuous.  
 Rays  $\frac{1}{2}$  in. long or less, or umbels capitate; crown compact.63. *E. incanum*.  
 Rays  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; crown loose.....64. *E. marifolium*.  
 Involucres solitary.  
 Calyx whitish or pinkish.....65. *E. kelloggii*.  
 Calyx yellow.....66. *E. alpinum*.

I.—SUBGENUS *Ganýsma*

Involucres campanulate or broadly turbinate, not angled, never congested in heads, always borne on filiform and usually elongated pedicels and disposed in racemes or panicles, often drooping or recurved; bracts in 3s, small, rigid, mostly oblong to triangular; calyx often accrescent, not stipe-like at base; ovary and filaments glabrous; annuals (except nos. 9 and 10); mostly of the deserts or arid plains.

1. *E. angulosum* Benth. Fig. 324. Stems diffusely and repeatedly dichotomous from near the base, 3 to 14 (or 24) in. high, the branches 4 to 6-angled; stems and leaves whitish tomentose, or glabrate and green; basal leaves roundish to broadly oblong or lanceolate, commonly undulate,  $\frac{1}{2}$  to 1 in. long, on rather short petioles; upper leaves oblong to lanceolate or oblanceolate, sessile or nearly so; pedicels of the involucres 3 to 8 lines long, in the forks or terminal; involucres turbinate or hemispherical, 1 line long, minutely glandular, woolly inside; calyx segments white or pink,  $\frac{1}{2}$  to  $\frac{3}{4}$  line long, minutely glandular-puberulent, the outer (with darker center) obovate or ovate, concave, the inner linear or lanceolate, distinctly longer than the outer, all abruptly short-clawed.—South Coast Ranges; upper San Joaquin Valley; Inyo Co.; Mohave Desert; coastal S. Cal.; e. to Ariz., thence n. to Wash. and s. to L. Cal. Var. *VIRIDESCENS* Jepson. Leaves oval to elliptic; calyx greenish.—Kern Co. Possibly a seasonal abnormality. Var. *MACULATUM* Jepson. Close to preceding; basal leaves oval, not revolute,  $\frac{3}{4}$  to 1 in. long and  $\frac{1}{2}$  to  $\frac{3}{4}$  in. wide; involucre more deeply lobed; outer calyx segments yellowish with an oblong red blotch.—Desert valleys: Mohave Desert; Inyo Co.; n. to western Nev. Var. *VARIABLE* Parish. Stems divergently branched above the base, leaving an open space in the middle.—Central Mohave Desert; upper San Joaquin Valley.

324. *E. angulosum* Benth.; a, involucre  $\times 4$ ; b, fl.  $\times 10$ .

2. *E. bidentatum* Jepson. NUN'S VEILING. Diffuse annual 5 to 7 in. high; stems repeatedly dichotomous; pedicels 3 to 5 lines long, borne in the forks and terminal, sometimes markedly racemose; bractlets of the involucre spoon-shaped; inner and outer perianth segments very unlike, somewhat unequal, the inner erect, linear-lanceolate, acuminate, arising from a dilated base, the outer spreading a little or approximate about the inner ones; the inner ones rounded-cucullate at the apex with a notch in the hood, each side of the notch ending in a small point; filaments little longer than the ovary.—Upper San Joaquin Valley, w. side (Taft); also a similar but doubtful plant 24 mi. north of Barstow.

325. *Eriogonum gracillimum* Wats.; a, involucre  $\times 4$ ; b, fl.  $\times 10$ .

3. *E. gracillimum* Wats. Fig. 325. Stems many from the base, diffuse, repeatedly dichotomous and very slender above, 4 to 10 (or 24) in. high; herbage

thinly woolly, especially on the under side of the leaves; basal leaves spreading, oblong to lanceolate,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, narrowed below, sessile or shortly petioled, the cauline sessile, erect, oblong-lanceolate, acute, blister-dilated, strongly revolute,  $\frac{3}{4}$  to 1 in. long; involucre turbinate, borne on filiform pedicels 4 to 8 lines long; calyx pink, minutely glandular-hispid outside, 1 line long, the tips of the segments white and erosulate; outer segments broadly oblong, erect with the white tips abruptly spreading, the edges below the tips incurved; inner segments like the outer but smaller.—Sandy soil, Mohave Desert to the upper San Joaquin Valley and San Luis Obispo Co.

4. *E. gossypinum* Curran. Diffusely branched from the base, 4 to 10 in. high, thinly tomentose throughout or the upper parts glabrate; leaves oblanceolate, narrowed to a short petiole, or the upper oblong or lanceolate and mostly sessile, 1 to 2 in. long; involucre  $1\frac{1}{2}$  lines long, borne on pedicels 1 to 6 lines long, turbinate, cleft to the middle, glabrous outside, heaped inside with a cottony wool in which the 5 to 8 flowers are concealed; calyx  $\frac{1}{2}$  line long, obscurely puberulent, the outer segments oblong or spatulate, the inner linear, acuminate, longer.—Upper San Joaquin Valley. A remarkable species.

5. *E. spergulinum* Gray. Stems erect, dichotomously branching, 4 to 11 in. high, minutely glandular pubescent or the upper half of the internodes usually glabrous; leaves linear, revolute, hairy,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, in whorls at the base of the stem and at the lower forks, reduced above to small bracts; involucre  $\frac{1}{4}$  line long, deeply 4-toothed, on pedicels 3 to 6 lines long; bracts none; calyx white with pink midveins,  $\frac{3}{4}$  to  $1\frac{1}{4}$  lines long, obscurely puberulent at base, the segments oblong-quadrate, erosulate at apex or merely acute.—Mt. slopes, North Coast Ranges and Sierra Nevada, 5000 to 9000 ft.

6. *E. hirtiflorum* Gray. Repeatedly dichotomously branched, 4 to 9 in. high, the stems lightly sprinkled with minute often stipitate glands, otherwise glabrous; leaves obovate, drawn down to a petiole-like base, sparingly hirsutulose, especially on the margins,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; involucre sessile along the branches and in the forks, or often on pedicels 1 to 3 lines long, narrow, 2-flowered; calyx reddish,  $\frac{1}{2}$  line long, its segments oblong, clothed with hooked hairs on the back; achene exserted.—Middle altitudes, Sierra Nevada and North Coast Ranges.

7. *E. inermis* (Wats.) Jepson. Stems 1 to 3 from the base, repeatedly and divaricately dichotomous, 3 to 10 in. high; leaves in a basal rosette, broadly spatulate,  $\frac{1}{2}$  to 1 in. long, sessile, glabrous save the ciliate margin; bracts (2 or 3 lines long) and branches hispidulose-glandular; involucre 4-cleft nearly to the base, 3 to 6-flowered, shortly pedicled (pedicels  $\frac{1}{4}$  to  $\frac{1}{2}$  line long); flowers rose-color; calyx hispid, its hairs hooked at tip, at least in age; inner calyx segments smaller than the outer and retuse.—Montane: San Bernardino Mts., n. to Monterey, San Benito and Tulare Cos.

8. *E. apiculatum* Wats. Stems erect, trichotomously branching,  $\frac{1}{2}$  to 2 ft. high, the peduncles (2 to 4 lines long) in all the forks and terminal, the lower half of the internodes and peduncles somewhat glandular-pubescent; leaves in a basal cluster, obovate or oblanceolate, narrowed below to a petiole, 7 to 12 lines long, hirsute-glandular; involucre 1 to 3-flowered, glabrous, turbinate, nearly 1 line long, 4-lobed, the lobes oblong and as long as tube; pedicels spreading or even deflexed, 2 to 7 lines long; calyx red in the bud, white in flower,  $\frac{3}{4}$  line long, puberulent outside, segments oblong obovate, deeply notched with a slender point in the sinus, sometimes one or more merely truncate, obtuse or apiculate.—Montane, 7800 to 8200 ft.: Mt. San Jacinto; Cuyamaca Mt. A dainty plant with peculiar calyx segments, closely allied to *E. parishii*.

9. *E. ordii* Wats. Diffusely paniculate,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  ft. high, the lower parts thinly tomentose, or the leaves glabrate above; leaves in a rosulate basal cluster and in whorls at the lower nodes, roundish to obovate,  $1\frac{1}{2}$  to 2 in. long, or the upper smaller, petioled; involucre 4-toothed,  $\frac{1}{2}$  to  $\frac{1}{2}$  line long.

1 to 3-flowered, on pedicels 3 to 9 lines long; calyx dull white or pinkish, densely pubescent outside,  $\frac{1}{2}$  to  $\frac{3}{4}$  line long, its segments ovate or oblong.—Caliente, Kern Co.; Split Mt., Colorado Desert; w. Ariz.

10. *E. parishii* Wats. Stems 1 to 3, forming a diffusely branched panicle above the first node, 4 to 9 in. high, glaucous but somewhat viscid with stipitate glands; leaves in a basal cluster, broadly oblanceolate, hirsute, narrowed to a short petiole,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; pedicels 1 to 4 lines long; involucre 4-lobed at least to middle,  $\frac{1}{2}$  line long, 1 or 2-flowered; calyx pinkish, minutely pubescent,  $\frac{1}{2}$  line long, outer segments ovate, the inner oblong-spatulate.—San Bernardino Mts.; Descanso; Campo; s. to L. Cal.

11. *E. trichopodium* Torr. Annual or perennial; stems 1 or several from the base, erect, umbellately 3 to 11-forked at and above the first node, glabrous and glaucous,  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high; first internode often inflated upwards; leaves in a basal cluster, roundish, crinkly, hirsute-pubescent, 6 to 9 lines long on petioles 1 to  $1\frac{1}{2}$  times as long; involucre minute ( $\frac{1}{4}$  line long), 4-lobed, 2 to 4-flowered, on divaricately spreading hair-like pedicels 3 to 5 lines long; calyx yellow or greenish, densely white-hispidulose on back of the ovate segments,  $\frac{1}{2}$  to  $\frac{3}{4}$  line long; inner and outer segments alike and equal.—Colorado and Mohave deserts n. to Inyo Co. and the San Carlos Range; e. to Utah and Ariz.

12. *E. inflatum* Torr. & Frem. DESERT TRUMPET. Fig. 326. Annual or perennial; stems several from the base, repeatedly tri- and di-chotomous, forming a diffuse panicle,  $\frac{1}{2}$  to 3 ft. high, glabrous, glaucous; lower internodes, especially the lowest peduncle-like one, strongly or slightly inflated upwards or rarely not at all; leaves roundish or round-ovate, cordate at base. 4 to 12 lines long, sometimes to  $1\frac{1}{2}$  in. long, short-hirsute but green, on petioles  $\frac{1}{2}$  to 2 times as long; pedicels racemose and in the forks, divaricately spreading, 4 to 10 lines long; involucre 3 to 7-flowered, glabrous, turbinate, 5-toothed,  $\frac{1}{2}$  line long, in age crowded with linear or oblong bractlets; calyx yellowish, 1 line long, all the segments densely whitish hispid along middle of back, the outer segments lanceolate, their edges revolute and thus becoming linear-lanceolate, the inner segments triangular-lanceolate, with scarious margins.—Colorado and Mohave deserts, n. to the San Carlos Range; e. to Utah and N. Mex. Also called Indian Pipe Weed.

13. *E. pusillum* T. & G. Stems 1 or several from the base, 4 to 12 in. high, trichotomously branched at or from below the middle, glabrous; leaves ovate or rounded, 3 to 8 lines long, tapering at base into the petiole, flocculent-tomentose below, less so above, the green bracts and involucre glandular-pubescent; pedicels of the involucre glabrous, filiform, 4 to 14 lines long, in all the forks of the trichotomous panicle and terminal; involucre broadly turbinate; calyx yellow, the segments with red centers, minutely pubescent, 1 line long, the outer segments obovate, the inner oblong; filaments included.—Mohave Desert; Inyo Co.; e. to Nev.

326. *Eriogonum inflatum* Torr. & Frem.;  
a, habit x  $\frac{1}{2}$ ; b, calyx x 12.

14. *E. renifórm*e Torr. & Frem. Stems 1 to several from the base, 2 to 6-forked, forming a diffuse plant 4 to 7 in. high; herbage glabrous and glaucous except the leaves and the slightly hairy lower internodes; leaves all basal, round-reniform or roundish, 5 to 11 lines broad, loosely white-woolly; petioles  $\frac{1}{2}$  to  $2\frac{1}{2}$  in. long; bracts glabrous but the margins loosely hairy; involucre glabrous, turbinate-campanulate, on pedicels 2 to 6 lines long; calyx whitish or yellowish, minutely glandular-puberulent,  $\frac{3}{4}$  line long, the outer segments ovate, the inner broadly linear; filaments exserted. —Inyo Co. s. to the Mohave and Colorado deserts; L. Cal.

327. *Eriogonum thomasi* Torr.;  
a, fl. in anthesis; b, fl. in fruiting  
stage. x 12.

and terminal, 2 to 9 lines long; involucre deeply 5-lobed,  $\frac{1}{2}$  line long, glabrous; calyx dull yellow,  $\frac{1}{3}$  to  $\frac{1}{2}$  line long, in age whitish and twice as long, hispidulose outside at base, the outer segments ovate, the margin in age saccate-dilated on each side of the cordate base, the inner segments linear-spatulate, finally exceeding the outer. —Colorado Desert, n. to Inyo Co.; e. to Ariz. and Utah.

16. *E. thúrberi* Torr. Fig. 328. Stems 1 or several from the base, diffusely and trichotomously branched, 4 to 13 in. high, tomentulose towards the base; leaves in a basal rosulate cluster, ovate to broadly oblong, woolly below, less so above,  $\frac{1}{2}$  to 2 in. long, the petioles about as long or longer; peduncles in the forks and terminal, 2 to 12 lines long; involucre 1 line long, nearly hemispherical; calyx rose-red or white,  $\frac{1}{2}$  to  $\frac{3}{4}$  line long; outer calyx segments roundish or transversely elliptic, abruptly narrowed to a broad claw, a floe of wool at summit of claw; inner calyx segments narrowly linear or lanceolate, somewhat hastately lobed near base,  $\frac{1}{4}$  as wide as outer segments. —San Bernardino Valley to San Diego Co. and L. Cal., e. to Ariz.

328. *Eriogonum thurberi* Torr.; a, fl.  
branchlet x 1; b, fl. x 10.

*E. PANDURÁTUM* Wats. Similar to no. 16; involucre turbinate-campanulate, nearly 1 line long; calyx white or pinkish,  $\frac{1}{2}$  line long, the outer segments reniform, drawn down to a narrow base, the inner narrowly oblong, undulate. —Palm Sprs., Mt. San Jacinto (acc. Parish).

17. *E. cérnum* Nutt. Stems glabrous, glaucous, diffusely di- or tri-chotomously branched, 6 to 14 in. high; leaves round to oval, white woolly below, glabrate above, 6 to 9 lines long, the petioles nearly as long; pedicels deflexed,  $\frac{1}{2}$  to 4 (or 7) lines long, somewhat racemose on the branches; involucre narrowly turbinate; calyx white, glabrous,  $\frac{3}{4}$  to 1 line long, narrowed to a shortly clavate base, its segments obovate or somewhat quadrate, undulate, retuse, the inner half as broad. —Colorado Desert; a. to Ore., e. to the Rocky Mts.

18. *E. nütans* T. & G. Similar to *E. cernuum* but pedicels glandular; base of calyx very obtuse (attenuate in *E. cernuum*). —Lassen Co.; nw. Nev.

19. *E. watsonii* T. & G. Similar to *E. cernuum*; stem sometimes a little inflated; branches erect; leaves round-cordate; pedicels divaricately spreading,

329. *Eriogonum deflexum* Torr.;  
a, involucre x 5; b, fl. x 10.

1 to 4 lines long; calyx segments oblong, subcordate at base.—Mt. Pinos; e. to Nev.

20. *E. deflexum* Torr. SKELETON WEED. Fig. 329. Stems 1 or several from the base, glabrous and green, 5 to 13 in. high, divaricately branched, the internodes short and branching, intricate, or sometimes simpler with elongated branchlets; leaves in a basal rosette, round-obcordate, whitish tomentose,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, the petioles half to twice

as long; involucre campanulate or broadly turbinate,  $\frac{1}{2}$  to 1 line long, with 5 short broad obtuse lobes, on pedicels  $\frac{1}{4}$  to 1 (or rarely 2) lines long, more or less deflexed; calyx white, or turning pink, glabrous,  $\frac{1}{2}$  to 1 line long, the outer segments elliptic or elliptic-ovate, very obtuse, cordate at base, the inner narrowly ovate-acuminate, shorter than the outer, half as wide.—Desert washes and flats, Colorado and Mohave deserts to Inyo Co.; e. to Nev. and Ariz.

## II.—SUBGENUS *Oregonium*

Involucres cylindric or cylindric-turbinate, 5-toothed, 5 or 6-nerved or angled, always sessile, solitary or congested in heads, always erect; bracts on the flowering branches in 3s, connate at base; calyx not at all or little accrescent, not stipe-like at base; ovary and filaments mostly glabrous; annuals, perennial herbs, or shrubs; mostly of deserts or arid foothills.

21. *E. nidularium* Cov. Fig. 330. Stems 1 or many from the base, repeatedly and regularly dichotomous, the forks short, making a dense mass of intricate branches which in well-grown plants curve in at maturity and suggest resemblance to a bird's nest; whole plant cobwebby-tomentose, often reddish in age, 3 to 8 in. high; leaves roundish ovate to orbicular and subcordate, 3 to 6 lines long, the petioles 1 to  $2\frac{1}{2}$  times as long; involucre sessile in all the forks and along the branches,  $\frac{1}{2}$  line long; calyx red, white or yellowish, glabrous,  $\frac{3}{4}$  to 1 line long; outer segments somewhat quadrate, dilated at the truncate apex, the sides incurved; inner segments similar but narrower; ovary glabrous, scabrous on upper part.—San Bernardino and Inyo Cos.; e. to Nev.

330. *Eriogonum nidularium*  
Cov.; fl. x 12.

22. *E. gracile* Benth. Stems strictly branched and forming a narrow panicle or more diffuse,  $\frac{1}{2}$  to  $2\frac{1}{2}$  ft. high; thinly tomentose throughout, becoming floccose; leaves oblanceolate or broadly oblong, attenuate to a slender petiole,  $\frac{1}{2}$  to 2 in. long, tomentose on both sides or less so above; involucre distributed along the elongated branches, glabrous or nearly so, barely exceeding the bracts and half concealed by them,  $\frac{3}{4}$  to 1 line long, cylindric-campanulate, the teeth acute, prominent, spreading; calyx white, rose-color or yellowish, glabrous,  $\frac{3}{4}$  line long.—Dry plains, valleys and low hills: Great Valley and Coast Ranges to S. Cal.; s. to L. Cal.

23. *E. citharaeforme* Wats. Stems 1 or several from the base, freely branching, 1 to 3 ft. high; herbage thinly tomentose, glabrous or glabrate above; leaves in a basal rosette, or a few at the lower nodes, roundish to ovate,  $\frac{3}{4}$  to 2 in. long, gradually or cordately contracted to a long winged petiole, the wing crenulately toothed, attenuate downward; involucre

turbinate,  $1\frac{1}{2}$  lines long.—San Luis Obispo Co. and e. to the inner South Coast Ranges.

24. *E. virgatum* Benth. Tomentose throughout, stem slender, erect, simple, or the few branches rather strict, 1 to 3 ft. high; leaves in whorls on lower part of stem or rosulate at the base, oblanceolate (or obovate),  $\frac{1}{2}$  to 2 in. long, on slender petioles, the margin usually undulate; involucre 2 to  $2\frac{1}{2}$  lines long, rather remote, tomentose, cylindric, truncate or nearly, the teeth minute; bracts lanceolate, shorter than the involucre; calyx glabrous, 1 line long, white, buff, sulphur-yellow or pink.—Stream beds: Coast Ranges; Sierra Nevada, 500 to 5000 ft.

25. *E. moléstum* Wats. Habit of *E. vimineum*, glabrous and glaucous above the white-woolly leaves; leaves roundish or cordate, crisped or undulate, 4 to 6 lines long; flowers white,  $\frac{3}{4}$  to 1 line long; involucre cylindric-turbinate,  $2\frac{1}{2}$  lines long; ovary scaberulous.—San Gabriel, San Bernardino and San Jacinto mountains and s. to San Diego. Var. *DAVIDSONII* Jepson. Habit and foliage of *E. molestum* but involucre  $1\frac{1}{4}$  to  $1\frac{3}{4}$  lines long, cylindric-prismatic; calyx pink or white; bracts more united and cup-like.—San Gabriel Mts. to the San Jacinto Mts.

26. *E. vimineum* Dougl. Fig. 331. Stems 1 or several, glabrous wholly or at least above the base, erect, 3 to 18 in. high, much branched from near the base, the branches elongated and virgate, with the lower often in whorls of 3 to 5; lower forks sometimes leafy; leaves orbicular to broadly ovate, 3 to 12 lines broad, greenish, reddish, or yellowish, white tomentose below, the margin undulate, at least in age, the petioles 1 to 3 times as long; involucre very narrow, cylindric, strongly angled, 1 to  $1\frac{1}{2}$  lines long; flowers rather few, rose-color, or yellowish, glabrous, 1 line long; outer calyx segments obovate, rounded at apex, the inner oblong.—Coast Range hills, especially slopes near rocky outcroppings.—Var. *ELEGANS* Jepson. Stem for a half-inch at base densely clothed with white-woolly obcordate small leaves; involucre turbinate; calyx rose-red or whitish,  $\frac{1}{2}$  line long.—San Luis Obispo Co. Var. *CANINUM* Greene. Stems several from the base, procumbent or very diffuse, repeatedly di- or at first tri-chotomous, with short forks and branchlets, or the stem sometimes solitary, erect and branching only at the first node; inflorescence and stems reddish; involucre narrowly turbinate, mostly at the ends of the short branches or sessile in the forks; calyx rose-red.—Oakland Hills; Marin Co.; Monterey Co.

331. *Eriogonum vimineum* Dougl.; involucre  $\times 5$ .

27. *E. baileyi* Wats. Diffusely branched from the base, glabrous, 5 to 12 in. high, and half again as broad, with something of the delicate or slender habit of *E. gracile*; leaves roundish to ovate, white-woolly; involucre cylindric or a little enlarged upwards,  $\frac{1}{2}$  to  $\frac{3}{4}$  line long; calyx lemon yellow or whitish, delicately glandular,  $\frac{2}{3}$  line long; outer segments ovate or oblong, the inner smaller, narrowly ovate; body of achene lenticular, strongly beaked.—Desert valleys: Mohave Desert; Inyo Co.; Nev. to Ariz. and Wash. Var. *BRACHYANTHUM* Jepson. Stems usually greenish rather than pale or glaucous, at base with a persistent lanate zone; internodes shorter and relatively stouter; bracts redder; calyx glabrous in age, usually constricted a little at middle and flaring at tip, as often in the species.—Mohave Desert n. to Inyo Co. Well-grown plants recall in miniature the habit of a Texas Umbrella Tree. Var. *TOMENTOSUM* Wats. Stems thinly tomentose.—San Bernardino Mts.

28. *E. dasyanthemum* T. & G. Fig. 332. Stems thinly tomentose or soon glabrate, 1 to 2 ft. high, branching from or near the base, and often bush-like in habit; leaves roundish, plane, tomentose below, less so above,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, abruptly contracted to a slender petiole half to as long; involucre 1 or 2 in. a piece, rather remote, cylindric, 2 lines long, tomentose between the

callous ribs; calyx white or red, 1 line long, densely hairy on outside, glabrous inside; filaments glabrous or slightly pubescent at very base.—Low dry hills, inner Coast Range from the Vaca Mts. to Lake Co. and n. to the Yollo Bollys. Sept.-Nov. This replaces *E. vimineum* of the middle North Coast Range.

29. *E. mohavense* Wats. Stems 1 or several from the base, repeatedly tri- and dichotomously branched, 4 to 12 in. high, glabrous or a little hairy at the nodes; branches green, bracts often red; leaves in a rosulate basal cluster, roundish or ovate, 2 to 6 lines long, abruptly narrowed to a slender petiole; involucre turbinatobellshaped, very shortly 5-toothed, glabrous outside, a hairy ring inside at throat,  $\frac{3}{4}$  line long, sessile in the forks and terminal on the short branchlets; calyx yellow, glabrous,  $\frac{1}{2}$  line long, the outer segments oblong or elliptic, the inner segments sometimes white, half as broad; achene partly exserted.—Dry hills, Mohave Desert. Involucres almost flaring just at mouth. Remarkable for the small size of its flowers.

332. *Eriogonum dasyanthemum*  
T. & G.; involucre x 5.

30. *E. truncatum* T. & G. Stems mostly several from the base, thinly tomentose or glabrate, 6 to 15 in. high, naked, bearing a leafy-bracted irregular umbel; leaves obovate or oblong-oblancheolate, with undulate margin, 1 to 2 in. long, attenuate to a slender petiole nearly as long; umbel of 3 to 6 elongated unequal rays loosely once or twice di- or tri-chotomous; bracts almost minute; involucre 2 to 4 in a cluster or solitary, tomentose, oblong-turbinat, 2 lines long; calyx light rose-color, glabrous,  $1\frac{1}{2}$  lines long; filaments pubescent at very base.—East base of Mt. Diablo n. to Antioch. The sinuses between the involucre teeth are completely filled by a membrane so that the involucre is truncate. Var. *ADSRGENS* Jepson. Leaves roundish, 5 to 11 lines broad, abruptly long-petioled; involucre turbinat, 1 line long, obviously toothed.—Inner South Coast Range from Waltham to Hernandez.

31. *E. saxatile* Wats. Flowering stems erect, naked, paniculately 1 or 2-forked, tomentulose,  $\frac{1}{4}$  to 1 (or 2) ft. high, arising from a woody caudex; caudex simple or branched, 2 to 5 in. high, densely crowded or even imbricated with leaves; leaves covered with a dense silvery felt, roundish to round-ovate, shortly acute,  $\frac{1}{4}$  to 1 (or  $1\frac{1}{2}$ ) in. long, shortly petioled; involucre tomentulose,  $1\frac{1}{2}$  to 2 lines long, scattered along the branches of the panicle; calyx white or pale yellowish, glabrous, 3 to 4 lines long, gradually narrowed to a stipe-like 3-angled or 3-carinate base as long as the segments; inner calyx segments obovate, rather exceeding the narrower outer ones; filaments hairy at very base.—Mt. sides, 3000 to 8500 ft.: cismontane S. Cal., n. in the Sierra Nevada to the Kaweah River and in the Coast Ranges to the Santa Lucia and Santa Cruz mountains.

32. *E. elongatum* Benth. Flowering stems erect, slender, leafless, simple or strictly branching, 1 to 4 ft. high, arising from a branching base composed of leafy stems 3 to 9 in. high; herbage whitish-tomentulose throughout, the leaves beneath densely white-tomentulose, above glabrate; leaves scattered or congested, ovate to oblong-lanceolate, acute, the margin undulate, 1 to  $1\frac{1}{2}$  in. long, narrowed to a short petiole; involucre remotely scattered along the elongated stems or branches, cylindric,  $3\frac{1}{2}$  lines long, truncate or obscurely toothed; calyx white, glabrous save a little hairiness on midveins inside,  $1\frac{1}{2}$  lines long, its segments obovate, obtuse, the inner slightly longer than the outer; filaments glabrous.—Mt. sides and cañons near the coast from Monterey Co. to cismontane S. Cal.; s. to L. Cal.

33. *E. wrightii* Torr. Flowering peduncles several, arising from the short erect very leafy branches of the much-branched woody base, the plants 4 to

12 in. high; leaves obovate or oblanceolate, acute, white-tomentose, 2 to 6 lines long, short-petioled, often with smaller ones fascicled in the axils, or the lowermost twice as long with longer petioles; peduncles short, once or twice di- or tri-chotomous, the branches erect and rather strict; involucre scattered along the branches or congested towards the ends, campanulate-tubular, prominently but obtusely angled and woolly between the angles; calyx white or pink,  $1\frac{1}{2}$  lines long, its segments obovate, rounded at apex, the inner longer than the outer.—Stream beds or mt. slopes: Sierra Nevada; Coast Ranges towards the interior; S. Cal.; e. to Tex. Var. *SUBSCAPOSUM* Wats. Leafy branches short, forming a close dense mat with short flowering stems; calyx smaller, the segments less narrowed at base.—High montane. Var. *MEMBRANACEUM* Stokes. Petioles dilated at base into a sheath clasping the stem; leaves glabrate above; sheaths soon glabrate,  $\frac{1}{2}$  to 1 line long.—S. Cal. mts.

34. *E. nodosum* Small. Stems several from the base, tri- or di-chotomously branching, leafy below,  $\frac{3}{4}$  to  $1\frac{1}{4}$  (or " $3\frac{1}{2}$ ") ft. high, white-tomentulose; involucre turbinate-cylindric,  $1\frac{1}{2}$  lines long, sessile and unilaterally crowded on the ultimate ( $\frac{1}{2}$  to 1 in. long) branchlets or pedicellate in the forks; calyx glabrous,  $1\frac{1}{2}$  lines long, parted about half-way, the base coriaceous; outer segments roundish, notched at apex, the inner similar, half as broad; filaments pilose below the middle; achene minutely scaberulous.—Desert regions: White Mts., Inyo Co.; Imperial Co.; Nev. to L. Cal. Var. *JAEGERI* M. & J. Upper portion of plant glabrous.—Morongo Wash.

35. *E. heermanni* D. & H. Stems woody at base, leafy below, soon branching into a panicle,  $1\frac{1}{2}$  to 2 ft. high; peduncle of the panicle short, repeatedly 2 or 3-forked and finally ending in somewhat spinescent branchlets; forks of the panicle rather short but straightish, rigid, somewhat divaricate, as if fistulous and a little constricted at the joints; plant flocculent or glabrate on lower part, glabrous above; leaves oblong, 6 to 8 lines long, petioled; involucre hemispherical or broadly turbinate, 1 line long, the broad rounded lobes scarious-margined and overlapping at the sinuses; calyx 1 to  $1\frac{1}{4}$  lines long, glabrous, the outer segments orbicular, the inner oblong, much narrower.—Mohave Desert; Mt. Pinos; s. Sierra Nevada; e. to Nev.

36. *E. plumatella* D. & H. Stems from a woody base, forming a compact erect cluster, branching above into a broad head, 1 to 2 ft. high; branches straightish or zigzag, covered with a dense thin tomentum; forks (or internodes) of the panicle short, somewhat curved, continuously divaricate so that the inflorescence eventually appears almost contorted; involucre narrowly campanulate, glabrous outside, the teeth pubescent inside, not scarious margined; calyx white or pinkish,  $\frac{3}{4}$  line long; outer segments obovate, truncatish, inner obovate, rounded or subacute, all cuneate at base; filaments a little hairy at base; beak of the ovary 3-angled, roughish.—Southern Sierra Nevada in Kern Co.; Mohave Desert. Flowers in rather small and compact clusters towards the ends of the rather long panicle branches.

37. *E. microthecum* Nutt. Stems woody at base, diffusely but shortly branched, 4 to 10 in. high, whitish tomentulose throughout or the leaves above and the stems and involucre glabrate; leaves oblong-spatulate to elliptic, sometimes revolute, 4 to 8 lines long, shortly petioled; peduncles 1 to 4 in. long, bearing a small cymosely branched compound umbel; involucre sessile, those in the axils pedicellate, narrowly campanulate,  $1\frac{1}{2}$  lines long, shortly toothed; calyx white, pink or yellow, glabrous, 1 to  $1\frac{1}{2}$  lines long, its lobes about equaling the tube; outer lobes round, often subcordate at base, the inner lobes elliptic.—Montane, 5000 to 10,000 ft.: San Antonio Mts.; e. slope of the Sierra Nevada; n. to Wash., e. to the Rocky Mts.

38. *E. arborescens* Greene. Shrubby, several ft. high, the trunk 3 to 4 in. thick; leaves crowded at the ends of the many branchlets, linear or oblong, strongly revolute, white-tomentose beneath, glabrate above,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; peduncles stout, bearing a large compound cyme, the involucre in capitate clusters; calyx rose-color, densely white-villous at base.—Santa Barbara Isls.: Santa Cruz; Anacapa; Santa Rosa.

39. *E. giganteum* Wats. Freely branching shrub 2 to 8 ft. high, bearing its white foliage towards the ends of the tomentose or glabrate branches; trunk with rough bark, 1 to 4 in. in diameter; leaves leathery, ovate, obtuse, 1 to 2½ in. long, white-lanate on both sides or glabrate above, strongly veined beneath, the petioles ½ to 1 in. long; peduncles stout, bearing a dense tri- or dichotomously branched compound cyme 2 to 12 in. broad; involucre sessile or pedicellate, somewhat crowded on the branchlets, campanulate with very low teeth, almost as if truncate, 2 lines long, densely close woolly outside; calyx 1 line long, densely white-hairy toward the cuneate base, its segments broadly obovate, rounded at apex, the inner narrower; filaments pubescent at base.—Santa Barbara Isls.: Santa Catalina; San Clemente; Santa Cruz.

40. *E. cinereum* Benth. Shrub 2 to 5 ft. high, the stems tomentulose; leaves ovate, puberulent above, obtusish, the larger abruptly short-cuneate at base, undulate, thinly gray-tomentose beneath, ½ to 1¼ in. long, short-petioled; peduncles elongated, sparingly dichotomous, the heads few and scattered in the forks; involucre tomentulose, 1½ to 2 lines long, with 5 triangular teeth; calyx densely silky outside, its segments narrowly obovate, obtuse, 1½ lines long; filaments glabrous.—Bluffs and foothills along the coast: Santa Barbara to San Pedro.

41. *E. parvifolium* Sm. Shrub 1 to 3 ft. high, or woody only at base; branches densely leafy with fascicled leaves; leaves thick, oblong-lanceolate to ovate or roundish, undulate and irregularly revolute-margined, truncatish or subcordate at base, dark green and glabrate above, white with a dense felt beneath, 2 to 6 lines long, shortly petioled; peduncles short, simple or umbellately 2 or 3-forked, bearing terminal or racemosely scattered heads of involucre. the heads few, compact, also sessile in forks when the inflorescence is umbellate; involucre 2 lines long, glabrate outside, densely woolly on inside at throat; calyx white, glabrous, 1½ to 2 lines long, its segments obovate, the outer obtuse, the inner slightly broader and retuse; filaments a little hairy at base.—Sand-dunes and hillsides near the coast: Monterey Bay to S. Cal.

42. *E. fasciculatum* Benth. FLAT-TOP. Stems woody at base, 2 to 3 ft. high with shreddy bark, the very leafy branches ending in a simple or compound umbel or the umbel reduced to a single head; leaves oblong, linear or oblanceolate, revolute-margined, 4 to 8 lines long, drawn down to a narrow base, densely white-woolly below, usually green and glabrate above; flower clusters in heads, these terminal on the unequal rays or sessile in the forks; rays 1 to 4 in. long; bracts linear; involucre 2 lines long, with short acute teeth; calyx white, glabrous, 1¼ to 1¾ lines long, the outer segments elliptic, the inner obovate and narrower, all rounded at apex; filaments glabrous or nearly so.—Abundant on mesa and mt. slopes. It is generally known as "Wild Buckwheat" and is the third most valued native bee-plant after White Sage and Black Sage. The form with glabrous flowers is confined to the sea-coast from Santa Barbara to San Diego. The two dominant mesa forms are the following: Var. *FOLIOLOSUM* Stokes. Peduncles long (4 to 10 in.); leaves more strongly revolute-linear, green but pubescent above, tomentose beneath; calyx slightly hairy outside.—Chaparral slopes, the abundant form: cismontane S. Cal. and n. to Monterey Co. and Mt. Hamilton Range (Corral Hollow). Var. *POLIFOLIUM* T. & G. Peduncles long; foliage gray, the leaves commonly less revolute, hoary above, tomentose below; calyx often conspicuously hairy outside, especially towards the base.—Desert slopes of the mts. in the Colorado and Mohave deserts, w. to Palomar, n. to Bakersfield and Inyo Co.; e. to Nev. Var. *FLAVOVIDE* M. & J. One ft. high; herbage green; calyx glabrous without, hairy within.—Mts. on n. side of Colorado Desert.

43. *E. latifolium* Sm. Flowering stems from a densely leafy caudex, stout, tomentulose, naked, ½ to 2 ft. high, 2 to 4-forked above, the forks simple or again forked; involucre in capitate clusters, terminal and sessile in the forks, or the whole inflorescence often reduced to a single large head or

with one proliferous branch from under the first head; leaves ovate to oblong, obtuse or acute, at base rounded or cordate, rarely cuneate, often undulate, densely white-woolly or lanate, or glabrate above, 1 to  $2\frac{1}{2}$  in. long, the petioles short or long; involucre tomentose, 2 lines long; calyx glabrous, white or light rose-color,  $1\frac{1}{2}$  lines long; filaments woolly at base.—Rocky cliffs or sandy places along the sea-coast from Humboldt Co. to S. Cal.

44. *E. nudum* Dougl. TIBINAGUA. Fig. 333. Tall and slender, 1 to 3 ft. high, the stems glabrous, peduncle-like, often fistulous, sometimes inflated, branching into a usually large panicle, the leaves all at base on the short woody caudex; leaves broadly ovate or oblong, obtuse, cordate or abruptly cuneate at base, undulate, densely tomentose beneath, glabrate above, 1 to 2 in. long, on slender petioles; involucre 2 or 3 lines long, glabrous or nearly so, 2 to 6 in each cluster; calyx glabrous, at least outside, 1 to  $1\frac{1}{2}$  lines long, usually white, sometimes rose-color or yellow; filaments a little hairy at base.—Very common on dry hills, valley flats or mt. slopes: coastal S. Cal.; Coast Ranges; Sierra Nevada; n. to Ore. July-Oct. Herbage used as "sour dock" for pies by settlers in Shasta Co. Var. *DEDUCTUM* Jepson. Stems many from the base, 5 to 13 in. high, umbellately trichotomous above, glabrous; leaves oval,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long, on petioles 3 to 4 times as long.—High Sierra Nevada, 7500 to 9500 ft. Seems no more than a slightly reduced state of the common form of the species prevailing at lower altitudes in the Sierra. Var. *SCAPIGERUM* Jepson. Like var. *deductum* but the inflorescence reduced to single heads terminating the slender scape-like stems.—High mts. about the upper Kern River. Var. *PUBIFLORUM* Benth. Stems  $1\frac{1}{2}$  to 3 ft. high, often inflated, glabrous, the branches elongated; involucre 1 to 3 in a place; calyx deep yellow, hairy towards the base.—Arid or desert region: Pahute Peak; Mt. Pinos; Independence; Goose Valley, Modoc Co.; Yreka. Var. *PAUCIFLORUM* Wats. Stems often inflated, indefinitely dichotomous, the involucre scattered along the slender branches or occasionally in pairs; calyx white.—S. Cal.: San Jacinto and San Bernardino mountains. Var. *OBLONGIFOLIUM* Wats. Stems and involucre whitish tomentulose, the stems above twice di- or tri-chotomous, the branches rather strict; leaves broadly oblong,  $\frac{1}{2}$  to  $2\frac{1}{2}$  in. long, abruptly contracted to slender petioles  $1\frac{1}{2}$  to 3 in. long; calyx white or rarely pale yellow, somewhat pubescent on the inner lobes.—Napa Co. to Humboldt Co. and e. to Modoc Co., thence s. to Nevada Co. Var. *SULPHUREUM* Jepson. Like the preceding var. but the branches of the inflorescence more spreading; calyx pale yellow or white, a little hairy at base.—Mendocino Co. to Siskiyou Co. Var. *AURICULATUM* J. P. Tracy. Stems  $\frac{1}{2}$  to  $2\frac{1}{2}$  ft. high, somewhat caudex-like at base, the caudexes set with leaves or old leaf-bases,  $\frac{1}{2}$  to 4 in. high, each giving rise to a glabrous glaucous peduncle bearing a dichotomous panicle; peduncles sometimes strongly fistulous; leaves oblong to elliptic, obtuse, truncatish or subcordate at base, crenulate-undulate margined, densely white-lanate below, soon glabrescent and deep green above, 1 to  $2\frac{1}{2}$  in. long; panicle usually large, the heads large, terminal and lateral, less commonly in the forks.—Dry rocky hills, central Coast Ranges. Var. *GRANDE* Jepson. Tall (3 to 5 ft. high) with a woody base; leaves ovate-oblong, the margin undulate-revolute.

333. *Eriogonum nudum* Dougl.; a, habit  $\times \frac{1}{4}$ ; b, fl.  $\times 4$ .

white-lanate below,  $1\frac{1}{2}$  to 3 in. long; involucre 3 lines long; calyx nearly or quite glabrous inside.—Santa Barbara Isls.

45. *E. elatum* Dougl. Stems rigid and rush-like, rarely naked, 1 to  $2\frac{1}{2}$  ft. high, sometimes inflated, bearing a trichotomous panicle, glabrous and glaucous; leaves erect, ovate to ovate-lanceolate, 1 to 3 (or 5) in. long, on petioles mostly as long; involucre in terminal clusters of 2 to 4, or solitary in the forks, either sessile or shortly pedunculate, hairy-pubescent,  $2\frac{1}{4}$  lines long, 5-toothed, the teeth scarious-margined; calyx white, 1 to  $1\frac{1}{2}$  lines long, its segments obovate, rounded at apex, with broad hairy-pubescent midvein.—East or transmontane side of the Sierra Nevada from Mono Co. to Modoc and Siskiyou Cos. Var. *VILLIDUM* Jepson. Stems villous-pubescent.—Dry hills, Siskiyou Co. to Modoc Co. Var. *INCURVUM* Jepson. Pubescence of preceding variety; branches or rays of ternately trichotomous panicle curving, fragile at the joints.—Shasta Sprs.

46. *E. indictum* Jepson. Stems 1 to 2 ft. high, several from the base, glabrous, glaucous, the lower internodes inflated like a slender trumpet; leaves ovate or deltoid-ovate, truncate at base, white-woolly below, whitish-arachnoid above, persistent on both faces,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long, the petioles as long and with a broad clasping base; involucre externally glabrous, tubular but a little widened upward, 2 lines long, solitary and racemose along the slender branches of the dichotomous panicle; calyx yellowish, glabrous.—Dry hills, San Carlos Range. Nearly related to *E. nudum*.

47. *E. kennedyi* Porter. Stems scape-like, wiry, 3 to 8 in. high, arising from a very dense leafy cushion; leaves obovate or oblong, revolute, white-woolly,  $1\frac{1}{2}$  to 5 lines long; involucre tomentulose or glabrate, turbinate-campanulate, nerved and rather strongly angled, deeply triangular-toothed,  $1\frac{1}{2}$  to 2 lines long, clustered in a terminal head; calyx white or pink, glabrous, 1 to  $1\frac{1}{2}$  lines long, segments oblong-obovate; ovary scarious.—Desert slopes or arid plateaus, n. and s. of the Mohave Desert.

48. *E. ochrocephalum* Wats. Stems scape-like, 2 to 6 in. high, erect from a caespitose leafy base; leaves silvery-tomentose, oblanceolate to ovate,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, narrowed to a petiole half to as long; involucre in a capitate cluster, turbinate-bellshaped, bladdery in age,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  lines long, the 6 to 8 short lobes erect; calyx yellow, glabrous, 1 to  $1\frac{1}{4}$  lines long, the segments elliptic, the inner narrower, all obtuse; filaments obscurely puberulous at base.—Nw. Nev. and e. Ore. Var. *AGNELLUM* Jepson. Dwarfed form, 2 to 4 in. high, the upper portion of peduncles and heads a little glandular; leaves ovate or narrowly obovate, 2 to 4 lines long, petioled.—N. Sierra Nevada (Placer Co. to Modoc Co.).

49. *E. ovalifolium* Nutt. Fig. 334b. Subalpine dwarf, the scape-like stems slender, tomentulose,  $\frac{1}{2}$  to 3 in. high, rising from a dense leafy cushion; leaves round-ovate to obovate, 1 to 4 lines long, contracted to a usually short petiole; involucre turbinate, woolly, several crowded together in a very close head with 3 or 4 short bracts; calyx white, with green midribs, often fading pinkish, glabrous, 1 to  $1\frac{1}{2}$  lines long; outer calyx segments elliptical, subcordate at base, their margins quite free and distinct to base, the inner broadly spatulate; filaments hairy at very base.—Granite peaks and ridges, 9000 to 12,000 ft.: Sierra Nevada from Fresno Co. to Nevada Co.; Snow Mt., Lake Co.; n. to B. C., e. to Rocky Mts. Var. *VINEUM* Nelson. Involucre vase-shaped, constricted near the top; calyx wine-red,  $2\frac{1}{2}$  to 3 lines long, its segments unequal.—San Bernardino Mts.; Ore. and Wash. Var. *NIVALE* Jones. Fig. 334a. Head

334. *Eriogonum ovalifolium* Nutt.; b, fl. x 5;  
a, var. *nivale* Jones, habit x  $\frac{2}{3}$ .

small and compact, appearing like a single involucre; flowers red; outer calyx-segments obovate; filaments hairy or glabrous.—S. Sierra Nevada.

50. *E. proliferum* T. & G. Stems erect, naked, scape-like, 4 to 7 in. high, bearing an umbellate inflorescence and arising from a compactly branched caudex with very short leafy branches; herbage tomentulose, the leaves densely white-woolly; leaves ovate, mostly obtuse, 4 to 12 lines long, on petioles as long or longer; umbels with 3 rays from beneath the sessile central involucre; rays  $\frac{1}{2}$  to 2 in. long, somewhat unequal, bearing a cluster of 2 or 3 involucres, or one or more of the rays again shortly 3-radiate; involucre 5-toothed, the teeth large, almost hooded; calyx white, 2 to  $2\frac{1}{2}$  lines broad, the outer segments roundish quadrate or elliptic (nearly as broad at base and apex as at middle), attached by the lower  $\frac{1}{4}$  of the mid-nerve, the sides free and overlapping; inner segments obovate, narrowed to a claw-like base.—Valleys and mt. slopes, 2600 to 5000 ft.: Sierra Valley to Siskiyou Co.; n. to B. C., e. to Rocky Mts.

### III.—SUBGENUS *Eueriógonum*

Involucres turbinate, 4 to 8-toothed or -lobed, either solitary or borne in umbels, the umbels sometimes congested in heads; bracts foliaceous; calyx stipe-like at base, often accrescent; filaments mostly hairy or pubescent at base; flowering stems (peduncles) scape-like; perennials; mountains from middle altitudes to alpine summits.

51. *E. caespitosum* Nutt. Dwarf, matted, the scape-like peduncles slender, naked, 2 to 4 in. high, bearing a single involucre; leaves white-tomentose, oval to oblong-spatulate, 2 to 3 lines long, the petioles  $\frac{1}{2}$  to as long; involucral lobes linear, as long or longer than the turbinate tube; calyx yellow or fading reddish, 1 to  $1\frac{1}{2}$  lines long, in age nearly twice as long, hairy on the mostly stipe-like base; filaments pilose; ovary glabrous.—Mt. slopes and dry plateaus e. of the Sierra Nevada: White Mts.; Warner Mts.; n. to Ore., e. to Rocky Mts.

52. *E. douglásii* Benth. Matted white-woolly dwarf similar to the preceding, the scape-like peduncles with a whorl of 5 or 6 oblanceolate bracts at the middle; involucral lobes linear, longer than the tube, reflexed; calyx yellow, hairy at base and along the midrib of the segments, stipe-like at base, 2 to 3 lines long, its segments obovate, obtuse, the inner exceeding the outer in age; lower half of filaments pilose; ovary hairy towards apex.—N. Sierra Nevada, e. slope from Nevada Co. to Lassen Co., 4200 to 6500 ft.; Nev. to Wash.

53. *E. sphaérocephalum* Dougl. Peduncles 3 to 6 in. high, bearing a solitary involucre and with a whorl of leafy bracts at their middle, or the whorl subtending a 2 to 4-rayed umbel, the rays also bearing a central whorl of bracts; base much-branched, with many short woody leafy branchlets; leaves oblong to broadly oblanceolate, acute, narrowed to a short petiole, 5 to 10 lines long, white-woolly below, soft pubescent above, the margins often revolute; involucre almost bowl-shaped, 3 to 4 lines long, its (7 or 8) oblong lobes as long or longer than the tube; flowers numerous in an involucre, forming a globose cluster; calyx whitish, very villous inside and out, especially towards the base, stipe-like at base, 4 lines long, the segments obovate or elliptic, obtuse; filaments hairy on lower half; ovary densely villous except at base.—Lassen Co. to Shasta Co., 2600 to 4200 ft., n. to Wash. May-June.

54. *E. tripodum* Greene. Habit similar to *E. sphaerocephalum* but more slender and taller (10 to 14 in. high); umbel 3-rayed, the rays 3 to 5 in. long, bearing a whorl of bracts at the middle or sometimes 2-forked and again bracteate; calyx yellow, densely hairy, 2 to 3 lines long, the stipe-like base very short; filaments hairy below; ovary very strongly angled, hairy at apex.—Indian Valley, Lake Co.; Benton Mills Road, Mariposa Co.

55. *E. siskiyouense* Small. Like *E. umbellatum* but the involucre solitary on an erect peduncle 4 to 10 in. high, with a whorl of bracts at middle (that is, the umbel reduced to one ray which is as long or longer

than the peduncle); bracts foliaceous, ovate, petioled, 2 to 6 lines long, the basal leaves of the same shape but usually larger.—Montane: Scott Mts., Siskiyou Co.; Calaveras Big Trees; Lake Merced, Yosemite.

56. *E. umbellatum* Torr. SULPHUR-FLOWER. Fig. 335. Peduncles erect or ascending from a branching woody base, naked, 3 to 5 in. high, tomentulose or glabrate; leaves ovate, glabrate above, white-woolly beneath, 3 to 12 lines long, on petioles  $\frac{1}{4}$  to  $\frac{1}{2}$  as long; umbels simple, subtended by a whorl of linear to obovate bracts, its rays 3 to 9 (rarely reduced to 1), 5 lines to  $1\frac{1}{4}$  (or 3) in. long, these and the bracts soft-pubescent; involucre 8-lobed, the lobes reflexed, nearly as long as the turbinate tube, the tube and throat crowded with the floccose-woolly bractlets; flowers sulphur-yellow; calyx glabrous, gradually narrowed into the long stipe-like base, 2 to 3, or in age 3 to 4 lines long; filaments pilose on lower half.—Higher Sierra Nevada and Coast Ranges, 4000 to 9000 ft.; n. to Wash., e. to Rocky Mts. Var. *STELLATUM* Jones. Rays simple and bearing a whorl of bracts at their middle or usually forked and the secondary rays similarly bracteate.—San Bernardino Mts.; Sierra Nevada; Siskiyou Co.; n. to Wash. Var. *BAHLAEFORME* Jepson. Inflorescence freely and irregularly branched.—Tehachapi region. Var. *MINTUS* Jtn. Herbage permanently tomentose; peduncles  $\frac{1}{2}$  to  $1\frac{1}{8}$  in. high, bearing simple 1 to 3-rayed umbels; rays 2 to  $4\frac{1}{2}$  lines long.—Subalpine, San Antonio Mts. Var. *MONOCÉPHALUM* T. & G. Dwarf mountain form with the umbel reduced to a single ray, that is, the peduncle naked or bracteate and bearing a solitary involucre.—Range of the species but far less common.

335. *Eriogonum umbellatum* Torr.: a, umbel, past anthesis  $\times \frac{1}{2}$ ; b, fl.  $\times 4$ .

57. *E. torreyanum* Gray. Habit of *E. umbellatum* but stems and leaves glabrous; outer rays of the umbel with a whorl of bracts midway; leaves obovate, thickish, about 1 in. long, narrowed below to a petiole as long; involucre lobes sparingly pubescent; calyx yellow, 4 to 5 lines long; filaments hairy below.—N. Sierra Nevada, 5000 to 7000 ft.

58. *E. compósitum* Dougl. Scape-like stems stout, 6 to 16 in. high from a simple short caudex, glabrate; leaves oblong-ovate or deltoid-ovate, cordate at base,  $1\frac{1}{2}$  to 2 in. long, with a close white felt beneath, green above or woolly-flocculent; petioles long, mostly 1 to  $2\frac{1}{2}$  times length of blade; bracts linear or oblanceolate; umbel 6 to 10-rayed, the rays sometimes with a blackish band at middle,  $\frac{1}{2}$  to 2 in. long, each bearing a capitate cluster of 1 to 5 involucre or a several-rayed umbellet; involucre broadly turbinate, woolly, 8-toothed, the teeth short, acute; calyx cream-color or yellow, glabrous, contracted to a stipe-like base, 2 to 4 lines long; segments elliptic, the inner becoming  $\frac{1}{2}$  longer in age; filaments short hairy at base.—North Coast Ranges; n. to Wash.

59. *E. lóbbii* T. & G. Peduncles lying along the ground, 2 to 7 in. long, borne on a densely leafy stout caudex; caudex crowded below with old leaf-bases and crowned with a tuft of silvery white leaves; herbage densely white-woolly; leaves roundish, oval or ovate,  $\frac{1}{2}$  to  $\frac{3}{4}$  or  $1\frac{1}{4}$  in. long, narrowed to rather broad petioles  $\frac{1}{2}$  to as long; umbels simple, bracteate, ascending from the tips of the peduncles; rays 3 to 6,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long (or reduced and then the umbels capitate), usually with a whorl of bracts at middle; involucre broadly campanulate, 3 to 5 lines long; calyx white,

fading pinkish, narrowed at base but not stipe-like, 3 to 4 lines long; filaments pilose on lower half.—Gravelly drifts and glaciated granite slopes and ridges, 7000 to 9500 ft.: Sierra Nevada on e. slope from Sierra Co. to Inyo Co., and w. slope from Nevada Co. to Tuolumne Co.; inner North Coast Range.

60. *E. pyrrolaeifolium* Hook. Peduncles scape-like, glabrous, 2 to 3½ in. high, arising from a densely leafy caudex; leaves roundish or oval, thick, glabrous, 4 to 12 lines long, abruptly petioled, the petioles villous; umbels small, bearing 1 to 3 involucre on short (1 or 2 lines long) rays or quite capitate; bracts 2, linear or spatulate, elongated; calyx red, not attenuate at base, 1½ to 2 lines long, somewhat glandular inside, hairy at base outside and on midribs half-way up segments; filaments glabrous; upper part of ovary densely hairy.—High northern peaks: Lassen Peak; Mt. Shasta; n. to Mt. Rainier.

61. *E. laténtis* Jepson. Peduncles naked, 8 to 12 in. high from the short leafy branches of a woody caudex; leaves roundish, or somewhat deltoid-ovate, acutish, short pilose, 7 to 12 lines long, abruptly or cuneately narrowed at base to a margined petiole half to as long as the blade; involucre congested in a terminal head, membranous, campanulate, 3 to 4 lines long, with short broad sparsely hairy lobes; calyx white, its base appressed hairy, the inner segments narrower than the outer; lower third of filaments pubescent.—Desert slopes of Sierra Nevada in Inyo Co.; 6500 ft.

62. *E. ursinum* Wats. Peduncles scape-like from a branching woody leafy crown or mat, 4 to 12 in. high, these and the umbels villous-tomentulose; leaves ovate, mostly acute, cordate at base, varying to cuneate, white-tomentulose beneath, glabrate and greener above, 4 to 8 lines long, the petiole half to as long; umbel compound, sometimes simple, 3 to 10-rayed or reduced to a head-like cluster; bracts obovate to subfiliform, subtending the umbel and secondary umbels, usually also with a whorl at or near the middle of the rays or secondary rays; involucre campanulate-funnelform, large (3 to 3½ lines high), thin, hairy-pubescent outside, shortly and sharply toothed; calyx yellow or white, glabrous, abruptly campanulate above the stipe-like base, 2 to 3 lines long; filaments copiously woolly, the wool filling the base of the calyx.—High montane, 5000 to 8000 ft.: Sierra Nevada from Nevada Co. to Shasta Co.; Snow Mt., Lake Co.

63. *E. incanum* T. & G. Peduncles stout, tomentulose, 1 to 3½ in. high, arising from a matted densely leafy crown; leaves oblong to ovate or obovate, white-tomentulose, the edges often disposed to be revolute, 3 to 6 lines long, mostly short-petioled; umbels with 4 or 5 rays 2 to 6 lines long or reduced to small dense heads; bracts few, linear; calyx yellow, often red, glabrous, 1 to 2 lines long, narrowed to a short stipe-like base; filaments sparingly hairy at base.—Gravelly slopes and peaks, Sierra Nevada, 7000 to 12,000 ft.: Farewell Gap and Mt. Whitney n. to Mt. Lyell and Mt. Ralston.

64. *E. marifolium* T. & G. Peduncles scape-like, slender, 3 to 12 in. high, arising from a loosely branched leafy base; leaves oval or ovate, white-woolly or commonly glabrate above, 3 to 8 lines long, the petioles mostly as long or longer; umbels with 3 to 6 rays ½ to 2½ in. long, the central involucre sessile, or the umbel sometimes reduced to a small head; flowers often more or less dioecious, yellowish (reddish in age), glabrous, 1 to 1½ lines long.—Higher Sierra Nevada; Mt. Wilson. Differs from no. 63 in its looser growth and larger umbels.

65. *E. kellöggii* Gray. Peduncles rising from a loose mat, scape-like, slender, 2 to 4 in. high, naked save for whorl of 3 leaf-like bracts at the middle; mat consisting of branching stolon-like woody stems with the leaves in rosettes on the ends of short branchlets; herbage tomentulose throughout or the leaves glabrate above; leaves oblanceolate or narrowly obovate, narrowed to a short petiole, 2 to 5 lines long; involucre solitary, turbinate, 2 to 2½ lines long, with erect teeth; calyx whitish or pinkish, glabrous, stipe-like at base, 3 to 4½ lines long, its segments obovate, rounded at apex; filaments

pilose below middle.—Red Mt., Mendocino Co., not otherwise known. Remarkably similar in habit to the monocephalous forms of *E. umbellatum*.

66. *E. alpinum* Engelm. White-lanate dwarf,  $1\frac{1}{2}$  in. high, the scape-like stems with a whorl of bracts at the middle and ending in a single involucre; leaves roundish, 5 to 7 lines broad; involucre turbinate, 3 lines long, with minute teeth; calyx yellow, glabrous,  $1\frac{1}{2}$  to 2 lines long, the stipe-like base short, the segments obovate, obtuse; filaments slightly pubescent at base.—Mt. Eddy, Siskiyou Co., 8700 ft.

### CHENOPODIACEAE. SALTBUSH FAMILY

Herbs or shrubs, mostly salt-loving, very often succulent or scurfy, with alternate or rarely opposite leaves, or leafless. Flowers small (1 or 2 lines long), perfect or unisexual with an herbaceous calyx of 5 or fewer sepals, or in the pistillate flower the calyx sometimes absent. Stamens as many as the sepals and opposite them, or fewer, distinct or slightly united at base. Ovary superior, 1-celled, containing a single ovule, becoming in fruit an achene or utricle. Styles or stigmas 2 or 3. Embryo curved; endosperm copious or sometimes wanting. *Nitrophila* has a scarious calyx.

Leaves never spiny.

Leaves not fleshy or scarcely so; embryo annular or curved, embracing or surrounding the central endosperm, or folded and the endosperm lacking.

Stems with foliaceous leaves.

Leaves opposite, united at base. . . . . 1. *NITROPHILA*.

Leaves alternate, sometimes the lowest opposite, but never united at base.

Calyx not horizontally winged; leaves plane (except no. 9).

Flowers perfect, all of one kind.

Calyx 3 to 5-parted or -toothed.

Stamen 1; flowers axillary and solitary. . . . . 2. *APHANISMA*.

Stamens 5 (or 4); flowers in clusters.

Calyx with a fleshy disk at base, the ovary partly sunk in it. . . . . 3. *BETA*.

Calyx without disk.

Calyx 5 (or 4)-parted, herbaceous or fleshy in fruit. . . . . 4. *CHENOPODIUM*.

Calyx saccate, 3 to 5-toothed, dry in fruit. . . . . 5. *ROUBIEVA*.

Calyx of 1 sepal; stamen 1. . . . . 6. *MONOLEPIS*.

Flowers unisexual, of 2 kinds, the staminate with calyx, the pistillate without calyx and enclosed by 2 appressed bracts.

Fruits not hairy; leaves not revolute.

Bracts distinct or more or less united, the margins never wholly united, at least partly free, the sides smooth or muricate. . . . . 7. *ATRIPLEX*.

Bracts wholly united into an orbicular strongly flattened sac with a pin-hole orifice at apex. . . . . 8. *GRAYIA*.

Fruits densely white-hairy; leaves linear revolute. . . . . 9. *EUROTIA*.

Calyx in fruit surrounded by a 5-lobed wing. . . . . 10. *KOCHIA*.

Stems with the leaves reduced to mere scales; flowers perfect or unisexual; stems fleshy, jointed.

Shrubs; scales alternate. . . . . 11. *ALLENROLFEA*.

Herbs; scales opposite. . . . . 12. *SALICORNIA*.

Leaves more or less fleshy, soft; embryo spirally coiled, the endosperm lateral or none.

Flowers unisexual, the staminate in a catkin-like spike, the pistillate axillary. . . . . 13. *SARCOBATUS*.

Flowers perfect and pistillate, in axillary clusters. . . . . 14. *SUAEDA*.

Leaves dry, rigid or spiny; flowers perfect; embryo spirally coiled. . . . . 15. *SALSOLA*.

#### 1. *NITRÓPHILA* Wats.

A low perennial glabrous herb with fleshy opposite amplexicaul leaves and axillary perfect flowers. Sepals 5 (rarely 6 or 7), chartaceous, imbricated, concave and carinate. Stamens 5, united at base into a narrow yellowish disk. Style longer than the subglobose ovary; stigmas 2. Achene beaked by the persistent style, included within the connivent sepals. (Greek nitron, carbonate of soda, and philos, fond of, these plants loving alkaline soils.)

1. *N. occidentalis* (Moq.) Wats. Fig. 336. Stems decumbent, oppositely branching, 4 to 14 in. long, from a deep-seated thick taproot; leaves linear, sessile,  $\frac{1}{2}$  to 1 in. long, the floral mostly 3 to 6 lines long, triangular in cross-section, mucronate; flowers solitary in the axils and bibracteate, or often 2 or 3 with the central one frequently bractless and the lateral shortly

336. *Nitrophila occidentalis* Wats.; a, fl. branchlet x 1; b, fl. x 6.

flowers cohering in fruit by the enlarged bases of the calyx. Calyx 5-parted, its lobes costate dorsally, in fruit indurated and closing over the achene. Stamens 5, perigynous; filaments frequently connate at base. Ovary sunk in the succulent base of the calyx; styles 2 or 3, short, stigmatose on the inside. Achene adnate to the calyx-base. Embryo annular. (Perhaps Celtic bett, red, on account of the color of the root.)

1. *B. vulgaris* L. BEET. Stems 2 to 6 ft. high, paniculately branched above; root conical; lower leaves 4 to 10 in. long, oblong or ovate, undulate, the upper smaller, ovate-lanceolate.—Garden plant, naturalized in marshes: Petaluma; Alvarado; Monterey; San Bernardino. Native of Eur. June.

#### 4. *CHENOPODIUM* L. GOOSEFOOT. PIGWEED

Annual or perennial herbs, frequently white-mealy or glandular, with alternate petioled leaves. Flowers perfect, greenish, bractless and sessile, clustered, the clusters commonly in simple or panicled spikes. Calyx 5 (or 3 to 4)-parted, persistent and usually inclosing the seed-like achene, rarely reduced to a single sepal. Stamens 5 or fewer. Ovary depressed; styles 2,

pediceled; sepals pinkish or whitish.—Moist alkaline soils, often on the black alkali: Sacramento Valley s. to S. and L. Cal.; desert side of the Sierra Nevada; Nev.; Ore.

#### 2. *APHANISMA* Nutt.

Annual with alternate sessile entire leaves. Flowers minute, perfect, without bracts, axillary, solitary. Calyx 3 or 4-cleft, without appendages. Stamen 1. Ovary depressed, the short style 2 or 3-cleft. Achene depressed-globose, indurated, somewhat 5-angled, subtended at base by the closely appressed dry calyx. Embryo annular, surrounding the copious endosperm. (Greek aphanes, inconspicuous.)

1. *A. blitoides* Nutt. Branched at the base with slender ascending stems,  $\frac{1}{2}$  to 2 ft. high; leaves ovate, acuminate, cordate or truncate at the sessile base,  $\frac{1}{2}$  to 2 in. long, or the lowest lanceolate and long-petioled; achene  $\frac{1}{2}$  line broad.—Del Mar; San Diego; Carrizo Creek; Santa Barbara Islands.

#### 3. *BETA* L.

Robust glabrous biennial herbs with large fleshy roots. Leaves alternate, large, long-petioled, the floral reduced and subsessile. Flowers perfect, protandrous, greenish white, in sessile axillary clusters: clusters 2 or 3-flowered, disposed in panicled spikes, the

rarely 3 or 4, slender. Achene with membranous pericarp closely investing the seed. Embryo annular, sometimes incompletely so. (Greek chen, goose, and pous, foot, on account of the shape of the leaves.)

Fruiting calyx dry.

Annual; calyx deeply parted into lobes or segments.

Finely mealy, at least not pubescent or glandular.

Achene with pericarp closely persistent on seed.

Erect, herbage light green.....1. *C. album*.

Diffuse, herbage dark green.....2. *C. murale*.

Achene with pericarp separating readily from seed.

Leaves triangular-hastate, thin; petioles half as long as the blades or longer.....3. *C. fremontii*.

Leaves linear, thick; petioles short, less than  $\frac{1}{4}$  as long as the blades. 4. *C. leptophyllum*.

Glandular-pubescent and aromatic, but not mealy.

Flower-clusters spicate or paniculate.

Leaves slender-petioled; achene imperfectly enclosed by calyx; spikes cymose-diverging, leafless.....5. *C. botrys*.

Leaves slightly petioled; achene perfectly enclosed by calyx.

Spikes dense, leafy.....6. *C. ambrosioides*.

Spikes more elongated, leafless.....7. *C. anthelminticum*.

Flower-clusters all axillary.....8. *C. carinatum*.

Perennial; calyx merely toothed or cleft, more distinctly synsepalous; spike terminal, leafy only below; achene exserted.....9. *C. californicum*.

Fruiting calyx fleshy, often reddish; annual.

Calyx deciduous.....10. *C. rubrum*.

Calyx persistent, the clusters red and berry-like.....11. *C. capitatum*.

1. *C. album* L. WHITE PIGWEED. WHITE GOOSEFOOT. Erect, 2 to 4 ft. high, usually paniculately branched; herbage more or less light green or white-mealy; leaves rhombic-ovate, sinuate-dentate below or about the middle, the uppermost varying to lanceolate and subentire, 1 to 2 in. long, whiter beneath than above; flowers densely clustered in close spikes, the panicle strict and close or somewhat spreading; calyx about  $\frac{3}{4}$  line wide in fruit, the lobes strongly carinate.—Common European weed in old fields or half-cultivated lands. July-Oct. Also well known as Lambs Quarters, the herbage making excellent boiled greens when taken young. Var. *viride* Moq. Leaves bright green on both sides or only slightly mealy beneath; inflorescence less dense.—Widely distributed but not so common as the species.

2. *C. murale* L. SOWBANE. NETTLE-LEAF GOOSEFOOT. Rather stout and succulent, the loose branches decumbent and ascending, 8 to 15 in. long; herbage dark green, the growing parts very finely mealy; leaves rhombic-ovate, irregularly and sharply toothed above the base, 1 to  $1\frac{3}{4}$  in. long; flowers in rather dense axillary or terminal spicate panicles; panicles leafless, or nearly so, often very small; fruiting calyx closed; achene acutely margined.—Naturalized from Eur.; a common weed in old yards and waste places, flowering through the winter.

3. *C. fremontii* Wats. Erect, slender, branching,  $\frac{1}{2}$  to 2 ft. high; sparingly white-mealy to light green; leaves glabrous on upper surface, sparsely farinose beneath; flower-clusters in slender spikes of the open panicle; sepals strongly carinate; calyx sparsely farinose.—Panamint Mts.; e. to the Rocky Mts., n. to Ore.

4. *C. leptophyllum* Wats. Erect,  $\frac{2}{3}$  to  $2\frac{1}{2}$  ft. high, branches densely farinose, or becoming glabrate; leaves densely white-farinose, or glabrate on the upper surface; calyx densely farinose.—Barstow, Mohave Desert; n. to Alb., s. to Mex.

5. *C. botrys* L. JERUSALEM OAK. Erect, often widely branching,  $\frac{1}{2}$  to 2 ft. high, glandular pubescent and viscid throughout; leaves slender-petioled, ovate to oblong,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, obtuse, truncate or cuneate at base, sinuately pinnatifid and the lobes usually toothed; spikes cymose, diverging, leafless; calyx not completely inclosing the achene.—Waste places near dwellings and in flood stream beds; nat. from Eur. and widely distributed but not common. July-Sept.

6. *C. ambrosioides* L. MEXICAN TEA. Erect, 2 to  $3\frac{1}{2}$  ft. high, usually stout and branched; herbage glabrous, scarcely glandular, when young sometimes tomentose-pubescent; leaves slightly petioled, oblong or lanceolate, 2

to 5 in. long, repand-toothed or nearly entire, the upper tapering to both ends; flowers in dense axillary clusters upon the branches, forming a leafy spike; calyx-lobes obtuse, appressed, slightly carinate, completely inclosing the achene; styles 3, sometimes 4; pericarp deciduous; seed smooth and shining, reddish, obtusely margined.—Common near salt marshes and abundant along interior streams: Great Valley and Coast Ranges to S. Cal.; nat. from trop. Am.; mostly autumnal.

7. *C. anthelminticum* L. WORMSEED. Very close to no. 6; sometimes biennial or perennial; herbage light green, glandular-puberulent and highly aromatic; leaves sinuate-serrate or the lower sometimes lacinate-pinnatifid,  $\frac{3}{4}$  to 3 in. long; inflorescence a terminal mostly leafless panicle of dense but elongated slender spikes; sepals not carinate.—Not so common as the last, but appearing to hybridize with it: Coast Ranges and Sacramento Valley; nat. from trop. Am.

8. *C. carinatum* R. Br. Stems several from the base, ascending or decumbent, 5 to 18 in. long; herbage puberulent, the under side of the leaves with minute resin-globules; leaves ovate, sinuate-crenate, 3 to 6 lines long, on slender petioles  $\frac{1}{2}$  to as long; flowers small, the clusters in all the axils; stamen usually 1.—Humboldt Co.; Hat Creek, e. Shasta Co.; Oroville; West Branch, Butte Co.; Ione; Jackson; Upland; Ontario; nat. from Austr.

9. *C. californicum* Wats. SOAP PLANT. Stout, erect or decumbent at base,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  ft. high from a very large carrot-like root; herbage green, scarcely at all mealy; leaves broadly triangular, truncate or cordate at base, or sub-hastate, sharply and unequally sinuate-dentate,  $1\frac{1}{2}$  to  $3\frac{1}{2}$  in. long; flowers in dense clusters in a terminal spike, leafless or leafy at the very base; calyx campanulate, barely exceeding 1 line; achene with persistent pericarp, sub-globose or somewhat compressed, exserted,  $\frac{3}{4}$  to 1 line broad; embryo completely annular.—Stream beds and moist slopes or swales in open foothills: Coast Ranges; Sierra Nevada foothills; s. to San Diego Co. Apr.-May. The root is grated on a rock by the native tribes and used as a soap.

10. *C. rubrum* L. RED GOOSEFOOT. Stems angled, erect, 1 to 2 ft. high; herbage green or nearly so; leaves lanceolate-oblong to broadly ovate, coarsely sinuate, 1 to 2 in. long; flowers numerous in dense short axillary spikes; calyx-lobes 2 to 4, rather fleshy; stamens 1 or 2; achene shining, the margin acute.—Low and marshy lands: lower Sacramento River; Alvarado; Nigger Slough and Ballona, Los Angeles Co.; nat. from Eur. Sept.

11. *C. capitatum* (L.) Asch. STRAWBERRY BLITE. Branched at base with erect or ascending stems 5 to 15 in. high; leaves hastate-triangular or -lanceolate, irregularly toothed or nearly entire,  $\frac{3}{4}$  to 2 in. long, on margined petioles  $\frac{1}{2}$  to as long; flower clusters large, in interrupted spikes, leafy below; stamens 1 to 5; calyx berry-like in fruit.—Sierra Co.; Sisson; n. to Alas., e. to the Atlantic.

#### 5. ROUBIÈVA Moq.

Heavy-scented herb, with prostrate branches. Leaves alternate, deeply pinnatifid. Flowers minute, perfect or pistillate, solitary or 2 or 3 together in the axils; calyx deeply bowl-shaped, 3 to 5-toothed, becoming saccate and contracted at the top, inclosing the fruit. Stamens 5, included. Ovary glandular at the top; styles 3, somewhat lateral, exserted. Pericarp of the achene membranous, glandular-dotted, thin and deciduous; seed lenticular; embryo annular. (G. J. Roubieu, French botanist.)

1. *B. multifida* (L.) Moq. Branches 1 to 2 ft. long; leaves  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; calyx in fruit obovate, very conspicuously reticulate-veined.—San Francisco sand-hills and in waste places e. to the Great Valley; nat. from Peru.

#### 6. MONÓLEPIS Schrad.

Low annuals with alternate fleshy leaves. Flowers polygamous, clustered in the upper axils. Sepal 1, entire, bract-like, persistent. Stamen 1. Styles 2, filiform. Achene with thin pericarp. Embryo annular around copious

endosperm. (Greek monos, one, and lepis, scale, referring to the solitary sepal.)

Pericarp minutely pitted, adherent to the seed.....1. *M. nuttalliana*.  
Pericarp minutely papillose, separating from the seed.....2. *M. spathulata*.

1. *M. nuttalliana* (R. & S.) Wats. Herbage pale green; branched at the base, the many stems 5 to 10 in. high; leaves linear or lanceolate with a salient tooth on each side near the middle,  $\frac{1}{2}$  to 1 (or  $1\frac{1}{2}$ ) in. long, shortly petioled or the lower petioles elongated; flower clusters dense, often reddish; sepal fleshy, foliaceous, often much exceeding the achene; pericarp minutely pitted,  $\frac{1}{2}$  line broad.—Alkaline soil, infrequent but widely distributed: S. Cal. to the Sacramento Valley and n. Sierra Nevada; e. to the Great Plains. Apr.-May.

2. *M. spathulata* Gray. Habit of no. 1; leaves oblanceolate or spatulate, entire,  $\frac{1}{2}$  to 1 in. long; sepal rarely exceeding the achene.—Sierra Nevada from Sierra Co. to Mono Pass; Panamint Mts.; San Bernardino Mts.

*Spinacia* L. Glabrous annual herbs. Flowers dioecious, in subglobose glomerules, the pistillate axillary, the staminate in interrupted terminal spikes. Pistillate flowers subtended by 2 bracts, these united except at apex and inclosing the utricle, often developing two opposite divergent spines below the apex. Stigmas 4 or 5, united at base, long-exserted. S. OLERACEA L. Spinach. Erect, 1 to  $1\frac{1}{2}$  ft. high; leaves triangular-ovate, hastate, 1 to  $2\frac{1}{2}$  in. long; fruiting bracts 2 lines long.—European garden plant, occasionally escaped from cult. (San Jose).

## 7. *ATRIPLEX* L. SALTBUSH

Herbs or shrubs, usually mealy or scurfy with bran-like scales. Leaves alternate or opposite. Flowers monoecious or dioecious, in axillary clusters, or in simple or panicle spikes; staminate flowers with a regular 4 or 5-parted calyx, the pistillate consisting of a pistil inclosed between a pair of appressed foliaceous bracts, without calyx. Styles 2. Bracts either free or united, much enlarged in fruit, the margin usually becoming more or less expanded or foliaceous and the sides thickened, indurated, muricate or variously appendaged. (The ancient Latin name.)

### A. Herbs; monoecious.

#### 1. Staminate and pistillate flowers usually mixed in the same cluster; annuals (except no. 11).

Somewhat succulent and mealy; leaves petioled, the lower at least 1 in. long; bracts distinct or nearly so, ovate to rhombic.

Lower leaves opposite; flowers in naked or nearly naked spikes; mostly coastal.

Leaves mostly lanceolate; fruiting bracts 4 to 6 lines long.....1. *A. patula*.

Leaves triangular-hastate or deltoid; fruiting bracts  $1\frac{1}{2}$  to 2 lines long.....2. *A. hastata*.

Leaves all alternate; interior species.

Leaves triangular-ovate; flowers in naked spikes; fruiting bracts 1 line long...3. *A. spicata*.

Leaves rhomboidal-hastate; flowers in axillary clusters; fruiting bracts 3 to 4 lines long.....4. *A. phyllostegia*.

Not succulent, commonly whitish-scurfy; bracts more or less united and indurated and nut-like in fruit, the margins partly or wholly free, the sides smooth, toothed or appendaged; flower clusters axillary; mostly small plants except no. 11.

Stems woolly-pubescent, the branches opposite throughout or mostly so; prostrate plant; leaves mostly less than  $1\frac{1}{2}$  lines long.....5. *A. parishii*.

Stems scurfy or glabrate but not woolly, the branches alternate, at least above the base; leaves small, 3 to 6 (or 10) lines long; fruiting bracts  $\frac{1}{2}$  to 2 lines broad.

Fruiting bracts gray or dull green.

Decumbent plants.

Bracts narrowly margined at summit with 3 to 5 small herbaceous teeth.....6. *A. microcarpa*.

Bracts narrowly margined and denate all around...7. *A. saltionensis*.

Erect or ascending plants.

Fruiting bracts with the margin toothed above the entire base.

Leaves cordate-ovate, sessile.....8. *A. cordulata*.

Leaves oblong-lanceolate to ovate, short petiolate or mostly sessile.

9. *A. coronata*.

Fruiting bracts circular, with a toothed margin all around.....10. *A. elegans*.

Fruiting bracts red, slightly succulent; diffuse perennial....11. *A. semibaccata*.

2. *Staminate flowers in terminal naked spikes, the pistillate in axillary clusters.*

Annuals; spikes usually moniliform; leaves mostly  $\frac{1}{2}$  to 1 in. long or less (except no. 14); commonly tall plants.

Plants erect, or mostly so, 2 to 3 ft. high.

Leaves oblanceolate or lanceolate; fruiting bracts 1 line broad...12. *A. coulteri*.

Leaves broadly or deltoid-ovate; fruiting bracts  $2\frac{1}{2}$  to 3 lines broad.

Staminate spikes short, dense.....13. *A. argentea*.

Staminate spikes elongated, interrupted.....14. *A. expansa*.

Plants decumbent; fruiting bracts triangular.....15. *A. decumbens*.

## Perennials.

Interior species of alkaline flats; bracts toothed; spikes often moniliform.

Diffuse; leaves mostly sharply dentate.....16. *A. bracteosa*.

Erect and rather rigid; leaves entire.....17. *A. fruticulosa*.

Sea-beach species; bracts entire; spikes usually dense.

Stems prostrate, wiry; fruiting bracts membranous, compressed. 18. *A. californica*.

Stems reclining, stout; fruiting bracts spongy, globose.....19. *A. leucophylla*.

## B. Shrubs, or at least suffrutescent; dioecious.

Fruiting bracts without lateral wings.

Sides of fruiting bracts smooth, the margins entire or with very low teeth.

Fruiting bracts large, their margins free and more or less divergent.

Leaves entire, sessile or nearly so; fruiting bracts ovate.

Fruiting bracts 3 to 5 lines long; leaves not cordate.....20. *A. confertifolia*.

Fruiting bracts 1 to  $1\frac{1}{2}$  lines long; leaves cordate.....21. *A. parryi*.

Leaves coarsely toothed, petioled; fruiting bracts orbicular.....22. *A. hymenoclytra*.

Fruiting bracts small, their margins not divergent.

Branches terete; bracts united about to middle or above; axes of spikes

filiform, pliable.

Bracts flattened, obscurely crenate; desert.....23. *A. lentiformis*.

Bracts convex, entire; coast.....24. *A. breweri*.

Branches striate-angled; bracts distinct but closely compressed; axes of

spikes stouter, rigid.....25. *A. torreyi*.

Sides of fruiting bracts crested or muricate, the margins lacinate or toothed.

Bracts flattened, united about  $\frac{1}{2}$ .....26. *A. polycarpa*.

Bracts thickish, spongy, united nearly to apex.....27. *A. nuttallii*.

Fruiting bracts with 4 very conspicuous longitudinal wings or crests.

Wings crest-like, about 1 line broad.....28. *A. linearis*.

Wings roundish, 3 to 5 lines broad.....29. *A. canescens*.

## Sect. I.—Herbs with pistillate and staminate flowers on the same plant; annuals (nos. 1 to 10 and 12 to 15) or perennials (nos. 11 and 16 to 19).

1. *A. pátula* L. SPEAR ORACHE. Stout and succulent, erect, 10 to 18 in. high, with few ascending branches; herbage green, only the growing parts somewhat mealy; leaves (the lowest often opposite) lanceolate or linear, sometimes with hastate base; inflorescence more or less leafy at base; fruiting bracts rhombic- or lance-ovate, thick and subcoriaceous, united at base, 4 to 6 lines long, entire or toothed, the sides smooth or muricate.—Common in salt marshes along the coast; S. Cal. to San Francisco Bay and n. to B. C.; seacoasts of n. hemisphere.

2. *A. hastata* L. FAT-HEN. Rather slender, with long (1 to  $2\frac{1}{2}$  ft.) ascending branches; herbage mealy, scarcely succulent; leaves triangular-hastate or deltoid, entire or sinuate-dentate, 1 to 2 in. long, often as broad or broader, on petioles 3 to 4 lines long; flowers in dense terminal and lateral spikes 1 to 4 in. long; fruiting bracts orbicular or triangular-ovate,  $1\frac{1}{2}$  (or 2) lines long, united at the cuneate base, the sides mostly toothed-crested.—Common in salt marshes about San Francisco Bay and n. to Wash.; Atlantic seacoast; Eur. Bracts very variable as to size and either much or little toothed, or entire. Lateral angles of the deltoid leaves often prolonged into salient lobes.

*A. ròsea* L. Annual; leaves all alternate, ovate, sinuate-dentate, densely scurfy, often turning red; flowers mostly in axillary capitate clusters, some in terminal spikes; bracts rhombic- or cuneate-orbicular, the margin dentate, the sides warty.—Yolo Co.; Los Angeles coast; native of Eur.

3. *A. spicata* Wats. Erect, 9 to 16 in. high; herbage scurfy, the stem below glabrate; leaves triangular-ovate, irregularly dentate or entire, cuspidate, 1 to 2 in. long, on petioles 1 to 6 lines long; flowers in a panicle of usually dense naked spikes; staminate calyx 4-parted; pistillate flowers nearly concealed by the staminate flowers; bracts in fruit little enlarged,

ovate, acute, united to the middle or above, the apex free, the sides smooth or slightly ridged, 1 to  $1\frac{1}{2}$  lines long.—Low alkaline tracts of the interior valleys: Sacramento, San Joaquin and Santa Clara valleys. Occasionally exhibits a tendency to become dioecious.

4. *A. phyllostegia* Wats. Bushy-branching, 4 to 13 in. high; herbage finally glabrous, inclined to be reddish; leaves rhomboidal-hastate with acuminate lobes,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, shortly petioled or subsessile, the blade entire, often almost as broad as long; fruiting bracts ovate or lanceolate, 4 lines long, abruptly and somewhat reniformly enlarged at base with 2 (or 4) tubercles or short ridges on the sides.—Mohave Desert; upper San Joaquin Valley; Owens Valley; e. to Nev.

5. *A. parishii* Wats. Prostrate, grayish-scurfy and slightly pubescent; stems slender, 1 to 4 in. long, densely foliaceous; leaves opposite, sessile, broadly ovate, acute, 1 to 2 (or 4) lines long; fruiting bracts ovate-hastate, acute, wingless, or the pair of hastate lobes representing the wing.—Low saline spots: Solano Co.; Redondo; Orange Co.; Palm Sprs.

6. *A. microcarpa* (Benth.) Dietr. Freely branching with very slender decumbent nearly glabrous branches 3 to 12 in. long; leaves thin, obovate, acute at base, abruptly acute at apex, slightly scurfy, 3 to 5 lines long, sessile or subsessile; fruiting bracts 1 line broad, the margins parallel above the acutish base and united nearly to the 3 (or 5)-toothed truncate summit, the convex sides 1 to 3-nerved, smooth or muricate.—San Pedro; San Diego; Santa Cruz and San Clemente Isls.; L. Cal.

7. *A. saltonensis* Parish. Stems somewhat decumbent, very leafy, 4 to 6 in. broad; herbage scurfy; leaves ovate to obovate, 3 to 5 lines long, shortly petioled; flowers axillary; bracts orbicular, 1 to  $1\frac{1}{2}$  lines broad with narrow margin dentate all around.—Mecca, Colorado Desert; not otherwise known.

337. *A. cordulata*  
Jepson; fr.  
bracts x 4.

8. *A. cordulata* Jepson. Fig. 337. Erect, the simple stems or branches commonly virgate, 7 to 15 in. high, scurfy; leaves somewhat crowded, cordate-ovate, sessile, 3 to 4 lines long; calyx 4-parted; fruiting bracts fan-shaped or somewhat rhomboidal,  $1\frac{1}{2}$  to 2 lines broad, much compressed, pedicellate, the margin denticulate above the middle, the terminal tooth commonly the largest, sides smooth or bearing one or more tooth-like projections.—Alkaline flats, Sacramento and San Joaquin valleys. Var. *TULARFENSIS* Jepson. More slender, taller (up to  $2\frac{1}{4}$  ft.), the leaves remoter, ovate and acuminate or lanceolate; fruiting bracts 1 line broad.—Bakersfield plain.

9. *A. coronata* Wats. Branching at the base, 3 to 12 in. high, sometimes rather stout, white-scurfy throughout; leaves oblong-lanceolate or ovate, sessile, 3 to 8 lines long; calyx 4-parted; fruiting bracts somewhat fan-shaped, compressed, 2 lines long and as broad, the margins crenate-dentate above the middle, the sides rarely muricate.—Saline flats: Solano Co. to Santa Clara Co. May-June. Var. *NOTATIOR* Jepson. Sides copiously toothed-crested, the fruits thus globose in outline.—San Jacinto Valley.

10. *A. elegans* (Moq.) Dietr. var. *fasciculata* (Wats.) Jones. Fig. 338. Scurfy, 3 to 10 in. high, with many ascending stems from the base; leaves obovate, usually entire, 4 to 10 lines long, sessile or the lowest petioled; fruiting bracts round, compressed, 1 to  $1\frac{3}{4}$  lines broad, the somewhat convex center margined all around, the margin regularly and minutely toothed, the sides smooth.—Mohave Desert and Inyo Co. (*A. fasciculata* Wats.)

338. *A. elegans*  
var. *fasciculata*  
Jepson; fr.  
bracts x 4.

11. *A. semibaccata* R. Br. AUSTRALIAN SALTBUSH. Diffusely spreading perennial, the stems 2 to 3 ft. long, woody below; leaves oblong, sinuate-toothed or entire,  $\frac{1}{2}$  to 2 in. long; fruiting bracts rhomboidal, acute, stipe-like at base, united about one-half, toothed at the lateral angles, 2 to 3 lines long, smooth on the 3-nerved sides.—Cult. as a forage plant and

becoming spontaneous: Marin Co.; San Joaquin Co.; San Diego Co.; Colorado Desert; native of Austr.

12. *A. coulteri* Dietr. Erect with very slender branches, 1 to 3 ft. high, or sometimes diffusely spreading, the very base woody; leaves oblanceolate or lanceolate,  $\frac{1}{2}$  to 1 in. long, entire, mucronate, sessile or the lowest petioled; fruiting bracts roundish, 1 line broad, with a narrow herbaceous laciniately toothed border, which reaches nearly to the base, the convex sides reticulate-veiny, smooth or rarely muricate.—Near the coast: Santa Catalina Isl.; San Diego Co.; s. to L. Cal.

13. *A. argentea* Nutt. SILVER ORACHE. Erect, branching,  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high, gray-scurfy or glabrate, the upper side of the leaves greener; leaves triangular-ovate or subhastate-ovate, acute, dentate or entire,  $\frac{3}{4}$  to 1 in. long, shortly petioled, or the upper sessile; flowers in axillary clusters, the staminate in the upper axils or in spikes; fruiting bracts roundish, spongy-thickened, 3 lines long, with an herbaceous irregularly toothed margin above the short turbinate or pedicellate base, one or both the sides with herbaceous teeth or lamellae.—E. side of the Sierra Nevada from Inyo Co. to Siskiyou Co.; n. to Wash., e. to the Rocky Mts.

14. *A. expansa* (D. & H.) Wats. FOG-WEED. Erect, much branched, 2 to  $3\frac{1}{2}$  ft. high; finely mealy-scurfy; leaves broadly ovate or deltoid-ovate, irregularly and sharply toothed or entire, 1 to 3 in. long, often as broad as long, the lower on stout petioles, 1 to 10 lines long and 3-nerved from the base, the upper reduced to sessile and more or less cordate floral bracts as broad as (or broader than) long; spikes elongated, slender; fruiting bracts sessile, roundish, mostly 3-nerved, 2 to 3 lines broad, the margin sharply toothed, the sides smooth or with a few irregular projections or crests.—Low alkaline areas of the interior: Sacramento and San Joaquin valleys, s. to S. Cal.; e. to N. Mex.

15. *A. decumbens* Wats. Stems trailing, 1 to 3 ft. long; leaves alternate or the upper mostly opposite, finely hoary, ovate, 4 to 9 lines long, sessile; fruiting bracts triangular, truncate at base, 3 to 4 lines long, nearly as broad, united to the middle, the sides smooth; margins denticulate, their lower  $\frac{1}{4}$  united.—Coast from San Diego to Long Beach; Santa Catalina Isl.

16. *A. bracteosa* Wats. More or less diffuse, the stems 1 to several ft. long; branches smooth and shining, straw-color; leaves finely grayish-scurfy, greener above, oblong-ovate, mucronate-acute, or acuminate,  $\frac{1}{2}$  to 2 in. long, thin, sharply but sparingly toothed or the smaller entire; fruiting bracts whitish, 1 to  $1\frac{1}{2}$  lines long, the herbaceous margin laciniately toothed, or simply dentate with the central tooth lanceolate and conspicuous.—Moist saline soil, Great Valley to S. Cal. Aug.-Oct.

17. *A. fruticulosa* Jepson. Fig. 339. Stems several from the base, erect, simple below, with terminal branchlets, 6 to 13 in. high, slightly woody at base; herbage grayish; leaves sessile, lanceolate or narrowly oblong,  $\frac{1}{4}$  to  $\frac{3}{4}$  in. long; fruiting bracts  $1\frac{1}{2}$  to 2 lines long and about as broad, the margins toothed above the base, the sides tooth-crested.—Alkaline flats of the Great Valley from the "goose-lands" of Glenn Co. to the San Joaquin.

18. *A. californica* Moq. Stems from a fleshy fusiform root, slender, wiry, mostly herbaceous, prostrate, often much branched and forming a thick mat; herbage finely white-mealy, but the general hue mostly greenish; leaves thinnish, ovate-lanceolate to oblong-lanceolate, 2 to 7 lines long, sessile or shortly petioled; flowers in mixed axillary clusters, or the staminate mostly in terminal spikes; fruiting bracts membranous, ovate, acute, entire, loosely closed over the utricle, but not united, 1 to 2 lines long.—Sandy beaches or bluffs along the coast: Marin Co. to San Diego and L. Cal. Apr.-May.

19. *A. leucophylla* Dietr. Fig. 340. Stems prostrate, often somewhat woody at base, 1 to several ft. long, the branches

339. *A. fruticulosa* Jepson fr. bracts x 4.

340. *A. leucophylla* Dietr.; fr. bracts x 4.

usually many, short, ascending, very leafy often almost imbricated-leafy; herbage densely scurfy, light brown, sometimes pinkish; leaves thick, orbicular to elliptic or elliptic-ovate, entire. 4 to 8 (or 12) lines long, sessile, 3-nerved; calyx rather large, 5-cleft; fruiting bracts subglobose,  $1\frac{1}{2}$  to 2 lines long, with the bracts completely united and marginless (except at the apex where there is a small ovate double wing) and the sides commonly with two (or several) warty projections.—Seabeaches, very common: San Francisco to S. Cal. June-Dec.

341. *Atriplex confertifolia*  
Wats.; fr. bracts x 4.

**Sec. II.—Shrubs, or at least woody at base, with staminate and pistillate flowers on different plants.**

20. *A. confertifolia* Wats. SHEEP-FAT. SPINY SALTBUSH. Fig. 341. Compact round bushes 1 to 2 ft. high, more or less spiny; flowers in subpaniculate spikes, in fruit very dense; leaves ovate or elliptic, entire, rounded at apex, abruptly cuneate at base, 3 to 8 lines long, very shortly petioled; fruiting bracts sessile, round-ovate or subdeltoid, acutish or mostly obtuse, truncate or subcordate at base, 4 to 10 lines long, entire or sometimes dentate, united around the seed, the dilated margins otherwise free and more or less spreading, the sides smooth.—Common on desert mesas and hills: Mohave Desert; n. to Inyo and Lassen Cos.; e. to Col., s. to Mex.

342. *A. parryi*  
Wats.; fr.  
bracts x 4.

21. *A. parryi* Wats. PARRY SALTBUSH. Fig. 342. Densely branching white-scurfy rounded bush 8 to 16 in. high, near the preceding but the rigid spinosely tipped branches more numerous and slenderer; leaves thick, round-cordate, obtuse or acute, sessile, 2 to 6 lines broad; flower-clusters axillary; fruiting bracts very small ( $\frac{3}{4}$  to  $1\frac{1}{2}$  lines long), somewhat fan-shaped, united to above the middle, abruptly dilated above the broadly cuneate base, the free margin short but broad and with a few low teeth, the sides smooth.—Mohave Desert and Inyo Co.; e. to southern Nev.

22. *A. hymenelytra* (Torr.) Wats. DESERT HOLLY. Fig. 343. Compactly branching, 1 to 3 ft. high, the stems from thickened and often very gnarled woody bases 1 in. in diameter; herbage covered with dense smooth silvery-white scurf; leaves roundish,  $\frac{1}{2}$  to  $1\frac{3}{4}$  in. broad, somewhat cordate at base, the undulate margin with coarse salient teeth, the petioles 3 to 6 lines long; flower clusters in paniced spikes; fruiting bracts on a short clavate pedicel, round-reniform, strongly flattened, entire,  $2\frac{1}{2}$  to 6 lines broad, distinct or nearly so, the margins entirely free and sides smooth.—Colorado and Mohave deserts; Owens Valley; e. to Utah. Also called Silver Holly.

343. *Atriplex hymenelytra*  
Wats.; fr. bracts x 4.

23. *A. lentiformis* (Torr.) Wats. QUAIL BRUSH. Fig. 344. Widely spreading shrub 6 to 10 ft. high and half again as broad; branches divaricate, occasionally spinescent; herbage closely scurfy; leaves ovate or triangular-hastate, rounded at apex,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, on short petioles; fruiting spikes dense, naked, pliable, in compact panicles, 4 to 8 in. long; calyx 5-cleft; fruiting bracts roundish, flattened, 1 to 2 lines broad, united by their edges to the middle or above, the sides smooth and the free margins obscurely crenulate.—Alkaline flats and river benches: upper San Joaquin Valley; Mohave and Colorado deserts; e. to Ariz.

344. *Atriplex lentiformis* Wats.;  
a, fr. branch  $\times \frac{3}{4}$ ; b, fr. bracts  
 $\times 3$ .

broader than long, laciniately or unequally toothed, the sides with 2 or more slender spreading teeth or tubercular crests or sometimes quite smooth.—Desert bottoms and flats and river benches: Colorado and Mohave deserts, n. to the San Joaquin Valley and Inyo Co.; e. to Ariz.

27. *A. nuttallii* Wats. SALT SAGE. Diffuse shrub 1 to 2 ft. high; leaves obovate to oblong or linear, entire, narrowed to a short petiole or sessile, 1 to 2 in. long; flowers in sparingly naked paniced spikes; fruiting bracts ovate, convex, united except at apex, 2 to 5 lines long, sessile or raised on a pedicel 2 lines long, the margin commonly 3-toothed at apex, the middle tooth often largest and the lateral small or wanting, the sides irregularly and often copiously tooth-crested.—Interior desert plains: Lassen Co.; e. to the Rocky Mts. Also called Nuttall Saltbush.

28. *A. linearis* Wats. Shrub, more woody than *A. nuttallii*; leaves linear or narrowed towards the base,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; staminate flowers in small globose clusters, in simple or paniced spikes, leafy below; pistillate flowers solitary or few together in similar spikes, more leafy; fruiting bracts lanceolate or ovate, 2 to 4 lines long, prolonged above into a narrow tip, the sides irregularly tuberculate or crested and developing 4 deeply toothed wings.—Colorado Desert; s. to Mex.

29. *A. canescens* James. SHAD-SCALE. Fig. 346. Roundish gray shrub 1 to 5 ft. high; leaves linear, entire, narrowed at base,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, finely scurfy-canescens; flowers mostly dioecious in elongated narrow spike-like panicles, very dense in fruit; fruiting bracts forming a thick hard body 2 to 4 lines long, tipped at apex with 2 lanceolate teeth 1 line long and

24. *A. bréweri* Wats. Very near preceding, 4 to 6 ft. high; calyx 4-cleft; fruiting bracts spongy, drab-color, rounded, somewhat convex, united to near the middle, entire,  $1\frac{1}{2}$  to 3 lines broad.—Coast from Santa Barbara to Santa Monica and San Juan Capistrano; Santa Cruz Isl.

25. *A. tórreyi* Wats. WATER SAGE. Leafy bush 2 to 5 ft. high, densely and divaricately branched, the branches striately angled, becoming spiny with the lateral axes of the old panicles; leaves ovate-hastate or broadly oblong,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long on petioles 1 to 4 lines long; flowers in narrow panicles; fruiting bracts roundish or transversely elliptic,  $1\frac{1}{2}$  to 2 lines broad, distinct, strongly compressed, with denticulate (sometimes smooth) margins and smooth veiny sides.—Alkaline desert flats: Mohave Desert and Inyo Co., e. to Utah; apparently also w. side San Joaquin Valley. Also called Nevada Saltbush.

26. *A. polycarpa* (Torr.) Wats. CATTLE SPINACH. Fig. 345. Light-gray shrub 2 to  $3\frac{1}{2}$  ft. high, with slender rigid branches and numerous more or less spiny branchlets; leaves thick, obovate to oblong-spatulate, obtuse, sessile, those of the vegetative branches 4 to 7 or 10 lines long, deciduous during the high heat period, those of the fruiting branches very small (1 to 4 lines long), with smaller ones fasciated in the axils; flowers in close naked paniced spikes; fruiting bracts roundish, united about  $\frac{1}{2}$ , 1 to 2 lines broad, commonly

345. *A. polycarpa* Wats.;  
fr. bracts  $\times 4$ .

346. *Atriplex canescens* James;  
fr. bracts x 4.

much reduced,  $\frac{3}{4}$  to  $1\frac{1}{2}$  lines broad, coarsely toothed.—Colorado Desert.

laterally margined by 4 roundish very conspicuous wings 3 to 6 lines long and 2 to 4 lines broad; wings decurrent at base on the pedicel and overtopping the free apex, the margin irregularly dentate or laciniate.—Desert flats or washes; Mohave and Colorado deserts, w. to San Bernardino and San Diego; e. to Nev. and South Dakota, s. to Mex. It is very abundant in the Colorado Desert where it occupies a position similar to that of *A. confertifolia* in the Mohave Desert. Var. *LACINIATA* Parish. Wings 3 or 4 lines broad, saliently laciniate. — Colorado and Mohave deserts. Var. *MACILÉNTA* Jepson. Wings

### 8. GRAYIA H. & A.

Low shrubs with alternate entire leaves. Flowers dioecious or sometimes monoecious, in axillary clusters or terminal spikes. Staminate flowers without bracts; calyx mostly 4-parted; stamens 4 or 5, with short subulate filaments. Pistillate flowers without calyx, the ovary inclosed in an orbicular strongly flattened membranous sac with a small orifice at the apex and bordered all around with a narrow wing, this sac really composed of 2 conduplicate bracts united by their edges nearly to the apex, each bract with a wing developed on the back or midrib, the whole much enlarged in fruit. Styles 2. Achene with very thin pericarp. (Asa Gray, 1810-1888, distinguished American botanist.)

1. *G. spinosa* (Hook.) Moq. HOP SAGE. Fig. 347. Deep green shrub  $1\frac{1}{4}$  to 3 ft. high, the branches frequently spinescent; young parts mealy, finally glabrous; leaves rather fleshy, linear-oblongate or obovate, 4 to 15 lines long, barely petioled; staminate flowers in axillary clusters, the pistillate mostly spicate; fruiting bracts round, 3 to 6 lines in diameter, sessile, entire, glabrous, thin, white or pinkish, emarginate, abruptly narrowed below to a short cuneate pedicel-like base or the pedicel often obscure or obsolete; styles slender, at first exserted. —Alkaline valleys: Mohave Desert; Owens Valley; n. to Wash., e. to Wyo.

### 9. EURÓTIA Adans.

Low white-tomentose shrubs with alternate entire leaves. Flowers dioecious or monoecious, in small axillary clusters, the clusters spicately disposed at the ends of the branches. Staminate flowers without involucre bracts; calyx hairy, 4-parted; stamens 4, exserted. Pistillate flowers without calyx; pistil inclosed in a membranous densely silky-hairy sac composed of two bracts united above the middle and with spreading apices; styles 2, slender, exserted. Sac in fruit enlarged, 4-angled, beaked above by two short horns. (Greek euros, mould, referring to the hairy or rufous covering.)

347. *Grayia spinosa* Moq.;  
fr. branchlet x 1.

348. *Eurotia lanata*  
Moq.; fr. branchlet  
x 1.

1. *E. lanata* (Pursh) Moq. WINTER FAT. Fig. 348. Branches slender, usually many from the woody stems, 1 to 2 ft. high, the herbage stellately white-tomentose or in age reddish; leaves linear with strongly revolute margins,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long or the axillary fascicled ones mostly 1 to 6 lines long; fruiting involucre 2 or 3 lines long, ornamented with 4 dense spreading tufts of silvery-white hairs; ovary densely white-hairy.—Subalkaline soils: Mohave Desert; upper San Joaquin Valley and neighboring inner Coast Range; Inyo Co. to Honey Lake Valley; n. to Wash. and Saskat., e. to N. Mex. Often abundant in the desert valleys and prized by the cattlemen for winter forage; they sometimes call it "White Sage" or "Sweet Sage."

#### 10. *KÖCHIA* Roth

Perennial herbs, woody at very base. Leaves linear, terete, entire. Flowers perfect, solitary or few in the axils of the virgate leafy stems, without bracts. Calyx herbaceous, subglobose, shortly 5-lobed, persistent over the fruit, and finally developing 5 horizontal wings. Stamens 5, usually exserted. Ovary depressed; styles 2 or 3, filiform. Achene with membranous persistent pericarp. Embryo nearly annular, green; endosperm none. (W. D. J. Koch, one time Director of the Botanic Garden at Erlangen.)

1. *K. americana* Wats. RED SAGE. Stems many from the branching crown of a woody root, erect, 5 to 11 in. high; stems whitish-tomentulose, the leaves silky-pilose, both finally glabrate and greenish; leaves ascending, narrowly linear, 4 to 7 lines long, ascending or strict; calyx densely white-tomentose or partly glabrate; wings fan-shaped, membranous, striate,

toothed or erosulate, 1 line long.—Desert valleys: Honey Lake Valley; Inyo Co.; e. to Col. Var. *CALIFORNICA* Jones. Six to 15 in. high; herbage grayish or rusty; leaves spreading, narrowly oblong, 2 to 6 lines long.—San Joaquin Valley; Mohave Desert; e. to southern Nev.

#### 11. *ALLENROLFEEA* Ktze.

Shrub with alternate leafless jointed branches; the branchlets fleshy and green with short scale-like leaves. Flowers perfect, arranged spirally by threes in a crowded spike, in the axils of fleshy subsessile bracts. Calyx of 4 (or 5) concave carinate imbricated sepals, more or less united. Stamens 1 or 2, with slender filaments at length exserted. Ovary oblong; styles 2, rarely 3, commonly distinct. Achene with membranous pericarp, free from the vertical oblong seed. Embryo green, nearly surrounding the rather copious endosperm. (Allen Rolfe, Kew botanist.)

1. *A. occidentalis* (Wats.) Ktze. IODINE BUSH. Fig. 349. Erect, diffusely branched, 2 to 4 ft. high; vestiges of leaves very short, broadly triangular and amplexicaul, acute, often nearly obsolete; spikes numerous, sessile or nearly so, cylindrical, 3 to 10 lines long; bracts rhomboidal; flowers crowded, slightly exserted; calyx becoming spongy

349. *Allenrolfea occidentalis*  
Ktze.; fl. spikes x 1.

and inclosing the fruit.—Moist alkaline clay soil: San Joaquin Valley; Inyo Co.; e. Mohave Desert; e. to Tex. (*Spirostachys occidentalis* Wats.)

## 12. *SALICÓRNIA* L. SAMPHIRE. GLASSWORT

Low very succulent herbs with jointed stems and opposite terete branches. Leaves reduced to mere opposite scales at the nodes, the flowers immersed in the axils of the scales of the thickened upper joints and forming a cylindrical spike. Flowers disposed in opposite clusters of 3, perfect or unisexual. Calyx small and bladder-like, with an anterior opening, in fruit spongy and deciduous. Stamens 2, exserted in flower. Ovary oblong; styles 2 or 3, short. Achene with membranous pericarp, adherent to the seed. Embryo folded, the cotyledons incumbent upon the caulicle; endosperm none or almost none. (Latin sal, salt, and cornu, horn, plants of saline habitat with horn-like branches.)

Perennial by rootstocks; flowers of a trio all of the same height.

- Spikes slender, narrower than stems.....1. *S. ambigua*.  
 Spikes rather thicker than stems.....2. *S. subterminalis*.  
 Annuals; middle flower higher than the lateral.  
 Joints of spikes longer than broad.....3. *S. europaea*.  
 Joints of spikes broader than long.....4. *S. mucronata*.

1. *S. ambigua* Michx. PICKLE-WEED. Fig. 350. Stems erect, or decumbent and rooting at the joints, 5 to 12 in. long, from woody rootstocks; herbage greenish; internodes rather long; spikes slender, about  $1\frac{1}{2}$  lines thick, usually narrower than the stem, all the scales flower-bearing to the top; achene pubescent.—Salt marshes along the coast: s. to L. Cal., n. to B. C.; Atlantic coast. (*S. pacifica* Sta.) Var. *UTAHENSIS* Jepson. Spikes thicker (about 2 lines thick).—W. base Panamint Mts. (*S. utahensis* Tidestrom.)

2. *S. subterminalis* Parish. Stems widely spreading or erect and compact,  $\frac{1}{2}$  to 1 ft. high, from running rootstocks; internodes short; branchlets very numerous, each pair often turned to one side, giving the stem a unilateral appearance; spikes 1 to 2 in. long, of few to several enlarged broad flower-bearing scales and terminated by about as many long slender sterile ones; achene glabrous.—Coastal S. Cal., n. to the upper San Joaquin Valley.

3. *S. europaea* L. Erect compactly branching annual 3 to 9 in. high; spikes slender, 1 line wide, mostly tapering toward tip, the joints much longer than broad; scales with blunt or very shortly acute tips; middle flower much higher than the lateral, shorter than the joints; fruiting calyx with raised spongy margin about a central crest.—Alkaline marshes, chiefly in the desert region: San Diego; Tehachapi Valley; Palo Alto; Modoc Co.; Atlantic Coast, Eur., Asia.

4. *S. mucronata* Bigel. Habit of no. 3; spikes thick-cylindric,  $2\frac{1}{2}$  to 3 lines broad, not tapering, the joints broader than long; scales with acuminate tips; middle flower half higher than the lateral, occupying the whole joint; fruiting calyx with flattish anterior face.—San Diego; e. to the Atlantic.

350. *Salicornia ambigua* Michx.; a, infl. x 1; b, staminate spike x 2; c, pistillate spike x 2.

13. **SARCOBATUS** Nees

Rigid and divaricately branched compact shrub with somewhat thorny branches. Leaves alternate, linear, sessile, entire. Flowers monoecious or dioecious, without bracts. Staminate flowers in terminal catkin-like spikes without calyx and with spirally arranged scales; stamens 2 to 5 under a stipitate peltate scale; filaments short. Pistillate flowers axillary and commonly solitary, sessile; ovary set in a sac-like adherent calyx; style short; stigmas 2, spreading horizontally; calyx laterally margined by a narrow border which becomes in fruit a broad circular horizontal wavy membranous wing. (Greek sarx, flesh, and batos, thicket.)

1. *S. vermiculatus* (Hook.) Torr. BLACK GREASEWOOD. Fig. 351. Branches closely interlocking, 3 to 5 ft. high; bark white; leaves  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long, fleshy, flat on the upper side, rounded beneath, usually glabrous; staminate

351. *Sarcobatus vermiculatus* Torr.; a, staminate inflo. x 1; b, pistillate inflo. x 1; c, fr. x 4.

spikes 7 to 10 lines long; fruiting calyx with prominently veined wing, 4 to 6 lines broad.—Alkaline clay soil of desert valleys: Mohave Desert; Inyo Co. to Lassen and Modoc Cos.; e. to N. Mex., n. to Wash.

14. **SUAEDA** Forsk. SEA BLITE

Fleshy plants of salt marshes or alkaline plains, with alternate subterete linear leaves. Flowers perfect, or with perfect, staminate and pistillate on the same plant, sessile in the axils of the leafy bracts, minutely bracteolate; calyx with 5 lobes, fleshy, inclosing the utricle and mostly carinate or crested. Stamens 5. Styles 2 or 3, short and rather thick. Seed with a dark shining crustaceous testa and a spiral embryo. (Name from the Arabic.)

Low shrubs or bushes; calyx not appendaged; stigmas from the concave summit of a short style; lower leaves mostly with an obscure short petiole.

Branchlets rather densely crowded with leaves and flowers; calyx cleft about half way.....1. *S. californica*.

Branchlets with smaller less crowded leaves.

Mostly pubescent or woolly; calyx cleft half way.....2. *S. suffrutescens*.

Mostly glabrous and glaucous; calyx parted nearly to base.....3. *S. moquini*.

Annuals; calyx transversely appendaged; leaves sessile by a rather broad base.....4. *S. depressa*.

1. *S. californica* Wats. Fig. 352. Plants decumbent, 3 to 9 ft. across, the stems woody at base, succulent above and bearing ascending or erect leafy branchlets  $\frac{1}{2}$  to 1 ft. long; leaves spreading or somewhat recurved, broadly linear, acute, 6 lines long; flowering branches rather thick and crowded with leaves and flowers, the leaves much surpassing the flower clusters; flowers large, 2 lines broad, 1 to 3 in the axils; seed jet-black.—Sandy beaches bordering San Francisco Bay. Sept.-Oct. Var. *PUBESCENTES* Jepson. Herbage woolly-pubescent.—Coast, Santa Barbara to San Diego.

2. *S. suffrutescens* Wats. Stem woody,  $1\frac{1}{2}$  to 3 ft. high, bearing an irregular crown of straggling branches; herbage clothed with a fine pubescence; leaves linear, 2 to 6 (or 12) lines long, the upper little surpassing the flower clusters; calyx cleft a little over half way; clusters mostly 3 to 9-flowered; flowers small,  $\frac{1}{2}$  to 1 line broad.—Alkaline valleys: Colorado and Mohave deserts, n. to Inyo Co.; e. to N. Mex., s. to Mex.

3. *S. moquini* Greene. ALKALI BLITE. Stems more or less decumbent or irregularly spreading, 2 to 3 ft. long; herbage glaucous, glabrous; flowering branches long and slender; leaves linear, 2 to 5 lines long, mostly acute; clusters several-flowered; calyx deeply 5-parted.—Alkaline soil: San Joaquin Valley; S. Cal.; e. to Col. Very like the preceding save in habit.

4. *S. depréssa* (Pursh) Wats. var. *erécta* Wats. PAHUTE WEED. Simple or branched at base, erect, strict,  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high, glabrous, often glaucous; leaves  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, acute; flowering branchlets dense, their leaves short, ovate-acuminate; calyx-lobes somewhat unequal, with a conspicuous horizontal wing on back.—Coastal S. Cal.; Modoc Co.; e. to Rocky Mts.

352. *Suaeda californica* Wats.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, pistillate fl.  $\times 4$ ; c, staminate fl.  $\times 4$ .

—Coastal S. Cal.; Modoc Co.; e. to Rocky Mts.

#### 15. *SÁLSOLA* L.

Bushy-branching herbs with rigid linear or subulate spinescent leaves. Flowers perfect, solitary, sessile and axillary, each subtended by 3 rigid spinescent organs consisting of a bract and 2 bractlets. Calyx 5-parted, its divisions at length horizontally winged on the back. Stamens 5. Ovary hollowed above like a shallow cup; styles 2. Seed horizontal; embryo coiled into a conic spiral; endosperm none. (Diminutive of Latin *salsus*, salty, most of the species of saline habitats.)

1. *S. káli* L. var. *tenuifolia* G. F. W. Mey. RUSSIAN THISTLE. Bushy annual 1 to 4 ft. high; leaves on the young plant linear, prickle-tipped; branches flowering from near the base; bracts ovate, shortly acuminate, prickly pointed, the bractlets similar but narrower; calyx divisions converging over mature fruit and forming a sort of beaked envelope, the wings irregular in shape and size and strongly veined.—Obnoxious weed, native of Asia: abundant in S. Cal.; San Joaquin Valley; Solano Co.; Long Valley, Lassen Co.; Alturas.

### AMARANTHACEAE. AMARANTH FAMILY

Ours coarse herbs with simple entire leaves. Flowers small, usually greenish, inconspicuous, perfect or unisexual, in ours congested in spikes or clusters. Calyx of 3 to 5 sepals, or sometimes only 1, persistent and more or less scarious. Corolla none. Stamens 5, sometimes fewer. Ovary superior, 1-celled, with 2 or 3 stigmas. Fruit a utricle, indehiscent, bursting irregularly or circumscissile. Embryo curved.

Leaves alternate; utricle mostly dehiscent.....1. AMARANTHUS  
Leaves opposite; utricle indehiscent.....2. TIDESTROMIA.

#### 1. *AMARANTHUS* L. AMARANTH

Annual weeds with alternate leaves and small green or sometimes purplish glabrous flowers. Flowers bracteate, disposed in axillary or terminal spikes.

or in axillary clusters, usually monoecious or polygamous, rarely dioecious, commonly with staminate and pistillate flowers in same cluster. Seed mostly black and shining. (Greek a-, not, and maraino, to fade, the spikes of certain species retaining their color in drying.)

Utricle circumscissile, the top falling away as a lid.

Sepals mostly narrowed upward; flowers monoecious.

Flowers in dense terminal and axillary spikes; sepals 5, mostly unequal.

Spikes stout.....1. *A. retroflexus*.

Spikes slender.....2. *A. hybridus*.

Flowers in small axillary clusters of short spikes.

Sepals of same number in staminate and pistillate flowers.

Sepals 3; plant erect, bushy-branched; utricle very rugose.....3. *A. graecizans*.

Sepals 5 or 4.

Plant prostrate; utricle a little wrinkled.....4. *A. blitoides*.

Plant with ascending stems; utricle smooth.....5. *A. carneus*.

Sepals of staminate flower mostly 3, of pistillate flower mostly 1.....6. *A. californicus*.

Sepals 5, mostly dilated upward.

Flowers monoecious; pistillate sepals fimbriate.....7. *A. fimbriatus*.

Flowers dioecious; pistillate sepals mostly retuse, mucronate.....8. *A. palmeri*.

Utricle fleshy, indehiscent; sepals 2 or 3; prostrate plant.....9. *A. deflexus*.

1. *A. retroflexus* L. ROUGH PIGWEED. Stoutish, commonly branched from the base, with erect or ascending branches, 1 to 4 ft. high; herbage roughish pubescent; leaves rhombic to oblong-ovate, petioled, 1 to 3 in. long; flowers green, densely crowded in spikes; spikes axillary and terminal, erect or slightly spreading, 1 to 4 in. long; bracts lanceolate-subulate, scarious except the green carinate midrib,  $1\frac{1}{2}$  to 3 lines long; sepals 5, unequal, oblong-lanceolate, cuspidate, 1 line long or less; utricle wrinkled, surpassed by the sepals.—Very common in orchards, gardens and waste lands. Introduced from trop. Am.

2. *A. hybridus* L. GREEN AMARANTH. Stems erect or ascending, 1 to 4 ft. high; herbage glabrous or sparingly pubescent; leaves broadly ovate to ovate-lanceolate, 1 to 4 in. long; spikes slender, bristly, paniced, especially at ends of branches; sepals about  $\frac{1}{2}$  as long as the subulate-lanceolate bracts, oblong, acute or acuminate; utricle surpassing the calyx, scarcely wrinkled.—Introduced from trop. Am., occurring locally through the state.

3. *A. graecizans* L. TUMBLE-WEED. Stems freely and rigidly branching, 1 to 3 or 4 ft. high, commonly of bushy outline; herbage light or somewhat yellowish green, glabrous or nearly so; leaves oblong-spatulate or obovate, 4 to 8 lines long; flowers in clusters in short axillary spikes; bracts subulate, 1 to  $1\frac{1}{2}$  lines long, much longer than the sepals; sepals 3, oblong, acute or obtuse, thin, shorter than the rugose utricle.—Summer weed; extremely abundant in cultivated fields; naturalized from trop. Am. The plant becomes rigid when dead and dry, and when loosened by fall winds is carried across the fields as a tumble-weed, the seeds being thus most effectively dispersed.

4. *A. blitoides* Wats. Stems branching, prostrate or spreading and mat-like,  $\frac{1}{2}$  to 2 ft. long; herbage glabrous or nearly so; leaves spatulate to obovate, 4 to 6 or 10 lines long, often white-nerved on the margins and beneath, drawn down to slender petioles; flowers in axillary clusters mostly shorter than the petioles; bracts ovate-lanceolate, little longer than the sepals; sepals 5 or 4, oblong or oblong-lanceolate, acute or cuspidate, slightly shorter, or 1 or 2 equaling or slightly longer, than the utricle; stamens 3; utricle somewhat wrinkled toward the summit.—Wash. to Col. and Mex.; introduced in Cal.: Santa Monica; Niles; Suisun; Yreka. Var. *CRASSIUS* Jepson. Stems 1 to  $1\frac{1}{2}$  ft. long, these and the branchlets coarsish, whitish, ascending; leaves not at all or scarcely white-veined.—East side of the Sierra Nevada from Reno to Modoc Co.

5. *A. carneus* Greene. Stems ascending, thickish, obscurely angled or grooved, somewhat flexuous, 1 to  $1\frac{1}{2}$  ft. long; leaves narrowly obovate, acute, bristly tipped,  $\frac{3}{4}$  to 1 in. long, acutely drawn down to a petiole; flowers in axillary clusters of short spikes little exceeding the petioles; axes of the spikes thickish, flexuous; sepals 5, unequal, broadly oblong, acuminate

or acute, equaling or the longer ones exceeding the smooth utricle, all more or less cuspidate-tipped; style short and thick, forming a distinct apiculation to the utricle; stigmas 3.—Siskiyou Co.; ne. to Ida.

6. *A. californicus* (Moq.) Wats. Stems prostrate, 4 to 12 in. long, stoutish and rather fleshy, with numerous short branchlets; leaves obovate to oblong, mostly obtuse, prominently mucronate, the veins and margins white, 2 to 5 lines long, the petiole  $\frac{1}{2}$  to as long; flowers green or reddish, in many small axillary clusters; sepals in staminate flower 3 (or 2), membranous, oblong-ovate, mucronate or erosulate; stamens 3 (or 2 or 1); sepals in pistillate flower 1 (or 2 or 3); utricle smooth, bursting irregularly and releasing a red seed.—Moist soils, often in beds of dried-up pools or lakes: Palomar; San Mateo Co.; Yreka; s. Ore. to w. Nev.

7. *A. fimbriatus* (Gray) Wats. Stems several from the base, 1 to 2 ft. high, simple or sparingly branched; herbage glabrous, purplish, especially the inflorescence; leaves linear, narrowed below into a short petiole, 1 to 2 in. long; flowers in rather loose clusters; clusters scattered or mostly approximate and forming a long terminal spike; bracts ovate, acute, scarious-bordered, shorter than the calyx; sepals of staminate flowers oblong, obtuse, those of the pistillate flowers broadly fan-shaped with a narrow thickened base and fimbriate margin, 1 line long; "stamens 2 or 3"; stigmas 3.—Mohave and Colorado deserts; e. to Utah and Tex., s. to Mex.

8. *A. palmeri* Wats. Stems stout, erect, 2 to 4 ft. high, glabrous or pubescent; leaves broadly ovate, acute or acuminate, broadly cuneate at base, 1 to 4 in. long, on petioles 1 to 2 times as long; flowers dioecious, in dense elongated spikes leafy at base; bracts solitary, those of the pistillate spikes subulate, spreading, rigid, awn-tipped, narrowly scarious-margined at base, 2 to 3 times as long as the flowers; calyx  $\frac{3}{4}$  to  $1\frac{1}{2}$  lines long, falling with the fruit, unequal, obscurely cordate at base; sepals of staminate flower oblong-ovate and acute, or oblong-lanceolate and acuminate; sepals of pistillate flower obovate, retuse or truncate, usually mucronate or setaceously apiculate; stigmas 2; utricle rugose at summit.—Colorado Desert; e. to Tex., s. to Mex.

9. *A. deflexus* L. Stems slender, prostrate, a little succulent, 1 to  $1\frac{1}{2}$  ft. long; leaves rhombic-ovate; flowers polygamous, in short spikes clustered in the axils, or disposed in dense terminal spikes 1 in. long or more; sepals 2 or 3, oblong, surpassing the bracts; utricle 3 to 5-ribbed, surpassing the sepals, indehiscent.—Nat. from s. Eur., chiefly in gardens and streets: Santa Rosa; Berkeley; Santa Barbara; Los Angeles; Ontario.

## 2. TIDESTRÖMIA Sta.

Annuals or woody-based perennials with opposite leaves. Flowers axillary, solitary or in small glomerules, perfect, subtended by 3 small bracts and by foliaceous involucre bracts. Sepals 5, equal, thin, pubescent. Stamens 5, arising from the margin of a short cup-shaped hypogynous disk, with 5 short teeth alternating with the filaments. Utricle subglobose, indehiscent. (Ivar Tidestrom, botanist in U. S. Bureau of Plant Industry.)

1. *T. oblongifolia* (Wats.) Sta. White-woolly perennial; stems widely branching, forming low broad mound-like plants 9 to 15 in. high and  $1\frac{1}{2}$  to 3 ft. broad; leaves roundish ovate, obtuse, 3 to 10 lines long, shortly petioled; involucre bracts united and forming definite involucre; involucre panicleately disposed, subsessile or shortly peduncled, their tubes oblong-turbinate, 1 to  $1\frac{1}{2}$  lines long, their lobes 3, foliaceous, round-ovate, 1 to 2 lines long; sepals ovate-lanceolate, 1 line long.—Sandy desert washes: Colorado and e. Mohave deserts; Inyo Co.; e. to Ariz. and southern Nev. (*Cladanthrix oblongifolia* Wats.)

## NYCTAGINACEAE. FOUR-O'CLOCK FAMILY

Ours more or less succulent herbs or low shrubs with opposite entire leaves and commonly swollen joints. Flowers perfect, regular, subtended by bracts which often form a calyx-like involucre. Bracts or involucre often colored.

Calyx plicate in the bud, tubular, colored like a corolla and very delicate, 4 or 5-lobed, the lower part of its tube circumscissile and leaving a persistent base which is closely constricted over but not attached to the superior ovary. Corolla none. Stamens in ours 3 to 5 (or 7), mostly unequal, hypogynous (or perigynous in *Abronia*). Ovary 1-celled, 1-ovuled; style and stigma 1. Fruit an achene, closely invested by the base of the calyx-tube, which becomes very much hardened and is often striate, ridged, or winged. Embryo mostly coiled, with mealy endosperm; cotyledons 2, or by reduction only 1 in *Abronia*.

Flowers without an involucre, each pedicel bearing or subtended by 1 to 3 small bracts.

Calyx campanulate or funnelform, mostly reddish or purplish.

Fruit 5-angled or 5-ribbed.....1. *BOERHAAVIA*.

Fruit globose, smooth.....2. *HERMIDIUM*.

Calyx salver-shaped with very much elongated tube, white.....3. *ACLEISANTHES*.

Flowers subtended by an involucre.

Involucral bracts distinct or nearly so; fruit usually winged.

Bracts 5 or more, wholly distinct; fruit without glands.....4. *ABRONIA*.

Bracts 3, distinct nearly to base; fruit with 2 rows of glands....5. *WEDELIELLA*.

Involucre composed of more or less united bracts; fruit not winged.

Fruit 5-ribbed; involucre enlarged in fruit.....6. *ALLIONIA*.

Fruit mostly smooth; involucre unchanged in fruit.....7. *MIRABILIS*.

### 1. *BOERHAAVIA* L.

Slender herbs with glandular rings about the internodes. Blades of the opposite leaves unequal. Bracts minute, 1 to 3 to each flower. Flowers small, on jointed pedicels. Calyx campanulate or funnelform, 5-lobed. Stamens 1 to 5; filaments slender, united at base. Stigma shield-shaped. Fruit club-shaped to obpyramidal, 3 to 5 (or 10)-ribbed, or -angled, or narrowly winged. (H. Boerhaave, 1668-1738, famous Dutch physician and botanist, professor at Leiden.)

Calyx campanulate; fruit 5-ribbed.

Annual; fruit glabrous.....1. *B. intermedia*.

Perennial; fruit glandular-viscid.....2. *B. hirsuta*.

Calyx funnelform; fruit obscurely 10-ribbed.....3. *B. annulata*.

1. *B. intermedia* Jones. Low, spreading or ascending, the stems almost filiform-slender,  $\frac{3}{4}$  to  $1\frac{1}{4}$  ft. long; leaves elliptic to lanceolate, obtuse or acute; peduncles bearing 2 to 5 umbellate or subcapitate flowers; calyx 1 line long; fruit cuneate or short-clavate, 1 to  $1\frac{1}{2}$  lines long.—Sw. Colorado Desert; e. to Tex., s. to Mex.

2. *B. hirsuta* Willd. Stem branching, 2 or 3 ft. long, parts or some of the internodes and petioles sparsely hirsute-glandular; leaves round-ovate, mostly obtuse or some acutish, rounded at base,  $\frac{1}{2}$  to 2 in. long; flowers nearly sessile in small clusters terminating slender peduncles, the peduncles more or less divaricate in a loose panicle; calyx red, 1 line long; fruit 1 to 2 lines long, 5-ribbed.—San Jacinto Valley; Coyote Cañon; e. to Ariz., s. to Mex.

3. *B. annulata* Cov. Perennial; stem stout, erect from an ascending base, glabrous, glaucous, 1 to 3 ft. high, the middle of each internode usually with a reddish mucilaginous ring; leaves ovate-oblong, cordate or rounded at base, obtusish at apex, thick, rigid, fleshy, entire or sometimes "lacerate," 1 to 2 in. long, hirsute; petiole nearly as long as blade; flowers 3 to 4 lines long, in small clusters terminating the branches; stamens 3, and with the style, conspicuously exserted; fruit turbinate, glabrous, obscurely 10-ribbed,  $2\frac{1}{2}$  lines long.—Death Valley region.

### 2. *HERMIDIUM* Wats.

Perennial glabrous herbs with thick fleshy leaves. Flowers in head-like clusters on the ends of terminal or axillary peduncles; clusters 6 to 8-flowered, each flower subtended by a large ovate leathery bract, the short pedicel adnate to the midvein of the bract. Calyx campanulate-funnelform, white to red, slightly lobed. Stamens 5 to 7, these and the style about as long as the calyx. Fruit nearly globose, smooth, glabrous. (Diminutive of the Greek Hermes, perhaps a fancied resemblance between the pediceled flower and a little statue of that god.)

1. **H. álipes** Wats. Stems several from a woody caudex, stout, ascending, simple or slightly branched, 5 to 12 in. high; leaves round to oblong-ovate, obtuse or subacute, subcordate at base, 1 to 2 in. long, very shortly petioled; bracts occasionally slightly united.—Panamint Range; White Mts.; e. to Utah.

### 3. **ACLEISÁNTHES** Gray

Perennial herbs or low shrubs. Flowers axillary or terminal, each subtended by 1 to 3 small narrow bracts. Calyx white, with a very much elongated slender tube and spreading but very small 5-lobed limb. Stamens 2 to 5, unequal, the slender filaments united at the base. Fruit narrowly ellipsoidal, 5-angled or 5-ribbed. (Greek *a-*, privative, *cleis*, something which closes, and *anthes*, flower, the flower not inclosed by the involucre.)

1. **A. longiflora** Gray. **YERBA DE LA RABIA**. Stems slender, scabrous puberulent, 6 to 10 in. long; leaves triangular-lanceolate, acute, broadly cuneate at base,  $\frac{1}{2}$  to 1 in. long, shortly petioled; calyx-tube 4 to  $4\frac{1}{2}$  in. long, its lobes 2 or 3 lines long; stamens exserted.—Maria Mts., e. Riverside Co.; e. to Tex., s. to Mex.

### 4. **ABRÓNIA** Juss.

Herbs with viscid herbage. Leaves of the opposite pairs more or less unequal. Peduncles axillary or terminal, bearing a many-flowered head subtended by 5 to 15 distinct involucre bracts. Flowers showy. Calyx salverform. Stamens commonly 5, unequal, included in the tube and inserted upon it. Style included. Persistent base of calyx 3 to 5-winged, more or less reticulate, inclosing a cylindrical achene. (Greek *abros*, graceful.)

#### 1. *Plants with leafy stems.*

Fruits with 2 to 5 conspicuous wings.

Fruits very large and with very thick wings; seacoast.

Flowers yellow.....1. *A. latifolia*.

Flowers deep dark red.....2. *A. maritima*.

Fruits smaller and with thinner wings; flowers red, pink or white.

Herbage glandular or glandular-puberulent; seacoast.

Wings mostly 5, broadened upward, truncate above or tapering to the beak.

Wings mostly 3, wider, produced above into a rounded lobe which surpasses the body.....3. *A. umbellata*.

Herbage villous, usually glandular; mostly of the interior.....4. *A. alba*.

Wings usually 5, often unequal.....5. *A. villosa*.

Wings only 2.....6. *A. pogonantha*.

Fruits narrowly winged or wingless.....7. *A. turbinata*.

Wings 5, narrow, sometimes ridge-like.....8. *A. exalata*.

Wings or ridges 2 or none.....9. *A. alpina*.

Prostrate, forming thick mats; clusters 2 or 3-flowered.....10. *A. nana*.

Erect, scapose; clusters about 15-flowered.....11. *A. alpina*.

Prostrate, forming thick mats; clusters 2 or 3-flowered.....12. *A. alpina*.

Erect, scapose; clusters about 15-flowered.....13. *A. nana*.

Prostrate, forming thick mats; clusters 2 or 3-flowered.....14. *A. alpina*.

Erect, scapose; clusters about 15-flowered.....15. *A. nana*.

Prostrate, forming thick mats; clusters 2 or 3-flowered.....16. *A. alpina*.

Erect, scapose; clusters about 15-flowered.....17. *A. nana*.

Prostrate, forming thick mats; clusters 2 or 3-flowered.....18. *A. alpina*.

Erect, scapose; clusters about 15-flowered.....19. *A. nana*.

Prostrate, forming thick mats; clusters 2 or 3-flowered.....20. *A. alpina*.

Erect, scapose; clusters about 15-flowered.....21. *A. nana*.

Prostrate, forming thick mats; clusters 2 or 3-flowered.....22. *A. alpina*.

Erect, scapose; clusters about 15-flowered.....23. *A. nana*.

Prostrate, forming thick mats; clusters 2 or 3-flowered.....24. *A. alpina*.

Erect, scapose; clusters about 15-flowered.....25. *A. nana*.

Prostrate, forming thick mats; clusters 2 or 3-flowered.....26. *A. alpina*.

Erect, scapose; clusters about 15-flowered.....27. *A. nana*.

Prostrate, forming thick mats; clusters 2 or 3-flowered.....28. *A. alpina*.

Erect, scapose; clusters about 15-flowered.....29. *A. nana*.

Prostrate, forming thick mats; clusters 2 or 3-flowered.....30. *A. alpina*.

Erect, scapose; clusters about 15-flowered.....31. *A. nana*.

Prostrate, forming thick mats; clusters 2 or 3-flowered.....32. *A. alpina*.

Erect, scapose; clusters about 15-flowered.....33. *A. nana*.

Prostrate, forming thick mats; clusters 2 or 3-flowered.....34. *A. alpina*.

Erect, scapose; clusters about 15-flowered.....35. *A. nana*.

Prostrate, forming thick mats; clusters 2 or 3-flowered.....36. *A. alpina*.

Erect, scapose; clusters about 15-flowered.....37. *A. nana*.

Prostrate, forming thick mats; clusters 2 or 3-flowered.....38. *A. alpina*.

Erect, scapose; clusters about 15-flowered.....39. *A. nana*.

Prostrate, forming thick mats; clusters 2 or 3-flowered.....40. *A. alpina*.

Erect, scapose; clusters about 15-flowered.....41. *A. nana*.

Prostrate, forming thick mats; clusters 2 or 3-flowered.....42. *A. alpina*.

Erect, scapose; clusters about 15-flowered.....43. *A. nana*.

Prostrate, forming thick mats; clusters 2 or 3-flowered.....44. *A. alpina*.

Erect, scapose; clusters about 15-flowered.....45. *A. nana*.

Prostrate, forming thick mats; clusters 2 or 3-flowered.....46. *A. alpina*.

Erect, scapose; clusters about 15-flowered.....47. *A. nana*.

Prostrate, forming thick mats; clusters 2 or 3-flowered.....48. *A. alpina*.

Erect, scapose; clusters about 15-flowered.....49. *A. nana*.

Prostrate, forming thick mats; clusters 2 or 3-flowered.....50. *A. alpina*.

Erect, scapose; clusters about 15-flowered.....51. *A. nana*.

Prostrate, forming thick mats; clusters 2 or 3-flowered.....52. *A. alpina*.

Erect, scapose; clusters about 15-flowered.....53. *A. nana*.

3. *A. umbellata* Lam. COMMON SAND-VERBENA. Stems slender, prostrate, viscid, 1 to 3 ft. long; leaves nearly glabrous, roundish or ovate to narrowly oblong, the margin often somewhat sinuate, 1 to 1½ in. long; heads 10 to 15-flowered, on peduncles 2 to 6 in. long; involucre bracts narrowly lanceolate, 2 or 3 lines long; calyx rose-purple, 6 to 8 lines long; fruit 4 to 5 lines long, often as broad; wings mostly 5, rather thin but firm, widened upward and broadest above, at apex truncate or sloping to the beak, usually shorter than the beak, or the wings sometimes reduced and the fruit narrow and spindle-like.—Common along the seashore from Los Angeles Co. to San Francisco and Eureka; n. to Wash.

4. *A. alba* Eastw. Similar to *A. umbellata*; leaves orbicular to elliptical or oblong, often wavy-sinuate; bracts narrowly ovate, acuminate; flowers white; fruit glabrous or nearly so, its body smaller and whiter than in *A. umbellata*, its wings thin but firm, broader below than in that species and somewhat prolonged above the body as rounded lobes.—San Nicolas Isl. Var. *PLATYPHYLLA* Jepson. Leaves mostly rather broad, wavy-sinuate; flowers pinkish or reddish; fruit wings chartaceous.—Seacoast, San Diego to San Luis Obispo Co., and perhaps n. to Monterey. Var. *VARIABILIS* Jepson.

Internodes elongated; leaves few, small, irregularly rhomboidal to oblong; flowers as in preceding var.; wings membranous.—San Diego to San Luis Obispo Co.

353. *Abronia villosa* Wats.; a, fl. branch x 1; b, fr. x 2.

5. *A. villosa* Wats. Fig. 353. Stems trailing, ½ to 1 ft. long; herbage glandular-villous or the blades subglabrous; leaves ovate to elliptic, a little wavy-margined, ½ to 1¼ in. long; bracts narrowly lanceolate, acuminate, 3 to 5 lines long, scarious; flowers rose-purple, 5 to 8 lines long; fruit 3 lines long and 4 or 5 lines broad, 5-winged, the thin wings obliquely widened upward and forming broad diverging lobes more or less auriculate produced beyond the body; body reticulate-honey-combed; beak slender, often prominent.—San Luis Obispo Co. to San Diego Co.; e. to

Ariz. and Utah. Var. *AURITA* Jepson. Body less reticulate; flowers 8 to 13 lines long.—Colorado Desert; San Jacinto Valley. Var. *PINETORUM* Jepson n. comb. Leaves smaller; fruit pink.—San Jacinto Mts. (*A. pinetorum* Abrams). Does not seem to differ essentially otherwise.

6. *A. pògonántha* Heimerl. Stems trailing, 10 to 12 in. long; herbage glandular short-villous or the blades nearly glabrous; leaves ovate or broadly oblong to oblong-lanceolate, 1 to 2 in. long; bracts ovate, acute or acuminate, 3 lines long; calyx pale or lavender white, or purple, 8 lines long; fruit commonly 2-winged, rarely with a third smaller wing, round-obcordate with a somewhat squarish notch at summit, 2 to 3 lines long and as broad, the body and wings reticulate.—Mohave Desert, n. to the San Carlos Range and to Inyo Co.

7. *A. turbinata* Torr. Annual; stems ascending or suberect, puberulent; leaves round-ovate to elliptical, glabrous, bright green, ½ to 1½ in. long; bracts lanceolate, acute; flowers whitish or pinkish, 8 or 9 lines long; fruit

2½ to 3 lines long, narrowly obpyramidal, its much wrinkled wings gradually narrowed upwards and truncate at summit.—Inyo Co.; n. to Ore., e. to N. Mex.

8. *A. exalata* Sta. Very similar to *A. turbinata* and perhaps only a mere form of it; leaves ovate to roundish, truncate at base, ½ to 1 in. long; flowers 5 lines long; fruit 2 lines long, with mostly 2 ridges or narrow wings on one side, these ridges incurved and forming a sort of half-closed concavity; beak prominent for the size of the fruit.—Kern River; Owens Lake; e. to Nev.

9. *A. alpina* Bdg. Stems from perennial roots, shortly branched, forming dense mats, 3 to 6 in. across; herbage glandular but blades mostly glabrous; leaves orbicular to round-ovate, 2 to 3 lines long, the petioles 1 to 3 times as long; involucre 3 to 5-flowered, on peduncles 2 to 3 lines long; flowers pink or white, 5 or 6 lines long, the limb 3 to 4 lines broad; fruit 1½ to 2 lines long, narrowed to both ends, 5-angled but not winged.—High sandy meadows, 8000 to 9000 ft., s. Sierra Nevada from near Mt. Whitney to Olancho Peak.

10. *A. nana* Wats. Peduncles 3 or 4 in. high, erect, scape-like, arising from a dense tuft of leaves crowning the shortly-branched caudex of a perennial root; herbage glandular-puberulent or the blades nearly glabrous; leaves ovate to oblong, 4 to 10 lines long, mostly long-petioled; involucre about 13 to 20-flowered; bracts ovate to oblong-lanceolate; flowers 6 lines long; fruit obcordate in outline, the wings membranous.—Desert ranges, 6000 to 9000 ft.: Mohave Desert; e. to Ariz. and Utah.

#### 5. *WEDELIELLA* Ckl.

Prostrate herbs, ours perennial. Leaves of the opposite pairs very unequal. Flowers reddish, rose-color or white, 3 in each involucre. Involucres solitary on axillary peduncles, deeply divided into 3 sepal-like bracts. Calyx with a short oblique tube and 4 unequal lobes. Fruit leathery, smooth and somewhat carinate on the convex side, the opposite side furnished with 2 low parallel thin ridges, each bearing a row of stipitate glands and covered by the inflexed toothed margins of the lateral wings. (Diminutive of *Wedelia*, Loeffing's name for this genus, which is doubtless based on a personal name.)

1. *W. incarnata* (L.) Ckl. Stems slender, 1 to 2½ ft. long; herbage pubescent; leaves ovate, acute, the veins prominent on the under side, ½ to 1¾ in. long, shortly petioled; flowers white to rose-color, 3 to 4 lines long; fruit 2 lines long, its inflexed margin 2 or 3-toothed.—Cañons on w. border of Colorado Desert; e. to Utah and Tex., s. to Chile. Var. *VILLOSA* Ckl. Stems villous pubescent.—Providence Mts. Var. *NUDATA* Ckl. Upper internodes long and upper leaves somewhat reduced.—Palm Cañon, Mt. San Jacinto; Coachella; Chuckawalla Wash; Ash Hill, Mohave Desert.

#### 6. *ALLIÖNIA* Loeff. UMBRELLA-WORT

Perennial herbs. Leaves slightly fleshy. Involucres 5-lobed, in fruit enlarged and membranous or reticulate-veined, 1 to 3-flowered. Flowers red to purplish or white. Calyx campanulate or funnelform. Stamens 3 to 5, unequal; filaments united at base or nearly distinct. Fruit clavate, 5-angled or 5-ribbed. (Chas. Allioni, 1725-1804, Italian botanist.)

1. *A. pumila* Sta. Stems erect or spreading, 4 to 7 in. high, from a thick woody root; herbage viscid pubescent or nearly glabrous; leaves ovate to broadly lanceolate, ¾ to 1½ in. long, shortly petioled; involucre one to an axil, shortly peduncled; flowers unknown; fruit with 4 or 5 low more or less tuberculate ribs, 3 lines long, pubescent.—Santa Aña River, San Bernardino Mts.; e. Mohave Desert; s. Nev. (*A. brandegei* Sta.)

#### 7. *MIRABILIS* L.

Perennial herbs. Flowers 1 to several in a 5-lobed calyx-like involucre. Involucres mostly campanulate, axillary or terminal, borne on short peduncles and in clusters or solitary. Calyx campanulate to funnelform, white or red.

Stamens usually 5. Fruit narrowly ellipsoidal to globose, not angled or ribbed, or rarely so, mostly smooth, glabrous. (Latin *mirabilis*, wonderful.)

Flowers several in an involucre; calyx funnelform; stamens united at base.—Subgenus QUAMOCLIDION.

Fruit 5-angled, tuberculate.....1. *M. greenii*.

Fruit not angled, 10-striate, not tuberculate.....2. *M. froebellii*.

Flowers solitary in each involucre; calyx campanulate; stamens distinct; fruit smooth.—Subgenus HESPERONIA.

Involucral lobes linear or lanceolate, 1 to 2 times as long as tube....3. *M. tenuiloba*.

Involucral lobes short-ovate to short-lanceolate,  $\frac{1}{2}$  to as long as tube....4. *M. laevis*.

1. *M. greenii* Wats. Stems several from a perennial root, once or twice forked, 1 to 2 ft. high; herbage minutely glandular-puberulent; leaves ovate, acute,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long, shortly petioled; involucre 7 to 10-flowered, 1 to  $1\frac{1}{4}$  in. high, campanulate, shortly lobed, the lobes broad, acute at apex; calyx greenish purple, tubular-funnelform,  $1\frac{1}{2}$  in. long; fruit "5-angled," longitudinally ridged, more or less tuberculate.—Tehama Co. to Siskiyou Co.

2. *M. froebellii* (Behr) Greene. Stems stout, many from a perennial root, forking and diffusely spreading and so forming circular plants 1 to 3 ft. broad; herbage glandular-pubescent; leaves broadly ovate,  $1\frac{1}{4}$  to 4 in. long, often broader than long, subcordate at base, acutish or obtuse at apex; petioles short; involucre 5 or 6-flowered, campanulate, 8 to 10 lines long, cleft nearly half way into acute lobes; calyx bright or pale purple, funnelform,  $1\frac{1}{2}$  to  $1\frac{3}{4}$  in. long, the limb 1 to  $1\frac{1}{2}$  in. across; fruit light brown, marked by 10 vertical lines of a darker color, not tuberculate.—Kern Co. and Argus Mts. to San Diego Co. In desert washes single plants when in flower form masses of rose-color the size of a wagon-wheel. Var. *GLABRATA* Jepson. Herbage glabrous.—San Jacinto Mts.; San Felipe.

3. *M. tenuiloba* Wats. Stems branching, woody at base, 1 to  $1\frac{1}{2}$  ft. high; herbage short pilose and glandular; leaves ovate, acute, truncate or subcordate at base, 1 to 2 in. long, sometimes broader than long, shortly petioled; involucre subcylindric, 4 to 6 lines long, cleft to the middle or below into lanceolate or linear lobes; calyx white, hairy; fruit broadly ovoid, smooth, brown.—Colorado Desert; s. to L. Cal.

4. *M. laevis* (Benth.) Curran. WISHBONE BUSH. Stems erect or ascending, many from the base, repeatedly forked, woody below, forming a bush 1 to  $1\frac{1}{2}$  ft. high; herbage roughish puberulent to almost glabrous, the inflorescence glandular-pubescent; leaves ovate, mostly acute, subcordate or rounded at base,  $\frac{1}{2}$  to 1 in. long, shortly petioled; involucre 2 to 3 lines long, in terminal clusters or solitary in the axils, each involucre on a short peduncle; involucral lobes oblong-ovate, obtuse or acute, equaling or a little exceeding the tube; calyx rose-color or reddish, 4 to 6 lines long, narrowly campanulate, its spreading lobes deeply cleft into 2 somewhat diverging segments; fruit ellipsoidal, sometimes obscurely striate longitudinally, often lineate-mottled transversely,  $1\frac{1}{2}$  to 2 lines long.—Mts., Kern and Inyo Cos., s. to San Diego Co. (*M. californica* Gray.) Var. *GLUTINOSA* Jepson n. comb. Herbage short-villous and glandular; leaves round-ovate, obtuse or acute, sometimes almost reniform; calyx white.—Colorado and Mohave deserts, n. to Inyo Co. (*M. californica* var. *glutinosa* Jepson.) Var. *RETRORSA* Jepson n. comb. Herbage bright green, minutely and retrorsely scabrous, often sparingly so, especially on the stems; calyx white.—Mohave Desert, n. to western Nev. (*M. californica* var. *retrorsa* Jepson.) Var. *ASPERA* Jepson n. comb. Herbage retrorsely pubescent or villous; leaves broadly ovate, obtuse or acute, subcordate at base, shortly petioled; calyx purplish red; fruit subglobose, brown, longitudinally 10-striate, the striae of lighter color.—Dry hills, Mohave Desert. (*M. californica* var. *aspera* Jepson.)

#### BATIDACEAE. BATIS FAMILY

Low maritime bush or woody plant with opposite entire fleshy leaves. Flowers dioecious, crowded in catkins. Catkins sessile, axillary, disposed in terminal spikes. Staminate flower with a 2-lobed calyx, 4 stamens and 4 alternating petal-like staminodia. Pistillate flower without calyx or corolla,

consisting of a 4-celled ovary with one ovule in each cell, and a sessile capitate stigma. Seed without endosperm; embryo slightly curved.

### 1. *BÂTIS* P. Br.

One genus. (Greek batis, the ancient name of some seashore plant.)

1. *B. maritima* L. Stems erect or ascending from a woody perennial base,  $1\frac{1}{2}$  to 3 ft. high; leaves linear-oblongate,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; staminate catkins 2 to 4 lines long, their bracts persistent; staminodia white, with a somewhat cucullate appendage; pistillate catkins 1 or 2 lines long, their bracts deciduous; ovaries coherent, in fruit forming a fleshy spikelet 4 to 6 lines long.—Seashores: San Pedro to Newport and Old Town, San Diego; L. Cal.; Hawaiian Is.; Fla. to Brazil.

## AIZOACEAE. CARPET-WEED FAMILY

Ours prostrate or decumbent herbs. Flowers perfect and regular, either solitary or clustered. Calyx 4 or 5-lobed or -parted, either free from or more or less adnate to the ovary. Stamens hypogynous or commonly perigynous, fewer than the sepals or more numerous. Fruit a loculicidal or circumscissile capsule or indehiscent. Plants of widely divergent aspect and flower structure.

Calyx free from the ovary; petals none; leaves opposite.

Capsule loculicidal, 3-valved; sepals 5; ovary 3-celled.

Stamens 3 to 5; herbage glabrous.....1. *MOLLUGO*.

Stamens 5 to 10; herbage soft-pubescent.....2. *GLINUS*.

Capsule circumscissile; calyx 5-cleft.

Stipules scarious, laciniate; ovary 1-celled; stamens 1 to 3.....3. *CYPSELEA*.

Stipules none; ovary 2 to 5-celled; stamens numerous.....4. *SESUVIUM*.

Calyx tube adnate to the ovary, the flattish summit of the latter free.

Petals none; leaves alternate, plane; fruit indehiscent.....5. *TETRAGONIA*.

Petals numerous; leaves opposite, 3-sided and very fleshy; fruit dehiscent.....6. *MESEMBRYANTHEMUM*.

### 1. *MOLLUGO* L. CARPET-WEED

Low glabrous much-branched annuals with whorled leaves and obsolete stipules. Flowers axillary, on slender pedicels. Sepals 5, scarious-margined, white within, thus resembling petals when expanded, persistent. Petals none. Stamens 5, hypogynous and alternate with the sepals, or 3 and alternate with the cells of the ovary. Stigmas 3. (Ancient Latin name for some soft plant.)

1. *M. verticillata* L. INDIAN CHICKWEED. Stems prostrate, slender, many from the base, 3 to 7 in. long, forming patches, not fleshy; leaves 5 or 6 in a whorl, unequal, oblongate, or spatulate, entire, 4 to 8 lines long; flowers several at each node; sepals oblong, 1 line long; capsule ovoid, scarcely exerted from the calyx; seeds reniform, shining, nearly smooth, obviously striate, crowded in the capsule and irregularly distending its half-transparent walls, which are thus roughened.—Los Angeles; Visalia; Healdsburg; Princeton; Shasta Co.; Modoc Co.; nat. from the Old World tropics.

### 2. *GLINUS* L.

Annual herbs with whorled petioled leaves; very near *Mollugo*. Flowers pediceled in dense glomerules in the upper axils. Stamens 5 to 10 or 20. Seeds with a strophiole, the funiculus very long and slender. (Greek name of Theophrastus for a maple, application to this genus unknown.)

1. *G. lotoides* Loefl. Diffusely branched from the base, the stems 4 to 8 in. long, procumbent or ascending; leaves orbicular to obovate, rounded at apex or abruptly acute, 3 to 6 lines long, at base narrowed to a slender petiole; flowers 2 lines long; stamens 5; seeds blackish, granulated.—Lathrop; Chico; Lakeport; introd. from Eur. but only slightly established.

### 3. *CYPSELEA* Turp.

Inconspicuous prostrate annual. Leaves opposite, those of each pair unequal, and with scarious laciniate stipules. Tube of the calyx short, campanulate, the lobes (in ours) 5, ovate, unequal. Petals none. Stamens 1 to 3. Ovary superior, 1-celled; style 2-cleft. Fruit a subglobose circumscissile cap-

sule. Seeds minute, smoothish, the funiculi persistent on the central placenta. (Greek kupsele, a beehive, which the capsule is thought to resemble.)

1. *C. humifusa* Turp. Stems much branched and matted, the plants 1 to 2 in. broad; leaves oblong or elliptical, obtuse, 2 to 6 lines long, the petioles slender, nearly as long.—Immigrant from the West Indies, occurring sparingly in low lands and rarely seen: lower San Joaquin River; Aptos, Santa Cruz Co.

#### 4. *SESUVIUM* L.

Fleshy decumbent or prostrate herbs with opposite leaves and no stipules. Flowers solitary in the axils, sessile or shortly pediceled. Calyx-tube turbinate, the lobes 5, rose-pink inside, oblong, obtuse. Petals none. Stamens (in ours) numerous, inserted on the calyx. Ovary 2 to 5-celled, with as many separate styles. Capsule membranous, the upper part falling off as a lid. Seeds smooth. Embryo annular. (Latin *Sesuvium*, the country of the *Sesuvii*, a Gallic tribe mentioned by Caesar, the application to this genus unknown.)

1. *S. sessile* Pers. LOWLAND PURSLANE. Stems prostrate, freely branching, 1 to 3 ft. long; herbage finely warty; leaves broadly spatulate,  $\frac{1}{2}$  to 2 in. long; flowers 4 to 5 lines long; sepals ovate-lanceolate, commonly acuminate, 3 lines long; leaves and stems glabrous.—River lowlands and alkaline fields: San Joaquin Valley; s. to S. Cal.; e. to Kan., s. to Mex. and Brazil. May-Aug.

#### 5. *TETRAGONIA* L. SEA SPINACH

Ours a succulent annual with alternate plane leaves. Flowers axillary, greenish, apetalous. Calyx 4 or 5-lobed, its tube adnate to the 3 to 9-celled ovary. Stamens in ours 7 to 16, perigynous. Fruit a hard or bony nut, indehiscent, enveloped by the calyx which bears several horn-like protuberances. (Greek tetra, 4, and gonu, knee or angle, alluding to the fruit.)

1. *T. expansa* Murr. NEW ZEALAND SPINACH. Branches procumbent or prostrate; leaves rhombic-ovate, entire, 1 to 2½ in. long, abruptly contracted at base to a broad petiole, the surface covered with crystalline papillae; flowers subsessile, 1 to 3 in each axil; calyx-lobes widely spreading, yellowish within; fruit 4-horned, 4 to 6 lines long.—Native of Australasia, cult. in Cal. for use as summer greens and sparingly spontaneous on seabeaches: Alameda; San Francisco; Pacific Grove; Canada del Refugio, Santa Barbara Co.

#### 6. *MESEMBRYANTHEMUM* L. FIG MARIGOLD

Ours herbs. Stems and leaves very succulent, without stipules. Flowers axillary and terminal. Calyx-tube adnate to the ovary, the lobes unequal and foliaceous. Petals linear, very numerous, inserted with the many to numerous stamens on the tube of the calyx. Ovary 5 to 12-celled, the styles as many as the cells of the ovary and distinct or nearly so. Capsule becoming baccate, dehiscing in rainy weather by stellate valves at the flattened summit. Seeds minute, numerous. (Greek mesembria, mid-day, and anthemon, blossom.)

Annual; leaves alternate; herbage covered with shining vesicles; ovary 5-celled.

Leaves linear, semiterete. . . . . 1. *M. nodiflorum*.

Leaves ovate to spatulate, flat. . . . . 2. *M. crystallinum*.

Perennial; leaves opposite, thick, dorsally carinate; herbage smooth; ovary 8 to 12-celled. . . . . 3. *M. aquilaterale*.

1. *M. nodiflorum* L. Stems several from the base, prostrate or ascending; herbage covered with fine vesicles; leaves linear, 4 to 8 lines long,  $\frac{1}{2}$  to 1 line wide; flowers solitary in the axils, subsessile or shortly peduncled; petals white, minute, much shorter than the calyx-lobes.—S. Cal. coast.

2. *M. crystallinum* L. ICE-PLANT. Stems repeatedly and rather shortly forked, 1 to 2 ft. long; herbage covered with crystalline-dewy vesicles; leaves broadly ovate to broadly spatulate,  $\frac{3}{4}$  to 1½ in. long, narrowed to a short amplexicaul base, the lowest 2 to 5 in. long and nearly as broad and with a subcordate petioled base; calyx campanulate, 4 to 6 lines long; petals

reddish, varying to white.—Coast from Santa Barbara Co. to San Diego; L. Cal.

3. *M. aequilaterale* Haw. SEA FIG. Stems several ft. long, the plants forming extensive mats; leaves 3-sided, with nearly flat faces, thicker than broad,  $1\frac{1}{2}$  to 2 in. long; flowers terminal, subsessile or shortly peduncled, fragrant and showy ( $1\frac{1}{4}$  to 2 in. broad); petals bright rose-purple.—Dunes and cliffs near the sea, Marin Co. to San Diego. In cultivation at Berkeley under the student name of "Faculty Onions." Also called "Beach-Strawberry."

*M. ÉDULE* L. Hottentot Fig. Leaves curved, serrate on the lower angle; stamens 8; flowers yellow or purple.—Cultivated as a sand-dune binder; an escape on the Los Angeles coast; native of S. Afr.

## PORTULACACEAE. PURSLANE FAMILY

Ours low herbs with succulent entire leaves and regular perfect flowers. Calyx chorisepalous (synsepalous and superior in Portulaca). Sepals 2 (or in *Lewisia* 2 to 8), fewer than the petals. Petals commonly 5 (3 to 16), opening only in sunshine, withering quickly. Stamens 3 to 20, sometimes more numerous, opposite the petals when of the same number. Ovary 1-celled, commonly superior; styles 2 to 8, united below or distinct, stigmatic along the inside. Fruit a capsule, dehiscent from the apex by 2 or 3 valves, or circumscissile and the top falling away as a lid.

Capsule 2 to 3-valved; sepals 2, distinct and free from the ovary, persistent.

Style 1, stigmas 2; flowers mostly in scorpioid spikes; capsule 2-valved; sepals plane, scarious or scarious-margined.....1. *CALYPTRIDIMUM*.

Style-branches 3; sepals more or less concave.

Flowers in leafy racemes or in panicles; petals commonly red, showy; stamens mostly 5 or more; seed numerous; annuals.....2. *CALANDRINIA*.

Flowers in naked or merely bracteate racemes; petals commonly white or pinkish; seeds few (3 to 6).

Stems from mostly fibrous roots; stamens 5 (or 3); annuals, or perennials by rhizomes or stolons.....3. *MONTIA*.

Stems from thick roots or corms; stamens 5.....4. *CLAYTONIA*.

Capsule circumscissile; stamens few to numerous.

Sepals 2 to 8, distinct and free from the ovary, persistent.....5. *LEWISIA*.

Sepals 2, united below and partly adherent to the ovary, the free upper portion deciduous.....6. *PORTULACA*.

### 1. *CALYPTRIDIMUM* Nutt.

Herbs with alternate or basal spatulate leaves. Flowers small (1 to  $2\frac{1}{2}$  lines long), in panicles or mostly in solitary or clustered scorpioid spikes. Sepals 2, scarious or scarious-margined, orbicular. Petals 2 to 4. Stamens 1, 2, or 3. Style simple; stigmas 2. Capsule membranous, 2-valved, few to many-seeded. (Greek *kaluptra*, a calyptra, the petals closing over each other and carried up on the capsule.)

Style very short, this and the 1, 2, or 3 stamens included; capsule 5 to 20-seeded.—Subgenus *EUCALYPTRIDIMUM*.

Spikes not scorpioid, borne in a panicle; petals 3 (or 2); stamen 1; capsule 3 to 4 times length of fruiting calyx.....1. *C. monandrum*.

Spikes scorpioid, sometimes very short; capsule little or not at all surpassing fruiting calyx.

Petals 2; stamen 1.....2. *C. roseum*.

Petals 4; stamens in same species 1, 2, or 3.

Sepals not emarginate or reniform at base; S. Cal.....3. *C. parryi*.

Sepals round-reniform; Clear Lake region.....4. *C. quadripetalum*.

Style long, filiform, this and the 3 stamens exserted; spikes borne in an umbel or capitate-congested at summit of the scape-like stems; capsule few-seeded.—Subgenus *SPRAGUEA*.....5. *C. umbellatum*.

1. *C. monandrum* Nutt. Annual; stems several from the base, spreading or prostrate, 1 or 4 to 9 in. long; leaves mostly in a basal rosette, some scattered along the stem, linear-spatulate,  $\frac{3}{4}$  to 2 (or 3) in. long; flowers in short spikes in a terminal panicle; panicle 1 to 6 in. long; sepals 1 line long, little accrescent; petals commonly 3; capsule linear, compressed, becoming much exserted, 3 to 4 lines long, more or less curved on dehiscence, 5 to 10-seeded.—Coastal S. Cal. (abundant); Colorado and Mohave deserts to Monterey, Kern and Inyo Cos.; e. to Ariz.

2. *C. ròseum* Wats. Annual; stems several from the base, decumbent, 1 to 3 in. long; leaves oblong-spatulate, 3 to 8 lines long, the basal ones few; flowers in very short scorpioid spikes; sepals orbicular-reniform, very shortly acute, green-herbaceous with scarious margins, 1 to 1½ lines long; petals 2, minute; stamen 1; capsule not exceeding the calyx, 6 to 12-seeded.—High mts., 9000 to 10,200 ft.: White Mts., Inyo Co.; w. Nev. to Ore. and Wyo.

3. *C. párryi* Gray. Annual; stems several from the base, prostrate, 3 to 6 in. long; leaves spatulate, 4 to 8 lines long; spikes in age secund and scorpioid, 4 to 12 lines long; fruiting sepals orbicular or oval, herbaceous but white-margined, 1 to 2 lines long, a little shorter than the oblong capsule; style one-half length of the ovary; capsule valves minutely notched at summit.—San Bernardino and San Jacinto mountains, 6500 to 9300 ft.

4. *C. quadripétalum* Wats. Annual; stems many, erect or spreading from a decumbent base, 2 to 4 (or 9) in. long; leaves basal and cauline, oblong-spatulate, 1 to 2 in. long including the tapering petiole; spikes dense, 3 to 8 lines long, terminating the leafy branches; sepals round-reniform, white-scarious and rose-tinged with greenish center, 2 to 4 lines broad, exceeding the 4 petals; capsule oblong-oval, 10 to 20-seeded, little or not at all surpassing the fruiting calyx.—Mts. around Clear Lake. June.

5. *C. umbellátum* (Torr.) Greene. PUSSY PAWS. Annual, biennial or perennial; stems several, erect or ascending, scape-like, 3 to 15 in. high, arising from a dense rosette of leaves; basal leaves spatulate, 1 to 2 (or 4) in. long, the cauline leaves few and similar, or mostly reduced, or none; flowers imbricate-crowded in scorpioid spikes; spikes borne in a terminal umbel or whorl, 3 to 6 lines long, on peduncles ½ to 2 times as long; sepals orbicular, emarginate at base and apex, equal, wholly scarious or with a mere greenish center, dull white or often pink, in age 2 to 4 lines broad; petals 4, pink or white, obovate; stamens 3, each filament enfolded by a half-involuted petal, the fourth petal embracing the style; stamens and the long style exserted; ovules 3 to 6 (or 10); capsule globose-ovate, 1 or 2-seeded; seed black, shining, microscopically tessellate.—Fine gravelly or sandy soil, common in open places in the mts., on plateaus, slopes, valley floors, or washes, 2500 to 8000 ft.: high mts. of S. Cal.; Sierra Nevada; Coast Ranges; n. to B. C., e. to Nev. and n. Rocky Mts. June-Sept. Var. CAUDICIFERUM (Gray) Jepson. Alpine perennial, all the parts much reduced; caudex branching, the branchlets short and densely leafy, bearing one terminal scape-like stem ½ to 2 in. high; leaves 3 to 6 (or 10) lines long; flowers glomerate-capitate.—Sierra Nevada, 8000 to 13,000 ft.; n. to Wash., e. to Wyo.

## 2. CALANDRÍNIA H.B.K.

Ours low fleshy annuals with alternate entire leaves and ephemeral red or rose-colored flowers, rarely varying to white. Flowers in a leafy raceme or in a panicle. Sepals 2, persistent. Petals 5, rarely more or less (3 to 7). Stamens 5 to 14, rarely 3, seldom of the same number as the petals. Style-branches 3. Capsule 3-valved from the apex. Seeds numerous, black and often shining. (J. L. Calandrini, Swiss botanist.)

Flowers in a raceme or mostly so; seeds with a strophiole.

Herbage green; calyx green; racemes erect; pedicels clavate-thickened and a little angled; seed black and shining, apparently smooth but microscopically papillate, the strophiole white, minute.

Capsule enveloped by the fruiting calyx, the latter as long or nearly; branches mostly ascending or erect; common.....1. *C. caulescens*.

Capsule nearly twice as long as the fruiting calyx; branches mostly trailing; rare.....2. *C. breweri*.

Herbage glaucous; calyx and bracts black-veined or mottled; racemes a little drooping at apex, the pedicels filiform; seed roughish, with a large strophiole; rare...

3. *C. maritima*.

Flowers in an umbellate panicle; seeds without a strophiole; Colorado Desert. 4. *C. ambigua*.

1. *C. caulescens* H.B.K. Stems spreading or ascending, 6 to 12 in. high; leaves narrowly oblanceolate to linear, acute, 1 to 2 in. long, somewhat succulent; flowers short-pedicled; pedicels erect; sepals ovate, apiculate or short-acuminate, glabrous or somewhat hispidulous on the margins or mid-

354. *Calandrinia caulescens*  
var. *menziesii* Gray; a, fl.  
branch  $\times \frac{2}{3}$ ; b, sect.  
pistil  $\times 5$ .

ribs; petals 5, red, obovate, obtuse, 2 to 4 lines long; stamens 3 to 6, sometimes more; capsule ovate, short-pointed, enveloped by the sepals which are nearly or quite as long.—Humboldt Co.; se. Cal.; Ariz. and s. to Bolivia. Var. *MENZIESII* Gray. Red Maids. Fig. 354. Stems 1 to several or many from the base, simple or sparingly branched, diffuse, or erect and simple,  $\frac{1}{2}$  to 2 ft. long; pedicels long (5 to 11 lines long) or sometimes short (3 to 5 lines long); petals orbicular-obovate, retuse at apex, crimson or rose-red, 3 to 5 lines long; stamens 7 to 14, commonly 10 to 12, rarely fewer than 7.—Orchards and vineyards, often very abundant in wet years; also in fields and on hilltops. Mar.-Apr. Flowers opening of afternoons. Called "Kisses" in Solano Co.

2. *C. bréweri* Wats. Stems lax, trailing or sometimes ascending, 1 to 2 ft. long; leaves spatulate or oblong-spatulate, 1 to  $2\frac{1}{2}$  in. long; flowers sparse; pedicels longer than in no. 1, typically deflexed in fruit; capsule narrower and longer (5 to 6 lines long) than in no. 1, at length twice or nearly twice as long as the calyx; sepals with a grooved edge, the lower margin of the groove scarious.—Coulterville; Mt. Tamalpais; Santa Barbara Co.; San Bernardino Mts.; Santa Cruz Isl.; s. to L. Cal. The known localities few and scattered. June.

3. *C. maritima* Nutt. Stems several from the base, spreading or ascending, 3 to 8 in. long; herbage very glaucous; leaves mostly basal or on lower part of stem, spatulate-obovate, narrowed to a petiole-like base, 1 to  $2\frac{1}{2}$  in. long; flowers long-pedicel in a terminal raceme or loose panicle,  $\frac{1}{4}$  to  $1\frac{1}{4}$  in. long; flowers red; sepals round-ovate, dark-veined, mucronate or abruptly short-acute, slightly surpassed by the ovate capsule.—S. Cal. coast from Santa Monica to San Diego; L. Cal.

4. *C. ambigua* (Wats.) Howell. Stems several from the base, erect or a little spreading, 2 to 7 in. high; stems and leaves very succulent; leaves linear-spatulate, 1 to  $1\frac{1}{2}$  in. long; flowers pedicel in rather compact umbellate panicles; pedicels 1 to 3 lines long; sepals ovate with shortly acute spreading tips and white-scarious margins, 1 to  $2\frac{1}{2}$  lines long, equaling or exceeding the 5 obovate white petals; stamens 5 (or 6 to 8); seeds many.—Colorado Desert. Apr.-May.

### 3. MONTIA L. INDIAN LETTUCE

Moderately succulent low herbs, very glabrous and often glaucous. Stems usually clustered. Leaves alternate, opposite, or basal. Flowers white or pinkish, commonly nodding in the bud, usually reopening the second or third day, borne in racemes or sometimes umbellate clusters. Pedicels commonly spreading or recurved in fruit. Sepals 2, persistent. Petals 5, equal or somewhat unequal, distinct, or more or less connate at base. Stamens 5 or 3. Styles-branches 3. Ovules commonly 3 (or to 6). Capsule 3-valved from the apex, 1 to 3 (or 6)-seeded. (Giuseppe Monti, Italian botanist, died 1760.)

#### A. Petals united at base into a tube, not notched at apex.

Stamens 3; petals unequal; leaves opposite. . . . . 1. *M. fontana*.

#### B. Petals distinct or a little united, commonly notched at apex.

1. Leaves alternate; petals equal or unequal.

Stamens 3; annuals; petals unequal.

Petals minute; upper leaves scarious-dilated at base. . . . . 2. *M. howellii*.

- Petals 2 lines long; leaves less scarious-dilated at base or scarcely at all so. . . . . 3. *M. linearis*
- Stamens 5; petals equal.
- Stems diffuse, dichotomous; annual. . . . . 4. *M. diffusa*.
- Flowering stems simple and scape-like; perennial by stolons or bulblets. . . . . 5. *M. parvifolia*.
2. *Leaves basal or opposite; petals equal; stamens 5.*
- Stems bearing several pairs of opposite leaves; racemes axillary or terminal; perennial by bulblets. . . . . 6. *M. chamissoi*.
- Stems bearing one pair of leaves, these opposite; racemes terminal.
- Cauline pair of leaves more or less united; annuals.
- Cauline pair of leaves united into a roundish or angular disk; petals commonly white and usually little surpassing the sepals; rather coarse annual. . . . . 7. *M. perfoliata*.
- Cauline pair of leaves not forming a disk, partially joined on one side.
- Stems slender; petals commonly pink, 3 times as long as sepals. . . . . 8. *M. gypsophiloides*.
- Caespitose dwarf; petals white, little exceeding sepals. . . . . 9. *M. spathulata*.
- Cauline pair of leaves quite distinct.
- Racemes bracteate in nos. 12 and 13, bractless in 10 and 11.
- Annuals; pedicels 1 to 3 lines long.
- Plant somewhat diffuse; leaves narrowly linear. . . . . 10. *M. exigua*.
- Plant a succulent ball; leaves obovate or spatulate, nearly sessile. . . . . 11. *M. saxosa*.
- Perennials; pedicels  $\frac{1}{2}$  to 2 in. long.
- Stem from a thick crown or short rootstock; coast. . . . . 12. *M. sibirica*.
- Stem from a small tuberous rootstock or cormlet; high s. Sierra Nevada. . . . . 13. *M. heterophylla*.
- Racemes bractless; perennial plants with horizontal rootstock.
- Flowers in a loose raceme; racemes much exceeding the basal leaves; pedicels  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; Humboldt and Siskiyou Cos. . . . . 14. *M. asarifolia*.
- Flowers in an umbellate fascicle; fascicles mostly shorter than the basal leaves; pedicels 5 to 7 lines long. . . . . 15. *M. nevadensis*.

1. *M. fontana* L. WATER CHICKWEED. Annual, or sub-perennial by rooting at the nodes; stems slender, 2 to 6 in. long, ascending or procumbent; leaves opposite, narrowly oblanceolate to spatulate-obovate or oblong, slightly connate at base, 2 to 10 lines long; racemes loose, 3 to 9-flowered; sepals  $\frac{1}{2}$  to 1 line long; petals minute, white, unequal, united at base, and exceeding little the sepals; seeds minute, roughened.—In water on margins of small surface streams or in muddy places; occasional throughout Cal.; of world-wide distribution. Mar.-May.

2. *M. howellii* Wats. Annual; stems simple or branching, diffuse or procumbent,  $\frac{1}{2}$  to 2 in. long; leaves alternate, elongated linear-spatulate, 4 to 10 lines long; racemes axillary, umbellately 2 or 3-flowered, shorter than the leaves; leaves opposite the racemes with a rather broad scarious-dilated clasping base, the racemes subtended by an ovate or short scale-like scarious bract; petals 3 or 4, unequal, minute, sometimes absent; stamens 3; seeds shining, microscopically foveolate-lineate.—Very wet soil, coast region: Humboldt Co.; n. to Wash.

3. *M. linearis* (Dougl.) Greene. Annual, nearly simple or very much branched, erect, 1 to 6 in. high; leaves alternate, narrowly and elongated linear (1 to  $2\frac{1}{2}$  in. long and  $\frac{1}{2}$  to 1 line wide), sessile by a clasping base; racemes terminal, commonly secund, about 4 to 8-flowered; pedicels 2 to 5 lines long; sepals broad and rounded or almost truncate, white-margined, straw-color in age; petals white, unequal, narrowly obovate, narrowed at base or clawed, slightly united on one side and not on the other side, 2 to  $2\frac{1}{2}$  lines long, slightly exceeding the sepals; stamens 3, inserted on the very base of the smaller petals; seeds lenticular, nearly or quite 1 line broad, smooth and shining, finely reticulated under a lens.—Wet banks: central Sierra Nevada, 3000 to 4500 ft., from Mariposa Co. n. to Modoc Co.; Coast Ranges, 200 to 3000 ft., from Contra Costa Co. to Siskiyou Co.; e. to Nev.; n. to B. C. and Mont.

4. *M. diffusa* (Nutt.) Greene. Annual, diffusely branched from the base, 2 to 6 in. high; cauline leaves alternate, deltoid-ovate to ovate or the upper narrowly ovate, acute,  $\frac{1}{2}$  to 1 in. long, the petiole nearly as long or longer; racemes 2, 3, or 4 on a branch, opposite the upper leaves or terminal, 1 to  $1\frac{1}{2}$  in. long, each 4 to 7-flowered; petals emarginate, white or pink, equal,

2 lines long, slightly exceeding the sepals; pedicels deflexed or divergently spreading in fruit; seeds black,  $\frac{1}{2}$  line long, lineated, the lineations composed of narrow transverse plates.—Under pines in the coast region: Marin Co. to Humboldt Co.; n. to Wash. Rare.

5. *M. parvifolia* (Moq.) Greene. Flowering stems erect or slightly spreading, whip-like or filiform and somewhat scape-like, 5 to 9 or 12 in. high, arising from the lower axils of Sedum-like rosettes of leaves borne on short caudex-like stems; these caudices also produce filiform surface runners; leaves of the rosettes ovate to oblanceolate, acute, 3 to 7 (or 10) lines long, passing into petioles as long or nearly; leaves of the flowering stems reduced above, small and bract-like (2 to 4 lines long), and bearing in their axils fleshy bulblets which fall away readily, the plant perennial by these; flowers umbellately racemose; racemes 2 to 7-flowered; sepals roundish, 1 line long, the petals equal, white or pink, retuse, 3 to 5 lines long; capsule mostly 1-seeded; seed rather dull, with minute pits.—Mossy surface of rocks and moist banks: Coast Ranges from Monterey Co. to Humboldt and Siskiyou Cos.; Sierra Nevada from Mariposa Co. n. to Modoc Co.; n. to Alas., e. to Mont.

6. *M. chamissoi* (Ledeb.) Dur. & Jac. TOAD-LILY. Stems decumbent or ascending, 2 to 6 in. or 1 ft. long, leafy to the top, rooting at the lower nodes; perennial by means of little tuber-like bulblets produced at the end of slender runners; leaves opposite, oblanceolate to oblong-obovate, obtuse or acute at apex, tapering into a petiole at base,  $\frac{1}{2}$  to 1 (or 2) in. long; racemes axillary or terminal, 2 to 8-flowered, rarely 1-flowered, bractless except 1 or 2 small bracts at base; sepals orbicular, 1 line long, the petals white or pink, elliptic, rounded at apex and entire, or sometimes retuse, 3 to 4 lines long; capsule small; seeds muriculate-roughened.—Wet or swampy meadows or moist stream borders, 4000 to 9000 ft.: San Bernardino and San Jacinto mountains; Mt. Pinos; Sierra Nevada from Tulare Co. n. to Modoc Co.; Snow Mt., Lake Co.; n. to Alas. In the White Mts. we noted that sheep do not touch it.

7. *M. perfoliata* (Donn) Howell. MINER'S LETTUCE. Fig. 355. Annual; stems several, erect or diffuse, 4 to 10 (or 16) in. high; basal leaves rhomboidal or deltoid to ovate or lanceolate or the earliest narrowly linear,  $\frac{1}{2}$  to 2 in. long, long-petioled; cauline pair completely united into a round and entire or angulately 2-lobed disk  $\frac{1}{2}$  to 2 (or 4) in. broad; racemes more or less interrupted (the flowers in 2s or 3s or fascicles), variable in length, sessile or on peduncles  $\frac{1}{4}$  to  $1\frac{1}{2}$  in. long, or the flowers glomerate on the disk in a sessile cluster; pedicels 1 to 5 lines long, rarely  $\frac{3}{4}$  in.; sepals roundish, 1 to 2 lines long; petals white,  $1\frac{1}{4}$  to  $1\frac{1}{2}$  times length of sepals.—Mostly in the shade of oaks and other trees: common throughout Cal.; n. to B. C., e. to Ariz., s. to Sonora and L. Cal. Var. *PARVIFLORA* Jepson. Same as the species in habit, but more slender; basal leaves filiform-linear or linear-spatulate; calyx 1 line long; petals white or rose-color.—Damp shady places: general range of the species. Var. *NUBIGENA* Jepson. Compact or caespitose plant with glaucescent herbage and numer-

355. *Montia perfoliata* Howell; a, habit  $\times \frac{1}{2}$ ; b, c, fl., two different views  $\times 3$ ; d, dehiscent capsule set in calyx  $\times 3$ .

356. *Montia gypsophiloides* Howell;  
habit  $\times \frac{1}{2}$ .

ous stems; leaves linear or a few spatulate at apex; racemes dense; petals white or pinkish, 3 lines long.—Mountain peaks about San Francisco Bay: Mt. Tamalpais; Mt. Diablo; Mt. Hamilton. Var. *DEPRESSA* (Gray) Jepson. Small and depressed, 1 to 4 or 5 in. high, the plant often livid red; basal leaves rhomboidal or broadly ovate, 2 to 6 lines broad, often broader than long, petioled; cauline disk split down one side or its leaves only partly united, subtending sessile glomerules or subumbellate clusters of flowers; petals twice as long as calyx.—Commonly in pine woods: Humboldt, Siskiyou and Modoc Cos.; n. to B. C.

8. *M. gypsophiloides* (F. & M.) Howell. Fig. 356. Stems slender, erect or ascending, 2 to 9 in. high; herbage very pale and glaucous; basal leaves linear or filiform, the flowering stems 2 to several times as long; cauline pair ovate to linear-lanceolate, partially

united on one side; raceme slender, elongated (half the height of the plant or more), the filiform pedicels becoming 2 to 8 lines long, spreading and often a little geniculate at the middle; flowers for their size showy and most delicately beautiful; petals pink, cuneate-obovate, retuse, 3 to  $3\frac{1}{2}$  lines long, about 3 times as long as the sepals.—Open summits, northward slopes or in moist thickets: Mt. Hamilton Range to Sonoma Co. Mar.-Apr.

9. *M. spathulata* (Dougl.) Howell. Caespitose, 1 to 6 in. high, the herbage glaucous and very fleshy; leaves narrowly or elongated linear or lanceolate, nearly as long as the flowering stems; cauline leaves linear or lanceolate, nearly distinct or somewhat connate upon one (rarely on both) sides, 4 to 10 lines long, nearly equaling to  $\frac{1}{2}$  as long as the raceme; sepals rather less than 1 line long; petals somewhat quadrangular, retuse or rounded at apex, short-clawed, white or light pink, 2 to 3 lines long.—Common on open gravelly or rocky hill tops (often in vineyards and other cultivated areas): Coast Ranges mostly near the coast; Sierra foothills in Fresno Co.; s. to coastal S. Cal.; n. to B. C. Feb.-Mar.

10. *M. exigua* (T. & G.) Jepson. Similar to *M. spathulata* but looser and larger (2 to 6 in. high) and less glaucous; basal leaves about equaling the stems, elongated linear, or slightly spatulate,  $\frac{1}{2}$  to 1 line broad; leaves of the cauline pair linear,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, distinct, or slightly connate on one side, usually much exceeding the raceme; petals white, 2 lines long, twice length of sepals.—Throughout Cal., but mostly towards the interior, the known stations few: San Diego; Santa Rosa Peak; Yosemite; Mt. Diablo; Howell Mt.; Yreka; n. to B. C., s. to L. Cal. It occurs at higher elevations than *M. spathulata*, which is chiefly of low hills near the coast. Var. *VIRIDIS* (Dav.) Jepson. Herbage green; cauline leaves lanceolate, nearly distinct.—Mt. San Antonio; Mt. San Jacinto.

11. *M. saxosa* Bdg. Stems numerous, caespitose, forming a dense succulent ball 1 to 2 in. in diameter; basal leaves obovate or spatulate, rounded at apex, 3 to 6 lines long, nearly sessile; cauline leaves a single pair, ovate, obtuse, not connate, 2 to 3 lines long; racemes umbellate, few-flowered, the pedicels equaling or exceeding the short scape-like stems; sepals roundish, 2 lines long, the roseate petals twice as long; capsules  $1\frac{1}{2}$  to 2 lines long; seeds foveolate-striate.—Yollo Bolly Range from North Yollo Bolly s. to Snow Mt., about 7000 ft.

12. *M. sibirica* (L.) Howell. Stems erect, 9 to 18 in. high; root fibrous and annual with a thick crown, or the crown persistent as a short rootstock; basal leaves ovate or obovate to suborbicular, acuminate or acute, rarely obtuse, 1 to 2 in. long, on petioles 3 to 5 in. long; cauline pair similar, distinct, sessile or short-petioled; raceme very lax, 3 to 7 in. long, bracteate, the flowers on long (1 to 2½ in.) pedicels; sepals orbicular to ovate, obtuse; petals white with pink veins or pink with rose-purple lines, coarsely notched, 3 to 5 lines long, narrowed at base into a distinct claw.—Swampy places along the coast: Marin Co. to Humboldt Co.; n. to Alas. Feb.-June.

13. *M. heterophylla* Jepson. Stems 5 to 11 in. high, rising from tuberous rootstocks or cormlets, these sending out slender stolons which produce terminal cormlets, the secondary cormlets promptly producing leaves and flowers; basal leaves narrowly ovate to oblanceolate, acute, ½ to 2 in. long, on long slender petioles; cauline pair similar, subsessile; raceme 5 to 11-flowered; pedicels becoming ¾ to 1 in. long; sepals round-ovate, obtuse or subcordate at base, 2 lines long; petals white, pink-veined, notched, twice as long as the sepals.—Sierra Nevada from Fresno Co. to Tulare Co., 5700 to 7000 ft.; Ore. to Alas. The tubers or fleshy rootstocks each produce only 1 or 2 stems and leaves, whereas in *M. sibirica* the numerous leaves and stems form by their bases a thick crown on the slender or fibrous taproots. Rare with us.

14. *M. asarifolia* (Bong.) Howell. Stems erect, naked save for one cauline pair of leaves, 7 to 12 in. high, arising from a slender horizontal rootstock; basal leaves round-ovate, obtuse to acutish, ¾ to 1¾ in. long, often broader than long, on petioles 3 to 6 in. long; cauline pair similar, sessile, obtuse or often more acute; raceme loosely 3 to 8-flowered, the pedicels ½ to 1¼ in. long; sepals orbicular, truncatish, 1½ to 2 lines long; petals white, merely retuse, 3 to 5 lines long.—High montane, 6000 to 7000 ft.: n. Humboldt Co. to w. Siskiyou Co.; n. to Alas., e. to northern Rocky Mts.

15. *M. nevadensis* (Wats.) Jepson. Basal leaves and scapes in a tuft 1 to 2 in. high on the end of a very slender rather deep-seated rootstock; leaves rhomboidal-ovate, obtuse, 6 to 11 lines long, the petioles as long or twice as long; cauline pair ovate, acute, sessile, 3 to 4 lines long; scapes shorter than the leaves, bearing an umbellate fascicle of 5 or 6 flowers, the scapes and pedicels angled or narrowly wing-ridged; fascicle of flowers consisting of 2 to 6 peduncles, the peduncles 5 to 7 lines long, 1-flowered or racemosely 2 or 3-flowered; sepals broadly ovate, shortly acute, reddish, 1½ to 2 lines long; petals narrowly obovate or spatulate, obtuse, drawn down to a narrow claw, 4 lines long; capsule equaling or slightly longer than the sepals; seeds 4 to 6.—Subalpine, 10,000 ft.: Mt. Leavitt (A. L. Grant 420). (Probably *Claytonia nevadensis* Wats.; *M. californica* Jepson ms.)

#### 4. CLAYTÔNIA Gron.

Low glabrous perennial herbs, the stems and basal leaves from globose deep-seated corms. Stems scape-like, bearing at summit a pair of opposite leaves and between them a several-flowered loose or umbellate raceme. Flowers opening for more than one day. Sepals 2. Petals 5, distinct and equal. Stamens 5. Ovules about 6. Style-branches 3. Capsule 3-valved, 3 to 6-seeded. (Dr. John Clayton, American botanist, of the colony of Virginia, who furnished Gronovius the materials for the *Flora Virginica*; died 1773.)

1. *C. lanceolata* Pursh. Stems 1 to 24 from a corm, erect, 2 to 4 in. high; corm globose, about ½ in. in diameter; basal leaves few or rare, narrow, long-petioled; cauline leaves narrowly to oblong-lanceolate, sessile, 1 to 2 in. long; racemes 1, or sometimes 2 or 3, sessile or short-peduncled, 5 to 17-flowered, the pedicels bractless except the lowest; petals pink with darker veins, or nearly white, often with a yellow dot at base, emarginate or obtuse, 3 to 4 lines long; pedicels recurved in fruit.—Montane, 4500 to 7000 ft.. San Antonio Mts. (Devils Backbone, F. W. Peirson); n. Sierra Nevada from Nevada Co. to Modoc Co., thence w. to Humboldt Co.; n. to B. C., e. to Utah.

5. *LEWISIA* Pursh

Fleshy perennials with very thick farinaceous roots bearing basal rosulate clusters of leaves and 1 to many-flowered scapes. Flowers often large and handsome. Sepals 2 to 8, herbaceous, persistent. Petals 5 to 16, varying from white to red. Stamens 5 to numerous. Styles 3 to 8, united at base, the free portion filiform, stigmatic the whole length. Capsule circumscissile near the base, the upper deciduous part more or less valvate-cleft from the base. Seeds several to many. (Capt. Lewis of the Lewis & Clark expedition across the continent, 1806-7, who collected the type species.)

Sepals 2; flowers medium; scapes commonly bearing a cyme or panicle.—Subgenus *OREOBROMA*.

Stems from a small globose corm; leaves 2 or 3 below the inflorescence. 1. *L. triphylla*.

Stems scape-like, leafless.

Scapes 1 to 4-flowered, with a pair of small bract-like leaves; root thick, fusiform to globose.

Leaves exceeding scapes; scapes 1 to 3-flowered.

Bracts ovate, borne above the middle of scapes; sepals ovate, obtuse, glandular-denticulate. .... 2. *L. pygmaea*.

Bracts linear, borne at surface of ground; sepals ovate, acute, entire, not glandular. .... 3. *L. nevadensis*.

Leaves shorter than the 2 to 4-flowered scapes; bracts and sepals denticulate, not glandular. .... 4. *L. oppositifolia*.

Scapes bearing a panicle of numerous flowers; leaves in a tuft on the caudex crowning a thick fleshy root; bracts and sepals ciliate-glandular.

Flowers 5 to 7 lines long; leaves narrowly linear. .... 5. *L. leana*.

Flowers  $2\frac{1}{2}$  to 3 lines long; leaves spatulate-ovate. .... 6. *L. cotyledon*.

Sepals and sepal-like bracts 4 to 8; flowers large; scapes 1-flowered.—Subgenus *EULAWISIA*.

Stamens 10 to 15; sepals 2, decussately and closely subtended by 2 bracts which resemble them; scape said to be "jointed" under the sepals.

Sepals glandular-denticulate; Sierra Nevada. .... 7. *L. kelloggii*.

Sepals not glandular-denticulate; S. Cal. mts. .... 8. *L. brachycalyx*.

Stamens over 15; scapes jointed near the middle or below; sepals not glandular-denticulate.

Sepals 4 (to 6); petals 8 to 11; stamens 16 to 26. .... 9. *L. yosemitana*.

Sepals 6 to 8; petals 13 to 15; stamens about 40 to 47. .... 10. *L. rediviva*.

1. *L. triphylla* (Wats.) Rob. Fig. 357. Scape half underground, arising from a globose tuber about the size of a pea, 1 to 2 in. high and bearing a simple or compound umbellate raceme subtended by 3 or 2 narrowly linear leaves; umbel 3 to 14 (or 27)-flowered, or the flowers only 2 or 1; petals white, 5 to 7 or 10, subequal or unequal,  $1\frac{1}{4}$  to 2 lines long; stamens 4 or 5; styles 5 (4 or 3).—Moist slopes or swales, in granite sand or fine gravel, 6000 to 9600 ft.: Sierra Nevada; North Coast Ranges; n. to Wash. and Ida.

357. *Lewisia triphylla*  
Rob.; habit x 1.

2. *L. pygmaea* (Gray) Rob. Scapes several to many, 1 to 2 in. high, these and the leaves from a fleshy root; root elongated-fusiform,  $\frac{1}{4}$  to 1 in. thick; leaves linear, slightly exceeding the flowers; scapes one-flowered with a pair of ovate bracts above the middle, or umbellately 2-flowered and the pedicels subtended by the bracts; sepals ovate, obtuse, glandular-denticulate; petals white, 6 to 9, subequal or unequal, often notched on one side or at apex, 3 lines long; stamens 5 to 8; styles 3 to 5; scapes soon retrocurved.—High montane, 8000 to 12,200 ft.: Sierra Nevada from Tulare Co. to Nevada Co.; White Mts., n. to Wash.; e. to the Rocky Mts.

3. *L. nevadensis* (Gray) Rob. Fig. 358. Scapes several to many,  $\frac{1}{2}$  to 4 in. high, naked save for a pair of bracts near the middle—that is, near the surface of the ground; scapes and leaves arising from a fleshy carrot-shaped or

358. *Lewisia nevadensis* Rob.;  
habit  $\times \frac{1}{2}$ .

2 to 3 lines long, roundish, denticulate at the truncate or obtuse apex but glandless; petals white or pink, 6 to 7 lines long; stamens about 12; styles 3.—Del Norte Co., Cal., to Josephine Co., Ore.

5. *L. leana* (Porter) Rob. Scapes few, 5 to 9 in. high, rising from a thick fleshy caudex, bearing a panicle of numerous flowers and a few scattered small bracts; leaves in a dense tuft crowning the caudex, narrowly linear, acute, more or less terete, 1 to  $2\frac{1}{2}$  in. long and 1 to  $2\frac{1}{2}$  lines wide; sepals ovate or roundish, 1 line long, fimbriate with reddish gland-tipped teeth; petals 5 to 7, red,  $2\frac{1}{2}$  to 3 lines long; stamens 5 (or 4); styles 2; scapes disarticulating from the caudex soon after flowering.—High montane, 6000 to 9000 ft.: s. Sierra Nevada (Fresno and Mariposa Cos.); Siskiyou and Salmon mountains; n. to Ore.

6. *L. cotyledon* (Wats.) Rob. Fig. 359. Scapes several from the leafy crown of a thick caudex, 4 to 10 in. high, bearing at summit a panicle and below the panicle two pairs of bracts; bracts ovate acute; leaves in a dense rosulate tuft, spatulate-obovate or orbicular,  $1\frac{1}{2}$  to 3 in. long; sepals roundish, very obtuse, glandular-denticulate, 2 to 3 lines long; petals 7 to 10, obovate or oblanceolate, white, strongly pink-veined along the middle, 5 to 7 lines long; stamens 6 to 9; petals 8 or 9; filaments dilated below and connate into a sheath surrounding the ovary; styles 3.—Montane, w. Siskiyou Co. and n. Trinity Co. A most attractive species. July.

7. *L. kellóggli* K. Bdg. Flowers and leaves densely crowded on the crown of a thick fleshy taproot; scapes very short, 3 to 7 lines long jointed at the base, these and the petioles with loose transversely wrinkled whitish epidermis; leaves spatulate or obovate, obtuse, mostly

sometimes globose root; bracts linear, opposite, often a little connate by their scarious bases; leaves narrowly linear or slightly broadened upward, 1 to  $2\frac{1}{2}$  in. long, 1 to 2 lines broad, exceeding the scapes; flowers white, solitary and terminal on the stems; sepals ovate, acute; petals 6 to 8 (rarely 5), 6 to 7 lines long; stamens 6 to 11; styles 5 (3, 4 or 6); scapes retrocurving in fruit.—Granite sand, 7000 to 11,000 ft.; San Bernardino Mts.; Mt. Pinos; Sierra Nevada from Tulare Co. n. to Modoc Co.; n. to Wash., e. to Utah. June.

4. *L. oppositifolia* (Wats.) Rob. Scapes 1 to 3, erect or ascending, 6 to 8 in. high, these and the leaves from a fleshy-fusiform root, or 1 or 2 pairs of leaves on the lower part of the scape; leaves linear-oblanceolate or linear, 1 to 3 in. long; scapes naked or with 1 or 2 lanceolate bracts, bearing 2 to 4 umbellately disposed flowers on long ( $\frac{1}{2}$  to  $1\frac{1}{2}$  in.) pedicels; sepals

359. *Lewisia cotyledon* R. b.; a, habit  $\times \frac{1}{4}$ ;  
b, fl.  $\times \frac{1}{2}$ .

notched at apex, 3 to 5 lines long, drawn down to a petiole as long or twice as long; sepals 4, oblong-lanceolate, acute, minutely glandular-toothed, 3 to 4 lines long; petals 5 to 9, white, 2 to 3 times as long as the sepals; stamens 12 to 15; styles 5 or 4; capsule thin-walled, separating in a circumscissile manner from the receptacle at base, then splitting upwards into 4 or 5 valves.—Northern Sierra Nevada from Placer Co. to Plumas Co., 4500 to 6000 ft.

8. *L. brachycalyx* Engelm. Scapes rather short, rising from a thickened caudex, surpassed by the moderately fleshy leaves; leaves in a spreading rosette, linear-spatulate or -oblanceolate, 1 to 4 in. long; bracts 2; sepals 2, ovate, entire, 3 to 4 lines long; petals 5 to 9, white,  $\frac{1}{2}$  to 1 in. long; stamens 9 to 15; styles 5 to 7.—Wet meadows, 5000 to 6700 ft.: San Bernardino Mts.; Cuyamaca Mts.; e. to Utah, Ariz. and N. Mex.

9. *L. yosemitana* Jepson n. sp. Leaves and flowers densely crowded on the crown of a thick fleshy taproot, the flowers on very short scapes jointed at or near the base; leaves spatulate, obtuse narrowed to a petiolar base,  $\frac{1}{2}$  to 1 in. long; corolla white, 10 to 11 lines broad; sepals 4 to 6, oblong,  $\frac{1}{4}$  to  $\frac{1}{2}$  as long as the corolla; petals 7 to 11; stamens 16 to 26; styles 5.—Summits of domes about Yosemite Valley. The plants barely push up through the granite sand; then the flowers open out on the surface of the sand, the cluster forming a rosette, which is very beautiful. The flowers do not disjoint from the plant on drying. (El Capitan, Jepson 4357, type; perhaps the same as *L. rediviva* var. *yosemitana* K. Bdg.)

10. *L. rediviva* Pursh. BITTER ROOT. Scapes from a thick caudex crowning a stout root,  $\frac{3}{4}$  to 2 in. high, jointed near the middle and bearing an involucre whorl of 5 or 7 scarious subulate bracts; leaves linear, thick, 1 in. long; sepals 6 to 8; petals 13 to 15, pink, bright rose or white,  $\frac{3}{4}$  to 1 in. long, spreading rotately; stamens 40 to 47; filaments united at base; styles 6 to 8.—Higher peaks of the hills or mts.: San Bernardino and San Gabriel mountains; Coast Ranges from Mt. Pinos to Mt. Diablo and Lake Co.; Modoc Co.; n. to B. C., e. to Rocky Mts. Inflorescence disjuncting readily at the middle of the scape on drying. Apr.

## 6. PORTULACA L.

Fleshy herbs, ours annuals, with alternate leaves and yellow flowers. Calyx 2-cleft, the tube adnate to the ovary below. Petals 5 (rarely 6), inserted with the stamens on the calyx. Stamens 7 to 20. Style mostly 3 to 8-parted. Capsule globose, opening transversely, the upper part coming off like a lid. Seeds many. (Old Latin name.)

1. *P. oleracea* L. COMMON PURSLANE. Stems 4 to 8 in. long; herbage glabrous; leaves cuneate or obovate; flowers sessile, opening only in sunshine; petals notched or 2-lobed.—Frequent in low lands throughout the state; introduced from trop. Am. June-Oct.

## CARYOPHYLLACEAE. PINK FAMILY

Herbs of inert properties, with commonly swollen nodes, simple and entire leaves always opposite, and regular perfect flowers. Calyx persistent. Corolla white, red or pink. Sepals and petals 5 (or 4), the stamens as many and alternate with the petals, or twice as many, rarely fewer. Ovary superior, 1-celled (imperfectly 3-celled in some *Silene*), with 1 to 5 styles and 1 to many ovules on a free central placenta. Fruit a few to many-seeded 1-celled capsule dehiscent at the summit by short valves or teeth (these as many or twice as many as the carpels), or 1-seeded and indehiscent, thus becoming an achene or utricle. Embryo commonly curved around the periphery of the seed, the endosperm occupying the center.

### A. Sepals distinct or united only at base.

Petals spreading, without claws or appendages, or in a few species wanting; ovary not stipitate; fruit a capsule; low herbs.

Styles 3 to 5, distinct; petals present, mostly obvious or relatively conspicuous.—  
Tribe ALSINEAE.

- Stipules none.  
 Petals bifid or 2-divided, rarely none; styles 3, 4 or 5, when of the same number as the sepals opposite them.  
 Capsule cylindric, usually conspicuously elongated and often curved; styles commonly 5, opposite the sepals.....1. *CERASTIUM*.  
 Capsule ovoid or oblong, relatively short; styles 3 (or 4).....2. *STELLARIA*.  
 Petals entire or merely notched, rarely none.  
 Styles as many as the sepals and alternate with them.....3. *SAGINA*.  
 Styles fewer than the sepals.....4. *ARENARIA*.  
 Stipules present, scarious; petals entire.  
 Styles 3; leaves opposite.....5. *SPERGULARIA*.  
 Styles 5; leaves apparently whorled.....6. *SPERGULA*.  
 Style 1, 3-cleft or -toothed; petals minute or none.—Tribe *POLYCARPEAE*.  
 Leaves opposite or in 4s, oblong or obovate.....7. *POLYCARPON*.  
 Leaves opposite, subulate, cuspidate.....8. *LOEFLINGIA*.  
 Petals none or represented by mere filament-like organs; style 1, 2-cleft or -parted, rarely 3-cleft, or styles 2; fruit a utricle or achene; very small or prostrate herbs.—Tribe *ILLECEBREAE*.  
 Sepals distinct or nearly so; stipules present.  
 Annual; stipules and flowers minute.....9. *HERNIARIA*.  
 Perennial; stipules conspicuous, silvery-scarious.  
 Leaves subulate; sepals very unequal, armed with a divergent spine.....10. *PENTACAENA*.  
 Leaves oblanceolate; sepals equal, cuspidate.....11. *PARONYCHIA*.  
 Sepals united below into a short tube.  
 Stipules present.  
 Staminodes without glands; annual.....12. *ACHYRONYCHIA*.  
 Staminodes with glands; perennial.....13. *SCOPULOPHILA*.  
 Stipules none; low annual.....14. *SCLERANTHUS*.

### B. Sepals united into a tubular calyx.

- Petals with conspicuous claws, these with the stamens and ovary frequently raised above the base of the calyx on a stipe; styles distinct; fruit a capsule; stipules none; mostly erect and often tall herbs.—Tribe *SILENEAE*.  
 Calyx teeth much shorter than the tube.  
 Styles 2; capsule opening by 4 short teeth.  
 Flowers showy.  
 Calyx ovate, with 5 prominent angles; petals not appendaged.....15. *VACCARIA*.  
 Calyx tubular, not angled; petals with scales.....16. *SAPONARIA*.  
 Flowers minute; calyx narrow-cylindric, about 15-ribbed.....17. *VELEZIA*.  
 Styles 3; capsule opening by 3 or 6 teeth or valves; claw of the petals commonly bearing scales or appendages at its junction with the blade.....18. *SILENE*.  
 Calyx teeth longer than the tube; styles 5; capsule opening by 5 teeth.....19. *AGROSTEMMA*.

### 1. *CERASTIUM* L. POWDER HORN

Pubescent herbs with white flowers. Cymes dichotomous with herbaceous or scarious bracts. Sepals 5. Petals 5, retuse or merely bifid. Stamens 10 or 5. Styles 5. Capsule long, slender-cylindric, often curved, usually much exceeding the calyx, dehiscent at apex by 10 teeth, these erect or spreading. Seeds rough, more or less flattened. (Greek *keras*, a horn, in allusion to the elongated curved capsules.)

Petals shorter than or about equaling the sepals.

- Annual; pedicels not longer than the flowers.....1. *C. viscosum*.  
 Perennial; pedicels longer than the flowers.....2. *C. vulgatum*.  
 Petals twice as long as sepals; perennial.....3. *C. arvense*.

1. *C. viscosum* L. MOUSE-EAR CHICKWEED. Erect, 3 to 10 (or 15) in. high, pilose-hirsute and somewhat glandular, especially on the calyx; leaves ovate to elliptic-oblong, sessile, slightly connate, 7 to 12 lines long; pedicels not longer than the sepals; petals equaling or distinctly shorter than the sepals, oblong, bifid at apex, 2 lines long; stamens 10, one or more with reduced or abortive anthers, or sometimes only 5 with anthers, the other 5 represented by mere scale-like filaments; capsule tubular, 4 lines long, about twice as long as the calyx, the slightly curved apex contracted; seeds numerous, minutely muriculate.—Common in fields and by roadsides; nat. from Eur. Mar.-Apr.

2. *C. vulgatum* L. Biennial or perennial; stems erect or ascending, 9 to 13 in. high; herbage hairy-pubescent throughout and somewhat viscid; lower leaves spatulate-oblong, upper oblong, 5 to 10 lines long; flowers loosely cymose, the pedicels as long as or at length exceeding the calyx; bracts scarious-margined; sepals 2 to 2½ lines long, about as long as the 2-cleft

petals; capsule curved upward, 2 to 3 times as long as the calyx.—Sparingly nat. from Eur. Often in lawns.

3. *C. arvense* L. FIELD CHICKWEED. Stems from running rootstocks, several from a decumbent very leafy and often matted base, nearly naked above, 5 to 9 in. high; herbage pubescent and often glandular, the pedicels and calyx glandular-pubescent; leaves linear, acute, the upper 1 to 1½ in. long, the lowermost often but half as long; cyme contracted, bearing 1 to 6 flowers; sepals 1½ to 2½ lines long, scarious-margined; petals usually twice as long as the calyx, obcordate, deeply notched; capsule scarcely exceeding the calyx, pendulous on the curved end of the pedicel.—Yosemite; Coast Ranges from San Francisco to Humboldt Co.; N. Am., Eur. Var. *MÁXIMUM* Holl. & Britt. Stout, tall, 1 to 2 ft. high; leaves elongated; cyme ample, spreading, 10 to 18-flowered; capsule equaling to nearly twice the length of the calyx.—Along the coast, Marin Co. to Humboldt Co.

## 2. *STELLARIA* L. STICHWORT

Low slender mostly glabrous herbs, loving moist ground or shaded habitat. Flowers white, small, axillary and solitary, or terminal and cymose. Sepals 5; acute or acuminate. Petals 5, 2-parted almost to the base into narrow segments. Stamens 3 to 10. Styles 3 or 4. Capsule ovoid or oblong, relatively shorter than in *Cerastium*, dehiscent to below the middle into as many or twice as many valves as there are styles. (Latin *stella*, a star, the flowers star-shaped.)

### A. Annual; lower leaves ovate, petioled.

Bracts foliaceous; stems procumbent, weak.....1. *S. media*.  
Bracts scarious; stems filiform, erect.....2. *S. nitens*.

### B. Perennial; leaves ovate, lanceolate, or linear, all sessile or nearly so.

Petals deeply 2-parted; herbage not glandular.

Bracts small and scarious.

Petals minute or none; flowers in umbels.....3. *S. umbellata*.

Petals longer than the sepals; flowers irregularly cymose, the cymes terminal, often reduced to a single long-pedicel flower.....4. *S. longipes*.

Bracts foliaceous.

Leaves shorter than internodes; petals shorter than the sepals or none.

Flowers cymose; leaves mostly lanceolate.....5. *S. borealis*.

Flowers solitary in the axils; leaves ovate.....6. *S. crispata*.

Leaves longer than internodes; petals equaling or slightly exceeding sepals; sea-shore species.....7. *S. littoralis*.

Petals merely retuse or bifid, exceeding the calyx; herbage glandular-pubescent.....8. *S. jamesiana*.

1. *S. media* (L.) Cyr. COMMON CHICKWEED. Slightly succulent, with weak procumbent stems, rooting at the lower nodes; lower leaves ovate, acute, rather abruptly contracted into slender petioles, the upper narrower, sessile; floral bracts foliaceous; pedicels slender, deflexed in fruit; petals shorter than the pubescent sepals; stamens 3, 5 or 10; capsule ovoid, slightly exceeding the calyx.—Common weed along fence lines and ditches and shaded half-waste places generally; nat. from Eur. Feb.-May. Stems with a pubescent line, and petioles of lower leaves hairy.

2. *S. nitens* Nutt. SHINING CHICKWEED. Stems erect, filiform, branching above, 3 to 7 (or 10) in. high, glabrous or slightly hairy below; leaves linear, acute, sessile, 2 to 7 lines long, or the very lowest ovate, 1 to 3 lines long, abruptly contracted into slender petioles nearly twice as long; inflorescence strict, the pedicels erect, ¼ in. long or less, or some of the flowers quite sessile; bracts scarious; sepals scarious-margined, subulate-lanceolate, 2 lines long; petals ½ as long as the sepals, sometimes none; capsule oblong, nearly as long as the calyx.—Grassy hillsides and plains, 100 to 2900 ft.: throughout cismontane Cal., a somewhat obscure plant; n. to B. C., e. to Utah.

3. *S. umbellata* Turcz. Stems slender, weak, ascending from a rooting base, 3 to 10 in. high; herbage glabrous; leaves ovate to oblong or those above the base oblong-lanceolate, acute, 4 to 8 lines long; flowers in regular or more or less irregular umbels, the umbels terminal on the stem or forks of the cyme; pedicels ½ to 1¼ in. long; sepals ¾ to 1 line long; petals minute or none; capsule twice as long as the calyx.—Montane, 7000 to 8000 ft.;

360. *Stellaria longipes* Goldie;  
a, fl. branch  $\times \frac{1}{2}$ ; b, petal  $\times 1$ .

Sierra Nevada from Tulare Co. to Mariposa Co.; White Mts.; e. to the Rocky Mts.; e. Siberia.

4. *S. longipes* Goldie. Fig. 360. Stems strictly erect, 5 to 12 in. high, from slender running rootstocks; at high altitudes dwarfish and densely matted; herbage glabrous; lower leaves oblong to linear, 3 to 6 lines long, or the upper linear-lanceolate, 6 to 10 lines long; flowers solitary and terminal, or in irregular terminal cymes, the pedicels of variable length ( $\frac{1}{4}$  to  $1\frac{1}{2}$  in. long) but commonly strictly erect; calyx  $1\frac{1}{2}$  to 2 lines long; petals cleft nearly to the base, equaling or exceeding the sepals; capsule dark or black, exceeding the calyx; seed microscopically and scantily puberulent, nearly smooth.—Common in moist often grassy places in the mts., 4300 to 8500 ft.: San Bernardino Mts.: Sierra Nevada from Tulare Co. n. to Modoc and Siskiyou Cos.; Yollo Bolly Mts. Var. *LAËTA* Wats. Herbage glaucous.—Volcano Creek, Tulare Co.; n. Rocky Mts. to arctic Am.

5. *S. borealis* Bigel. Stems erect or spreading, weak, sparingly branched, 6 to 10 in. long; herbage glabrous; leaves ovate to elliptic-ovate, acute, 3 to 5 lines long, sometimes a little crisped; flowers in loose terminal leafy cymes, or often solitary in the lower forks or rarely in the lower leaf axils, on pedicels 2 to 4 or 8 lines long; sepals  $1\frac{1}{2}$  to 2 lines long, the petals shorter or wanting; capsule greenish or brownish, oblong, nearly a half longer than the calyx; seed microscopically roughened.—Alpine or subalpine, in wet or cool places, 9000 to 12,000 ft., rare with us: San Bernardino Mts.; Kaweah Peak; South Yollo Bolly; Medicine Lake. Var. *BONGARDIANA* Fer. Stems 10 to 17 (or 30) in. long; leaves ovate-lanceolate, acuminate,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, 1 to 2 (or 3) lines broad; pedicels  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long.—Montane, 4000 to 8500 ft. (Mt. San Jacinto; Sierra Nevada from Tulare Co. to Mariposa Co.) or at low altitudes near the coast from Mendocino Co. to Humboldt Co.; n. to Alas., e. to N. Eng.

6. *S. crispa* C. & S. Stems ascending or reclining, 4 to 15 in. long, simple above the base or sparingly branched; herbage glabrous; leaves rather remote, ovate, abruptly short-acuminate or very acute, usually crisped on the edges, 2 to 6 (or 9) lines long; flowers solitary in the axils (at every other node or more scattered), on pedicels 3 to 5 lines long; pedicels erect, or often spreading or deflexed in fruit, about half the length of the internode; calyx  $1\frac{1}{2}$  lines long; petals divided, equaling the sepals or shorter, or none; capsule straw-colored,  $\frac{1}{2}$  longer than the calyx.—Grassy wet meadows, North Coast Ranges from Marin Co. to Mt. Shasta; n. to Alas. May-July.

7. *S. littoralis* Torr. Stems stoutish, ascending, very leafy, 1 to 2 ft. long; herbage weakly pubescent; leaves rather crowded, ovate, acute, rounded at the sessile base,  $\frac{3}{4}$  to  $1\frac{3}{4}$  in. long; flowers in a terminal compound leafy cyme; pedicels 3 to 5 (or those in the lower forks (7 to 10) lines long; sepals lanceolate, acute, 2 lines long, slightly shorter than the deeply cleft petals; capsule included within the calyx.—Bogs or marshes, seacoast only. San Francisco to Humboldt Co. May-June.

8. *S. jamesiana* Torr. Fig. 361. Stems diffuse, 5 to 12 in. high, from slender rootstocks, often with fusiform-thickened joints; herbage minutely glandular puberulent; leaves narrowly lanceolate to ovate or broadly lanceolate,  $1\frac{1}{4}$  to 2 (or 3) in. long, the pairs horizontally spreading; flowers in loose terminal or axillary cymes on spreading peduncles; peduncles 1 to 2 in. long; pedicels 4 to

361. *Stellaria jamesiana* Torr.; inf.  $\times \frac{1}{2}$ .

10 lines long; sepals  $1\frac{1}{2}$  to 2 lines long, the petals twice as long, broadly notched at apex; capsule ovate, shorter than the calyx.—Meadows or pine forest, 5000 to 8500 ft.: Frazier Mt.; Sierra Nevada from Tulare Co. n. to Modoc Co.; North Coast Ranges from Mt. Sanhedrin to Siskiyou Co.; n. to Wash., e. to Rocky Mts.

### 3. *SAGINA* L. PEARLWORT

Diminutive herbs with subulate or filiform leaves. Leaves of the opposite pairs scarious-connate at base. Flowers minute, terminal, often long-pedicelled. Sepals 5 or 4, obtuse. Petals white, much shorter than the sepals, rarely subequal, mostly minute, entire or slightly emarginate, or sometimes none. Stamens 5 or 10. Styles as many as the sepals and alternate with them. Capsule dehiscent to the base by entire valves. (Latin *sagina*, fattening, some species abundant in sheep-grazed country.)

Stems filiform; pedicels straight; annuals; low altitudes.

Sepals and petals 5; connate bases of leaves glabrous. . . . . 1. *S. occidentalis*.

Sepals 4; petals commonly none; connate bases of leaves ciliolate. . . . . 2. *S. apétala*.

Stems stoutish, more or less succulent; herbage wholly glabrous; biennials or perennials.

Petals mostly  $\frac{1}{2}$  length of sepals; pedicels curved at summit; high altitudes. . . . . 3. *S. linnaei*.

Petals and sepals subequal; pedicels rarely curved at summit; seashore. . . . . 4. *S. crassicaulis*.

1. *S. occidentalis* Wats. WESTERN PEARLWORT. Inconspicuous annual with almost capillary stems, branching at the base, erect or spreading, 2 to 5 in. high; slightly hispidulous-glandular on the calyx and upper portion of pedicel, otherwise glabrous; upper leaves broadly subulate, acute, 2 to 3 lines long, the lower filiform-linear, 3 to 6 lines long; pedicels 3 to 6 lines long; sepals and petals 5; sepals  $\frac{3}{4}$  line long, the petals nearly as long; calyx rounded at the base; stamens 3 to 10; capsule  $1\frac{1}{4}$  lines in length.—Not uncommon, but obscure and mostly in low ground or borders of salt marshes. 50 to 800 (or 2700) ft.: coastal S. Cal.; Coast Ranges; Great Valley; n. to B. C. Apr.-May.

2. *S. apétala* Ard. DWARF PEARLWORT. Tiny annual, erect, 1 to 2 in. high, usually minutely glandular-pubescent; leaves linear-subulate, acute,  $1\frac{1}{2}$  to 3 lines long; pedicels capillary, erect; calyx 4-parted; petals commonly none, or 4, minute and obovate; capsule ovoid,  $1\frac{1}{2}$  times as long as the calyx.—Pasadena. Seldom collected but perhaps overlooked. Introduced from Eur.; as also the var. *BARBATA* Fenzl. Leaves with the connate scarious bases more or less ciliolate.—About ranches or near dwellings: Jackson; Ione; Auburn; Crane Creek, Tehama Co.

3. *S. linnaei* Presl. ARCTIC PEARLWORT. Biennial or perennial; stems numerous, forming a close mat, 1 to 3 in. high, often with leaf-rosettes at base; herbage glabrous; leaves thickish, linear, 3 to 5 or 8 lines long; pedicels filiform, commonly recurved at summit; stamens 10; petals  $\frac{1}{2}$  to  $\frac{3}{4}$  the length of the sepals; capsule ovate-conic,  $1\frac{1}{2}$  to 2 times length of the calyx.—High wet meadows or on rocks, 4000 to 11,000 ft.: San Jacinto, San Bernardino and San Antonio mountains; Mt. Pinos; Sierra Nevada; North Coast Ranges; n. to Alas., thence around the earth. June-July.

4. *S. crassicaulis* Wats. Glabrous perennial, the stems stoutish and succulent, branching, 1 to 5 in. long, decumbent; leaves linear, thickish, 2 to 9 lines long, the basal forming a rosette, the cauline connate by broad scarious membranes; flowers erect or nodding; petals and sepals subequal,  $1\frac{1}{2}$  lines long; stamens 10; capsule ovate, little exserted from the fruiting calyx.—Beaches along the coast from Monterey to Tomales Bay; Wash. and B. C. June-July.

### 4. *ARENARIA* L. SANDWORT

Low branching annuals, or tufted or matted perennials. Leaves mostly subulate or acerose and pungent, but often linear, lanceolate or ovate. Flowers white, in terminal cymes or heads, rarely solitary and axillary. Sepals 5. Petals 5, entire or nearly so. Stamens 10. Styles 3. Capsule globose or short-oblong, dehiscent into as many entire or 2-cleft valves as there are styles. (Latin *arena*, sand, in which many species grow.)

**A. Capsule valves 2-toothed or 2-cleft.**

Leaves linear, lanceolate or ovate (1 or 2 lines broad), not acerose or pungent.

Perennial.

Plants with running rootstocks; leaves linear-lanceolate. . . . . 1. *A. macrophylla*.

Plants without rootstocks; leaves oblanceolate to linear. . . . . 2. *A. saxosa*.

Annual; leaves ovate. . . . . 3. *A. serpyllifolia*.

Leaves subulate or like pine needles, mostly pungent; perennial.

Condensed alpine plant. . . . . 4. *A. compacta*.

Taller or more loosely branched plants.

Flowering stems simple, the flowers capitate or umbellate. . . . . 5. *A. congesta*.

Flowering stems branching.

Stout or compact; Great Basin species.

Rare; foliage glaucous. . . . . 6. *A. aculeata*.

More common; not glaucous. . . . . 7. *A. macradenia*.

Slender; high Sierra Nevada. . . . . 8. *A. capularis*.

**B. Capsule valves entire.**

Lower altitudes, mostly of the foothills.

Swamp plant; perennial. . . . . 9. *A. paludicola*.

Dry ground plants; low annuals.

Petals longer than the sepals; common species.

Leaves filiform. . . . . 10. *A. douglasii*.

Leaves lanceolate, broad at base. . . . . 11. *A. californica*.

Petals shorter than sepals or none; northern border, rare. . . . . 12. *A. pusilla*.

High altitudes or alpine; leaves subulate or filiform, rather rigid, mostly pungent; sepals acute or pungent.

Cyme strict, 1 to 4-flowered. . . . . 13. *A. propinqua*.

Cyme more or less spreading, several to many-flowered. . . . . 14. *A. nuttallii*.

Sect. 1. **Moehringia**.—Seeds with a strophiole; capsule valves 2-cleft.

1. ***A. macrophylla*** Hook. Perennial, with running rootstocks; stems ascending or erect, puberulent, 2 to 4 in. high; leaves in 3 to 5 pairs, lanceolate or linear-lanceolate, acute at each end,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; peduncles slender, terminal or becoming axillary, 1 to 5-flowered; sepals ovate, acute or acuminate, 1 to 2 lines long, exceeding the petals; capsule ovoid, nearly equaling or a little exceeding the calyx.—Shady slopes in the mountains, often on mossy rocks, 1600 to 4000 ft.: coastal S. Cal. and n. through the Coast Ranges and Sierra Nevada to Siskiyou Co.; n. to B. C. May.

Sect 2. **Euarenaria**.—Seeds without a strophiole; capsule valves 2-toothed or -cleft.

2. ***A. saxosa*** Gray. Stems slender, spreading or decumbent at base, arising from a branching root-crown, 5 to 12 in. high; herbage green, glabrous or retrorsely puberulent; leaves oblanceolate to linear, mucronate, 5 to 10 lines long; flowers in a paniculate cyme, more or less leafy-bracteate; sepals narrowly ovate, sharply acute,  $1\frac{1}{2}$  lines long, the petals almost or quite equaling them.—Santa Ana Cañon, San Bernardino Mts.; e. to the Rocky Mts.

3. ***A. serpyllifolia*** L. Stems several from the base, retrorsely puberulent, 3 to 9 in. high; leaves ovate, acute, 1 to 2 lines long; flowers loosely cymose-paniculate, on pedicels 2 to 4 lines long; calyx-lobes ovate-lanceolate, hispidulose on back,  $1\frac{1}{2}$  lines long, twice as long as the petals; capsule ovate, equaling the calyx.—Stream beds, Humboldt Co.; n. to Wash.; nat. from Eur.

4. ***A. compacta*** Cov. Flowering stems short ( $\frac{1}{2}$  to 2 in. high), scantily leafy, glandular-puberulent, rising little above the much-branched crown of a perennial taproot; crown cushion-like, densely leafy, 1 to 2 in. broad; leaves linear, thickish, minutely glandular and minutely denticulate, 1 to 2 lines long; flowers solitary in the axils or terminal, on pubescent pedicels 2 to 3 lines long; sepals  $1\frac{1}{2}$  to 2 lines long, shorter than the petals.—High montane, 9000 to 11,600 ft.: Sierra Nevada from Yosemite Park to Tulare Co.

5. ***A. congesta*** Nutt. Flowering stems slender, simple, many from the branching or matted crown of a perennial taproot, densely leafy at base, viscid, 4 to 10 in. high; basal leaves setaceous or needle-like, ciliolate-serrate near the base,  $\frac{1}{2}$  to  $\frac{3}{4}$  or 2 in. long; cauline leaves reduced to distant bracts 2 or 3 lines long; flowers congested in a head or close cluster, sessile or on pedicels 1 to 2 lines long; sepals broadly ovate, acute; petals oblong, 2 lines long, considerably exceeding the sepals.—High montane, 6000 to 10,000 ft.: Sierra Nevada from Tulare Co. n. to Modoc Co.; North Coast Ranges from

Lake Co. to Siskiyou Co.; n. to Wash., e. to Col. Var. *SUFFRUTESCENS* Rob. Root-crown woody; stem leaves less reduced; flowers umbellate with pedicels 2 to 4 lines long.—With the species in Cal. and passing into it.

6. *A. aculeata* Wats. Flowering branches erect, 4 to 6 in. high, nearly naked; branches of the root-crown many, short, densely leafy at summit, forming a dense mat, only a few of them giving rise to flowering branches; herbage minutely glandular; foliage very glaucous; leaves subulate, pungent, 4 to 8 lines long; flowers in a rather close mostly few-flowered cyme; sepals ovate, 2 lines long, acute, the petals  $1\frac{1}{2}$  times as long.—Argus Mts., Inyo Co.; e. to Utah, n. to Ore.

7. *A. macradenia* Wats. Flowering stems erect, often swollen at the joints, 8 to 15 in. high, arising from a woody branching crown 1 to 4 in. high and ending above in a loosely branched cymose inflorescence; herbage glabrous, rarely a little viscid; leaves acerose or subulate, obscurely ciliate at base,  $\frac{3}{4}$  to  $2\frac{1}{2}$  in. long, the cauline little or not at all reduced and the basal rarely dense or congested; pedicels 4 to 14 lines long; sepals ovate, very acute,  $2\frac{1}{2}$  to 3 lines long, the petals equaling or commonly 1 or  $1\frac{1}{2}$  lines longer than the sepals; filaments of stamens opposite sepals with glands at base.—Ranges bordering the deserts, chiefly on the desert slopes, 4000 to 7000 ft.: Santa Rosa Mts.; San Bernardino Mts.; San Gabriel Mts.; s. Sierra Nevada; e. to Utah and Ariz.

8. *A. capillaris* Poir. Flowering stems very slender, bright green and viscid, branching, 2 to 8 in. high, numerous from a matted base of short branches crowning a perennial taproot; leaves chiefly basal, subulate, 4 to 6 lines long, or as much as  $1\frac{1}{4}$  in. long, the cauline few, distant, reduced; inflorescence loosely cymose, the flowers on pedicels 2 to 5 lines long; petals elliptic-obovate or oblong, obtuse, exceeding the elliptic acute sepals.—Granite domes and ridges, 6000 to 10,000 ft.: San Bernardino Mts.; Sierra Nevada from Fresno Co. to Sierra Co.; e. to Utah, n. to B. C.; Asia. Var. *URSINA* Rob. More condensed and regularly branched; leaves 2 to 3 lines long; sepals blunter, nearly as long as the petals.—Bear Valley, San Bernardino Mts.

Sect. 3. *Alsine*.—Seeds without a strophiole; capsule valves entire.

362. *Arenaria douglasii* Fenzl.; a, habit x 1; b, stamen x 5; c, stamen with gland x 5.

9. *A. paludicola* Rob. Glabrous flaccid perennial, the stems procumbent, rooting at the lower joints, sulcate, shining, leafy throughout, 1 to  $2\frac{1}{2}$  ft. long or when growing amongst tules or other plants to 5 ft. long; branches few, very long; leaves linear or linear-lanceolate, thickish, acute,  $\frac{3}{4}$  to  $2\frac{1}{4}$  in. long, slightly connate at base; peduncles solitary in the axils, 1 to 2 in. long, spreading or somewhat deflexed; sepals elliptic, nerveless, herbaceous,  $1\frac{1}{2}$  to 2 lines long, about half the length of the obovate petals; capsule oblong, shorter than the calyx.—Swamps, rarely collected: Santa Ana River near San Bernardino; Los Angeles; San Francisco; n. to Wash. The angled stems are very noteworthy.

10. *A. douglasii* Fenzl. Fig. 362. Annual, nearly glabrous, sometimes minutely glandular-pilose; stems much branched, 2 to 8 in. high, developing a loosely cymose inflorescence; leaves filiform, 3 to 5 lines long or the lowermost longer; pedicels filiform, 3 or mostly 7 to 13 lines long; flowers numerous;

sepals oblong-ovate, narrowly thin-margined, 1 to  $1\frac{1}{2}$  lines long; petals obovate or roundish, conspicuous,  $\frac{1}{2}$  again as long as the sepals; filaments opposite the sepals bearing a yellow bidentate gland at base; capsule subglobose; seeds large, smooth, compressed-reniform, acutely margined.—Sterile soil of hillsides or mesas, 100 to 4000 ft.: coastal S. Cal.; n. through the Coast Ranges and Sierra Nevada to Siskiyou Co. Apr.-May.

11. **A. californica** Brew. Stems delicate and filiform, diffusely branching from the base, 1 to 4 in. high, the flowers loosely cymose on pedicels 3 to 8 lines long; herbage glabrous; leaves lanceolate, obtuse, very short, slightly fleshy, 1 to 2 lines long; sepals oblong-ovate,  $1\frac{1}{2}$  lines long, the petals oblong,  $1\frac{1}{2}$  times as long; filaments without glands at base, those opposite sepals arising from a minute lobe of the glandular disk; seeds small, finely roughened.—Gravelly hillsides or disintegrating rock outcroppings, 100 to 2000 ft.: Coast Ranges from Mt. Hamilton to Mendocino Co.; Sierra Nevada from Eldorado Co. to Butte Co.; n. to southern Ore. Apr.-May.

12. **A. pusilla** Wats. Stems simple or several from the base, capillary, 1 to 2 in. high; leaves lanceolate, 1 to 2 lines long; sepals ovate-lanceolate, acute, 1 line long; petals lanceolate or narrowly ovate, nearly transparent, shorter than the sepals, or more minute, or none; stamens 3, rarely 4 or 5; capsule scarcely equaling the calyx; seeds smooth.—Dry pine woods, Humboldt and Siskiyou Cos.; n. to Wash. Appears like a reduced form of *A. californica*.

13. **A. propinqua** Rich. Tufted, 1 to 3 in. high, with numerous filiform stems mostly leafy at base and ending above in a rather strict 1 to 4-flowered cluster; herbage glandular-puberulent; leaves linear-subulate,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  lines long; flowers small; sepals ovate to ovate-lanceolate, acute, 1 to  $1\frac{1}{2}$  lines long, strongly 3-nerved on the back, larger than the petals.—High montane, 8000 ft.: Siskiyou Co.; n. to arctic Am.

14. **A. nuttallii** Pax. Stems prostrate or ascending, many from the crown of a perennial taproot, more or less matted, giving rise to erect flowering branches which are commonly densely leafy at base; herbage glandular-puberulent; leaves subulate, rigid, pungent, 3 to 5 lines long; flowers rather loosely and divergently cymose, on pedicels 3 to 6 lines long; sepals lanceolate, or oblong-lanceolate, very acute, 2 to  $2\frac{1}{2}$  lines long, equaling or exceeding the petals.—Lassen Peak and Mt. Eddy; n. to Ore. and Mont. Var. **GRACILIS** Rob. Plant more compact and regular; sepals lanceolate-subulate, acuminate or shortly awn-tipped,  $2\frac{1}{2}$  to 3 lines long, the midnerve on the back very strong; petals oval or oblong-ovate, acute or acuminate, much shorter than the sepals.—Decomposed granite, 9000 to 12,000 ft.: Sierra Nevada from Yosemite Park to Farewell Gap; San Bernardino and San Gabriel mountains. Passing into the typical form. Var. **GREGARIA** Jepson. Flowering stems numerous, 3 to 5 in. high, ending above in a cymose panicle, leafy-imbricated at base and borne on ascending or creeping stems arising from the crown of a taproot; herbage purplish or green, clammy or softly viscid-pubescent; leaves subulate, 3 to 5 lines long, blunt; flowers more or less clustered in a many-flowered panicle, 1 to  $2\frac{1}{2}$  in. high, the pedicels  $\frac{1}{2}$  to 2 (or 3) lines long; sepals often purplish, oblong-ovate or lanceolate, shortly acute or acuminate, 2 to  $2\frac{1}{2}$  lines long, commonly exceeded by the oblong-lanceolate or narrowly obovate petals.—Rocky ridges, 4000 to 7000 ft., North Coast Ranges from Snow Mt. to w. Siskiyou Co. July. Intergrading to the species.

##### 5. **SPERGULARIA** J. & C. Presl. SAND SPURRY

Low herbs, usually of alkaline plains, borders of salt marshes, or maritime. Leaves linear or subulate-filiform, semi-terete, with scarious stipules. Flowers cymose or racemose, the pedicels at length spreading or deflexed. Sepals 5. Petals 5, purplish or white, entire. Stamens commonly 10. Style 3, rarely 5. Capsule 3-valved. Seeds often wing-margined. Embryo annular. (Derivative of *Spergula*.)

**Perennials.**

Erect or ascending, more or less succulent, with fusiform fleshy roots; saline or sea-coast habitats. .... 1. *S. macrotheca*.

Prostrate, not obviously succulent; roots fibrous, not fleshy-fusiform.

Stems long and somewhat straggling, from a matted or tufted center, flowering from the middle to the ends of the branches. .... 2. *S. rubra*.

Plants matted; flowering mostly at the ends of the branches. .... 3. *S. clevelandii*.

**Annuals, quite erect or ascending.**

Herbage more or less pubescent; saline habitats.

Capsules slightly longer than the sepals; petals 5, nearly equaling the sepals. .... 4. *S. salina*.

Capsules nearly twice as long as the sepals; petals 3 to 5,  $\frac{1}{2}$  to  $\frac{3}{4}$  as long as the sepals. .... 5. *S. tenuis*.

Herbage glabrous; flowers  $\frac{1}{2}$  to 1 line long; dried ponds. .... 6. *S. platensis*.

1. *S. macrotheca* (Hornem.) Heynh. Stems stout, 7 to 12 in. high, erect or ascending from the short, often branched, woody crown of a very thick and fleshy taproot; herbage deep green and viscid-pubescent throughout, rarely subglabrous; leaves narrowly linear, 1 to  $1\frac{1}{2}$  in. long; flowers in terminal cymes, their branches often racemose; pedicels 2 to 7 lines long; sepals 3 to 4 lines long, scarious-margined; petals as long, pink; capsule equaling or a little exceeding the calyx; seeds with or without a wing, even in the same capsule.—Sandy borders of salt marshes, coast region of Cal. Var. *LEUCANTHA* Rob. Glabrous, especially below, or more lightly pubescent; inflorescence looser; flowers commonly white.—Alkaline plains of the interior valleys: Sacramento, San Joaquin and Livermore valleys; s. to S. Cal. May-June. Var. *SCARIOSA* (Britt.) Rob. Herbage pale, glandular-pubescent or almost glabrous; stipules ovate, acuminate, 4 to 5 lines long, conspicuously silvery-scarious; flowers scattered and on pedicels 3 to 7 lines long or less, or in reduced terminal cymes.—Sea-bluffs, San Francisco to Monterey. Var. *TALINUM* Jepson. Slightly woody at base; internodes very short (2 to 5 lines mostly), the stems densely clothed with leaves; herbage heavily glandular-pubescent or nearly glabrous; cyme shortly peduncled.—San Clemente Isl.

2. *S. rubra* (L.) J. & C. Presl. var. *perennans* (Kindb.) Rob. Stems prostrate, 4 to 9 in. long, slender and wiry, many from a densely tufted base, branching little, flowering from about the middle; herbage comparatively glabrous; leaves narrowly linear,  $1\frac{1}{2}$  to 5 lines long; stipules ovate, silvery-scarious, 2 lines long, very conspicuous; pedicels slender, 2 to 3 (or 5) lines long; sepals oblong, acute,  $1\frac{1}{2}$  to 2 lines long; petals red or reddish, about equaling the sepals; capsule not exceeding the calyx; seeds with a marginal elevation.—Beaten paths and by roadsides, cent. and n. Cal. Introduced from Eur. and spreading gradually. May.

3. *S. clevelandii* (Greene) Rob. Perennial, the prostrate stems forming deep green mats 5 to 13 in. broad; herbage viscid-glandular; leaves filiform, conspicuously fascicled in the axils, ascending, 6 to 9 lines long, all longer than the internodes; flowers in terminal cymes; sepals oblong, acute, 2 lines long; corolla white, about equaling the calyx; seeds winged or not winged, even in the same pod.—Sandy soil near the ocean: San Diego and San Francisco Cos.

4. *S. salina* J. & C. Presl. Stems branching, erect, or sometimes diffuse and prostrate, 3 to 8 in. long; herbage somewhat fleshy, nearly glabrous or lightly pubescent; leaves narrowly linear,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, commonly shorter than the internodes; flowers in terminal cymes, the branches often racemose; pedicels leafy-bracted or the upper bractless, not exceeding the capsules; sepals oblong-ovate, obtusish, scarious-margined, 2 lines long, the petals nearly as long; capsule slightly longer than the calyx.—Alkaline plains of the Sacramento and San Joaquin valleys, w. to the salt marshes near the coast, and s. to S. Cal.; n. Atlantic coast; Eur. May-Aug. Var. *SORDIDA* (Greene) Jepson. Leaves dark with a heavy glandular indument; branches of the cymes secund, rather dense.—Marshes about San Francisco Bay.

5. *S. tenuis* (Greene) Rob. Annual; stems dichotomously and copiously branched from the base, erect or diffuse, 3 to 5 in. high, the branches slender and internodes long; herbage scarcely fleshy, lightly viscid-puberulent; leaves linear-filiform, 4 to 7 lines long, shorter than the internodes; flowers

$\frac{3}{4}$  to 1 line long, in terminal cymes, numerous, short-pediceled, the uppermost sessile in close clusters; sepals oblong-ovate; stamens 2 to 5; capsule twice as long as the fruiting sepals or nearly.—Saline plains, Sacramento Valley.

6. *S. platensis* (Cambess.) Fenzl. Annual; stems numerous, nearly filiform, branching,  $1\frac{1}{2}$  to  $3\frac{1}{2}$  in. high; herbage glabrous; leaves linear-filiform, 3 to 8 lines long, mostly shorter than the internodes; upper leaves much reduced, not exceeding the scarious stipules; flowers in terminal cymes, the branches somewhat racemose; pedicels 1 to 2 lines long; flowers  $\frac{1}{2}$  to 1 line long; petals 1 to 3 and minute, or lacking; capsule somewhat exceeding the sepals.—Dried ponds, S. Cal.; e. to Tex.; Brazil.

#### 6. SPÉRGULA L. SPURREY

Annual. Leaves narrowly linear or subterete, apparently in whorls, but really opposite, several others of their own size being crowded in the axils; stipules small and scarious. Flowers symmetrical. Sepals 5. Petals 5, white, entire. Stamens 10, occasionally 5. Styles 5, alternate with the sepals. Capsule 5-valved, the valves entire, opposite the sepals. Embryo spirally annular. (Latin spargere, to scatter, in reference to the dispersion of the seeds.)

1. *S. arvensis* L. CORN SPURREY. Diffusely branching from the base, the stems 1 to 2 ft. long; pubescence of short spreading glandular hairs; leaves slightly fleshy,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, numerous in rather remote whorls; flowers white, 4 lines broad, in a cymose panicle with strongly divergent branches turned abruptly downward after flowering; petals ovate.—Fields and orchards near the coast, rarely in the interior; introduced European weed. Readily eaten by cattle and said to increase the flow of milk. The flowers open only of afternoon.

#### 7. POLYCÁRPON L.

Low much-branched annuals with numerous flat leaves, small scarious stipules and very small flowers in cymes. Sepals 5, more or less carinate, scarious-margined. Petals 5, hyaline, shorter than the sepals. Stamens 3 to 5. Style 1, very short, 3-cleft or the stigma 3-lobed. Capsule 3-valved. Seeds several. Embryo little curved. (Greek polus, many, and karpos, fruit, in reference to the numerous pods.)

Leaves in 4s or opposite; inflorescence leafless. . . . . 1. *P. tetraphyllum*.  
Leaves opposite; inflorescence more or less leafy. . . . . 2. *P. depressum*.

1. *P. tetraphýllum* L. Stems diffuse or prostrate, 2 to 5 in. long; herbage glabrous or nearly so; leaves in 4s or opposite, oblong or obovate, short-petioled, 2 to 6 lines long; cyme leafless, many-flowered, dense, the flowers 1 line long, short pediceled; sepals green or purplish, strongly keeled, apiculate-hooded; style slender,  $\frac{2}{3}$  as long as the ovary; stigma 3-lobed; capsule nearly equaling the calyx.—Beaten gravelly places in the valleys: St. Helena; Vallejo; Berkeley; Santa Barbara; native of Eur. July-Aug.

2. *P. depressum* Nutt. Plants prostrate, 1 to 3 in. broad with slender stems; leaves spatulate, varying to obovate, obtuse or acute,  $\frac{1}{2}$  to 2 lines long; flowers  $\frac{1}{2}$  as large as in the preceding; sepals not keeled or scarcely so, about  $\frac{1}{2}$  line long; petals white, membranous, linear,  $\frac{1}{2}$  as long as the sepals; style very short, 3-cleft.—Mesas and foothills, 100 to 2000 ft.: coastal S. Cal.; Monterey Co.

#### 8. LOEFLÍNGIA L.

Low rigid annuals, dichotomously branched from the base, with subulate leaves and setaceous stipules. Flowers small, sessile in the axils. Sepals acuminate or awn-tipped, the outer with a tooth on each side. Petals 3 to 5, minute or none. Stamens 3 to 5. Style 1, very short or none; stigmas 3. Capsule 3-valved, several-seeded. (Peter Loeffing, Swedish traveler of the 18th century.)

Sepals recurved; style very short but present. . . . . 1. *L. squarrosa*.  
Sepals straight; style none. . . . . 2. *L. pusilla*.

1. *L. squarrosa* Nutt. Stems diffusely branched from base, 2 to 5 in. high; herbage glandular-pubescent; leaves cuspidate, squarrose-spreading, 2 to 3 lines long; petals very minute; sepals rather strongly recurved and squarrose; capsule shorter than the sepals.—Valleys, 100 to 200 ft.: coastal S. Cal. n. to the San Joaquin and Sacramento valleys.

2. *L. pusilla* Curran. Much like no. 1 but more delicate; stems spreading. 2 to 3 in. long; sepals narrowly lanceolate, abruptly acute, entire, neither rigid nor squarrose; petals none; stamens 3; capsule as long as the sepals.—Tehachapi Mts., 4000 ft.

### 9. *HERNIARIA* L.

Ours a very small annual, with minute scarious stipules. Flowers minute, green, in clusters, crowded, sessile. Sepals 5 or 4, united at base. Petals setaceous and minute, or none. Stamens 2 to 5, inserted on the calyx base. Style very short, 2-cleft or -parted. Fruit a 1-seeded indehiscent achene, with a thin pericarp, inclosed in the calyx. (Latin hernia, a rupture, which one species was thought to cure.)

1. *H. cinerea* DC. Tiny erect plants, 1 to 2½ in. high, or sometimes forming prostrate mats 3 to 14 in. broad, the branches bearing 2-ranked branchlets; herbage hispidulous; leaves oblong-oblancheolate, 1½ to 2½ lines long; flowers in all the axils, even the lowest; calyx ½ line long, very hispid.—Foothills on either side of the lower San Joaquin Valley; nat. from Eur.

### 10. *PENTACAENA* Bartl.

Tufted perennials with subulate pungent leaves and silvery hyaline stipules. Flowers sessile, clustered in the axils. Sepals 5, almost distinct, very unequal, hooded, the 3 outer larger, and with a stout divergent terminal spine, the 2 inner smaller and with a shorter spine. Petals minute, scale-like. Stamens 3 to 5, inserted at the base of the sepals. Style very short, bifid. Utricle inclosed in the rigid persistent calyx. (Greek pente, five, and akaina, a thorn, the five sepals spine-tipped.)

1. *P. ramosissima* H. & A. SAND MAT. Stems prostrate, forming dense mats 5 to 18 in. broad, pubescent; leaves crowded on the stems, 2 to 4 lines long, the stipules ½ or sometimes nearly as long; calyx 1½ to 2 lines long; sepals hairy or woolly below the divergent spinose apex; utricle apiculate.—Sand-dunes or sandy soil along the entire Cal. coast; n. to Wash., s. to Mex.; Chile.

### 11. *PARONYCHIA* L. WHITLOW-WORT

Prostrate tufted perennial, with scarious stipules and clustered axillary flowers. Sepals 5, almost distinct, equal, linear or oblong, concave or cucullate under the apex, the very tip furnished with a short bristle or cusp. Petals filament-like, or minute teeth, or none. Stamens 5, inserted on the base of the sepals. Ovary 1-ovuled. Style deeply 2-parted. Fruit a utricle inclosed in the persistent calyx, at length bursting longitudinally. (Greek paronuchia, a whitlow or felon, the name applied to an herb used as a remedy.)

1. *P. franciscana* Eastw. Stems 4 to 12 in. long, tough, the internodes very short (only 1 to 2 lines long at base); leaves oblanceolate, acute, cuspidate, 2 to 4 lines long, much crowded on the branches and branchlets, especially towards the ends; stipules hyaline; flowers 1 line long, obviously pediceled, 3 or 4 in the axils.—Grassy hilltops near the ocean: San Francisco Co. to Sonoma Co.; nat. from Chile.

### 12. *ACHYRONYCHIA* T. & G.

Glabrous plants with spatulate leaves and large hyaline stipules. Leaves of the opposite pairs unequal. Flowers bright silvery-white by reason of the scarious calyx-lobes, borne in dense axillary cymose clusters. Calyx-lobes 5. Petals none. Stamens 10 to 15, only 1 to 5 anther-bearing. Style bifid, included. Utricle thin, included in the calyx. (Greek achuron, chaff, and onyx, onychos, a finger nail, in reference to the thin shining calyx-lobes.)

c

363. *Achyronychia cooperi* T. & G.;  
a, habit x 2 $\frac{1}{2}$ ; b, fl. x 6; c, calyx  
spread open x 6.

1. *A. cooperi* T. & G. Fig. 363. Stems 2 to 5 in. long, slender, prostrate, radiating from the crown of an annual root; leaves spatulate,  $1\frac{1}{2}$  to 9 lines long; flowers 1 line long, in conspicuous dense axillary cymes; calyx-lobes scarious, their lower third fleshy-herbaceous like the urn-shaped calyx-tube.—Sandy washes and valleys, Mohave and Colorado deserts. May.

### 13. *SCÓPULOPHILA* Jones

Perennial with erect stems and linear leaves. Stems arising from a woody root crown crowded with scales and lacerate-fringed stipules. Flowers sessile in small axillary 1 to 3-flowered clusters. Calyx tube  $\frac{1}{4}$  to  $\frac{1}{3}$  as long as the lobes, the 5 lobes membranous with a central lanceolate green spot. Stamens 10, 5 fertile, the 5 lanceolate staminodes petaloid, each bearing at base a circular red scale. Style

long but not exserted, 3-cleft. Fruit unknown. (Greek skopelos, a rocky peak, and phileo, to be fond of. The plants growing in rocky places in the desert.)

1. *S. rixfordii* (Bdg.) M. & J. Fig. 364. Stems several, branching, strict, 3 to 5 in. high; leaves 2 to 4 lines long; calyx  $1\frac{1}{2}$  lines long, the staminodes as long as the calyx-lobes.—Rocky places, 4500 to 6000 ft.: Owens Valley; e. to southern Nev. (*Eremolithia rixfordii* Jepson.)

### 14. *SCLERÁNTHUS* L. KNAWE

Indifferent annuals with subulate leaves and no stipules. Flowers small, greenish, clustered. Petals none. Calyx deeply 5-lobed, the cup-like tube indurated and inclosing the utricule. Stamens 10 or 5. Ovary 1-ovuled. Styles 2, distinct. (Greek scleros, hard, and anthos, flower, referring to the hardened calyx-tube.)

1. *S. ánnuus* L. GERMAN KNOTGRASS. Stems much branched, spreading, 2 to 3 in. long; flowers 1 to  $1\frac{1}{2}$  lines long, sessile in the forks; calyx  $1\frac{1}{2}$  lines long, its lobes narrowly scarious-margined.—Placerville; introd. from Eur.

### 15. *VACCÁRIA* Medic.

Glabrous glaucous annual with sessile leaves and showy red flowers in a broad loose flat-topped corymb. Calyx synsepalous, ovate, with 5 prominent angles. Petals 5, clawed, not appendaged. Stamens 10. Styles 2. Ovary 1-celled but with rudimentary partitions at base. Capsule ovate, dehiscent at apex by 4 short teeth. (Latin vacca, cow, some species used for fodder.)

1. *V. vulgaris* Host. COW-HERB. Strictly erect, dichotomously branching above, 2 to 3 ft. high; leaves ovate or the upper lanceolate, 3 to 4 in. long with cordate-clasping base; flowers 7 to 9 lines long; petals red, the blade obcordate and claw linear.—Grain-field weed: Dulzura, San Diego Co.; San Bernardino Val-

364. *Scopulophila rixfordii*  
M. & J.; a, habit x  $\frac{1}{2}$ ; b, fl.  
spread open x 8.

ley; Sonoma; College City; Lundy, Mono Co.; Plumas Co.; Honey Lake Valley; Jess Valley and Lake City, Modoc Co.; nat. from Eur.

#### 16. **SAPONARIA** L. SOAPWORT

Ours a stout perennial. Flowers white, in corymbed clusters. Calyx cylindric. Petals with a crest of 2 subulate teeth. Otherwise similar to *Vaccaria*. (Latin *sapo*, soap, the mucilaginous juice with saponaceous qualities.)

1. *S. officinalis* L. BOUNCING BET. Erect, 2 to 3 ft. high, glabrous; leaves ovate, acute, 3 to 4 in. long; blade of petals cuneate-obovate, notched at apex, 6 to 7 lines long.—Escaped garden plant: Sacramento River cañon (Delta and Castella); e. of South Fork Peak, Lassen Co.; native of Eur.

#### 17. **VELEZIA** Loeffl.

Annuals with tough dichotomous stems and sparse foliage. Flowers pink, solitary in the axils of the subulate leaves, or in clusters of 2 or 3, divaricately divergent from the stem, borne on short peduncles or sessile. Calyx slender, elongated-cylindric, 15-ribbed, sharply 5-toothed. Petals small, with minute filiform crests, the blade in ours notched. Stamens 5. Styles 2. Capsule slender, terete, 4-valved at the summit. (Cristobal Velez, friend of Loeffling.)

1. *V. rigida* L. Stems slender, trailing, 4 to 8 in. long, in age readily breaking up at the joints; herbage glandular-puberulent; leaves subulate, 2 to 6 lines long; blade of petals 1 line long; capsule sheathed by the calyx. 6 to 7 lines long; seeds laterally meniscoid.—Dry foothills: La Grange, Stanislaus Co.; Hupa, Humboldt Co.; introduced from s. Eur.

#### 18. **SILÈNE** L. CATCH-FLY. CAMPION

Annual or perennial herbs, more or less viscid and mostly large-flowered. Calyx tubular or inflated, 5-toothed. Petals 5, with long claws, these sometimes with auricles at summit; junction of the claw and blade commonly furnished with 2 scales; blades spreading, entire, or more commonly cleft or laciniate. Stamens 10. Styles 3, rarely 4. Capsule opening by 3 or 6 teeth at apex. (Greek *sialon*, saliva, the stems and other parts being viscid.)

##### A. Annuals.

- Calyx-ribs conspicuous, about 20-nerved. . . . . 1. *S. multinervia*.  
 Calyx 10-nerved, the nerves sometimes weak or obscure.  
 Internodes not glandular; flowers in one-sided racemes. . . . . 2. *S. gallica*.  
 Upper internodes with a glandular black band; flowers in cymes or panicles. . . . . 3. *S. antirrhina*.

##### B. Perennials.

1. *Flowers large, mostly  $\frac{3}{4}$  to 2 in. broad (except no. 7); petals 4 to 6-cleft; stems leafy.*  
 Corolla crimson; mostly low altitudes.  
 Plants 2 to 5 ft. high; corolla  $\frac{1}{2}$  to  $\frac{3}{4}$  in. broad. . . . . 4. *S. laciniata*.  
 Plants mostly  $\frac{1}{2}$  to 1 ft. high; corolla 1 to  $1\frac{1}{2}$  in. broad. . . . . 5. *S. californica*.  
 Corolla white, yellowish or pink; plants mostly 3 to 7 in. high.  
 Herbage grayish; corolla much exserted; north coast. . . . . 6. *S. hookeri*.  
 Herbage dull or yellowish green; corolla scarcely exserted; high montane, S. Cal. . . . . 7. *S. parishii*.  
 2. *Flowers smaller, mostly 3 to 6 (or 10) lines broad.*  
 Flowers solitary in the upper axils or terminal, the stems very leafy throughout.  
 Calyx broadly turbinate-campanulate; flowers nodding on deflexed pedicels; petals 4 to 6-cleft. . . . . 8. *S. campanulata*.  
 Calyx broadly oblong; flowers erect; petals notched, the lobes divergent. . . . . 9. *S. menziesii*.  
 Flowers mostly scattered in a naked panicle or rarely solitary; stems mostly leafy at base or on lower part.  
 Flowers nodding or mostly so; stamens and style long-exserted.  
 Petals 4-cleft. . . . . 10. *S. lemmonii*.  
 Petals 2-cleft. . . . . 11. *S. bridgesii*.  
 Flowers erect or mainly so; stamens and style included or little exserted.  
 Mostly of middle altitudes or on the sea coast.  
 Calyx campanulate, cleft to the middle or nearly, about  $\frac{1}{2}$  as long as the corolla; petals 4-toothed; scales none. . . . . 12. *S. aptera*.  
 Calyx toothed at summit, its teeth relatively short; scales present.

- Calyx narrowly cylindric.  
 Auricles none or feebly developed; scales long-lanceolate, entire.  
 Petals 4-cleft; capsule long-stiped.....13. *S. occidentalis*.  
 Petals 2-cleft; capsule sessile.....14. *S. pectinata*.  
 Auricles present; scales various; capsule stiped.  
 Petals 4-cleft; scales laciniate or fimbriate.  
 Ovary with minute valvular cap; claws glabrous; leaves mostly 2 to 6 lines broad.....15. *S. montana*.  
 Ovary with conspicuous valvular cap  $\frac{1}{2}$  as long as the ovary; claws woolly; leaves mostly  $\frac{1}{2}$  to 1 line broad.....16. *S. bernardina*.  
 Petals 2-cleft; scales entire or toothed, not fimbriate; claws woolly.....17. *S. verecunda*.  
 Calyx oblong-campanulate; petals unequally 4-cleft; claws glabrous; sea coast.....18. *S. grandis*.  
 High montane, mostly above timber line; calyx broadly cylindric or oblong-campanulate.  
 Stems from a loosely branched crown.....19. *S. douglasii*.  
 Stems caespitose.  
 Leaves 2 to 3 lines broad.....20. *S. grayi*.  
 Leaves mostly 1 line broad.....21. *S. watsonii*.

1. *S. multinervia* Wats. Annual; stems erect, simple or branching from the base, 7 to 16 in. high; herbage pubescent throughout, viscid-glandular above; leaves linear to lanceolate, 1 to 2 in. long; flowers short-pedicel in close terminal clusters on the unequal branches of the cymosely forked inflorescence, or on mostly long (3 to 15 lines) pedicels in the forks; calyx ovate, broadly so in fruit, 3 to 4 lines long, about 20-ribbed, the ribs strong and equally prominent; petal blades small, pink, 2-cleft with obtuse lobes, without scales, not exceeding the subulate spreading calyx-teeth or very little; claws without auricles; capsule nearly sessile, ovate.—Coast region, Marin Co. to Santa Barbara Co. and the Santa Barbara Isls.

2. *S. gállica* L. WINDMILL PINK. Erect, simple to freely branched, 10 to 15 in. high, hirsute or hispidulous with spreading hairs; leaves spatulate-obovate, 1 to  $1\frac{1}{2}$  in. long; flowers in a mostly 1-sided raceme on very short (1 to 2 lines long) pedicels; corolla white or flesh-color, 3 to  $4\frac{1}{2}$  lines broad; petal blades obovate and entire, the scales small; ovary almost completely 3-celled.—Weed everywhere in fields and along roadsides, the only common pink: nat. from Eur. The petals are commonly twisted one-fourth round or nearly so, thus resembling the fans of a turbine windmill. Flowers not withering early in the morning. Apr.-May.

3. *S. antirrhina* L. SLEEPY CATCHFLY. Stems erect, slender, sparingly branched, 1 to  $2\frac{1}{2}$  ft. high; herbage minutely puberulent below, mainly glabrous above, the upper internodes with a black glandular band at the middle; leaves oblong-lanceolate or linear, 1 to 2 in. long; inflorescence paniculate; pedicels 3 to 6 lines long, filiform; flowers small; petals pink or red, emarginate, the blade 1 line long; scales minute; capsule ovoid, 3 lines long.—Sandy soil, almost throughout Cal., but nowhere common.

4. *S. laciniata* Cav. Stems branching from the base, stiffly erect or climbing amongst bushes, knotty below, 2 to 5 ft. high; herbage finely scabrous-puberulent and a little glandular; leaves elongated and narrowly lanceolate, or linear-lanceolate, and acute, sometimes varying to obovate, 2 to 6 in. long, narrowed to a sessile base; flowers terminal on the branches of a naked panicle, sometimes in clusters, crimson,  $\frac{1}{2}$  to  $\frac{3}{4}$  (or 1) in. broad; calyx cylindric, 8 to 9 lines long, its obtuse teeth 1 line long; petals narrow, deeply 4-cleft into lanceolate divisions; scales erect, denticulate; capsule oblong, usually exserted at maturity.—Foothills, 500 to 5300 ft.: coastal S. Cal., n. to San Luis Obispo Co.; e. to N. Mex., s. to Mex.

365. *Silene californica* Dur.;  
 fl. x  $1\frac{1}{2}$ .

5. *S. californica* Dur. INDIAN PINK. Fig. 365. Stems 1 or several, erect or half-erect, very leafy,  $\frac{1}{2}$  to 1 ft. high or reclining amongst bushes and up to  $3\frac{3}{4}$  ft. high; herbage puberulent and more or less glandular; leaves elliptic-ovate or ovate to oblanceolate, more or less abruptly acuminate, 1 to  $3\frac{1}{2}$  in. long; pedicels  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; calyx oblong, soon turbinate or obovate-distended, 7 to 11 lines long, its teeth lanceolate; corolla crimson, 1 to  $1\frac{1}{4}$  in. broad; petals deeply 4-cleft, the middle segments the longer, all the segments toothed, or the lateral entire or rarely all entire; scales 2 to 4, conspicuous, incurved; capsule obovoid, 6 to 8 lines long, not exceeding the broad calyx; seeds regularly papillate, the papillae with a depression in the center.—Open woods of cañons: Tehachapi Range; Sierra Nevada from Tulare Co. to Shasta Co., 2000 to 5000 ft.; Coast Ranges from Santa Cruz Co. to Del Norte Co., 800 to 2000 ft.; n. to southwestern Ore. The most widely distributed native *Silene* in cent. and n. Cal.

6. *S. hookeri* Nutt. Stems several, 3 to 5 in. high, erect or decumbent, arising from slender rootstocks derived from the crown of a perennial taproot; herbage grayish pubescent or glabrate; leaves obovate to oblanceolate, attenuate at base, acute at apex, 1 to 2 in. long; flowers few, solitary in the upper axils, or often only a single terminal one; calyx at first clavate-tubular, 8 to 10 lines long,  $1\frac{1}{2}$  to 2 lines broad, its lanceolate teeth  $\frac{1}{4}$  as long as the tube; calyx in age strongly turbinate, becoming 4 lines broad; corolla white or pink, 1 to 2 in. broad; petals deeply slashed into 4 lacinate or linear entire or cleft lobes; scales conspicuous, only the very tips free, entire or notched; capsule globose-ovate.—Open woodlands: Mendocino Co. and n. to western Ore. May-June.

7. *S. parishii* Wats. Stems several from the slender branching crown of a fleshy taproot, 4 to 7 or 10 in. high; herbage including the calyx densely pubescent; leaves narrowly or sometimes broadly lanceolate to oblanceolate, acuminate,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; flowers in terminal 1 to 4-flowered clusters; calyx yellowish, broadly cylindric, 8 to 11 lines long, the lanceolate teeth 2 to 3 lines long; corolla white or lemon-yellow, little exerted from the calyx, about 5 to 7 lines broad, the blades of the petals cut nearly to base into about 4 narrowly lanceolate or subulate segments, with a supplementary tooth on each side at base; seeds with a double marginal crest of flattened tubercles.—Among rocks or in loose granitic soil in pine forest, 8000 to 11,000 ft., chiefly north slope: San Gabriel Mts.; San Bernardino Mts.; San Jacinto Mts.

8. *S. campanulata* Wats. Stems erect, leafy, many from the thick crown of a perennial taproot, 9 to 11 in. high; herbage green, finely glandular-puberulent; leaves oblanceolate to ovate, acute to acuminate, sessile,  $\frac{3}{4}$  to 1 in. long; flowers racemose, on deflexed pedicels 3 to 4 lines long; calyx broadly campanulate, 4 to 6 lines long, its broad rounded teeth  $\frac{1}{2}$  to  $\frac{1}{2}$  as long as the tube; petals greenish white or flesh-tinted, 4 to 6-cleft into linear lobes, the lobes 2-cleft at apex; auricles broad; scales well developed, several cleft and toothed.—Northern Mendocino Co. to western Siskiyou Co. Var. *GREENEI* Wats. Finely and often rather densely pubescent to glabrous, but not at all or scarcely glandular.—Western Siskiyou Co. Var. *PETROPHILA* Jepson. Stems and leaves puberulent, not glandular, glaucous; leaves ovate; petals pale yellow.—Salmon Summit, sw Siskiyou Co.

9. *S. menziesii* Hook. Stems slender, erect, very leafy, 3 to 11 in. high, arising from slender branching rootstocks derived from a perennial root; herbage puberulent; leaves obovate to oblanceolate, tapering to base, acute or short-acuminate at apex,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; flowers

366. *Silene lemmonii* Wats. :  
fl. x  $2\frac{1}{4}$ .

few in the axils of the reduced upper leaves, on pedicels 4 to 6 (or 15) lines long; calyx oblong, 2 to 3 lines long; corolla 3 to 4 lines broad; petals narrowly fan-shaped, deeply and broadly notched, with or without small lateral teeth; claws without scales or with small ones.—Montane, 3000 to 9000 ft.: San Bernardino Mts.; Sierra Nevada from Tulare Co. n. to Modoc Co. thence w. to Humboldt Co.; n. to Brit. Am., e. to Mo.

10. *S. lemmönii* Wats. Fig. 366. Stems slender, erect, very leafy at base. 8 to 14 in. high, arising from the slender branched rootstocks crowning a deep-seated taproot; herbage puberulent and somewhat glandular; basal leaves narrowly obovate, acute, narrowed at base,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; stem leaves similar or linear or lanceolate, the upper remote and much reduced; flowers nodding, in a narrow few-flowered panicle; calyx 3 to  $3\frac{1}{2}$  lines long, oblong (soon turbinate-distended by the ovoid capsule), scarious, with 10 green nerves, the alternate ones ending in the short rounded teeth; corolla dull or pale yellowish white, 4 to 6 lines broad; blade of petals 4-cleft into linear-subulate segments, the segments entire or rarely lobed; scales entire or 2-toothed, erect; auricles broad, rounded; claws woolly-pubescent; stamens long-exserted, twice as long as the corolla.—Open pine forest in the mts., 4000 to 6500 ft.; Cuyamaca Mts. to the San Bernardino Mts. and San Gabriel Mts.; Sierra Nevada from Tulare Co. n. to Modoc and Shasta Cos. The most common *Silene* in the coniferous belt.

367. *Silene aptera*  
Greene; fl. x 2.

11. *S. bridgèsii* Rohrb. Stems 1 to 4 from the crown of a taproot, leafy,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  ft. high; herbage glandular-puberulent; leaves sessile, lanceolate to oblanceolate, acute or acuminate, sometimes varying to oblong-lanceolate, 1 to  $2\frac{1}{2}$  in. long; flowers nodding, verticillately racemose or in a narrow loose panicle with spreading branches; calyx nearly cylindric, soon clavate or obovate in fruit, 3 to 5 lines long, the teeth acute or lanceolate,  $\frac{1}{4}$  to  $\frac{1}{3}$  as long as the tube; corolla white or purplish, 5 to 8 lines broad; petal blades 2-cleft into linear segments; scales lanceolate; stamens and style long-exserted; capsule ovate-globose.—Montane, 4000 to 5700 ft.; Sierra Nevada from Amador Co. to Tulare Co.

12. *S. áptera* Greene. Fig. 367. Stems very slender, erect, 9 to 14 in. high, one or several from the condensed crown of a taproot, the leaves chiefly basal, the stems with mostly a single pair at or near the middle; herbage minutely pubescent; leaves linear or linear-subulate,  $1\frac{1}{2}$  to  $3\frac{1}{4}$  in. long,  $\frac{1}{2}$  to  $1\frac{1}{4}$  lines wide; stems 1-flowered, or few-flowered and loosely cymose; calyx campanulate,  $3\frac{1}{2}$  to  $4\frac{1}{2}$  lines long, cleft to the middle or below into lanceolate acute scarious-margined lobes; corolla nearly twice as long as the calyx, 5 to 7 lines broad; petal blades shallowly 4-notched or -lobed, the broad claws hairy-tomentulose; scales and auricles none; capsule oblong, exceeding the calyx.—Hockett Mdw., Tulare Co., 8500 to 9000 ft.

368. *Silene occidentalis* Wats.; fl. x 2.

13. *S. occidentális* Wats. Fig. 368. Stems erect, 13 to 19 in. high, 1 to 4 from the crown of a stout taproot; herbage viscid-glandular; basal and lower leaves narrowly obovate or oblanceolate,

369. *Silene pectinata* Wats.;  
fl. x 2.

acute, narrowed gradually at base into a long slender margined petiole, 2 to 4½ in. long, the upper linear or lanceolate, acuminate, 1 to 2 in. long; flowers terminal on the forks of a loosely branched panicle; calyx narrowly tubular or soon slightly distended above the middle, 6 to 9 lines long, its teeth obtuse; corolla purple or dull white, 6 to 10 lines broad; petal blades cuneate, cleft half way into 4 or 5 linear or lanceolate segments; claws without teeth or auricles; scales linear or lanceolate, nearly entire; capsule oblong-cylindric, 5 to 6 lines long, on a stipe 2 lines long.—Montane, 4400 to 6000 ft., n. Sierra Nevada from Alpine Co. to Modoc Co. Var. *NANCTA* Jepson. Panicles loose, broad, with white flowers; blade of the petals cut into 2 divergent lanceolate lobes, each with one small lateral tooth;

scales lanceolate, very long, entire.—Hockett Mdw., Tulare Co.

14. *S. pectinata* Wats. Fig. 369. Stems erect, 1½ to 2½ ft. high, 1 or 2 (or several) from the crown of a stout taproot, the leaves in a coarse tuft at base or the lower part of the stem with a few remote pairs; herbage very gummy or glandular-pubescent; leaves elliptic-ovate to lanceolate, acute or acuminate, 2 to 3½ in. long; flowers erect, few in a narrow or rather strict panicle; calyx cylindric, soon turbinate-distended or ovoid, 5 to 6 lines long, the teeth long-lanceolate. ⅓ to ½ as long as the tube and usually exceeding the mature capsule; corolla deep red, 6 to 8 (or 9) lines broad; petal blades cuneate, broadly notched, with rounded lobes; scales lanceolate or subulate, entire or notched; capsule ovoid, sessile or nearly so, 3 to 4 lines broad.—E. slope Sierra Nevada, from Mono Co. to Lassen Co., thence w. on the interior plateau to ne. Shasta Co.

370. *Silene montana* Wats.; long. sect. fl. x 2.

15. *S. montana* Wats. Fig. 370. Stems several to many, erect, 9 to 16 in. high, from the branching crown of a taproot; herbage puberulent, glandular above; leaves narrowly linear-lanceolate or -oblanceolate, 1 to 2¼ in. long; flowers in a spicate panicle; calyx cylindric, soon clavate-distended, 6 to 7 lines long, its short teeth very acute and narrowly scarious-margined; corolla greenish white to rose, 4 to 7 lines broad; petal blades cut at apex into 4 (or 6) narrow segments; scales 2, fimbriate or toothed; auricles roundish, commonly denticulate; filaments scarcely exerted; capsule slender-cylindric, tapering to apex, 4 to 5 lines long, included, its stipe 1½ to 2 lines long.—Montane, 4000 to 6500 ft.: White Mts.; Sierra Nevada from Tulare Co. to Lassen Co.; Mt. Hull, Lake Co.

371. *Silene bernardina* Wats.;  
a, fl.; b, petal. x 2.

16. *S. bernardina* Wats. Fig. 371. Stems erect, densely leafy at base, 7 to 15 in. high, several to many from the loosely branching crown of a stout taproot or sometimes caespitose; herbage dark green, glandular-puberulent throughout, or often grayish pubescent below; leaves grass-like, narrowly linear- or subulate-lanceolate, acuminate, 10 to 16 lines long, ½ to 1 (or 2) lines wide; flowers in a narrow panicle; calyx cylindric, at length

turbinate-distended, 6 lines long, its teeth broadly lanceolate, acute, scarious-margined, 1 to  $1\frac{1}{2}$  lines long; corolla white, nearly half longer than the calyx, 3 to 4 lines broad; petal blades 4-cleft, or deeply 2-cleft with the divergent lobes again 2-cleft to middle; claws commonly sparingly woolly on lower part; scales long, lacinate nearly or quite to the base; auricles rounded or lanceolate; capsule ovoid,  $3\frac{1}{2}$  to 4 lines long, long-stiped.—Montane, 5000 to 8000 ft.: Sierra Nevada from Fresno Co. to Tulare Co.

17. *S. verecunda* Wats. Fig. 372a. Stems erect or decumbent, several from the branching crown of a stout taproot, leafy along the lower part of the stem and also very leafy at base,  $\frac{1}{2}$  to 1 ft. high; herbage finely pubescent below, glandular-viscid above; leaves linear-lanceolate, acuminate; flowers in 1 to 3-flowered peduncled clusters scattered along the simple or

sparingly branched flowering stems, the pedicels short and stout; calyx densely pubescent and also glandular, cylindric, 5 to 6 lines long, or becoming clavate or obovate as the fruit develops; corolla rose-color, 4 to 6 lines broad; petal blades cleft to the middle into 2 entire or slightly toothed oblong lobes, and with 2 nearly obsolete lateral lobes or rounded teeth; scales broadly oblong, obtuse or often notched; claws woolly pubescent; auricles

rounded; capsule ovoid, slightly exserted, sessile or stiped; seeds papillate, the papillae developed into a crest on the margin.—Coast Ranges from San Francisco s. to the Santa Ana Mts., passing into the variety. May-Sept. The stipe is very variable in length. Var. *PLATYOTA* Jepson. Fig. 372b, c. Stems slender, branching above and forming a mostly open panicle with scattered flowers on long pedicels or sometimes in 3-flowered short-peduncled clusters; basal leaves oblong- to linear-oblancheolate, narrowed at base to a margined petiole,  $1\frac{1}{2}$  to 4 in. long; calyx lightly pubescent; petals pink, purple, or (?) greenish white, very narrow; scales mostly lanceolate or linear; auricles rounded or acute.—High montane, 5000 to 9000 ft.: s. Sierra Nevada from Fresno Co. to Tulare Co.; San Gabriel, San Bernardino, San Jacinto and Cuyamaca mountains.

372. *Silene verecunda* Wats.; a, petal; b, var. *platyota* Jepson, fl.; c, petal. x 2.

373. *Silene grandis* Eastw.; fl. x 2.

18. *S. grandis* Eastw. Fig. 373. Stems  $\frac{3}{4}$  to 2 ft. high, very stout, strongly thickened at the nodes, unbranched, densely leafy, bearing peduncled or subsessile clusters of flowers in the axils of the somewhat reduced upper leaves; stem leaves roundish-ovate, shortly acute, 1 to 2 or 3 in. long, sessile or drawn down to a margined petiole, the pairs connate-clasping by a broad base; basal leaves similar but long-petioled; calyx oblong-campanulate, 5 to 7 lines long, scarious between the green nerves, which are densely hairy or velvety, its teeth roundish, scarious margined; petal blades unequally 4-cleft, the two middle ones longer, truncate, toothed or shortly cleft, the lateral very small, lanceolate, strongly divergent; scales quadratish, truncate, toothed; claws glabrous; auricles narrow, rounded; capsule oblong, stipitate, slightly exceeding calyx.—Sea bluffs of Marin and Sonoma Cos. Var. *PACIFICA* Jepson.

Much more slender and less densely leafy; leaves narrower, the basal 2 to 3 in. long on petioles nearly twice as long; claws glabrous.—Sea coast, San Francisco to Eureka. A transition to *S. verecunda*.

19. *S. douglásii* Hook. var. *monántha* Rob. Stems erect, several from the loosely branching crown of a taproot, 10 to 20 in. high, the leaves chiefly basal, the stem with mostly 1 or 2 remote pairs; herbage very minutely pubescent or nearly glabrous, especially below; leaves linear-lanceolate to oblanceolate, tapering to both ends, 1 to 2½ in. long; stems (or the main branches) 1 or more commonly 3 to 5-flowered; calyx oblong-cylindric, soon inflated and oblong-campanulate, 6 to 7 lines long, its teeth roundish, often a little constricted at base, obtuse at apex or at length with the membranous margins inflexed and thus acute; corolla dull white, 5 to 8 lines broad; petal blades 2-cleft, the lobes entire; claws somewhat exserted; scales oblong entire; auricles obtuse or acute; capsule elliptic or oblong, 4 to 5 lines long included, on a stipe 1½ lines long.—Montane, 6000 to 8000 ft.: Placer Co. n. to Modoc Co., thence to w. Siskiyou Co.

20. *S. grayi* Wats. Stems erect, caespitose, 4 to 7 in. high, arising from the branching crown of a taproot; herbage finely puberulent, glandular above; leaves linear to oblanceolate, 5 to 8 lines long, mostly 2 to 3 lines broad, somewhat fleshy, densely crowded at base, the cauline pairs few and reduced; flowers 1 to 4 or 5, in a loose terminal cluster; calyx purplish, broadly cylindrical, soon ovoid-distended, 5 lines long, the teeth rounded; corolla pink, 3 to 4 lines broad; petal blades bifid, the segments each bearing a lateral tooth; scales lanceolate; auricles narrow, truncate; capsule obovoid, 4 to 5 lines long, the stipe almost none.—High montane, above timber line, 7000 to 8000 ft.: Medicine Lake Mts.; Mt. Shasta; Mt. Eddy; near Preston Peak.

21. *S. watsonii* Rob. Fig. 374. Flowering stems densely caespitose on the branched crown of a taproot, 3 to 5 in. high, nearly filiform; herbage glandular-puberulent; leaves mostly crowded at base, narrowly linear to narrowly oblanceolate, ¼ to 1½ in. long, rarely exceeding 1 line in breadth; flowering stems with 1 terminal flower or often with 1 to 3 lateral

374. *Silene watsonii* Rob.; a, fl.; b, petal; c, another petal, typical form.  $\times 2$ .

short-peduncled flowers racemosely scattered below the terminal flower, sometimes a lateral flower replaced by a 2-flowered cluster; calyx purplish, broadly cylindrical or soon becoming obovate, 5 to 6 lines long, its teeth obtusish, scarious-margined; corolla white or rose-color, 4 to 6 lines broad; petal blades 1 to 2 lines long, bifid, the lobes obtuse, laterally short-toothed or entire; scales quadrate and obtuse, or 2-cleft; styles 3 (or 4), spirally twisted and exserted in anthesis; capsule cylindric-ovoid.—High montane, above timber-line, 6500 to 12,000 ft.: Sierra Nevada from Tulare Co. n. to Siskiyou Co., n. to Ore.

#### 19. AGROSTÉMMA L.

Tall hairy annual with linear exstipulate leaves. Flowers few, solitary, purplish-red, long-peduncled. Calyx-tube ovoid, with 10 strong ribs, the 5 teeth conspicuously prolonged into foliaceous lobes exceeding the 5 large entire unappendaged petals. Stamens 10. Capsule coriaceous, dehiscent by 5 teeth. (Latin *ager*, a field, and *stemma*, a wreath, the showy flowers in ancient times made into garlands.)

1. *A. githâgo* L. CORN COCKLE. Erect, rather strictly branching,  $1\frac{1}{2}$  to 2 ft. high, hirsute with long ascending or somewhat appressed whitish hairs, especially on the peduncles and calyx; leaves 2 to 4 in. long,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  lines wide, tapering to the acute apex; calyx-teeth  $\frac{5}{8}$  to  $\frac{7}{8}$  in. long, rather longer than the tube, or in age much longer and eventually deciduous from it; corolla  $\frac{7}{8}$  to  $1\frac{1}{2}$  in. in diameter; blade of petals obovate, black-dotted toward the claw.—Occasional grain-field waif: San Bernardino; St. Helena; College City; Live Oak; native of Eur.

### CERATOPHYLLACEAE. HORNWORT FAMILY

Aquatic submerged fragile herbs, with cylindric jointed stems. Leaves whorled, sessile, 2 to 3 times cut into linear or filiform divisions. Flowers minute, axillary, monoecious, without perianth but surrounded by an 8 to 12-cleft persistent involucre. Staminate flower consisting of numerous sessile anthers crowded on the receptacle. Pistillate flower consisting of one pistil; ovary superior, 1-celled, with a single ovule. Fruit indehiscent, beaked by the slender persistent style, spinose or tuberculate at base.

#### 1. CERATOPHYLLUM L.

The only genus. (Greek *keras*, a horn, and *phullon*, a leaf, the leaves cut into slender rigid divisions.)

1. *C. demersum* L. HORNWORT. Stems slender,  $\frac{1}{2}$  to 2 ft. long; leaves in whorls of 6 to 8, the segments prickly-dentate,  $\frac{1}{4}$  to 1 in. long; style as long as and forming a beak to the achene; achene variable, 1 to 2 lines long, with a horn or reflexed spur on each side near the base or spurless, the margin winged or wingless, and the sides sometimes tuberculate.—Ponds and lakes, widely distributed in Cal.; all continents. Aug. Seldom collected in fruit.

### NYMPHAEACEAE. WATER-LILY FAMILY

Aquatic perennial herbs with horizontal rootstocks or with tubers. Leaves floating or erect, peltate or deeply cordate. Flowers large, solitary, complete, on long peduncles. Sepals 3 to 12. Petals 3 to many. Stamens 6 to numerous. Carpels 3 to many, superior, united into a single pistil with many cells, or distinct.

Petals many; pistil 1, compound. . . . . 1. NYMPHAEA.  
Petals 3 or 4; pistils several, distinct. . . . . 2. BRASENIA.

#### 1. NYMPHAEA L. POND LILY

Aquatic or subterrestrial plants. Scapes and leaves from creeping rootstocks. Leaves cordate; petioles long. Sepals 5 to 12, conspicuous, orbicular, concave, mostly petal-like, unless at base or on the outside. Petals 10 to 20, small and thick, bearing more or less resemblance to staminodia. Stamens numerous, densely imbricated around the ovary, at length recurving; anthers linear; filaments very short. Ovary 10 to 25-celled, the stigmas radiating upon its truncate or disk-like summit. Fruit coriaceous-baccate. (Latin name of the water-lily.)

1. *N. polysépala* (Engelm.) Greene. INDIAN POND LILY. Leaves 6 to  $11\frac{1}{2}$  in. broad, 7 to  $14\frac{1}{2}$  in. long, rounded at apex, the lobes rounded and the narrow or closed sinus  $\frac{1}{3}$  to  $\frac{1}{2}$  the length of the blade; calyx yellow or brownish red, subglobose or somewhat cup-shaped, 3 (or when fully expanded 4 to 5) in. in diameter; sepals 9 to 12; petals 12 to 18, nearly or quite concealed beneath the many stamens; anthers dark red; stigmatic rays 10 to 24; fruit ovate or subglobose, 1 to  $1\frac{1}{2}$  in. in diameter, with short constricted neck and convex disk.—Ponds: near the coast, Santa Cruz Co. to Humboldt Co., 100 to 500 ft.; higher mts., 4500 to 7500 ft. (Yollo Bolly Mts. to Siskiyou Co.; Sierra Nevada from Mariposa Co. to Lassen Co.); n. to Ore.

2. **BRASËNIA** Schreb.

Leaves peltate, oval, floating, long-petioled from fleshy creeping root-stocks. Flowers small, dull purple. Sepals and petals 3 or 4. Stamens 12 to 18 with filiform filaments. Carpels 4 to 18, distinct, becoming indehiscent clavate pods. (Derivation unknown.)

1. *B. schreberi* Gmel. WATER SHIELD. Leaves 1½ to 4 in. long; petals linear, about 6 lines long.—Lakes and slow streams, 35 to 6200 ft.: Kern Cañon; Stockton; Lakeport; Lake Leonard, n. Mendocino Co.; Pitt River near Ft. Crook.

**RANUNCULACEAE. BUTTERCUP FAMILY**

Herbs with alternate or basal leaves (excepting the opposite-leaved climber *Clematis*). Flowers with the parts all free and distinct, commonly perfect, solitary, or in terminal racemes or panicles. Sepals usually 5, always more than 2, often petal-like. Petals usually 5, often more, sometimes minute or altogether wanting. Stamens indefinite, usually numerous. Pistils several, superior, always 1-celled, bearing a single style. Fruit a follicle or achene, rarely a berry. Seeds containing abundant endosperm and a minute embryo.—Leaves mostly palmately divided or lobed, in all cases without stipules, but the petioles often with a broad sheathing base. Flowers regular, except in *Delphinium* and *Aconitum*, and most frequently with a pronounced convex receptacle. Species of *Thalictrum* and *Clematis* are dioecious or polygamodioecious. *Actaea* has only 1 pistil. In *Paeonia* the petals and stamens are inserted on a fleshy disk.

**A. Ovary several to many-ovuled; fruit a follicle (a berry in no. 5).**

Flowers regular, without spurs.

Petals not spurred.

Flowers solitary, rarely 2 or 3.

Petals present.

Flowers brownish red; petals roundish, inserted on a fleshy disk.....

1. *PAEONIA*.

Flowers white; petals linear; disk none.....

2. *COPTIS*.

Petals none; sepals white (rarely pinkish or bluish).

Leaves simple, round-reniform.....

3. *CALTHA*.

Leaves compound.....

4. *ISOPYRUM*.

Flowers many, in racemes, white.....

5. *ACTAEA*.

Petals 5, prolonged backward into hollow spurs.....

6. *AQUILEGIA*.

Flowers irregular, complete, with spurs; sepals 5.

Upper sepal spurred.....

7. *DELPHINIUM*.

Upper sepal helmet-like.....

8. *ACONITUM*.

**B. Ovary usually with one ovule; fruit an achene.**

Leaves alternate or basal; flowers perfect (except in most *Thalictra*).

Petals none.

Cauline leaves in a single involucrel whorl of 3; flowers mostly large.....

9. *ANEMONE*.

Cauline leaves alternate; flowers inconspicuous.

Leaves simple; flowers perfect.....

10. *TRAUTVETTERIA*.

Leaves compound; flowers commonly dioecious.....

11. *THALICTRUM*.

Petals present.

Sepals spurred; achenes on a slender spike-like receptacle; diminutive herbs...

12. *MYOSURUS*.

Sepals not spurred; achenes crowded on a convex receptacle so as to appear capitate.

Petals with a nectar-pit on claw; sepals greenish or yellowish.

Flowers yellow or white; achene with a close coat.....

13. *RANUNCULUS*.

Flowers pink; achene utricular.....

14. *BECKWITHIA*.

Petals reduced to a minute stiped nectary; sepals white, corolla-like.....

15. *KUMLIENIA*.

Leaves opposite; flowers polygamous; achenes with a feathery tail; woody climber.....

16. *CLEMATIS*.

1. **PAEONIA** L.

Perennial herbs with ternately divided leaves. Flowers large, solitary and terminal. Calyx herbaceous, persistent. Sepals and petals 5 or 6, the latter and the numerous stamens borne on a fleshy disk adnate to the base of the calyx. Style short or none. Follicles 2 to 5, thick and leathery, several-seeded. (Paion, the physician of the gods.)

1. *P. brównii* Dougl. WESTERN PEONY. Somewhat fleshy plants 8 to 14 in. high; leaves glaucous or pale, ternately or biternately divided, chiefly basal, the lobes obovate to linear-spatulate; peduncles 1 to 2 in. long; flowers  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. broad; petals orbicular, plane, brownish red, thick and leathery, scarcely longer than the roundish concave sepals; follicles mostly 5, broadly oblong, smooth, 1 to  $1\frac{1}{2}$  in. long; stems several, bending over in age and the pods resting on the ground.—Brushy hillslopes, 600 to 5400 ft.: coastal S. Cal. and n. to San Luis Obispo Co.; Mendocino Co. to Siskiyou Co.; Sierra Nevada from Tuolumne Co. to Plumas and Modoc Cos.; n. to Wash., e. to Utah.

## 2. *CÓPTIS* Salisb. GOLDTHREAD

Low perennial herbs with slender rootstocks. Leaves basal, divided or compound. Stems scapose, bearing 1 to 3 white flowers. Sepals 5 to 7, petal-like. Petals 5 to 7, small, linear, hooded above. Stamens 10 to 25. Pistils 10 to 12, stipitate, in fruit forming an umbel of follicles. (Greek *koptein*, to cut, referring to the divided leaves.)

1. *C. láciniata* Gray. Scapes 2 or 3-flowered, 4 to 6 in. high; leaves trifoliate, each leaflet deeply 3 to 5-cleft or divided, or more or less completely replaced by 3 separate leaflets; leaflets ovate, serrate or incised,  $\frac{3}{4}$  to 2 in. long; sepals slender, 4 to 5 lines long, the slender petals a third shorter; follicles 4 to 6 lines long, exceeding the stipes.—Woods near the coast from Mendocino Co. to Del Norte Co.; n. to Wash.

## 3. *CÁLTHA* L. MARSH MARIGOLD

Perennial herbs, ours with round-cordate basal leaves and 1 to 2-flowered scapes. Rootstock short, vertical, bearing a fascicle of strong fibrous roots. Sepals 5 to 9 (in ours) white or bluish on back, showy. Petals none. Stamens numerous. Pistils 5 to 10 (or to 24), bearing ovules in 2 rows along the ventral suture, in fruit becoming follicles. (Ancient Latin name of the Marigold.)

1. *C. biflóra* DC. Scapes 1 or 2, erect, 2 to 10 in. high, exceeding the leaves; leaves crenate or nearly entire, 1 to 3 in. broad, broader than long, the basal lobes overlapping, or their inner tips turned inward and upward; sepals 6 to 9, oblong, 5 to 7 lines long; stamens about 130; follicles stipitate.—Subalpine, 6100 to 10,500 ft., in marshy slopes or wet meadows: Sierra Nevada from Tulare Co. to Plumas Co.; n. Humboldt Co. to w. Siskiyou Co.; n. to Alas.

## 4. *ISOPÝRUM* L.

Low glabrous slender perennials with (in ours) a cluster of fusiform tubers or thickened fibres. Leaves twice ternately compound, the leaflets 2 to 3-lobed, petiolulate. Flowers commonly white, solitary, terminal or axillary. Sepals 5, petal-like. Petals (in ours) none. Stamens 10 to 30. Follicles 5 to 11, oblong or ovate, 2 to several-seeded. (Isopyron, the Greek name of a species of *Fumaria*.)

Stamens about 23 to 27; peduncles surpassing the leaves.....1. *I. occidentale*.  
Stamens about 10; peduncles not surpassing the leaves.....2. *I. stipitatum*.

1. *I. occidentále* H. & A. Plant of delicate habit; stems from a cluster of slender fusiform roots, branching above, 4 to 10 in. high; leaflets obovate or fan-shaped, 5 to 9 lines long, glaucous beneath; flowers commonly white, rarely pink, 6 to 9 lines broad; filaments slender; follicles 5 to 7, sessile, 4 to 6 lines long; seeds 8 or 9, wrinkled.—Shady places in the hills or lower mts., 300 to 2000 ft.; widely distributed in the Coast Ranges and Sierra Nevada but very local: Gabian Peak; Mt. Hamilton; Vaca Mts.; Amador Co.; Kinsley, Mariposa Co.; Girard, Kern Co. Apr. (*Enemion occidentale* Drum. & Hutch.)

2. *I. stipitátum* Gray. Fig. 375. Tufted plant 1 to 3 in. high, the stems from a cluster of numerous fusiform tubers; leaves glaucous, the leaflets or divisions oblong-oblancheolate or oblongish, 2 to 4 lines long; flowers

375. *Isopyrum stipitatum* Gray; a, habit  $\times \frac{3}{4}$ ; b, fl.  $\times 2$ ; c, pistil  $\times 4$ .

Fig. 376. Stems one to several,  $1\frac{1}{2}$  to 3 ft. high, arising from the scaly terminal buds of the rootstock; leaves all cauline, none basal,  $\frac{1}{2}$  to 2 ft. long; leaflets broadly to narrowly ovate, rather deeply incised and sharply serrate, 1 to  $2\frac{1}{2}$  in. long; petioles rather short; racemes terminal,  $\frac{3}{4}$  to 1 in. long, or with 1 or 2 small lateral racemes in the axils of the upper leaves; sepals  $1\frac{3}{4}$  lines long, their tips often pinkish; petals none, or 1 to 7 (or 9) and white, oval to rhombic-spatulate, slender-clawed; stamens 11 to 35, 2 to 3 lines long; berries ellipsoid or subglobose, red or white, with polished surface, 3 to 5 lines long.—Wooded or brushy hills, mostly north slopes: Coast Ranges (mostly near the coast, commonly 100 to 2000 ft., from Santa Lucia Mts. to Siskiyou Co.); or in the higher mts., 4000 to 8200 ft. (San Bernardino Mts.; Sierra Nevada from Tulare Co. n. to Modoc Co.); n. to Alas., e. to Rocky Mts.

#### 6. *AQUILEGIA* L. COLUMBINE

Perennial herbs with ternately compound chiefly basal leaves, petiolulate leaflets and showy solitary flowers. Sepals 5, plane, colored like the petals. Petals 5, all alike and produced backward into large hollow spurs projecting below the calyx. Stamens numerous, some sterile inner ones with dilated filaments, appearing like scarious scales. Pistils 5, becoming several-seeded follicles. (Derivation doubtful, said by some to be from the Latin aquila, an eagle, on account of the claw-like spurs.)

whitish, 3 to 4 lines broad; filaments enlarged in the middle; follicles 6 to 11,  $2\frac{1}{2}$  to 3 lines long; seeds 3 to 5.—Brushy or wooded hillslopes, 2400 to 4500 ft.: Mt. Hamilton Range; Mendocino Co. to Siskiyou Co., thence e. to Modoc Co.

#### 5. *ACTAEA* L. BANEERRY

Perennial herbs with bi- or tri-ternately compound ample leaves. Stems tall, arising from short branching rootstocks and bearing 1 or 2 leaves. Flowers small, white, in a short terminal raceme. Sepals about 4, petal-like, roundish or obovate, concave, caducous. Petals 1 to 10, small, entire, or none. Stamens many, with small anthers and slender white filaments, longer and more showy than the petals or sepals. Pistil 1; ovules 10 in 2 rows; stigma broad, sessile, obscurely 2-lobed. Fruit a berry, somewhat poisonous. (Latin name of the Elder, transferred by Linnaeus to these plants.)

#### 1. *A. spicata* L. var. *arguta* Torr.

376. *Actaea spicata* var. *arguta* Torr.; a, fr. branch  $\times \frac{1}{2}$ ; b, fl.  $\times 2$ .

Flowers pendulous.

Blade of petals nearly obsolete.

Throat of petal spurs truncate, about 2 lines in diameter. . . . . 1. *A. truncata*.

Throat of petal spurs cut backward, about 4 lines in diameter. . . . . 2. *A. tracyi*.

Blade of petals 3 to 5 lines long. . . . . 3. *A. formosa*.

Flowers erect or soon becoming so. . . . . 4. *A. pubescens*.

1. *A. truncata* F. & M. Stems several, erect, branching, 1½ to 3½ ft. high; herbage glabrous; leaves biternate, the leaflets ¾ to 1¾ in. long, broad or roundish in outline, 3-cleft or -divided, or incised, crenately toothed; flowers scarlet, tinged with yellow, pendulous in anthesis, the spurs, therefore, erect, 8 to 9 lines long, truncate at the orifice, the blade almost none; sepals widely spreading, 9 to 11 lines long; follicles 8 to 10 lines long, conspicuously veined, the long styles persistent.—Moist shaded places in the lower hills, or at middle altitudes in the mts., almost throughout Cal. May-July. Var. *PAUCIFLORA* Jepson. A more compact plant; leaves mostly basal, these and the nearly naked stems forming a dense heavy tuft; stems 1 to 1½ ft. high, few-flowered.—High montane in the Sierra Nevada.

2. *A. tracyi* Jepson. Similar to the preceding; herbage puberulent and viscid throughout, especially on the stems; upper leaves reduced to small bracts; flowers larger and stamens longer; sepals reflexed; petal spurs usually spreading more widely, the throat nearly twice the diameter of the throat in no. 1, and with its orifice cut backward obliquely and not horizontally; styles very long.—Rocky places along streams: Mt. Diablo; Marin Co. to Napa and Mendocino Cos. A glabrous form is found in the Santa Cruz Mts. Rare. June-Sept.

3. *A. formosa* Fisch. Stems 1½ to 3 ft. high; flowers crimson to scarlet; sepals 8 to 10 lines long; petal blades yellow, truncate, about ½ to ½ the length of the crimson spurs which nearly or quite equal the spreading sepals; follicles 10 to 14 lines long.—Higher mts., Butte Co. to Siskiyou Co.; n. to Alas., e. to Utah.

4. *A. pubescens* Cov. Stems 9 to 18 in. high; leaves minutely soft-pubescent or quite glabrous; leaflets small (4 to 6 lines long), cleft and crenate at apex; flowers erect, cream yellow, varying occasionally to white or to shades of red, pink or purple; sepals oblong-ovate to ovate, 7 to 11 lines long, 4 to 5 lines broad; petal-blades obtuse, 4 to 5 lines long, their spurs 11 to 13 lines long.—Alpine, in rocky places, 9000 to 12,000 ft.: Sierra Nevada from Mariposa Co. to Tulare Co.

## 7. DELPHINIUM L. LARKSPUR

Herbs, ours perennial, with palmately divided leaves. Flowers in terminal racemes. Sepals 5, irregular, the upper one produced into a spur at the base. Petals 4, in unequal pairs, with small spreading usually oblique blade on a claw of about equal length, the upper developed backward into nectary-bearing spurs, which are concealed within the spur of the calyx. Pistils (in ours) 3, seldom more, becoming many-seeded follicles. (Greek delphinion, larkspur, derived from delphin, the flowers of some species resembling the classical figures of the dolphin.)

### A. Flowers red; follicles glabrous; seeds sharply angled, narrowly margined.

—Sect. PHOENICODELPHIS.

Leaves divided into narrowly linear or lanceolate divisions; stem leafy. . . . 1. *D. cardinale*.  
Leaves parted into broad mostly obtuse divisions.

Stem few-leaved; common. . . . . 2. *D. nudicaule*.  
Stem leafy; rare. . . . . 3. *D. purpureum*.

### B. Flowers blue, white, pink or lavender.—Sect. DELPHINASTRUM.

1. Root a globose tuber or a cluster of fleshy roots.

Leaves mostly twice palmately divided or cleft and toothed.

Follicles erect, glabrous; foothills and middle altitudes. . . . . 4. *D. decorum*.

Follicles strongly curved-diverging, pubescent; n. Mendocino to Siskiyou and Modoc; higher altitudes. . . . . 5. *D. menziesii*.

Leaves commonly pedately divided into very narrow, mostly entire, lobes; n. Sierra Nevada at higher altitudes. . . . . 6. *D. pauciflorum*.

## 2. Root a cluster of hard woody, often fusiform, fibres.

Leaves not fan-shaped; stems freely or sparsely leafy, at least with a few leaves towards the base; upper petals usually white, the lower simulating the color of the calyx. Stems very tall; flowers numerous; pedicels spreading, the racemes loose or, at least, broad; follicles glabrous.

Ultimate leaf-lobes little unequal, obtuse, mucronulate; raceme mostly loose; herbage glabrous; far North Coast Ranges.....7. *D. trollisifolium*.

Ultimate leaf-segments unequal, lanceolate or acute.

Flowers slightly puberulent; herbage glabrous; Sierra Nevada.....8. *D. scopulorum*.

Flowers rather densely pubescent; herbage pubescent; coast species.....9. *D. californicum*.

Stems tall; racemes commonly very strict or cylindric, sometimes loose; follicles puberulent.

Seeds densely covered with thin processes, as if scaly-echinate; Sierra Nevada, lower altitudes.....10. *D. hansenii*.

Seeds not scaly-echinate.

Coastal or interior valley species.

Petioles hirsute with spreading hairs, mostly short; racemes of medium length and often loose; flowers commonly royal purple, rarely pinkish; mostly central Coast Ranges.....11. *D. variegatum*.

Petioles finely canescent.

Sepals densely pubescent on the back (usually blurring the color) in a median longitudinal band; pedicels mostly 2 to 6 lines long; leaf-lobes mostly short; petioles mostly short; west-central Cal. chiefly.....12. *D. hesperium*.

Sepals lightly pubescent on the back (not blurring the color); pedicels mostly 4 to 12 lines long; leaf-lobes usually long; petioles often long; S. Cal. chiefly.....13. *D. parryi*.

Desert or transmontane species; leaves thickish; stems and petioles glabrous or nearly so.

Flowers a light but lively blue; leaves glabrous; Death Valley region, and Mohave and western Colorado deserts.....14. *D. parishii*.

Flowers deep-blue; leaves sparingly pubescent; chiefly east side of n. Sierra Nevada.....15. *D. andersonii*.

Leaves cuneately fan-shaped; stems scape-like; inner North Coast Ranges.....16. *D. uliginosum*.

1. *D. cardinale* Hook. SCARLET LARKSPUR. Stem stout, 3 to 6 ft. high, leafy; leaves 3 to 9 in. broad, divided into 5 to 7 narrowly linear or lanceolate divisions, the divisions usually again lobed or parted; racemes  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. long; pedicels of about the same length as the flowers; calyx bright scarlet; sepals 6 to 9 lines long, exceeded by the spur; petals mostly yellow, the upper unequally 2-lobed, one lobe truncate, the other very much longer, emarginate, and hairy at tip on inside; lower pair of petals with ovate blade commonly notched at apex, short-hairy on inside.—Among shrubs or bushes, mesas, foothills or washes, 500 to 1500 ft.: coastal S. Cal., e. to San Felipe Creek, s. to L. Cal.

2. *D. nudicaule* T. & G. RED LARKSPUR. Stems slender, 1 to 2 ft. high, few-leaved or quite naked; herbage glabrous or nearly so; leaves somewhat succulent, 3 to 5-parted into broad mostly obtuse divisions, the divisions cleft, lobed or entire; racemes 2 to 12-flowered, loose and open; pedicels 1 to  $3\frac{1}{2}$  in. long, the lower often much longer than the upper; calyx red, glabrous or very sparsely puberulent; sepals 4 to 6 lines long, the spur nearly one-half longer; petals partly or mostly yellow, the upper narrowly obovate, sharply notched at summit, much larger than the small cleft lower ones; follicles glabrous, divergent-curving.—Banks of rivulets and rocky summits: Coast Ranges, 800 to 3000 ft., from Santa Lucia Mts. to Siskiyou Co.; Sierra Nevada, 4000 to 8000 ft., from Mariposa Co. to Modoc Co.; s. Ore. Var. *LUTEUM* Jepson n. comb. Leaves sparsely short-hairy; flowers larger, pale yellow, pubescent; spur broader.—Marin and Sonoma coasts. (*D. luteum* Hel.)

3. *D. purpusii* Bdg. Stems  $1\frac{1}{2}$  to 3 ft. high; stems and petioles slightly pubescent, the leaves a little ciliate; leaves 2 to 3 in. broad, 3-cleft into very broad toothed or incised lobes; racemes sparsely flowered, 4 to 8 in. long; flowers purplish red or dull pink, disposed to dry lavender; sepals about 4 lines long, much shorter than the thickish spur; follicles 7 to 10 lines long.—Rocky slopes, Greenhorn Range.

4. *D. decorum* F. & M. Stem lax, 1 to  $1\frac{1}{4}$  (or 2) ft. high; herbage glabrous, or sometimes slightly pubescent, especially the petioles and pedicels;

basal leaves thick, often somewhat succulent, roundish in outline, 1 to 2½ in. broad, mostly shallowly 3 to 5-parted into broadly cuneate or roundish segments; segments entire, or 3-cleft or -lobed, the lobes obtuse, mucronate; upper leaves pedately 3 to 5 or rarely 7-parted into linear-oblong lobes; racemes mostly many-flowered, 2 to 4 (or 11) in. long; pedicels slender, spreading, ½ to 1 or 2 in. long; flowers purple-violet, glabrous or nearly so; sepals oval, 5 to 8 lines long, equaled or excelled by the spur; mature follicles thickish, oblong, glabrous, 5 to 6 lines long, erect or the tips spreading; seeds sinuous-roughened with short scales.—Open woods in the foothills of the Coast Ranges and Sierra Nevada; s. to the San Gabriel, San Bernardino, San Jacinto and Cuyamaca mountains. Var. *PATENS* Gray. Pedicels glabrous or sparsely glandular-pubescent; racemes mostly strict; flowers smaller (sepals 4 to 5 lines long), deep blue, magenta, pink or lavender-white; follicles diverging from below the middle.—Open places in woods: Sierra Nevada, 3000 to 8300 ft., from Calaveras Co. to Tulare Co.

5. *D. menzièsii* DC. Stem arising from a cluster of connected roundish or cylindric tubers, 6 to 11 in. high, slender, often flexuous, usually branching at the base, the branches often strongly divergent; herbage quite glabrous, or sometimes pubescent; leaves twice palmately divided and cleft into linear or oblong, mostly obtusish, lobes; racemes 2½ to 6 in. long, mostly few (2 to several)-flowered; pedicels spreading, ½ to 1 in. long, the lower usually elongated, 1 to 1½ in. long; flowers blue, sparingly pubescent, with short scattered hairs; sepals 4 to 8 lines long, ¾ to as long as the slender spur; follicles hirsutulose or nearly glabrous, 7 to 9 lines long, curving and strongly divergent from very base at maturity, rarely suberect; seeds narrowly subconic, rotately cellular-margined at the truncate end, and a little at the pointed end, rarely on the sides.—Northern Mendocino Co. to Siskiyou Co., 1000 to 6500 ft.; n. to B. C. and Mont.

6. *D. pauciflorum* Nutt. Stems low (5 to 15 in. high), slender, mostly simple, few-leaved, arising from a fascicle of oblong or fusiform tubers; leaves pedately divided into nearly distinct segments; segments linear or lanceolate (sometimes oblong), entire or some of them 1 or 2-toothed, 6 to 12 lines long; racemes few, 2 to 8 (rarely more)-flowered; pedicels spreading, 4 to 12 lines long; flowers blue to pink purplish; sepals 4 to 6 lines long, much shorter than the slender spur; follicles pubescent, short-oblong (4 to 6 lines long), more or less spreading at tip in age; seeds margined on the quadrate summit but not on the angles.—Montane, 5000 to 9100 ft.: Sierra Nevada from Mariposa Co. n. to Siskiyou Co.; n. to Wash., e. to Col.

7. *D. tróliifólium* Gray. Cow POISON. Stems coarse, 4 to 6 ft. high; herbage glabrous; leaves thinnish, 2½ to 5 in. broad, orbicular in outline, 5 to 7-cleft into cuneate segments, the segments incised or with rounded teeth, the upper leaves with acute teeth or segments; racemes very loose below, sometimes dense above, ¾ to 1 or 2 ft. long; pedicels widely spreading, 1 to 1¾ in. long, or the lowermost 3 to 5 in. long, hairy or glabrous; bractlets narrowly lanceolate, 2 to 4 lines long; flowers deep blue; sepals 4 to 5 lines long, the very slender spur nearly half again as long; follicles glabrous, 9 to 12 lines long, only slightly spreading, or sometimes strongly recurved-spreading.—Moist ground on edges of woods near the coast: Humboldt Co.; n. to Ore.

8. *D. scopulòrum* Gray var. *gláucum* Gray. Stems tall (2½ to 6 ft. high), very leafy; herbage glabrous, sometimes glaucous; leaves 4 to 6 in. broad, deeply 5 to 7-parted into cuneate divisions; divisions incised and cleft, the central lanceolate segments of each division prominent and salient; racemes 1 to 1½ ft. long; pedicels 5 to 7 (or 12) lines long, ascending; bractlets filiform, 4 to 6 lines long; flowers blue or purplish, puberulent, numerous in racemes 1 to 1½ ft. long; sepals 5 to 6 lines long, the spur about as long; lower petals cleft to the middle; follicles 5 to 6 lines long, glabrous.—High montane, 6000 to 8000 ft.: South Fork Santa Ana River, San Bernardino Mts.; Sierra Nevada from Mariposa Co. to Nevada Co.; n. to Alas. (*D. glaucum* Wats.) Var. *LUPORUM* Jepson. Leaves smaller (1¼ to 2¼ in.

broad), very light green, the segments of the divisions more nearly equal; flowers comparatively few (5 to 13), in a rather loose raceme; calyx lightly villous-pubescent.—High s. Sierra Nevada (Inyo, Fresno and Tulare Cos.), 10,000 ft.

9. *D. californicum* T. & G. COAST LARKSPUR. Stems stout,  $2\frac{1}{2}$  to 7 ft. high, sparsely pubescent, many-leaved; leaves very large, 4 to 6 in. broad, 2 to 4 in. long, deeply parted into 3 to 5 deeply incised segments; sinuses of the primary divisions mostly closed in the lower leaves, open in the upper; racemes very dense,  $\frac{3}{4}$  to  $1\frac{1}{2}$  ft. long; pedicels 4 to 7 lines long, or the lowest somewhat more; bractlets very long and slender (4 to 8 lines long); flowers rather densely pilose-pubescent, white or whitish, or somewhat purplish inside, never fully expanded; sepals 3 to 4 lines long, commonly shorter than the spur; follicles oblong, turgid, 4 to 5 lines long, hardly, if at all, diverging; seeds black, wrinkled.—Low hills near the coast: San Luis Obispo Co. to Marin Co.; also higher north slopes of inner Coast Range peaks (Mt. Diablo; Cedar Mt.).

10. *D. hanseni* Greene. HANSEN LARKSPUR. Stems slender or sometimes very coarse, commonly simple,  $1\frac{1}{4}$  to 4 ft. high; leaves twice or thrice palmately divided into narrow or oblong lobes; petioles hispid-hirsute; flowers pale blue to pink, lavender or white, essentially as in *D. hesperium* but usually smaller; raceme narrow, mostly dense,  $1\frac{1}{2}$  to 8 in. long; pedicels 2 to 4 lines long, or the lower sometimes 1 to  $1\frac{1}{2}$  in. long; seeds densely covered with minute scale-like processes.—Sierra Nevada foothills, 500 to 2500 ft., from Butte Co. to Tulare Co. Var. *ARCUATUM* Greene. Racemes more elongated ( $\frac{1}{2}$  to  $1\frac{1}{4}$  ft. long), looser; spur strongly curved or straight.—Higher foothills 2500 to 4000 ft., from Calaveras Co. to Kern Co.

11. *D. variegatum* T. & G. ROYAL LARKSPUR. Stems erect, simple or branching above,  $\frac{3}{4}$  to  $1\frac{1}{2}$  ft. high; herbage hispidulous with spreading hairs, especially at base; leaves regularly twice or thrice parted or divided, the segments oblong, mostly obtusish (or those of the upper leaves acute), mucronulate, usually diverging; raceme few (about 1 to 10)-flowered, loose, the pedicels  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, or the lower ones sometimes much elongated; flowers royal purple, rarely whitish lavender; sepals 7 to 12 lines long; spur stoutish, as long as the sepals, the tip often slightly curved; lower petals large, elliptic or roundish, commonly colored like the sepals; upper petals obliquely oblong, whitish; follicles oblong, rather turgid, 7 to 10 lines long, hispid-pubescent; angles of the seeds narrowly winged, the wings soft-cellular, commonly sordid.—Open grassy hills, commonly gregarious in small colonies: Coast Ranges near the coast from Mendocino Co. to San Luis Obispo Co. Var. *APICULATUM* Greene. Flowers usually on shorter pedicels in a cylindrical raceme.—Inner foothills from Butte, Tehama and Napa Cos. to Santa Clara Co.

12. *D. hesperium* Gray. WESTERN LARKSPUR. Stem commonly simple,  $1\frac{1}{2}$  to 3 ft. high, arising from a cluster of thick-fibrous roots or a single woody taproot; herbage shortly pubescent; leaves 2 to 3 times palmately cleft into oblong or linear spreading segments; raceme rather dense, virgate, 6 to 14 in. long; pedicels 2 to 6 lines long, or the lowest 1 in., strictly erect; flowers commonly blue, rarely pink or white or intermediate shades; sepals 4 to 6 lines long, equaled or exceeded by the straight spur, somewhat densely puberulent on the outside or the alternate ones with a rather definite puberulent band; petals little shorter than the sepals; follicles short-oblong, 3 to 5 (or 7) lines long, pubescent; seeds with a loose cellular whitish coat, which is produced into narrow wings on the angles.—Dry open ground in the foothills: Coast Ranges (Humboldt Co. to Contra Costa Co. and Monterey Co.). Flowering at beginning of the dry season; rather common, but occurring as scattered individuals, rarely in colonies. Var. *RECURVATUM* Davis. Habit of the species; leaves usually with narrower more acute divisions; flowers pink-lavender or lavender-white, rarely blue; sepals recurving.—Low, especially alkaline lands, Sacramento and San Joaquin valleys, and saline valleys of the inner South Coast Ranges. Var. *CUYAMACAE* Jepson. Leaves thick-

ish or subcoriaceous, the sinuses with straight rather than curving sides, the lobes broad and mainly cleft at apex; raceme dense (like San Joaquin Co. specimens of var. *recurvatum*) or loose; flowers blue, like those of the species.—Curamaca Mts. Perhaps also on Mt. Pinos. Var. *SÈDITIÒSUM* Jepson. Leaves mostly basal, minutely pubescent or canescent, the segments filiform or narrowly linear, more or less revolute.—Monterey Co. towards the coast.

13. *D. párryi* Gray. Stems commonly simple, 1 to  $2\frac{3}{4}$  ft. high, arising from a short caudex crowning several woody-fibrous roots; herbage minutely puberulent; leaves twice divided and redivided into narrowly linear lobes, the lobes usually elongated, acute,  $\frac{1}{2}$  to  $2\frac{1}{2}$  in. long, and often arcuate-contorted; upper leaves often pedately 5-divided into filiform lobes; racemes virgate, often cylindric, sometimes loose, strict, 4 to 14 in. long; pedicels mostly 4 to 12 lines long or the lower longer; flowers blue or light purplish, rarely white-flowered; sepals 6 to 8 lines long, equaling the spur,  $1\frac{1}{2}$  to 2 times as long as the petals; follicles puberulent, 5 to 6 lines long; seeds with a loosely cellular whitish margin to the angles.—Sandy or loam soil, open ground: coastal S. Cal., e. to edge of Colorado Desert, n. to San Carlos Range and s. Sierra Nevada (Tulare Co.). The blades of the lower leaves are inclined to disjoint roughly in age, leaving the rigid petioles behind. Var. *BLÓCHMANÆ* Jepson. Leaf-lobes narrowly linear ( $\frac{1}{2}$  to  $\frac{3}{4}$  line wide); flowers large, in a dense short raceme ( $2\frac{1}{2}$  to 4 in. long), the light blue sepals in pleasing contrast to the white petals; sepals 8 to 11 lines long, with crisped edges; seed unknown.—Near the coast, San Luis Obispo Co. Var. *MARITIMUM* Dav. Commonly branching; leaf-lobes mostly 1 to 3 lines broad, often falcately curving; raceme loose, commonly elongated (4 to 15 in. long), the pedicels 1 to 2 in. long; flowers large, the sepals 6 to 11 lines long; angles of the seed not winged.—Coast region, San Luis Obispo to Los Angeles Co. and San Diego.

14. *D. parishii* Gray. Stems stout or somewhat slender,  $1\frac{1}{2}$  to 2 ft. high, one or several from the crown of a stout root, which forks into several deep-seated branches; herbage wholly glabrous or commonly so; leaves  $\frac{3}{4}$  to  $1\frac{1}{2}$  (or 2) in. broad, the basal cut into broadish segments which are again cleft or toothed, the basal similar but often more narrowly divided; raceme virgate, many-flowered, 5 to 7 in. long; pedicels 4 to 8 lines long; flowers a light but lively sky-blue; sepals 3 to 5 lines long, the petals  $\frac{2}{3}$  as long; follicles obscurely puberulent, sometimes a little distended at the middle, 5 to 6 lines long; seeds as in *D. hesperium*.—Sandy washes or mesas, 500 to 7500 ft.: Mohave Desert, s. to Palm Sprs., n. to Inyo Co. Var. *INOPINUM* Jepson. Stems 3 ft. tall, the stems and leaves quite glabrous; sepals very narrow (suboblong), glabrous; flowers pale lavender; follicles glabrous.—Kern River Cañon, 7800 ft.

15. *D. andersónii* Gray. Stems several from the base,  $1\frac{1}{2}$  to 2 ft. high; herbage more or less glaucous, glabrous or nearly so, the blades lightly pilose; leaves thickish, 1 to  $2\frac{1}{2}$  in. broad, deeply and incisely 2 to 3 times parted into oblong or linear segments, the teeth of the lower leaves mostly obtuse, sometimes acute; raceme rather loose, 7 to 10 in. long; pedicels  $\frac{1}{2}$  to 1 (or  $1\frac{1}{2}$ ) in. long; flowers blue; sepals 5 to 6 lines long, mostly longer than the stout spur, which is shortly curved at the blunt tip; follicles glabrous, 5 to 7 lines long.—Adobe soil: e. side of northern Sierra Nevada; w. Nev.

16. *D. ùliginòsum* Curran. Stems erect, nearly naked, 1 to 2 ft. high, glabrous or sparingly hispidulose; leaves glabrous, cuneately fan-shaped, 1 to 3 in. long (on petioles as long or longer), the earliest merely cleft or toothed at apex, the later incisely parted; racemes strict, the pedicels subequal; flowers blue or occasionally pink; sepals 3 to 6 lines long, the spur as long or longer; petals deeply notched, ciliate, and with a tuft of hairs on the upper side; follicles slender, puberulent, 4 to 6 lines long; seeds densely covered with minute blunt processes, some short, some longer and branched.—Moist gravelly stream beds or water-trickles on rocky slopes: Howell Mt.; Knoxville Ridge, Napa Co.; Indian Valley, ne. Lake Co.; w. Colusa Co.

8. *ACONITUM* L. ACONITE

Tall perennial herbs with palmately lobed leaves. Flowers showy, irregular. Sepals 5, the upper one larger and hooded or helmet-like. Upper petals 2, reduced to slender claws terminating in a nectary and covered by the helmet-like sepal, the 3 lower ones minute rudiments or wanting. Stamens numerous. Pistils 3 to 5, many-ovuled, becoming follicles in fruit. (Ancient Greek name.)

1. *A. columbianum* Nutt. WESTERN MONKSHOOD. Stems  $1\frac{1}{2}$  to 3 ft. high, arising from thick roots; leaves roundish in outline, 2 to 3 in. broad, parted or divided into 5 cuneate toothed or incised lobes; raceme loose, sometimes paniculate, viscid-pubescent; flowers blue, rarely white; hooded sepal 6 to 7 lines long.—Wet meadows and streamlet borders, 4000 to 8000 ft.: Sierra Nevada from Tulare Co. n. to Modoc Co., thence w. to Salmon Mts.; e. to Ariz., n. to B. C.

9. *ANEMONE* L. WIND-FLOWER

Perennial herbs, the stems and basal leaves from a rootstock. Stem leaves none except an involucrel whorl of 3 near to or distant from the solitary or umbellate flowers. Sepals 5 to 8, petal-like, imbricate. Petals none. Stamens numerous. Achenes numerous, the style short or developing into a long plumose tail. Seed suspended. (Greek anemos, wind, the flowers disturbed by the wind.)

Leaves 2 to 3 times finely dissected into small segments; stems from the crown of a thick root.

Styles densely hairy, becoming plumose tails in fruit.....1. *A. occidentalis*.

Styles not hairy.

Sepals elliptic or oval, 7 to 10 lines long; stems from the crown of a taproot....

2. *A. baldensis*.

Sepals oblong, 4 lines long; stems from a tuber.....3. *A. tuberosa*.

Leaves 3-foliolate, not dissected; stems from horizontal rootstocks.

Involucrel leaves sessile; rootstocks filiform.....4. *A. deltoidea*.

Involucrel leaves petioled; rootstocks thickened.....5. *A. quinquefolia*.

A. Styles densely soft-hairy; achenes with long plumose tails.—

Subgenus *PULSATILLA*.

1. *A. occidentalis* Wats. Stems from the crown of a thick vertical root, 4 to 15 in. high, 1-flowered; stems, petioles and midribs woolly-pubescent, mostly glabrate, except at base of bracts and of stems; leaves divided into 5 petioled divisions, the divisions 2 or 3 times divided and cleft; involucrel leaves sessile by a broad base, similar to the basal leaves; sepals 5 (or 6), white "or purplish," oval or broadly oblong, 1 in. long; achenes pubescent, their tails  $\frac{3}{4}$  to 1 in. long, at length recurved, forming a globose head  $1\frac{1}{2}$  to 2 in. in diameter; receptacle minutely velvety.—Alpine, 6000 to 10,000 ft.: Sierra Nevada from Tulare Co. to Plumas Co.; nw. to Mt. Shasta and to w. Siskiyou Co.; n. to B. C.

B. Styles glabrous or nearly so; achenes with glabrous or pubescent tails.—Subgenus *EUANEMONE*.

2. *A. baldensis* L. Stems 1 to several, 4 to 15 in. high, arising from the branching crown of a thick taproot, 1-flowered; herbage glabrate (sometimes silky when young); leaves 3 times dissected into linear or oblong acute lobes, the lobes 2 to 6 lines long; flowers white or "bluish," 1 to  $1\frac{1}{4}$  in. broad; sepals 5 or 6 to 8, elliptic or oval; ovary hairy; style almost capillary, glabrous or nearly so.—Mt. slopes, 5000 to 7000 ft.: Sierra Nevada from Nevada Co. to Plumas Co.; Salmon Mts.; Marble Mt.

3. *A. tuberosa* Rydb. Stems 4 to 10 in. high, from a tuberous root, 1 or rarely 2-flowered; leaves 3-foliolate, glabrate, the divisions ternately cleft and toothed; flowers white or purplish, 7 to 9 lines broad; sepals 8 to 10, linear-oblong; style filiform, straight, nearly as long as the ovary; achenes densely woolly.—Panamint Mts.; Providence Mts. (P. A. Munz); Ariz. to Utah.

4. *A. deltoidea* Hook. Stems 3 to 12 in. high; rootstocks filiform or whip-like, several in. long; basal leaves and involucrel leaves 3-foliolate; leaflets

broadly ovate or rhombic, crenately toothed above the entire base, some sparingly incised, 1 to 3 in. long; sepals commonly 5, white, 6 to 11 lines long; achenes hirsute-pubescent, with straight style.—Woods, 600 to 5500 ft.: Humboldt Co. to Siskiyou Co.; n. to Wash. May-July.

5. *A. quinquefolia* L. var. *grayi* (Greene) Jepson. WOOD ANEMONE. Stems slender, 1-flowered, 4 to 12 in. high, from a thickish rootstock; basal leaf simple, of reniform outline, trifid; involucre leaves 3-foliate, petioled, the leaflets obovate, entire at base, crenately toothed or incised above, the lateral usually oblique,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; flowers white or pale blue, 6 to 8 lines broad; sepals 5 (or 6); achenes puberulent, with short recurved style.—Shady woods in mts., mostly near the coast, 200 to 5000 ft.: Santa Cruz Co. to Siskiyou Co. Mar.-June.

#### 10. *TRAUTVETTERIA* F. & M.

Perennial herbs. Leaves alternate, simple, palmately cleft, mostly basal. Stems branching at summit and bearing loose corymbose cymes of white flowers. Sepals 3 to 5, broad, white, petal-like, caducous. Petals none. Stamens numerous, filaments clavate, white, conspicuous. Achene utricular, capitate on the short receptacle. (E. R. Trautvetter, Russian botanist, 19th century.)

1. *T. grandis* Nutt. Stems  $1\frac{1}{2}$  to 3 ft. high; leaves deeply about 5-cleft,  $2\frac{1}{2}$  to 8 in. broad, unequally serrate, the basal long-, the cauline short-petioled; flowers 6 to 8 lines broad; sepals oval or roundish, concave, 2 lines long; achenes glabrous.—Mountain woods, Plumas Co. to Siskiyou Co.; n. to B. C.

#### 11. *THALICTRUM* L. MEADOW RUE

Perennial herbs with mostly tall erect stems from a short rootstock. Leaves bi- or tri-ternately compound, with petiolulate (or some sessile) leaflets. Flowers many, small ( $1\frac{1}{2}$  to 3 lines long), panicled, rarely in a raceme, dioecious, or sometimes perfect. Sepals 4 (or 5 to 7), greenish, or more or less petal-like. Petals none. Stamens numerous with long mucronate anthers on capillary filaments. Achenes 4 to 15, veined or furrowed, sometimes inflated, tipped with the persistent long styles. (Greek thallo, to grow green, the application uncertain.)

Flowers in a simple raceme, perfect, nodding; alpine or subalpine dwarf... 1. *T. alpinum*.  
Flowers in a panicle; tall plants, mostly of the foothills and middle altitudes.

Flowers perfect; achenes stiped..... 2. *T. sparsiflorum*.

Flowers dioecious; achenes not stiped or scarcely so.

Achenes broad, strongly oblique both ventrally and dorsally; common.

Sides of achene 3 or 4-ribbed..... 3. *T. fendleri*.

Sides of achene with branching nerves, at most 1-ribbed... 4. *T. polycarpum*.

Achenes narrow, scarcely oblique; rare..... 5. *T. occidentale*.

1. *T. alpinum* L. Stems 3 to 6 in. high; leaves basal, short-petioled, 1 to  $1\frac{1}{2}$  in. long, ternate, the lateral divisions with 3, the terminal with 5 leaflets; leaflets notched, 3-cleft or -divided,  $1\frac{1}{2}$  to 2 lines long; flowers in a simple raceme, perfect, purplish, nodding; achenes slightly flattened, sessile, 4 or 5-ribbed on the sides, 1 to  $1\frac{1}{4}$  lines long.—White Mts.; Nev. to Col., n. to the Arctic. Circumpolar. It is probable that this species once occupied most of the northern hemisphere south of the great glaciers (John Lubbock).

2. *T. sparsiflorum* Turcz. Stems erect, slender, 2 to  $2\frac{1}{2}$  ft. high; flowers perfect, few in a narrow panicle; leaflets small (6 to 10 lines long); ovaries densely and minutely glandular; achenes very minutely glandular-dotted, shortly stiped,  $2\frac{1}{2}$  lines long,  $1\frac{1}{4}$  to  $1\frac{1}{2}$  lines wide, strongly oblique (half-obovate), with the dorsal angle straight, the sides with 3 or 4 veins curving upward and inward from the base and more or less branching above.—High mts., 5000 to 9500 ft.: San Bernardino Mts. and Sierra Nevada; e. to the Rocky Mts., n. to Alas.; Asia.

3. *T. fendleri* Engelm. Stems 2 to 3 ft. high; herbage glabrous; leaflets roundish, 5 to 8 lines long, incised or crenate, the teeth mostly rounded but apiculate; panicle 3 to 6 in. long or with accessory panicles from the upper

axils; sepals mostly white-scarious, elliptic to ovate, mostly obtuse; achenes 2 to 3 lines long, 1 to 2 lines broad, irregularly oval in outline, more oblique ventrally, the sides 3 or 4-nerved or -ribbed, the central nerve most prominent, the lateral often branched, or merely with irregular branching nerves on the sides.—Montane, 2000 to 8500 ft.: Sierra Nevada from Nevada Co. to Tulare Co.; mts. of S. Cal.; e. to N. Mex. Var. *HESPERIUM* Jepson. Inflorescence and achenes very sparsely glandular-puberulent; achenes flattened.—Sierra Nevada, about 7000 ft.

4. *T. polycarpum* Wats. Stems 2 to 3 (or 6) ft. high; herbage glabrous throughout; leaflets rather prominently veined beneath; sepals elliptic to ovate, mostly acute; achenes many, somewhat inflated, the sides marked with anastomosing veins and mostly with a salient rib down the middle.—Mostly foothills or lower altitudes of the mts.: S. Cal.; Coast Ranges; n. to Ore. Var. *CAESIUM* Jepson. Glaucous throughout; achenes less turgid, the sides simple with anastomosing veins.—Cent. and n. Sierra Nevada foothills and lower altitudes of the mts.

5. *T. occidentale* Gray. Leaflets 1 to 2 in. long; achenes few, lanceolate or oblong-lanceolate, acuminate, scarcely oblique, 3 to 4 lines long,  $\frac{3}{4}$  to 1 line wide, the sides with 3 prominent ribs or nerves.—Moist shady places, Plumas Co. to Siskiyou Co.; n. to B. C., thence e. to the Atlantic. Rare with us.

## 12. MYOSÛRUS L.

Dwarf annuals with entire tufted basal leaves and naked 1-flowered scapes. Flowers whitish or yellowish, small ( $1\frac{1}{2}$  to 2 lines broad). Sepals 5, spurred at base. Petals 5, with a nectar-bearing hollow at the summit of the slender claw. Stamens 5 to 20. Achenes numerous, crowded on a long and slender spike-like receptacle. Ovules attached near the summit of the cell. (Greek mus, a mouse, and oura, a tail, in allusion to the curious receptacles.)

Flowers raised on scapes; achenes with an appressed beak.

Back of achene narrow, its keel ending in a straight or spreading subulate beak. . . .

Back of achene rhomboidal, flattish, its low keel ending in a short or nearly obsolete beak. . . . 1. *M. aristatus*.  
Flowers sessile in a close cluster on the ground, or shortly scapose; achenes with a spreading beak. . . . 2. *M. minimus*.  
3. *M. alopecuroides*.

1. *M. aristatus* Benth. Scapes several,  $\frac{3}{4}$  to  $1\frac{3}{4}$  in. high; leaves mostly shorter than the scapes; petals present or wanting; spike-like receptacles 2 to 4 lines long; achenes thin-walled, the narrow back continued into a subulate straightish or spreading beak.—San Jacinto Mts.; San Bernardino Mts.; Sierra Valley; n. to B. C., e. to the Rocky Mts. Var. *LEPTÛRUS* Jepson. More slender, 1 to 3 in. high; carpels beakless or very short-pointed; carpel-spike 3 to 8 lines long.—Livermore and Sacramento valleys.

2. *M. minimus* L. MOUSE TAIL. Scapes 2 to 6 in. high, the slender spike-like receptacles  $\frac{1}{2}$  to  $1\frac{3}{4}$ , commonly about 1 in. long; leaves linear-filiform, 1 to 2 in. long; mature achenes with somewhat rhomboidal back and very low keel ending in a straight appressed or rarely obsolete tip.—Low ground: inner Coast Ranges; Sacramento and San Joaquin valleys; n. to Ore., e. to Ill. and Fla. Back of achene broader than in no. 1. Var. *APUS* Greene. Spike-like receptacles nearly or quite sessile in a cluster amongst and shorter than the leaves.—Lower San Joaquin Valley; San Diego Co.; L. Cal. Var. *FILIFORMIS* Greene. Scapes 1 to 6 in. high; receptacles not tapering, very slender, almost thread-like.—San Francisco and Antioch.

3. *M. alopecuroides* Greene. Leaves 1 line wide,  $\frac{1}{2}$  to  $2\frac{1}{2}$  in. long; spike-like receptacle slender-conical, rather thick, 3 or 6 to 10 lines long, sessile or very shortly scapose, in clusters of about 4 to 9; achenes not flattened on the back, thin-walled and with prominent spreading beak.—Shallow vernal pools of alkaline flats: w. side of the lower Sacramento and lower San Joaquin valleys. Mar.-Apr.

13. *RANUNCULUS* L. BUTTERCUP. CROWFOOT

Annual or perennial herbs with divided or entire leaves. Flowers solitary or somewhat corymbed, yellow, or less commonly white, rarely pink. Sepals 5, rarely 4 or 3. Petals 5 (rarely 1 or 3) to 16, with a little nectar-bearing pit at base, the pit commonly covered by a scale. Stamens usually numerous. Achenes numerous, in a globular or oblong cluster. Seed attached near the base of the cell. (Latin name for a little frog, some species growing in wet places where frogs are found.)

## A. Nectar-bearing pit on petal claws covered with a scale.

1. *Achenes with a firm close coat, not loose or utricular.*—Subgenus *EURANUNCULUS*.

Aquatic; perennials.

Leaves finely dissected.....1. *R. delphinifolius*.

Leaves cordate, entire.....2. *R. hydrocharoides*.

Terrestrial plants, often in muddy or marshy places, but not truly aquatic or floating.

Achenes not spiny-muricate, nor with hooked hairs.

Leaves simple, entire; achenes thickish.

Perennials; petals 5, medium to showy; achenes not papillate.

Stems erect or ascending from a cluster of fibrous roots, not rooting at the nodes.

Leaves glabrous or slightly hairy; stems mostly leafy; achenes

turgid, glabrous.....3. *R. alismaefolius*.

Leaves mostly densely pilose; stems naked or nearly so; achenes

turgid, pubescent.....4. *R. lemmonii*.

Stems filiform, creeping or decumbent, rooting at the nodes.....

5. *R. flammula*.

Annuals; basal leaves ovate; petals 1 to 3, minute; achenes papillate.....

6. *R. pusillus*.

Leaves (or some of them) toothed, lobed or divided.

Herbage glabrous or nearly so; achenes thick or plump.

Perennials; low plants; alpine or northern.

Basal leaves nearly or quite as broad as long, rounded or trun-

cate at base, 3-lobed at apex or entire.....7. *R. glaberrimus*.

Basal leaves broader than long, subcordate, 3 (or 5) -parted and

coarsely toothed.....8. *R. eschscholtzii*.

Annuals; stems fistulous.....9. *R. sceleratus*.

Herbage pubescent or hirsute; leaves lobed or divided, mostly compound;

perennials.

Beak of the achenes commonly curved, much shorter than the body,

rarely as long.

Stems commonly rather coarse, mostly erect and rather tall;

achenes strongly flattened.

Corolla pale or whitish, very small; beak of achene like a

grab-hook.....10. *R. bongardii*.

Corolla golden, showy; sepals reflexed.

Beak deltoid, slightly curved at the acute tip; petals 5

to 10.....11. *R. canus*.

Beak narrowly or broadly subulate, not deltoid.

Petals 9 to 16; beak very short, stoutish, rather

closely recurved.....12. *R. californicus*.

Petals 5 or 6; beak rather slender, falcate-curved

but more or less erect.....13. *R. occidentalis*.

Stems creeping or reclining; achenes roundish or turgid, the beak

curved or, if straight, at least hooked at tip; sepals not

reflexed.

Corolla showy; achene margined; beak somewhat recurved....

14. *R. repens*.

Corolla small; achene not margined; beak nearly straight....

15. *R. macounii*.

Beak of the achenes straight, as long as the body; sepals reflexed;

stems spreading or ascending.

Leaflets toothed or lacinate.

Petals 5, emarginate; leaflets crenate, mostly not lobed....

16. *R. bloomeri*.

Petals 5 to 8, rounded at apex; leaflets deeply 3-cleft or

lacinate.....17. *R. orthorhynchus*.

Leaflets or their divisions with entire margins, not serrate or

lacinate.....18. *R. marmorarius*.

Achenes prickly or with stiffish hooked hairs; annuals.

Flowers minute; achenes with hooked hairs; delicate plant...19. *R. hebecarpus*.

Flowers medium; achenes spiny-muricate, with raised border.

Leaves cleft into 3 to 5 lobes, the lobes toothed; border of achene beveled,

not spiny.....20. *R. muricatus*.

Leaves deeply 2 or 3 times divided; border of achene spiny...21. *R. arvensis*.

2. *Achenes with a thin coat; perennials.*

Leaves cordate, lightly crenate; flowers yellow; achenes thin-walled, striate; receptacle

elongated-oblong; stems creeping.—Subgenus *HALODES*.....22. *R. cymbalaria*.

**B. Nectar-bearing pit on petal claws naked; leaves or some of them filiform-dissected; flowers white; aquatic.**—Subgenus **BATRACHIUM**.

Leaves immersed, all filiform-dissected, or rarely some floating leaves 3-parted into broad rounded lobes. . . . . 23. *R. aquatilis*.

Leaves floating, with 3 broad divergent narrowly ovate lobes, or some submersed leaves capillary-dissected . . . . . 24. *R. lobbiai*.

1. *R. delphinifolius* Torr. **YELLOW WATER CROWFOOT**. Aquatic perennial; stems fistulous, 1 to 2 ft. long; leaves three or four times ternately dissected into linear-filiform acuminate segments; flowers golden-yellow, showy (8 to 13 lines broad), on naked fistulous peduncles  $\frac{3}{4}$  to  $2\frac{1}{4}$  in. long; petals 5 or 6, broadly obovate; scale of the nectary pit prolonged upwards into narrow or broad wings attached by one edge to the petal and often with free tips, the whole structure conspicuous,  $\frac{1}{4}$  to  $\frac{1}{2}$  as long as the petal, but apparently variable in form and size; achenes turgid, callous-margined at base and ventrally with a tumid ridge,  $\frac{3}{4}$  line long, the subulate beak over half as long.—Stagnant ponds or pools or slow-flowing streams: Humboldt Co.; Modoc Co.; n. to B. C., e. to the Atlantic; Siberia. Rarely collected in Cal.

2. *R. hydròcharoides* Gray. Aquatic perennial; stems rather slender, sparingly branched above, 3 to 8 in. high from a coarse but short vertical rootstock, which also produces creeping stems; leaves mostly basal, these long-petioled, simple, ovate to cordate, entire, undulate and somewhat callous-margined, 5 to 12 lines long, a little succulent; flowers  $2\frac{1}{2}$  to  $3\frac{1}{2}$  lines broad; upper leaves obovate or spatulate; achenes  $\frac{3}{4}$  line long.—Marshes and springs: Owens Valley; Ariz. to Mex. Aspect suggestive of a small *Sagittaria*.

3. *R. alismaefolius* Geyer. Stems stout, somewhat fistulous, erect, sparingly branched above, several-flowered, 8 to 18 in. high, arising from a short perennial rootstock bearing thick-fibrous roots; herbage glabrous, rarely a little hairy; leaves oblong-lanceolate or lanceolate,  $2\frac{1}{2}$  to 6 in. long, mostly 5 to 8 (or 12) lines broad, tapering to apex, and at base usually tapering gradually into the petiole, the basal and lower leaves long-petioled, the upper shortly petioled or sessile, entire or commonly a few on a plant obscurely serrulate; flowers 8 to 10 lines broad; petals 5, roundish obovate; achenes smooth, glabrous, turgid, 1 line long, with a short-subulate introrse beak.—

377. *Ranunculus alismaefolius* var. *alismellus* Gray; plant  $\times \frac{1}{2}$ .

Swamps in Mendocino and Humboldt Cos.; n. to B. C. and Ida. Var. **HARTWEGII** Jepson. Stems slender, not fistulous, ascending, 3 to 13 in. high, usually a little leafy, simple or sparingly branched, but umbellately 3-flowered at summit; stems and petioles hairy or glabrous; leaves lanceolate or oblong-lanceolate, 1 to 4 in. long, tapering gradually into the petiole or the uppermost sessile or nearly so; petioles about half as long as the blade, rarely longer; flowers 5 to 8 lines broad; achenes with short-filiform or slender beak.—Higher altitudes (4500 to 9000 ft.): Sierra Nevada from Tuolumne Co. to Siskiyou Co., thence to n. Trinity Co. This variety passes into var. *alismellus*, although the two in their extreme forms are quite different. Var. **ALISMELLUS** Gray. Fig. 377. Leaves thin, mostly or usually wholly basal, these and the stems in dense tufts; stems 2 to 10 in. high, commonly simple and 1-flowered, naked or 1 or 2-leaved; herbage glabrous, sometimes slightly hairy at base; leaves ovate to oblong-lanceolate, 4 to 12 lines long, on petioles as long or longer, the few stem leaves nearly sessile; flowers 3 to 6 lines broad.—Alpine or subalpine wet meadows or shallow streamlets, 7000 to 10,500

378. *Ranunculus flammula* var. *reptans* E. Mey.;  
a, habit  $\times \frac{1}{2}$ ; b, fl.  $\times 1\frac{1}{4}$ ; c, achene  $\times 4$ .

in a globose head, very turgid, minutely pubescent, the beak very short.—Dry plains or valleys in the mts., e. slope of the Sierra Nevada in Sierra and Nevada Cos., 5000 ft. May. Very nearly related to *R. alismaefolius* var. *hartwegii*.

5. *R. flammula* L. var. *reptans* E. Mey. CREEPING SPEARWORT. Fig. 378. Perennial; stems slender or almost filiform, decumbent or creeping, rooting at the nodes, 3 to 13 in. long; leaves lanceolate, linear- or oblong-lanceolate or oblong-ovate, entire,  $\frac{1}{2}$  to  $1\frac{3}{4}$  in. long, tapering into petioles  $\frac{1}{2}$  to  $2\frac{1}{2}$  in. long, or sometimes sessile; flowers 2 to 5 lines broad, terminating leafy stems or naked scape-like peduncles 1 to 2 in. high; petals 5 (or to 8); achenes comparatively few, thick, less than  $\frac{1}{2}$  to 1 line long, the beak short.—Margins of lakes or shallow slow meadow-streamlets: San Bernardino Mts.; Sierra Nevada at middle altitudes; North Coast Ranges; n. to Alas., e. to N. Eng. July.

6. *R. pusillus* Poir. DWARF SPEARWORT. Slender annual 3 to 11 in. high; herbage glabrous or the dilated petiole somewhat sparingly villous-ciliate; basal leaves round-ovate to ovate, toothed or entire, 3 to 8 lines long, on elongated petioles; cauline leaves elliptic-oblong to linear-lanceolate, entire or slightly denticulate,  $\frac{3}{4}$  to 2 in. long, more shortly petioled; flowers minute; sepals subscarious, mostly not reflexed; petals commonly 1 to 3,  $\frac{3}{4}$  line long; achenes numerous in a small globose head, papillate,  $\frac{1}{2}$  line long, the beak very minute.—Low wet ground or in shallow pools, North Coast Ranges (Marin Co. to Humboldt Co.); e. U. S. Apr.-May.

7. *R. glaberrimus* Hook. SAGEBRUSH BUTTERCUP. Fig. 379. Perennial; stems 2 to 7 in. high, 1 to 3-flowered, these and the basal leaves from a cluster of slender-fusiform roots; herbage glabrous, somewhat succulent; basal leaves roundish to oval, obtuse or truncate at base, 3-lobed at apex, or entire,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long, on petioles 3 to 4 times as long; cauline leaves

ft., often filling gravelly meadows with golden bloom: Sierra Nevada; far North Coast Ranges; high mts. of S. Cal. July.

4. *R. lemmönii* Gray. Perennial; stems scape-like, 4 to 7 in. high, these and the leaves from a small short or globose root-stock bearing numerous stoutish fibres; scapes glabrous, simple or 3-branched near the ground or midway, with a pair of opposite bracts or leaves below the middle; leaves lanceolate, pilose,  $1\frac{1}{2}$  to  $3\frac{1}{2}$  in. long, drawn down to petioles as long or nearly (and strongly dilated at base); flowers 6 to 9 lines broad, solitary on the scape or its scape-like branches; petals 5, rarely 6 or 7, obovate or oblong; achenes

379. *Ranunculus glaberrimus* Hook.;  
a, plant  $\times \frac{1}{2}$ ; b, achene  $\times 6$ .

380. *Ranunculus eschscholtzii* Schlecht.; a, plant  $\times 1$ ; b, achene  $\times 6$ .

few, 3-lobed or 3-parted, short-petioled or subsessile; flowers golden-yellow, sometimes aging white,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. broad; achenes plump, with roundish back,  $\frac{3}{4}$  line long, the short beak slender-subulate, straight.—Sandy and gravelly sagebrush flats, plains and mt. slopes: Lassen, Modoc and Siskiyou Cos.; n. to B. C., e. to Col. This species flowers rather close to the ground, the stems and petioles elongating markedly after anthesis (Mary H. Manning.)

8. *R. eschscholtzii* Schlecht. Fig. 380. Perennial; stems and leaves in a dense tuft on a very short vertical rootstock; stems erect, 4 to 6 ( $2\frac{1}{2}$  to 10) in. high; herbage glabrous, the calyx slightly hairy; basal leaves 6 to 15 lines broad, broader than long but roundish or reniform in outline, subcordate at base, unequally 3-cleft or -parted, the smaller central lobe obovate, entire, or 3-toothed, the lateral mostly 3-cleft, rarely all the lobes alike, but all the apices acute; petioles 1 to 2 in. long; cauline leaves few, similar or pedately 3-cleft, short-petioled; peduncles terminal, naked,  $\frac{1}{2}$  to 1 (or  $2\frac{1}{2}$ ) in. long; flowers golden-yellow (often aging dull white), 4 to 9 lines broad; petals round-obovate; achenes thickened, glabrous, smooth, somewhat carinate on the back, the beak short, recurved; receptacle oblong, 4 to 5 lines long.—Subalpine, in gravelly

or rocky surface streamlets on cool mountain slopes, 9000 to 13,700 ft.: Sierra Nevada from Nevada Co. to Tulare Co.; White Mts.; San Bernardino and San Jacinto mountains; w. Nev.; n. to Alas. The thicker-leaved form of the central Sierra Nevada is var. *oxynotus* Jepson (*R. oxynotus* Gray.)

9. *R. sceleratus* L. CURSED CROWFOOT. Annual; stems erect, somewhat fistulous, branching, leafy, 7 to 12 in. high, from a cluster of stout fibrous roots; herbage glabrous or nearly so, somewhat succulent; leaves  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. broad, parted into 3 (or 5) cuneate segments which are again cleft and coarsely toothed, the ultimate lobes or divisions short-oblong, obtuse; basal leaves long-petioled; uppermost leaves nearly sessile, the segments broadly linear and nearly entire; flowers 3 to 5 lines broad; petals pale yellow, scarcely exceeding the calyx; receptacle elliptic or oblong,  $1\frac{1}{2}$  to 4 lines long; achenes thick,  $\frac{1}{2}$  line long, the beak almost none.—Shallow pools or muddy margins of lakes, Modoc Co.; n. to B. C., s. to Ariz., e. to N. B. Juice acrid, raising blisters on the skin.

10. *R. bongárdii* Greene. Perennial; stems slender, or often coarse, 1 to 2 ft. high; herbage sparsely or densely pilose below, above pubescent or hirsutulose; leaves 3-parted, the divisions shallowly 3-cleft or disposed to be quite entire, rather broad and elongated, especially the upper; flowers small (2 to 3 lines broad), very pale yellow or whitish; achenes elliptic, glabrous, the very slender beak as long as the body, erect-curved like a grab-hook.—Shady woods: Humboldt Co. and n. Sierra Nevada; n. to Alas. Var. *GREENEI* Piper. Achenes hispidulose.—San Bernardino Mts.; Pine Ridge, Fresno Co.; Humboldt Co.

11. *R. canus* Benth. Perennial; stems erect, branching, 1 to  $1\frac{3}{4}$  ft. high; herbage fragrant (at least at certain stations, probably not always), soft-villous all over when young or the leaves beneath conspicuously silky-lanate; leaves mostly in a basal tuft, deeply parted and subdivided into many lanceolate acute segments, long-petioled; flowers 6 to 12 lines broad; petals 5 to 8 (or 10); achenes large, flat, glabrous, 2 to 3 lines long, including the rather conspicuous triangular-subulate beak which is slightly curved at the tip.—Plains or low rolling hills: Sacramento Valley; e. Contra Costa Co. It passes into *R. californicus*.

12. *R. californicus* Benth. CALIFORNIA BUTTERCUP. Fig. 381. Stems mostly caespitose, arising from a cluster of stout fibrous perennial roots, erect or ascending. 9 to 18 in. high, freely branching and many-flowered; herbage hirsute (especially below) to nearly glabrous, the leaves often silky beneath; leaves ovate or roundish in outline, 1 to 2 (or 3) in. long, ternately divided, and again divided, parted or lobed, the earlier with the broad divisions shallowly and mostly obtusely lobed, the later with the laciniately and sharply cleft divisions less broad or narrowly linear; flowers 6 to 11 lines broad; sepals usually somewhat petal-like, closely reflexed; petals 9 to 16, uncommonly as few as 7 or 8, obovate to oblong; achenes glabrous, strongly flattened, nearly as broad as long,  $\frac{3}{4}$  to  $1\frac{1}{2}$  lines long, very rounded dorsally, the ventral side straightish; beak very short, mostly stoutish and closely recurved, sometimes slender and slightly recurving.—Open hills and moist

381. *Ranunculus californicus* Benth.; a, fl. branch x 1; b, usual type of leaf x 1; c, lower leaf x 1; d, petal x 3; e, achene x  $4\frac{1}{2}$ ; f, seedling x 1; g, h, later leaves of seedling x 1.

valleys, our most common species, abundant in the Coast Ranges and s. to S. Cal. Also occurring in the Great Valley and neighboring foothills but localized or less common. Var. *CUNEATUS* Greene. Stems prostrate or decumbent; leaves thin; the lower leaves sharply cleft into 3 broad lobes, the divisions incised but more equally toothed than in the species, so that the outline is roundish-subcordate.—San Mateo to San Francisco and Marin Co.; often on ocean bluffs. Var. *CRASSIFOLIUS* Greene. Stout, low, the stems assurgent; herbage somewhat succulent, sparingly villous; basal leaves shallowly 3-lobed, the lobes rounded and more or less coarsely toothed; cauline leaves parted into 3 oblong lobes.—Coast bluffs, Mendocino Co. to San Francisco. Var. *LUDOVICIANUS* (Greene) Davis. Stems many, coarse, rather densely tufted; herbage rather densely pilose or even silky, especially below:

leaves cut into rather broad acuminate or lanceolate segments; flowers and achenes of the species.—Mt. mdws., 4500 to 7000 ft., Tehachapi Mts. to the San Bernardino Mts. and San Diego Co.

13. *R. occidentalis* Nutt. Perennial; habit of *R. californicus*; herbage pilose or hirsute below with spreading hairs, often densely so on the petioles, or varying to nearly glabrous; basal leaves of roundish outline,  $\frac{3}{4}$  to 2 in. broad, incisely 3 (or 5)-cleft or -parted, rarely divided into separate leaflets, the segments mostly broad, shallowly but incisely lobed and toothed; upper cauline leaves divided into linear segments; flower 6 to 10 lines broad; petals 5; achenes flattened, obliquely rounded dorsally, nearly straight on the ventral side, 1 to 2 lines long, the subulate beak saliently erect, straight or somewhat falcate, and commonly projecting somewhat forward rather than recurving,  $\frac{1}{2}$  to  $\frac{3}{4}$  as long as the body.—Placer and Mendocino Cos. n. to Siskiyou Co.; far n. to Wash. There are intergrades to the varieties. Var. *EISENII* Gray. Stems slender, erect, 1 to 1½ ft. high; stems and leaves pilose with spreading hairs or only the leaves pilose, or the herbage subglabrous; leaves lobed as in the species; flowers 5 to 8 lines broad; petals commonly 5, sometimes 6, rarely 7; beak of the achenes slender, curving, rarely closely recurved.—Openly wooded ridges, flats or valleys: middle and inner Coast Ranges from Santa Clara Co. to Siskiyou Co., 500 to 2500 ft.; Sierra Nevada foothills from Tulare Co. to Shasta Co., 2500 to 4500 ft. This is the most common buttercup throughout most of its range. Var. *RATTANII* Gray. Stems slender, 1 to 2 ft. high; pubescence as in var. *eisenii*; petals 5 or 6; achenes hispidulose, the beak slender, nearly erect or projecting forward a little, or recurved.—Mendocino and Humboldt Cos.; n. to southern Ore., ranges s. to Napa Co. in a modified form. Var. *ALCEUS* Jepson. Plants diffuse, 6 to 9 (or 15) in. high; stems and petioles very pilose below; flowers small; achenes as in var. *eisenii*.—North Coast Ranges and Sierra Nevada, (3000 or) 5000 to 7500 ft.; a late flowering rather small plant about intermediate between the species and var. *eisenii*.

382. *Ranunculus repens* L.; a, fl. branchlet and basal leaf  $\times \frac{1}{2}$ ; b, head of achenes  $\times \frac{1}{2}$ ; c, achene  $\times 2$ .

14. *R. repens* L. CREEPING CROWFOOT. Fig. 382. Perennial; stems trailing, arising from a cluster of stout fibrous roots,  $\frac{1}{2}$  to 1 ft. long, rooting at the lower nodes; herbage sparsely bristly, often densely so on the petioles; leaves 1 to 4 in. broad, the basal long-petioled, composed of 3 distinct or nearly distinct leaflets; leaflets incisely 3-parted and again incisely cleft or toothed; flowers 6 to 12 lines broad; sepals not reflexed; petals much longer than the sepals, brilliant gold; achenes flattened, keel-margined all around, 1 line long, bearing a short stout somewhat curved beak which is bent or hooked at tip.—Native of Eur., sparingly naturalized in marshes: Marin Co.; Humboldt Co.

*R. BULBOSUS* L. Stem erect, from a bulb-like base; herbage hairy; basal

383. *Ranunculus bloomeri* Wats.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, basal leaf  $\times \frac{1}{2}$ ; c, achene  $\times 3$ .

around, 1 to  $1\frac{1}{2}$  lines long, with a short-lanceolate straightish beak  $\frac{1}{2}$  line long.—Nev. to Ore. and B. C., entering Cal. in Modoc Co.; e. to the Atlantic.

16. *R. bloomeri* Wats. Fig. 383. Stems erect or ascending, 5 to 18 in. high, from a cluster of thick-fibrous or even slender-fusiform perennial roots; herbage somewhat succulent, glabrous or a little hairy, especially on the leaf bases; basal leaves 3 foliolate (or a few simple), on petioles 6 to 14 in. long; leaflets (as well as the simple blades) ovate to roundish, obtuse to cordate at base, coarsely dentate, sparsely incised, or 3-lobed, usually petiolulate,  $\frac{3}{4}$  to 2 in. long; flowers few and large, 1 to  $1\frac{1}{2}$  in. broad; petals 5, emarginate at apex, the greenish area at base conspicuous and the nectar-gland large; achenes turgid,  $1\frac{1}{2}$  lines long, tipped with a slender subulate beak as long.—Low fields near the coast from San Mateo Co. to Contra Costa and Mendocino Cos. Feb.-Apr.

17. *R. orthorhynchus* Hook. Fig. 384. Stems leafy, ascending or erect,  $\frac{3}{4}$  to  $1\frac{1}{2}$  ft. high, these and the basal leaves from a large cluster of stout-fibrous or slender-fusiform perennial roots; petioles and stems hirsute or villous with spreading hairs; leaves pinnately 5-foliate, the 3 upper leaflets often approximate; leaflets incisely cleft or toothed, or 3-parted, especially the terminal one,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; flowers yellow, 6 to 9 lines broad; petals 5; achene glabrous, thickish, 2 lines long, with a broad ventral channel and weak dorsal keel, the subulate upright beak quite as long as the body.—Wet meadows, middle altitudes (3600 to 5600 ft.) in the Sierra Nevada from Mariposa Co. to Modoc Co. and Siskiyou Co.; n. to B. C. Var. *HALLII* Jepson. Leaflets of basal leaves broader than long, with mostly shallow lobes and obtuse teeth (suggestive of *Apium graveolens*); achenes rather sharply margined, the margins running onto the stout beak as salient ridges.—Pine

384. *Ranunculus orthorhynchus* Hook.; a, habit  $\times \frac{1}{2}$ ; b, leaf  $\times \frac{1}{2}$ ; c, achene  $\times 3$ .

leaves 3-parted; peduncles furrowed. — An escape at Fortuna, Humboldt Co. (acc. J. P. Tracy); native of Eur.

15. *R. macounii* Britt. Perennial; stems stoutish, trailing or reclining, rarely rooting at the nodes, 1 to  $1\frac{1}{2}$  ft. long; general aspect similar to *R. orthorhynchus*; stems and petioles hispidly hirsute with spreading hairs; leaves 3-foliate, incisely 3-cleft, with laciniate and sharply toothed segments; flowers relatively insignificant (4 to 5 lines broad); petals little surpassing the early deciduous sepals; heads of achenes large, dense, globular or somewhat oval; achenes somewhat flattened, carinate-margined all

385. *Ranunculus hebecarpus* H. & A.; a, fr. branch  $\times 1$ ; b, achene  $\times 4\frac{1}{2}$ .

lous with hooked hairs, orbicular, flat, 1 line long, tipped with a short curved beak.—Common in the foothills and sometimes in the valleys, in the shade of oak and other trees: frequent in the Coast Ranges; Sacramento Valley; Sierra Nevada; S. Cal. near the coast; s. to L. Cal., n. to Wash.

20. *R. muricatus* L. Fig. 386. Annual; stems stout, 3 to 10 in. high; herbage yellowish green, somewhat succulent, glabrous; leaves roundish or reniform,  $\frac{3}{4}$  to 2 in. broad, coarsely toothed and commonly 3-cleft; flowers 3 to 7 lines broad; petals 5 (or 3); achenes 4 lines long, including the stout ensiform beak, the sides very flat, surrounded by a conspicuous raised smooth border and coarsely muricate or prickly.

387. *Ranunculus cymbalaria* Pursh.; a, plant  $\times \frac{1}{2}$ ; b, stolon rooting at tip; c, achene  $\times 4\frac{1}{2}$ .

386. *R. muricatus* L.; achene  $\times 3$ .  
—Low places in valley fields: nat. from Eur., widely scattered in cent. and n. Cal., but not common.

21. *R. arvensis* L. HUNGER-WEED. Erect annual, 1 to  $1\frac{1}{2}$  ft. high; lower leaves with three broad coarsely crenate lobes, the upper 2 or 3 times divided into narrow acute segments; achenes spiny-tuberculate on the raised margin as well as on the sides.—Mariposa Co.; introd. from Eur.

22. *R. cymbalaria* Pursh. DESERT CROW-FOOT. Fig. 387. Perennial by whip-like or thread-like stolons which root at intervals of  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. and produce tufts

Ridge, Fresno Co. Var. *PLATYPHYLLUS* Gray. Stems very stout, ( $\frac{1}{2}$  or)  $1\frac{1}{2}$  to  $3\frac{1}{2}$  ft. high, from a cluster of slender fusiform roots; herbage brownish-hirsute or pilose, the hairs often retrorse and often dense on the petioles, or nearly glabrous throughout; leaves 3-foliolate or the leaflets replaced by 3 leaflets; lateral leaflets sessile or short-petiolulate, the terminal one long-petiolulate; flowers  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. broad; petals 5 to 8, round-ovate to broadly oblong, deep rich glistening yellow; achenes margined.—Swamps and ditches: North Coast Ranges, mostly near the coast; n. to Wash. Mar.-May.

18. *R. marmorarius* Jepson & Tracy. Stems ascending, 6 to 10 in. high, from perennial roots; herbage sparsely hirsute; basal leaves 3-foliolate, the leaflets cuneate-obovate, 3-cleft into narrow lobes, otherwise entire; cauline leaves deeply 3 parted, or 3-foliolate with lanceolate entire petiolulate leaflets, or simple and lanceolate; achenes with very slender beak as long as or longer than the body.—Marble Mt., w. Siskiyou Co.

19. *R. hebecarpus* H. & A. Fig. 385. Slender delicate annual herb, 5 to 12 in. high, branching, sparsely villous; leaves thin, round or reniform in outline, 3-parted or -divided, the divisions somewhat divergent, entire, notched or lobed, or the uppermost divided into 3 narrowly oblong acute segments; peduncles 3 to 9 lines long; flowers minute, pale yellow; petals early deciduous, commonly before the stamens; achenes few, hispidulous

of leaves and scapes; scapes  $1\frac{1}{4}$  to 8 in. high, 1 to 3-flowered; leaves round-ovate to reniform, cordate at base, remotely notched, 4 to 10 lines long, on petioles 2 to 3 times as long; flowers 4 to 6 lines broad; petals 5 to 9 (or 12), oblong, shorter than or little exceeding the sepals; receptacle oblong-conic, obtuse, 2 to 6 lines high; achenes with striate sides.—Moist alkaline soils in river bottoms or desert lake beds or about desert springs: upper San Joaquin Valley; cismontane S. Cal.; Mohave Desert; thence n. along the e. side of the Sierra Nevada through Inyo and Lassen Cos. to Modoc Co. Widely distributed in N. and S. Am. and Asia. May-July.

23. *R. aquatilis* L. WATER BUTTERCUP. Perennial submersed aquatic, only the tips of the slender stems and the flowers resting on the surface of the water; leaves all many times dissected into filiform or capillary divisions, rarely some floating leaves with 3 broad lobes 2 or 3-toothed at apex; flowers 3 to 5 (or 5) lines broad; sepals deciduous; styles subulate, rarely persisting; receptacle often hairy; achenes transversely rugose, commonly hispidulous, about 11 to 18 in a rather compact round head.—Ponds, vernal pools, and slow streams in the valleys and mts.: Coast Ranges; Sierra Nevada; S. Cal. It is variable, and being rather common and nearly cosmopolitan, a large number of forms have received specific names. Apr. Var. *TRICHOPHYLLUS* Gray. Green Eel-grass. Leaves rather short and rigid, not collapsing on withdrawal from the water.—Widely distributed. Var. *BAKERI* Jepson. Leaves small, sparsely branched, the rigid segments divaricate.—Santa Clara Co. Var. *PEDUNCULARIS* Jepson. Peduncles very stout, falcate-curved, 1 in. long.—Lake Co. Var. *HISPIDULUS* Drew. Lower base of the emerged leaves, and the petioles and stipules hispid.—Humboldt Co.

24. *R. lobbii* Gray. LOBB'S BUTTERCUP. Annual; submersed leaves none, or when present, few and as in *R. aquatilis*; floating leaves 6 to 9 lines broad, divergently 3-parted into oblong or ovate lobes, the lateral lobes notched and the middle one commonly entire, or, rarely, all notched; stamens 5 to 10; petals withering persistent; style filiform, about 3 times the length of the ovary; achenes few (4 to 6), rugose, the mature ones commonly with minute black dots.—Whitening the surface of shallow vernal pools: Alameda and Marin Cos. to Napa Valley and n. Sonoma Co.; n. to B. C.

#### 14. *BECKWITHIA* Jepson.

Perennial herb with the dissected leaves and 1-flowered scapes from a stoutish rootstock. Petals rose-color or pink, roundish, with short narrow claw and a pocket-like pit near the base of the blade. Sepals and petals withering-persistent. Achenes strongly utricular. (Lieut. E. G. Beckwith, leader of a Pacific Railroad survey through the northern Sierra Nevada.)

1. *B. andersøni* (Gray) Jepson. Scapes naked, 4 to 9 in. high; herbage glabrous; leaves of rounded outline, palmately twice or thrice dissected into oblong or linear segments; segments acute, 2 to 4 lines long; flowers 12 to 14 lines broad; sepals round-ovate, purplish-margined; achenes numerous, 3 to 4 lines long, the beak very short.—Modoc and Mono Cos.: Ore. to Ariz. (*Ranunculus andersøni* Gray.)

#### 15. *KUMLIENIA* Greene

Glabrous perennial with the leaves and 1-flowered scapes from a fascicle of thickened or fleshy-fibrous roots. Leaves all basal, roundish, shallowly 3-lobed and sparingly toothed, cordate or truncate at base. Sepals 5 or 6, white. Petals 5 or 6, minute, reduced to small yellow stiped nectaries. Achenes sub-follicular, capitate, membranous, lanceolate, attenuate upward into a broadly subulate beak hooked or coiled at the tip, 2 (or 3)-nerved on the sides, at least when dead ripe. Seed fusiform, longitudinally multi-striate. (T. L. Kumlien, one-time Professor of Natural History at Albion College.)

1. *K. hystricula* (Gray) Greene. Fig. 388. Scapes 2 to 9 in. high; leaves roundish in outline but broader than long,  $\frac{1}{2}$  to  $2\frac{1}{2}$  in. broad, on petioles

$\frac{3}{4}$  to 2 in. long; flowers 5 to 7 (or 12) lines broad; sepals oval; nectaries spoon-shaped, one line long; achenes weakly pubescent, 2 to  $2\frac{1}{2}$  lines long; seed  $\frac{3}{4}$  line long.—Clefts of rocks on moist cañon sides, often within reach of flying spray: Sierra Nevada at middle altitudes (1500 to 5000 ft.), from Tulare Co. to Butte Co.; n. to Ore. Jan.-June.

# 16. CLÉMATIS L. VIRGIN'S

BOWER

Stems woody below, climbing by aid of the petioles of the opposite compound leaves. Peduncles axillary, bearing 1 to numerous flowers. Flowers (in ours) polygamous. Sepals 4, valvate in the bud, white and petal-like. Petals none (in ours). Stamens numerous. Achenes numerous in a head-like cluster, the styles persistent as hairy or plumose tails, very conspicuous in fruit. (Ancient name, from Greek klema, a twig.)

388. *Kumlienella hystericula* Greene; a, plant  $\times \frac{1}{2}$ ; b, fl.  $\times 1$ ; c, achene  $\times 4\frac{1}{2}$ .

Peduncle bearing a cymose panicle of many flowers, the cymes leafy-bracteate; leaflets 5 to 7; achenes pubescent. .... 1. *C. ligusticifolia*.  
Peduncle 1 to 3-flowered, with 2 bractlets below the middle. .... 2. *C. lasiantha*.

Leaflets 3; achenes pubescent. .... 3. *C. pauciflora*.  
Leaflets mostly 5 to 9; achenes glabrous. .... 4. *C. pauciflora*.

1. *C. ligusticifolia* Nutt. YERBA DE CHIVATO. Nearly glabrous, except the inflorescence; leaflets 5 to 7, ovate, cordate or obtuse at base, 3-lobed or coarsely toothed about midway, or nearly entire, mostly 1 to 3 in. long; peduncles 1 to 4 in. long, bearing a panicle of many to numerous flowers; flowers  $\frac{1}{2}$  to  $\frac{3}{4}$  in. in diameter; sepals narrowly oblong, acute, tomentulose; tails of the achenes 10 to 13 lines long; fruiting panicles corymbose to long-paniculate, 2 to 15 in. long.—Valleys, foothills and mts., 100 to 3500 ft.: S. Cal.; Sierra Nevada; Coast Ranges; n. to Ore. It climbs high over shrubs and sometimes ascends trees. An infusion of the herbage is used by Spanish-Californians as a healing wash for cuts in horses.

2. *C. lasiantha* Nutt. PIPE-STEM. Branchlets and sepals tomentose-pubescent, the foliage less so; leaves trifoliolate, the leaflets elliptic to orbicular, truncate or rounded at base, coarsely toothed and often 3-lobed, 1 to 2 in. long; peduncles 1 (rarely 3)-flowered, 2 to 6 in. long; flowers  $1\frac{1}{4}$  to  $2\frac{1}{4}$  in. in diameter; sepals broadly oblong, usually obtuse; achenes supporting a tail 1 to  $1\frac{1}{2}$  in. long, the fruit of one flower forming a head-like cluster 2 to  $2\frac{1}{2}$  in. broad.—Cañons and hillsides, 100 to 2000 ft.: Coast Ranges; Sierra Nevada; mts. of S. Cal. It clammers over shrubs or low trees, often illuminating a hillside with its profusion of flowers; occasional along streams in the valleys. Apr.-May.

3. *C. pauciflora* Nutt. ROPE VINE. Stems slender; herbage silky-pubescent when young; leaves more or less fascicled, 3 to 5-foliolate or the basal leaflets each replaced by 3 leaflets; leaflets roundish to ovate, toothed and often 3-lobed, often cordate at base,  $\frac{1}{4}$  to 1 in. long; peduncles 1 (or 3)-flowered,  $\frac{3}{4}$  to 1 in. long; flowers  $\frac{3}{4}$  to 1 in. broad; sepals 4 or 3; achenes glabrous, their tails about 1 in. long.—Trailing over rocks or clambering over bushes: cismontane S. Cal. Mar.-Apr.

## CALYCANTHACEAE. SWEET-SHRUB FAMILY

Aromatic shrubs with opposite entire leaves and no stipules. Flowers large, solitary, terminating the branches. Bracts, sepals and petals passing into each other, imbricated in many series, adnate at base to the enlarged hollow receptacle which is like a rose-cup. Stamens numerous, the inner ones sterile. Pistils many, distinct, nearly inclosed in the hollow receptacle, becoming achenes.

## 1. CALYCANTHUS L.

Flowers livid red. Petals in several rows at mouth of tube, the inner ones shorter. Styles equaling the anthers, filiform, colorless. Seed without endosperm; cotyledons foliaceous, convolute, caulicle inferior. (Greek kalyx, covering or calyx, and anthos, flower.)

1. *C. occidentalis* H. & A. SPICE BUSH. SWEET SHRUB. Fig. 389. Erect branching shrub 5 to 9 ft. high; leaves ovate to oblong-lanceolate, acute, rounded at base,  $1\frac{1}{2}$  to 6 in. long; sepals and petals linear-spatulate,  $1\frac{1}{4}$  in. long or less, the upper  $\frac{1}{2}$  or  $\frac{1}{3}$  fading tawny or brown in age; filaments  $\frac{1}{2}$  line long; fruiting receptacle cup-like, 1 to  $1\frac{1}{4}$  in. long; achenes oblong-ovate, slightly oblique or curved, a trifle flattened and bordered all around with a granular margin, somewhat velvety-hirsute, 4 to 5 lines long. — Along cañon streams in the North Coast Ranges and Sierra Nevada foothills 800 to 3800 ft.

389. *Calycanthus occidentalis* H. & A.; a, fl. branch; b, fr. receptacle.  $\times\frac{1}{2}$ .

## BERBERIDACEAE. BARBERRY FAMILY

Shrubs or herbs, ours with alternate compound leaves. Flowers perfect, regular, hypogynous. Sepals 6, in 2 circles. Petals 6, in 2 circles, the stamens as many and opposite them. Anthers opening by an uplifting valve or lid. Ovary one, superior, 1-celled, becoming in fruit a capsule, a berry, or dry and coriaceous. Seeds with endosperm.—*Achlys* is anomalous; it has no perianth and 9 to 13 stamens.

Shrubs or low woody plants; leaves pinnate, prickly; petals bifid.....1. *BERBERIS*. Perennial herbs; leaves all basal, ternate, not prickly.

Calyx and corolla none; leaves with 3 sessile leaflets.....2. *ACHLYS*.

Calyx and corolla present, reflexed; petals entire; petioles once or twice ternately divided, the divisions bearing 3 (rarely 1) petiolulate leaflets.....3. *VANCOUEVIA*.

1. *BÉRBERIS* L. BARBERRY

Evergreen shrubs or low suffrutescent plants with yellow wood. Leaves alternate, prickly, in ours pinnately compound with the rachis jointed at the insertion of the leaflets. Flowers yellow, in racemes. Sepals petal-like, subtended by 3 somewhat colored bractlets. Petals concave, in ours distinctly bifid. Filaments irritable. Stigma peltate-umbilicate. Fruit a berry. (Arabic name.)

Filaments with a pair of recurved teeth near the apex; racemes short, from small terminal or lateral buds; bud-scales few, deciduous, small (1 to 2 lines long); leaflets 3 to 9, pinnately veined.

Leaflets with comparatively few (mostly 5 to 15) teeth, the teeth strongly spinose; erect shrubs of dry inner ridges or of the desert.

Racemes loosely few-flowered.

Leaflets equal or nearly so; tooth-like lobes of the leaflets coarse, mostly subequal.....1. *B. fremontii*.

Terminal leaflet much longer than the lateral ones; terminal lanceolate tooth of each leaflet often entire, many times larger than the small lateral teeth.....2. *B. nevinii*.

Racemes densely many-flowered; teeth of the leaflets very coarse.....3. *B. californica*.

Leaflets with more numerous teeth.

Foliage not very dense; leaflets with many teeth.

Low (about  $\frac{1}{2}$  to 1 ft. high).

Stems erect or ascending; leaflets mostly pale or glaucescent above, mostly glaucous or whitish beneath, their teeth spine-tipped....4. *B. pumila*.

Stems prostrate or ascending; leaflets dull, their teeth bristle-tipped....5. *B. repens*.

Erect, 1 to 3 ft. high; leaflets shining above, their teeth spine-tipped.....6. *B. aquifolium*.

Foliage mostly forming a dense terminal fascicle; leaflets thin, with numerous small bristle-tipped teeth; coast region.....7. *B. pinnata*.

Filaments without teeth; racemes elongated, loose, solitary or few from a terminal bud; bud-scales large ( $\frac{1}{4}$  to  $1\frac{1}{4}$  in. long), persistent; leaflets 11 to 21, somewhat palmately veined.....8. *B. nervosa*.

1. *B. fremontii* Torr. DESERT BARBERRY. Shrub 5 to 8 (or 15) ft. high; leaflets 5, ovate, rigidly coriaceous, yellowish or glaucous, scarcely at all or only moderately undulate, 6 to 12 lines long, strongly and sinuately 5 or 7-lobed, the lobes strongly spinose; petiole articulated near the base or often a supplementary pair of leaflets borne at this point; racemes few (3 to 9)-flowered, 1 to  $1\frac{1}{4}$  in. long, the peduncles as long or almost none; berries at maturity dull brown, somewhat inflated, 5 to 6 lines in diameter.—Mt. slopes: e. Mohave Desert; Colorado Desert; e. to Ariz. and s. Nev., s. to L. Cal. and Sonora. May-June.

2. *B. nevinii* Gray. Shrub 6 to 8 ft. high, with many erect loose branches; leaflets 5,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long, the lateral oblong, the terminal one broadly lanceolate, acuminate, all with few and small spinose teeth; petioles almost none; racemes loosely 5 to 7-flowered.—Sandy slopes: e. edge of San Fernando Valley; Arroyo Seco, San Gabriel Mts. (F. W. Peirson); very rare; closely allied to *B. fremontii*.

3. *B. californica* Jepson. Stems rigidly erect, 3 to 6 (or 10) ft. high, little branched; leaves  $1\frac{1}{2}$  to 4 in. long; leaflets 5 to 9, ovate, 1 to 2 in. long, very pale or glaucescent, strongly reticulate, repandly dentate, the 8 to 12 teeth ending in long stout spines, their length  $\frac{1}{2}$  to  $\frac{2}{3}$  the breadth of the body of the blade, the blade so strongly undulate that the spines are presented in nearly all directions; racemes 1 to 2 in. long, the pedicels mostly 3 to 5 lines long.—Dry rocky interior foothills, 300 to 1500 ft. or up to 6000 ft. on arid ridges: Inner Coast Range, s. to cismontane S. Cal.; apparently also in s. Sierra Nevada foothills.

4. *B. pumila* Greene. Stems erect, rigid, 5 to 14 in. high; leaflets 5 (3 to 7), broadly ovate, whitish, glaucescent or dull green,  $1\frac{1}{4}$  to  $2\frac{1}{4}$  in. long, the rather coarse or medium-sized teeth about 10 to 18, spine-tipped; racemes dense, 1 to  $1\frac{1}{2}$  in. long; berries blue, small, oblong.—Inner North Coast Range and higher Sierra Nevada foothills; n. to southern Ore.; 3000 to 5000 ft.

5. *B. repens* Lindl. CREEPING BARBERRY. Stems ascending from a creeping or stolon-like base, simple, 4 to 6 in. high; leaflets 3 to 5, plane or nearly so, dull above, paler beneath, with many small teeth and weak spines; racemes rather dense, 2 to  $2\frac{1}{2}$  in. long; berries blue-glaucous.—Del Norte Co. to Modoc Co., thence s. to Inyo Co.; n. to B. C., e. to Rocky Mts.

6. *B. aquifolium* Pursh. MOUNTAIN GRAPE. Stems erect, 1 to 3 ft. high; leaves thin-coriaceous, bright-green and glossy-shining above, duller beneath; leaflets plane, 3 to 5 or 7, elliptic-ovate to oblong-ovate,  $1\frac{1}{4}$  to 3 in. long, the margin with many long slender spines; lowest pair of leaflets remote

from base of petiole; racemes fascicled in the axils and at the summit, dense, 1 to 2 in. long; berries blue, glaucous, rather large.—North Coast Ranges from Napa Co. to Humboldt Co.; n. Sierra Nevada from Amador Co. to Modoc Co.; n. to B. C. Var. *dictyodonta* Jepson. Erect, stout,  $\frac{1}{2}$  to 1 ft. high, sparsely leafy; leaflets 5 to 7, broadly ovate, prominently reticulated, shining and yellow above, paler beneath, 1 to  $2\frac{1}{4}$  in. long, undulate, sinuous-dentate, the 10 to 20 teeth with strong spines; lowest pair of leaflets close to base of petiole; racemes dense,  $\frac{3}{4}$  to 1 in. long.—Rocky slopes, Marysville Buttes.

390. *Berberis pinnata* Lag.; a, fl. branch  $\times \frac{1}{2}$ ; b, fl.  $\times 1$ ; c, stamen  $\times 4$ .

7. *B. pinnata* Lag. CALIFORNIA BARBERRY. Fig. 390.

Stems erect, stout, branching,  $\frac{1}{4}$  to  $1\frac{1}{2}$  ft. high (or even to 4 or 5 ft.); leaves 2 to 4 in. long; leaflets usually 7 to 13, but sometimes 5 to 17, rather crowded on the rachis, ovate-elliptical to oblong, thinnish and plane, somewhat bubbly-undulate, 1 to  $2\frac{1}{4}$  in. long, shining above, somewhat paler beneath, shallowly sinuate-dentate, the numerous teeth prickly; lowest pair close to base of petiole; racemes clustered, dense.—Hill summits and slopes, mostly along the edge of thickets, near the coast from Marin Co. to San Diego Co. Mar.-Apr.

8. *B. nervosa* Pursh. OREGON GRAPE. Stem scaly, caudex-like, simple,  $\frac{1}{2}$  to 1 (or 2) ft. high, bearing the leaves in a terminal tuft; leaves 9 to 16 in. long, the rachis conspicuously nodose; leaflets 11 to 21, bright green, ovate to ovate-lanceolate, spinulose-serrate, and somewhat palmately nerved,  $1\frac{1}{2}$  to 3 in. long; scales of the strong terminal bud  $\frac{3}{4}$  to  $1\frac{3}{4}$  in. long, coriaceous-glumaceous; racemes erect, elongated, 2 to 4 (or 6) in. long; bracts oblong to lanceolate, membranaceous; berries blue-glaucous, 4 to 5 lines in diameter.—Woods near the coast from the Santa Lucia Mts. to Shasta and Siskiyou Cos.; n. to B. C.

2. *ACHLYS* DC.

Perennial herbs with long-petioled 3-foliolate leaves and leafless scapes rising from a very slender rootstock. Flowers perfect, in a short dense spike. Calyx and corolla none. Stamens 9 to 13, 2 to 3 times as long as ovary, the outer dilated upward. Fruit dry, indehiscent, broadly moon-shaped. (Greek Achlus, the god of night or gloom.)

1. *A. triphylla* (Sm.) DC. DEER-FOOT. Plants about 1 ft. high; leaflets fan-shaped, sinuate-dentate, 2 to 6 in. broad.—Woods near the coast, 100 to 2500 ft., Mendocino Co. to Humboldt Co.; n. to B. C. Also called Sweet Leaf. Settlers on the Humboldt coast, prizing the delicate fragrance, hang bunches of the leaves in their houses.

3. *VANCOUVÈRIA* Morr. & Dec.

Low perennial herbs with slender creeping rootstocks. Leaves once or twice ternately compound, all basal or nearly so. Flowers small, nodding, arranged in an open panicle on a slender scape-like peduncle. Sepals 6, in 2 series, obovate, petal-like, reflexed, subtended by 6 to 9 small calyx-like membranous bractlets. Petals 6, ligulate, tipped with a hood-like nectar-bearing

ing appendage, reflexed. Stamens 6, closely erect about the pistil, the anther connective produced into a pointed tip. Style 1; stigma thin, cup-shaped. Fruit a follicle. Seeds with an aril. (Capt. George Vancouver of the English exploring ship Discovery, who visited San Francisco Bay in 1792.)

Leaflets with cartilaginous-margin; panicle beset with gland-tipped hairs; stamens glabrous.....1. *V. parviflora*.  
 Leaflets not cartilaginous-margined; panicle glabrous; stamens covered with short gland-tipped hairs.....2. *V. hexandra*.

1. *V. parviflora* Greene. INSIDE-OUT FLOWER. Stems 8 to 20 in. high, sparsely hairy, at base rusty-pilose, the panicle pubescent with short spreading gland-tipped hairs; leaves glabrous or with rusty hairs on the petioles at the forks, persisting through the winter; leaflets thickish, roundish in outline, broadly cordate at base, with mostly closed sinus, obscurely or evidently 3-lobed with a notch at the summit of each lobe,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, frequently broader than long, the margin cartilaginous and often crisped; panicle  $2\frac{1}{2}$  to 7 in. long, 25 to 55-flowered; flowers white or lavender-tinged, 4 lines long; sepals 2 lines long; stamens glabrous.—Shade of coniferous forests, mostly in the Redwood region, from the Santa Lucia Mts. to Humboldt Co.; n. to Ore. May-June.

2. *V. hexandra* (Hook.) Morr. & Dec. Flowering stems 7 to 21 in. high; leaves sparingly pubescent with short scattered hairs, perishing after the maturing of the fruit; leaflets thinnish, ovate to oval or roundish in outline (seldom broader than long),  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, cordate at base with open sinus, 3-lobed at apex (the middle lobe largest); panicle glabrous, 10 to 25-flowered; flowers 6 lines long; sepals 3 lines long; sepals and petals pearly white; stamens covered with small stipitate glands; ovules 3 in each cell.—Woods, 500 to 3000 (or even 4000) ft.: Mendocino Co. to Siskiyou Co.; n. to Wash. Commonly in deeper shade than *V. parviflora*. May-June.

#### LAURACEAE. LAUREL FAMILY

Aromatic evergreen trees and shrubs with alternate simple leaves and no stipules. Flowers perfect, regular. Petals none. Anthers opening by uplifted valves. Ovary superior, 1-celled, 1-ovuled, with a single style. Fruit in ours a drupe.

##### 1. UMBELLULARIA Nutt.

Flowers in simple peduncled umbels. Sepals 6. Stamens 9, the three inner with stipitate orange-colored gland on each side of the filament at base and alternating with scale-like staminodia; anthers 4-celled, 4-valved, the three inner extrorse, the outer introrse. (Latin *umbellularia*, a little umbel.)

391. *Umbellularia californica* Nutt.; fr. branchlet  
 x  $\frac{1}{2}$ .

1. *U. californica* Nutt. CALIFORNIA LAUREL. Fig. 391. Tree 20 to 60 ft. high with a dense crown of erect slender branches, or in the chaparral as a mere shrub; leaves oblong or oblong-lanceolate, entire,  $2\frac{1}{2}$  to  $4\frac{1}{2}$  in. long, on short petioles; umbels 4 to 9-flowered, but setting only 1 to 3 (rarely 6) fruits; flowers 2 lines long; drupe subglobose or ovoid, 1 in. long, greenish, or when ripe brown-purple.—Cañon walls; mountain slopes and stream flats: Coast Ranges and Sierra Nevada, s. to San Diego Co. and n. to southern Ore. It is most abundant and of greatest size on the alluvial river flats of northwestern California and adja-

cent Oregon. Also called Bay Tree and Bay Laurel, but in the woods of Mendocino and Humboldt the name "Pepperwood" is the only one in use. While in Oregon the name "Myrtle" replaces all others. The wood is prized by the cabinet-maker.

### PAPAVERACEAE. POPPY FAMILY

Herbs or shrubs with mostly colored juice and regular complete flowers. Sepals 2 or 3, caducous, the petals twice as many. Calyx in *Eschscholtzia* resembling a fool's cap, the 2 sepals completely united into a single piece. Stamens numerous, rarely few. Pistil 1, composed of 2 to several united carpels; ovary superior, 1-celled (several-celled in *Romneya*); in *Platystemon* the lightly united carpels become distinct in fruit.

Sepals distinct, caducous; receptacle not hollowed (slightly hollowed in no. 6).

Leaves usually opposite or whorled, entire; annual herbs.

Stamens numerous; carpels lightly joined, distinct in fruit....1. *PLATYSTEMON*.

Stamens 6 to 12 or numerous; carpels combined into a 3-angled or linear ovary...

2. *MECONELLA*.

Leaves alternate or mainly so, often in a basal tuft.

Stamens 6 to 9; minute annual.....3. *CANBYA*.

Stamens many or numerous.

Herbs; leaves toothed, lobed or pinnatifid.

Petals deciduous; stigmas opposite (that is, over) the placentae.

Flower buds erect; petals white; herbage prickly...4. *ARGEMONE*.

Flower buds drooping; petals red; herbage not prickly.5. *PAPAVER*.

Petals persistent around the capsule; stigmas alternate with the placentae; herbage not prickly.....6. *AEOTOMECON*.

Shrubs or at least woody at base.

Petals white; leaves pinnatifid; capsule ovate, 7 to 12-valved.....

7. *ROMNEYA*.

Petals yellow; leaves entire or merely denticulate; capsule linear,

2-valved.....8. *DENDROMECON*.

Sepals united into a calyptra or foolscap body which is pushed off by the 4 expanding

petals; receptacle hollowed; herbs.....9. *ESCHSCHOLTZIA*.

#### 1. *PLATYSTEMON* Benth.

Low annual with mainly opposite entire leaves. Sepals 3. Petals 6 in two series, tardily deciduous, withering and closing over the forming fruit. Stamens numerous; filaments more or less dilated and petal-like. Stigmas subulate-filiform, one terminating each carpel; carpels 6 to 17 or 20, each several-ovuled, connivent or coherent in a circle, becoming moniliform, at maturity separating and breaking transversely into indehiscent 1 seeded joints. (Greek *platus*, broad, and *stemon*, a stamen.)

1. *P. californicus* Benth. CREAM CUPS. Figs. 392, 393. Branched from the base, the branchlets widely spreading and more or less decumbent, or often erect, 3 to 9 (or 12) in.

392. *Platystemon californicum* Benth.; a, habit x  $\frac{1}{4}$ ; b, fl. x 1; c-e, stamens showing variations in filaments x 4; f, circle of moniliform carpels x  $1\frac{1}{2}$ .

393. *Platystemon californicus* Benth.; a, fl. bearing 2 distinct gynoeceia, each gynoeceium composed of several normal carpels; b, fl. with 3 gynoeceia; c, fl. with moniliform carpels; d, fl. (from same plant as c) with cylindrical carpels. x 1.

high, the leaves often borne on the lower part (or wholly basal) and the peduncles therefore more or less scape-like and 2 to 7 (or 10) in. long; herbage pilose; buds round-obovoid, elliptic or oblong, long-hairy; petals commonly cream yellow, 3 or 6 to 11 lines long.—Foothills, plains and valleys, in sandy or clay soils, common almost throughout Cal., but absent from the deserts, except the w. margins of the Colorado and Mohave; e. to Ariz. and Utah, s. to L. Cal. Passes into the varieties. Var. *CRINITUS* Greene. Peduncles and buds with longer hairs, often densely pilose; buds globose; petals yellow, often with pink or greenish tips.—Tehachapi Mts., s. to the Cuyamaca Mts. Var. *HORRIDULUS* Jepson. Petals spreading nearly rotately from a turbinate or almost cylindric base 3 to 4 lines long; carpels white when young with a dense covering of stiffish hairs, the hairs rapidly deciduous and the carpels soon becoming only thinly hairy.—S. Sierra Nevada foothills from Fresno Co. to Tulare Co., 3500 to 5000 ft. Var. *NUTANS* Bdg. Fruits nodding.—San Diego; Santa Cruz Isl.

## 2. *MECONELLA* Nutt.

Low annuals with opposite leaves. Sepals 3, rarely 2. Petals 6, rarely 4, deciduous. Stamens 6 to 12, or numerous. Carpels 3, combined into a single 1-celled ovary, which is 3-lobed or nearly terete. Placentae as many as the carpels, parietal, many-ovuled. Stigmas ovate to subulate. Capsule completely 3-valved, dehiscent through the placentae. (Greek mekon, poppy, and ella, diminutive.)

Plants with the leaves all basal or sub-basal and with unbranched hairy scapes; petals light yellow; ovary and capsule narrowly obovoid, 3-lobed..... 1. *M. linearis*.  
Plants with branching leafy stems and glabrous peduncles; petals white; ovary and capsule linear..... 2. *M. oregana*.

1. *M. linearis* (Benth.) Jepson. Fig. 394. Plants with the leaves all basal or nearly so, the scapes 4 to 8 in. high and hispid with spreading hairs; leaves linear, 1 to 2¼ in. long, sessile; sepals brownish; petals light yellow, cuneate-orbicular or obovate, 4 to 9 lines long; stamens numerous, filaments linear or oblong-dilated, rarely filiform; body of capsule 5 to 7 lines long.—Sandy soil in the Coast Ranges from Sonoma Co. to Santa Barbara Co., chiefly near the coast, but inland to the s. Sierra Nevada (Fresno Co. to Kern Co.); Ore. Mar.-Apr. (*Platystigma lineare* Benth.) Var. *PULCHÉLLA* Jepson. Outer petals yellow, inner white.—Coast from San Francisco to Sonoma Co.

2. *M. oregana* Nutt. var. *californica* Jepson. Fig. 395. Very slender, erect, branching, 4 to 7 in. high, glabrous throughout; leaves entire, the basal and lower ones elliptic to obovate-spatulate, ½ to 1 or 1½ in. long, commonly contracted to a petiole, the upper cauline oblanceolate to linear; peduncles 2 to 3 in. long, erect in anthesis, in fruit deflexed almost horizontally but the capsule vertical or nearly so; sepals often reddish; petals

394. *Meconella linearis* Jepson; a, habit; b, capsule. x ½

395. *Meconella oregana* var. *californica* Jepson; a, habit; b, capsule. x 1.

with a horn-like appendage below the apex. Petals white, twice as many as the sepals. Ovary 1-celled; stigmas radiate. Capsule 4 to 6-valved at summit. (Greek name of some herb, transferred here.)

Calyx rather densely spiny; horn-like appendage of sepals large or conspicuous, spine-tipped and with many spines over its surface; flowers not corymbose.....1. *A. platyceras*.

Calyx with scattered spines; horn-like appendage of sepals small or inconspicuous, spine-tipped, its surface otherwise unarmed; flowers corymbose.....2. *A. intermedia*.

1. *A. platyceras* Link & Otto. CHICALOTE. Stems stout, branched, more or less prickly with long yellow spines,  $1\frac{1}{2}$  to  $2\frac{3}{4}$  ft. high; herbage glaucescent; leaves oblong, sinuate-pinnatifid into spinose-toothed lobes, tapering to a winged petiole, spinose chiefly along the margin and along the main veins, 2 to 9 in. long; flowers in leafy-bracteate panicles; sepals 3, spiny, each with a horn at apex, the horns lanceolate, spiny on the sides and strongly spine-tipped; petals 6, obovate, truncate, 1 to 2 in. long; capsule narrowly cylindrical,  $1\frac{1}{2}$  to 2 in. long, the valves firm, becoming somewhat indurated, densely spiny.—S. Cal.; e. to Tex. Apr.-July. Passing by intergrades into

white, elliptic to oblong, 2 to 5 lines long; stamens 12, unequal, in two series, the outer shorter; filaments filiform or slightly dilated upwards; capsule linear, twisted,  $\frac{1}{2}$  to 1 (rarely  $1\frac{1}{2}$ ) in. long.—Sierra Nevada foothills from Shasta Co. to Amador Co.; San Francisco Bay region. Var. *OCTÁNDRA* Jepson. Petals almost fan-shaped; stamens 8, the 4 outer shorter.—S. Sierra foothills (or their bordering plains) from Merced Co. to Tulare Co. Var. *DENTICULATA* Jepson. Leaves entire, sometimes denticulate; stamens 6, in one set.—Cismontane S. Cal. from Santa Inez Mts. to San Diego Co.

### 3. CÁNBYA Parry

Minute glabrous annuals with the leaves crowded in a dense basal tuft on the very shortly branched stems. Leaves mostly alternate, linear, fleshy, entire. Flowers on axillary filiform pedicels. Sepals 3. Petals 6, white, after anthesis withering and closing over the capsule. Stamens 6 (or 5) to 9. Ovary 1-celled, with 3 nerve-like placentae. Style none. Stigmas 3, linear, radiate-recurved and appressed to the subglobose ovary. Ovules several. (W. M. Canby, botanist of Delaware.)

1. *C. cándida* Parry. Fig. 396. Plants 1 in. high; leaves fleshy, 2 to 4 lines long; petals roundish, 1 to  $1\frac{3}{4}$  lines long.—Sandy washes, Mohave Desert, 2000 to 3500 ft. Apr.-May.

### 4. ARGEMONE L.

Annual herbs with acrid orange juice, prickly sinuate or pinnatifid leaves and flowers erect in the bud. Sepals 2 (often 3),

396. *Canbya candida* Parry; a, habit x 1; b, fl. x 2.

the var. *HISPIDA* Prain, the whole plant densely setose-hispid as well as armed with stouter yellow spines.—Mt. valleys or cañon flats, 2000 to 8000 ft.: Coast Ranges; e. side of the Sierra Nevada; mts. of S. Cal. June-Sept. Sometimes perennial.

2. *A. intermedia* Sweet var. *corymbosa* Eastw. PRICKLY POPPY. Plants 1 to 3 ft. high, prickly with stout yellow spines; leaves oblong to obovate or the upper ovate, repand-toothed to sinuate-pinnatifid; flowers fragrant, somewhat regularly corymbose; petals 10 to 14 lines (sometimes to 1½ in.) long; capsule ¾ in. long.—Mohave Desert. May-June.

### 5. PAPAVER L. POPPY

Erect herbs (ours annual) with narcotic juice. Leaves pinnately cleft, lobed or divided. Flowers showy, solitary on long peduncles, nodding in bud. Sepals 2. Petals 4, in ours red. Stamens very many. Ovary and capsule obovoid to subglobose, with 4 to many intruded placentae. Capsule opening by holes just below the summit. (Latin name of the poppy.)

Juice milky; stigmas sessile and radiate upon the summit of the ovary.—Subgenus *EUPAPAVER*. . . . . 1. *P. californicum*.  
Juice yellow; stigmas capitate upon the short slender style.—Subgenus *MECONOPSIS*. . . . . 2. *P. heterophyllum*.

397. *Papaver californicum* Gray; capsule  $\times 1\frac{1}{2}$ .

1. *P. californicum* Gray. WESTERN POPPY. Fig. 397. Glabrous or sparsely pilose-pubescent, 1½ to 2 ft. high; juice milky; leaves pinnately divided, the segments oblong or roundish, toothed, lobed, or incised; petals red with a green spot at base, 7 to 10 lines long; stigmas sessile and radiate upon the summit of the ovary, forming a sort of "skull cap," persistent in fruit; capsule turbinate-obovate, 6 to 7 lines long.—Cismontane S. Cal., n. to Marin Co. Apr.-May.

2. *P. heterophyllum* (Benth.) Greene. WIND POPPY. Fig. 398. Glabrous, 1½ to 2 ft. high; juice yellow; leaves pinnate or pinnately divided, the segments entire, toothed or divided, exceedingly diverse in shape even on the same plant or the same leaf, varying from oval to narrowly linear; petals brick-red with a dark spot at base, broadly cuneate-obovate, ½ to 1 in. long; stigmas capitate at summit of a distinct and slender style; capsule clavate-obovoid, 4 to 7 lines long.—Hill slopes and valley fields: Lake Co.; South Coast Ranges; San Joaquin Valley and s. Sierra Nevada from Kern Co. to Fresno Co.; coastal S. Cal.; s. to L. Cal. May.

### 6. ARCTOMÉCON Torr. & Frem.

Herbs with a stout tap root. Leaves long-hirsute, crowded toward the base of the plant. Flowers large, white or yellow, solitary or in an umbelliform cluster. Sepals 2 or 3. Petals 4 or 6, round-obovate, in age persisting around the base of the capsule. Stamens numerous, short. Ovary and subcoriaceous capsule ovoid or obovoid, 3 to 6 (commonly 4)-valved; style shorter than the globular and lobulate mass of 3 to 6 erect and somewhat united stigmas. Seeds rather few, oblong. (Greek arctos, a bear, and mecon, poppy; from the hirsuteness.)

1. *A. merriamii* Cov. DESERT POPPY. Plants 1 ft. high, the stems somewhat branched near the base; herbage glaucous; leaves mostly basal, cuneate-filabelliform, petiolate, coarsely toothed at apex, hirsute with long brown hairs, 3 to 7½

398. *Papaver heterophyllum* Greene; a. habit  $\times \frac{1}{2}$ ; b. c. d. different leaf types  $\times \frac{1}{4}$ ; d. capsule  $\times 1$ .

399. *Romneya coulteri* Harv.; a, fl.; b, bud.  $\times \frac{1}{2}$ .

lines long, the cauline shorter; flowers  $1\frac{1}{2}$  to 2 in. broad, solitary on long naked peduncles; sepals 3, villous; petals 6, white; filaments slender, slightly dilated upwards; stigmas sessile.—E. Inyo Co. and s. Nev. Apr.

#### 7. *RÓMNEYA* Harv.

Tall glabrous perennial from a soft woody base, with colorless bitter juice and alternate pinnatifid leaves. Corolla very large, bright white, with frilled petals. Stamens very numerous. Ovary and coriaceous capsule with 7 to 12 plate-like placentae, some of which meet in the axis and form partitions. Style none. Stigmas 7 to 12, partly coherent in a ring. (The astronomer, T. Romney Robinson of Dublin, friend of Dr. Thos. Coulter, the discoverer of the plant.)

1. *R. coulteri* Harv. MATILJA POPPY. Fig. 399. Stems branching, leafy, 3 to 8 ft. high; herbage glabrous, glaucescent; leaves petiolate, pinnately parted or divided into 3 to 9 cuneate-oblong to lanceolate divisions or leaflets, these sparingly dentate or the terminal one 3-cleft, the margins and rachis often sparsely spinulose-ciliate; flowers short-peduncled, terminal, not drooping in bud, delicately fragrant, lasting a few days; calyx glabrous, somewhat beaked; corolla 3 to 5 in. broad; capsule ovate to oblong,  $1\frac{1}{2}$  in. long, strigose-hispid, the 7 to 12 valves opening from the summit downward; seeds slightly incurved with dull roughish coat.—Washes and cañon beds, 1000 to 2500 ft., coastal S. Cal. from Santa Barbara Co. to San Diego Co.; s. to L. Cal. May-June. Var. *TRICHOCALYX* Jepson. Calyx setose, beakless or nearly so.—Range of the species.

#### 8. *DENDROMÈCON* Benth.

Glabrous evergreen shrub with alternate entire coriaceous leaves and golden yellow flowers. Sepals 2. Petals 4. Stamens numerous, with short filiform filaments and linear anthers. Style short, bearing 2 oblong stigmas. Capsule linear, curved, its two valves separating tardily or incompletely from the 2 thread-like placentae. Seeds pitted, provided with a caruncle. (Greek dendron, tree, and mecon, poppy.)

1. *D. rigida* Benth. BUSH POPPY. Fig. 400. Stems few to many from the base, 2 to 4 (or 8) ft. high, the main stem bark shreddy; branches whitish; leaves yellowish green, oblong to linear-lanceolate, reticulate, minutely denticulate, mucronate, 1 to  $3\frac{1}{2}$  in. long, borne on very short petioles which, by a twist, bring the blade vertical; flowers on peduncles 1 to 3 in. long; corolla 1 to  $2\frac{1}{2}$  in. in diameter; capsule 2 to 4 in. long.—Dry slopes and ridges at middle altitudes (1000 to 3000 ft.): Coast Ranges and Sierra Nevada, n. to Shasta Co. and s. to cismontane S. Cal. May-June. Var. *HARFÓRDII* K. Bdg.

400. *Dendromecon rigida* Benth.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, dehiscent capsule  $\times \frac{1}{2}$ .

Tree-like or shrubby, 6 to 10 (or 18) ft. high, the branches more or less drooping; leaves elliptic,  $1\frac{1}{4}$  to  $5\frac{1}{4}$  in. long, entire, rarely minutely roughened.—Santa Barbara Isls.

### 9. ESCHSCHÖLTZIA Cham.

Annuals or perennials with watery juice, petioled ternately dissected leaves and peduncled yellow flowers. Receptacle hollowed or excavated, surrounding the base of the pistil, the calyx or corolla in consequence seeming as if perigynous; this receptacle (or torus) in addition often bearing a spreading outer and an erect inner rim. Sepals completely united into a calyptra or pointed cap-like body which parts from the receptacle and is pushed off by the expanding petals. Stamens many, mostly on the base of the petals; anthers commonly longer than the filaments. Ovary linear; style very short; stigmas commonly 4, subulate-filiform, unequal. Capsule 1-celled, many-seeded, 2-valved.—Dehiscence of the capsule commonly occurs in flight, after the capsule parts from the receptacle and before it reaches the ground, usually beginning at the moment that the base of the capsule is released from the vise-like hollowed receptacle, this action allowing the valves which are elastically dehiscent from base to apex, to separate. (Dr. J. F. Eschscholtz, college friend of Adelbert von Chamisso, German poet and naturalist, and his companion on Kotzebue's scientific voyage around the world.)

Cotyledons 2-cleft; receptacle (torus) with a collar-like rim; perennials (commonly flowering the first year).....1. *E. californica*.  
Cotyledons entire; receptacle (torus) without rim or with only a very narrow one; annuals.

Stems more or less leafy.

Petals 1 to  $2\frac{3}{4}$  lines long (longer in vars.); herbage usually glabrous; species of the Mohave and Colorado deserts.....2. *E. minutiflora*.  
Petals about  $\frac{1}{2}$  to 1 in. long; cismontane species.

Herbage glabrous or nearly so.

Stems stout; leaves very finely cut; insular species.....3. *E. elegans*.

Stems slender; leaves not so finely cut; mainland species; var. hypocoides of.....4. *E. lemmonii*.

Herbage hoary-pubescent with curled white hairs.....4. *E. lemmonii*.

Stems scapose, the leaves all in a low basal tuft or sometimes a few sub-basal.

Seeds strongly muricate with flattened processes, i.e., bur-like; leaf divisions long and rather few.....5. *E. lobbiai*.

Seeds not muricate; leaf divisions numerous.

Seeds smooth or reticulate; leaves in a moderately dense tuft, the petioles unequal.....6. *E. caespitosa*.

Seeds with large deep rather remote pits; leaves in a very dense tuft, the petioles about equal.....7. *E. glyptosperma*.

1. *E. californica* Cham. CALIFORNIA POPPY. Fig. 401. Stems scapose or leafy, erect or diffuse,  $\frac{3}{4}$  to 2 ft. high; basal leaves ternately several times dissected into linear or oblong segments, on long or short petioles, the whole leaf  $\frac{1}{2}$  to 1 ft. long; cauline smaller on short petioles; peduncles 2 or 3 to 6 in. long; petals fan-shaped,  $\frac{1}{2}$  to 2 in. long, varying from deep orange or copper-color to straw-color; outer spreading rim of the receptacle commonly  $\frac{1}{2}$  to 2 lines wide, the inner erect rim hyaline; capsule 1 to 3 or even 4 in. long.—Throughout cismontane Cal. in the valleys and foothills, 10 to 2000 ft. Widely naturalized in Aust. and India. Var. *CRÖCEA* Jepson. In the most marked form individual plants of this variety pass normally through two seasonal flowering stages. (a) Vernal stage: stems often many, mostly stiffly erect, 1 to  $1\frac{1}{2}$  (or 2) ft. high; herbage glaucous; flowers 1 or mostly  $1\frac{1}{2}$  to  $2\frac{1}{4}$  in. long; buds 8 to 18 lines long, long-pointed; torus rim 1 to 2 lines broad; petals a deep rich orange; pods 2 to 3 in. long. (b) Aestival stage: stems fewer, diffuse, spreading or decumbent,  $\frac{1}{2}$  to 1 (or  $1\frac{1}{2}$ ) ft. long; flowers  $\frac{1}{4}$  to  $\frac{1}{2}$  (or 1) in. long; buds 2 to 3 lines long, apiculate; torus rim  $\frac{1}{8}$  to  $\frac{1}{4}$  line broad; petals pale or straw-yellow; pods 1 to  $1\frac{1}{2}$  in. long.—Interior valleys, particularly the Sacramento and San Joaquin, reaching its highest development and most marked differentiation into two distinct flowering stages, vernal and aestival, when in rich alluvial loams. Var. *MARITIMA* Jepson. Stems leafy, early ascending, later becoming prostrate,  $\frac{1}{2}$  to 1 ft. long; herbage very glaucous, glabrous or minutely scaberulous or the pubescence often scurf-like; leaves with short crowded segments; calyptra of bud short-oblong, 4 to  $5\frac{1}{2}$  lines long, abruptly narrowed to a blunt or beaked

apex; petals  $\frac{3}{4}$  in. long, lemon yellow with an orange spot at base; pod  $1\frac{1}{2}$  to 2 in. long; seeds nearly smooth.—San Miguel Isl. and coast of Santa Barbara Co., n. to Monterey Co. June-Sept.

2. *E. minütiflora* Wats. Stems several to many, branching, leafy and floriferous, 2 to 12 in. high, from a slender sometimes branched taproot; herbage glabrous (rarely pubescent), often glaucous; flowers on slender peduncles little or not at all exceeding the foliage; torus tubular-campanulate, the rim not expanded but often obscurely fluted, a hyaline internal edge commonly a little projecting; petals 1 to  $2\frac{3}{4}$  lines long; seeds spherical or nearly so, reticulate.—Colorado and Mohave deserts, the bordering ranges, and n. to Inyo Co.; e. to Utah and Ariz. Apr.-June. Var. *PARISHII* Jepson. Petals 3 to 6 (or 7) lines long.—Colorado and Mohave deserts, n. to Inyo Co. and the Sierra Nevada in Kern Co. Var. *RUTAEOFOLIA* Jepson. Stems slender, many from the base; leaves ternate or biternate, the lobes broadly cuneiform.—Havilah, Kern Co.

402. *Eschscholtzia lemmönii* Greene; a, habit  $\times \frac{3}{8}$ ; b, seed  $\times 5$ .

3. *E. elegans* Greene. Stout leafy-stemmed annual, much branched above the base, 1 ft.

high; herbage glaucous, glabrous or slightly scabrous; leaves very finely cut; torus narrow-campanulate, the scarious inner ring conspicuous; corolla  $\frac{1}{2}$  in. long; mature seeds reticulate.—Santa Barbara Isls. Apr.-May.

4. *E. lemmönii* Greene. Stems usually somewhat leafy, branching, 6 to 12 in. high; herbage more or less pubescent with white hairs; torus urn-shaped, glabrous, 3 to 4 lines long; calyptra white-pubescent; petals orange,  $\frac{1}{2}$  to 1 in. long; capsule  $1\frac{1}{4}$  to  $2\frac{1}{2}$  in. long.—San Carlos Range and s. to e. San Luis Obispo Co. May-June. Var. *ASPRELLA* Jepson. Buds lightly pubescent to quite glabrous.—Plaskett Ranch, King City; Waltham Creek, San Carlos Range.

5. *E. lobbii* Greene. FRYING-PANS. Fig. 402. Scapose, 4 to 8 (or 11) in. high, the leaves in a basal or sub-basal tuft with comparatively few linear or linear-lanceolate to almost filiform divisions; petals light yellow, 3 to 6 lines long; seeds strongly muricate with flattened processes, i. e., bur-like.—

401. *Eschscholtzia californica* Cham. The form of the interior valleys (var. *crocea* Jepson) commonly shows two distinct flowering stages: the vernal flowering stage (a) with stout erect stems and large bronze-gold corollas and broad torus rim (b); and the summer and autumnal flowering stage (c) with slender diffuse stems and small straw-yellow corollas and narrow or obsolescent torus rim (d). The branchlet a was drawn in April, the branchlet c in August; both were taken from the same root-crown. These figures ( $\times \frac{1}{2}$ ) illustrate the great range of variation which occurs in individual plants of this species. e, seed  $\times 6$ .

Sterile gravelly or clay foothills and rolling valley plains, 100 to 2000 ft.: Sierra Nevada foothills; foothills of inner North Coast Ranges and the Sacramento Valley. Mar.-Apr.

6. *E. caespitosa* Benth. Stems usually scapose, several to many from a tuft of basal leaves, 3 to 9 in. high, far exceeding the leaves; herbage glaucous, glabrous or below somewhat hispidulous; leaves cut into rather numerous narrow lobes; torus turbinate to oblong-turbinate; petals pure yellow,  $\frac{1}{2}$  to 1 in. long; seeds longer than broad, abruptly acute, lightly reticulate or almost smooth.—South Coast Ranges and s. to Los Angeles Co. Apr.-May. Var. *RHOMBIPÉTALA* Jepson. Similar in habit but the scapes hardly exceeding the leaves; torus about twice as long as broad; petals fugacious; seeds reticulate-pitted.—Foothills and plains at e. base of Mt. Diablo Range. Var. *HYPECOLDDES* Gray. Stems slender, leafy, somewhat branched, 3 to 12 (or 18) in. high; petals  $\frac{1}{2}$  to 1 in. long; seeds spherical or slightly elongate.—Fertile hillslopes: Sierra Nevada foothills from Kern Co. to Butte Co., about 1200 to 2500 ft.; Coast Ranges from Monterey Co. to Trinity Co., 100 to 2000 ft.

7. *E. glyptospérma* Greene. Glaucous annual with densely tufted nearly equal basal leaves; stems numerous, scapose, slender, rather stiffly erect, usually 3 to 7 in. high, far exceeding the leaves; leaves much dissected into short crowded linear divisions; petals broad, 5 to 7 (or 10) lines long; capsule  $1\frac{1}{2}$  to 2 in. long; seeds globose, coarsely pitted and without reticulation, the pits rather distant.—Mohave Desert; e. to Utah. May.

### FUMARIACEAE. FUMITORY FAMILY

Ours glabrous perennial herbs with alternate compound dissected leaves and irregular perfect flowers. Sepals 2, small and scale-like. Petals 4, in 2 dissimilar pairs, the outer larger, inner pair narrower, carinate or crested on the back, cohering by the callous apex and covering the anthers and stigma. Stamens in 2 sets of 3 each, placed opposite the outer petals, the filaments of each set usually united; middle anther of each set 2-celled, the lateral ones 1-celled. Ovary superior. Capsule 1-celled, with 2 parietal rib-like placentae from which the valves separate, or indehiscent.

Corolla 2-spurred or 2-saccate at base.....1. *DICENTRA*.  
Corolla 1-spurred at base.....2. *CORYDALIS*.

#### 1. *DICENTRA* Bernh. DUTCHMAN'S BREECHES

Flowers in racemes or panicles, or solitary. Corolla flattened and cordate at base. Filaments of each set dilated and united, but distinct at the very base and slightly free above. (Greek *dis*, twice, and *kentron*, a spur, some species 2-spurred.)

Stems leafy, tall; flowers yellow, erect; corolla deciduous; petals distinct; crests of the inner petals tubular; seeds crestless.

Flowers sulphur-yellow; outer petals spreading or recurving to the middle; widely scattered.....1. *D. chrysantha*.

Flowers straw-yellow or cream-color; outer petals erect or only the tips spreading; seaward South Coast Ranges.....2. *D. ochroleuca*.

Stems naked, scape-like, the leaves all basal; flowers more or less nodding; corolla withering-persistent; sepals persistent or at least not caducous; seeds crested.

Flowers rose-purple; petals united; crests of inner petals tubular, conspicuous; scapes tall, bearing a cluster of racemes.....3. *D. formosa*.

Flowers whitish or flesh-color; petals distinct, the outer with narrow recurving tips; crests of inner petals none or obscure; diminutive alpine herbs, the scapes 1 or 2 (or 3)-flowered.

Recurving tips longer than the body of outer petals.....4. *D. uniflora*.

Recurving tips shorter than the body of outer petals.....5. *D. pauciflora*.

1. *D. chrysantha* (H. & A.) Waip. GOLDEN EAR-DROPS. Fig. 403. Glaucous plants with stiff coarse leafy stems 2 to 5 ft. high, arising from stout roots; leaves bipinnate,  $\frac{1}{2}$  to 1 ft. long, the divisions cleft into narrow lobes; flowers yellow, in a large racemose panicle; corolla linear-oblong, only slightly cordate, 6 to 7 lines long; sepals somewhat caducous; outer petals spreading or recurving to the middle, saccate below the tip; crest of inner petals rather narrow, crisped or curly; capsule  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long.—High

403. *Dicentra chrysantha* Walp.; a, upper portion of leaf  $\times \frac{1}{2}$ ; b, infl.  $\times \frac{1}{2}$ ; c, capsule  $\times 1$ ; d, fl.  $\times 1$ .

crest.—Santa Ynez Mts. to the Santa Monica Mts. Apr.-June.

3. *D. formosa* (Andr.) DC. BLEEDING HEART. Fig. 404. Flowering stems naked, scape-like, 8 to 18 in. high, somewhat exceeding the leaves, terminated by a cluster of short racemes; rootstock fleshy and spreading; leaves all basal, on very long petioles, biternately compound, the divisions incisely cleft or pinnatifid; corolla rose-purple (rarely white), ovate-cordate, 7 to 9 lines long, the petals all united to above the middle; sometimes one filament free in each stamen set. — Shady woods, Coast Ranges from Del Norte Co. to Alameda Co.; Sierra Nevada from Shasta Co. to Tulare Co.; n. to B. C. Apr.-June.

404. *Dicentra formosa* DC.; a, infl.; b, blade of leaf.  $\times \frac{1}{2}$ .

4. *D. uniflora* Kell.

STEER'S HEAD. Fig. 404a.

Scapes 1 or 2-flowered, 1 to 3 in. high, arising from a fascicle of tubers; leaves triternately divided into oblong lobes; flowers white or pink; upper portion of outer petals very narrow, recurving to below the middle; inner petals spoon-shaped at apex, expanded downward, then abruptly truncate and borne by a claw-like base; fruiting scapes prostrate.—Rocky slopes, 6000 to 12,000 ft., Sierra Nevada from Fresno Co. n. to Siskiyou Co., thence s. to Humboldt Co.; n. to Wash., e. to Utah.

5. *D. pauciflora* Wats. Scapes 4 to 5 in. high, 1 to 3-flowered, arising from fleshy creeping rootstocks; leaves similar to *D. uniflora*; flowers white or flesh-color, outer petals with saccate spur, the upper portion linear-oblong, 4 lines long, recurving or widely spreading; inner petals narrow or ligulate, abruptly expanded into a spatulate apex, contracted at base and borne on a much dilated or oblong claw as long as the blade proper.—Alpine, 9000 to 10,000 ft., localized in two widely separated regions: Salmon, Scott and Trinity mountains; Sawtooth Range, Tulare Co.

dry ridges of the inner ranges, 1000 to 5400 ft.: Coast Ranges from Mendocino Co. southw.; Sierra Nevada foothills from Calaveras Co. southw.; Ventura Co. to San Diego Co. Widely distributed but not common. June.

2. *D. ochroleuca* Engelm.

Similar to *D. chrysantha*, 2 to 3 ft. high; panicle consisting of numerous flowers in one or few dense roundish clusters; sepals straw-color or brown, more persistent than in *D. chrysantha*; flowers pale or somewhat straw-yellow,  $\frac{3}{8}$  to 1 in. long; outer petals with only the tips spreading, the inner with purple tips and a broad

404a. *Dicentra uniflora* Kell.; habit x 1.

2 times as long.—Sierra Nevada from Nevada Co. to Plumas Co., 5000 to 6300 ft.

2. *C. aurea* Willd. Branching from the base, spreading, about 10 in. high; leaves finely dissected; raceme few-flowered, short, the pedicels 1 to 2 lines long; flowers yellow; petals  $3\frac{1}{2}$  to 4 lines long, the spur about half as long; capsules terete, at length torulose, 10 lines long; seeds black, glossy.—Mono Co., 6900 to 7000 ft.; Rocky Mts. to Alas. and Nova Scotia.

*Fumaria* L. Corolla 1-spurred; fruit indehiscent, 1-seeded; seeds not crested. *F. officinalis* L. Fumitory. Corolla flesh-color, crimson-tipped—Orchards, San Luis Obispo, Ontario and Upland; introduced from Eur.

## 2. *CORYDALIS* Vent.

Stems with ample 2 or 3-pinnate leaves. Flowers in racemes. Corolla with only one of the outer petals spurred or gibbous, this becoming posterior by the torsion of the flower; petals all erect and connivent up to the engaged tips of the outer ones. Filaments with nectar-bearing process projecting into the petal-spur. Seeds with a concave aril-like crest. (Greek Korydallis, the ancient name of the crested lark.)

Flowers white or cream-color; spur  $1\frac{1}{2}$  to 2 times as long as the petals....

1. *C. caseana*.

Flowers yellow; spur barely  $\frac{1}{2}$  as long as the petals..

2. *C. aurea*.

1. *C. caseana* Gray. Stem  $1\frac{1}{2}$  to 3 ft. high, arising from thickened roots; leaves  $\frac{1}{2}$  to  $1\frac{1}{4}$  ft. long; leaflets ovate, mucronate, 3 to 9 lines long; raceme dense,  $1\frac{1}{2}$  to 3 in. long; corolla white or cream-color, with bluish tips; petals 4 to 5 lines long, the spur nearly straight,  $1\frac{1}{2}$  to

## CAPPARIDACEAE. CAPER FAMILY

Herbs (ours annuals) or shrubs, with heavy-scented herbage. Leaves alternate, ours palmately compound with 3 (rarely 5) leaflets, or sometimes simple. Flowers perfect in bracted racemes, or solitary and axillary. Bracts usually petioled, conspicuous or minute, even in one species. Calyx lobes or sepals 4, minute or small, much smaller than the petals, usually persistent. Petals 4, not clawed or scarcely so. Stamens 6 (in *Polanisia* and other genera often many), nearly equal. Ovary superior, 1 (or rarely 2) -celled, borne on a stipe and often exserted. Receptacle (torus) often thickened or lengthened between the stamens and petals. Fruit a few to many-seeded 2-valved capsule, the valves separating from the filiform placentae, or the valves separating from the axis as closed 1-seeded nutlets.

Shrub; ovary 1-celled, many-ovuled; capsule inflated; torus enlarged at summit into a circular disk.....1. *ISOMERIS*.

## Herbs.

- Ovary 1-celled; capsule few to many-seeded, its valves separating from the placentae; torus more or less thickened and sometimes lengthened.  
 Flowers in ours white; stamens 8 or more.....2. *POLANISIA*.  
 Flowers yellow; stamens 6.  
   Capsule linear to oval (longer than broad).....3. *CLEOME*.  
   Capsule short, nearly as broad as long or broader, more or less flattened contrary to the replum; valves boat-like or conical...4. *CLEOMELLA*.  
 Ovary 2-celled, didymous, the cells with 1 or 2 ovules; fruit 2-seeded, each valve closely investing its seed and falling away with it; torus short.  
 Stamens elongated; stipe long; stipules present.....5. *WISLIZENIA*.  
 Stamens little surpassing petals; stipe very short; stipules none...6. *OXYSTYLIS*.

1. *ISÓMERIS* Nutt.

Glaucous shrubs. Leaflets 3. Flowers large, yellow, in bracted racemes. Calyx 4-cleft, persistent. Stamens long-exserted. Capsule large, inflated, coriaceous, long-stipitate, tardily dehiscent. Seeds few, large. (Greek isos, equal, and meris, part.)

1. *I. arborea* Nutt. BURRO FAT. Branching, 2 to 4 ft. high; leaflets oblong, acute,  $\frac{1}{4}$  to  $1\frac{1}{2}$  in. long; petals 6 to 8 lines long, the calyx lobes half as long; capsule elliptic-oblong to lanceolate, long-pointed or short-pointed,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long, on long ( $\frac{1}{2}$  to  $\frac{3}{4}$  in.) stipes.—Western Mohave Desert, s. to San Diego Co. Feb.-May. Var. *GLOBOSA* Cov. Capsule globose to broadly elliptic, abruptly short-pointed, 1 to  $1\frac{1}{2}$  in. long.—Monterey Co. to San Diego Co. and e. to Tehachapi.

2. *POLANÍSIA* Raf.

Viscid-glandular annuals. Leaves palmately 3 to 5-foliolate. Flowers in a terminal raceme, with simple bracts. Stamens 8 to 32. Petals commonly clawed. Gland on the receptacle behind the ovary. Ovary sessile or short-stipitate. Capsule linear to oblong, many-seeded, erect, on spreading pedicels. (Greek polus, many, and anisos, unequal, referring to the stamens.)

1. *P. trachysperma* T. & G. Erect, branching from below, 7 to 12 in. high; leaflets 3, narrowly ovate to oblanceolate, 6 to 9 lines long; petals white, obovate, strongly notched, clawed; stamens 9 to 16; capsule linear-lanceolate, turgid, 1 to  $1\frac{3}{4}$  in. long.—Ne. Modoc Co.; e. to the Great Plains, n. to Wash.

3. *CLEOME* L. SPIDER PLANT

Ours annuals. Leaflets 3, sometimes 5, entire. Flowers yellow, in racemes. Sepals distinct or united at base. Capsule oval to linear, pendulous or erect. Seeds several to many, round-reniform. (Ancient name of some European mustard-like plant.)

- Calyx 4-cleft; stamens longer than petals; capsule linear, pendent; herbage glabrous.  
 Flowers purple.....1. *C. serrulata*.  
 Flowers yellow.....2. *C. lutea*.  
 Calyx of 4 distinct sepals.  
 Stamens much longer than petals; capsule oval or oblong, pendent; herbage viscid-pubescent.....3. *C. platycarpa*.  
 Stamens not longer than petals; capsule linear, erect on its stipe; herbage glabrous...4. *C. sparsifolia*.

1. *C. serrulata* Pursh. ROCKY MOUNTAIN BEE PLANT. Erect, simple or branching, 1 to 3 ft. high; leaflets 3, oblong or oblong-lanceolate, entire, 1 to 2 in. long; flowering racemes dense; calyx lobes mucronate or subulate, short, mostly shorter than tube; petals reddish purple, sometimes pinkish or white, 3 to 5 lines long; capsule linear, sometimes torulose, 1 to  $2\frac{1}{4}$  in. long; pedicel about equalling stipe, pedicel and stipe together nearly to fully as long as capsule.—Pt. Sur; San Diego Co.; Ariz. to Wash., e. to Rocky Mts. June-July.

2. *C. lutea* Hook. Similar in habit to no. 1; leaflets 3 to 5, oblong or oblong-ob lanceolate, mucronate, mostly  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; calyx lobes triangular-acute to lanceolate, longer than tube; petals golden yellow, 3 lines long; capsule linear,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, of about the same length as stipe and pedicel together; stipe about equalling pedicel.—Desert region of Inyo and Mono Cos.; n. to Wash., e. to Col. May-Aug.

3. *C. platycárpa* Torr. STINK-CLOVER. Erect, 1 to 2 ft. high; leaflets 3 oval or oblong,  $\frac{1}{2}$  to 1 in. long; bracts oval or oblong, petioled; flowering raceme dense; sepals subulate; petals golden yellow, ovate-oblong, 3 to  $3\frac{1}{2}$  lines long; capsule turgid, oval or oblong, 8 to 12-seeded,  $\frac{1}{2}$  to 1 in. long, the stipe mostly a little shorter.—Butte Co. to Siskiyou and Modoc Cos.; Ore. to w. Nev. June-Aug.

4. *C. sparsifolia* Wats. Erect, branching,  $\frac{1}{2}$  to 2 ft. high, sparsely leaved; petioles  $\frac{1}{2}$  to  $1\frac{3}{4}$  in. long; leaflets 3, obovate to cuneate, 2 to 5 lines long; flowers few in the raceme, greenish yellow, 3 to 4 lines long; sepals denticulate; pedicels 1 to 3 lines long; petals spatulate, 5 lines long, with nectar-bearing scale at base; stamens not longer than petals; capsule linear,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; stipe  $1\frac{1}{2}$  to 2 lines long.—Inyo Co.; w. Nev. May-June.

#### 4. CLEOMÉLLA DC.

Annuals. Leaves with 3 leaflets. Flowers yellow. Capsule rhomboidal, few-seeded and small, pendent or spreading on a long or short stipe and pedicel, ours with the valves laterally distended or produced into short horns. (Diminutive of Cleome.)

Stipules none; herbage glabrous.

Flowers in racemes.

Stipe and pedicel about equal, widely spreading or the stipe sometimes a little deflexed on its pedicel. .... 1. *C. oocarpa*.

Stipe almost obsolete, the pedicel elongated. .... 2. *C. parviflora*.

Flowers solitary and axillary; capsule mostly deflexed on its pedicel; leaves subsessile, glabrous. .... 3. *C. brevipes*.

Stipules scarious-laciniate, resembling a tuft of wool; leaves long-petioled, pubescent. .... 4. *C. obtusifolia*.

1. *C. oocarpa* Gray. Erect, simple or branching, 5 to 24 in. high; leaflets lanceolate or linear,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, the petioles as long to half as long; flowering racemes dense; petals a pale but not dull yellow, 2 lines long, exceeded by the stamens; capsule 2 lines long, the valves boat-shaped or low conical; stipe and pedicel about equal, the two together 8 to 10 lines long.—Alkaline soil, Colorado and Mohave deserts, n. to Inyo Co.; e. to Col. May-June.

2. *C. parviflora* Gray. Mostly freely branching from near the base, 4 to 10 in. high; leaflets linear,  $\frac{3}{4}$  to 1 in. long, very short-petioled; flowering raceme dense, its bracts commonly simple, sometimes similar to the leaflets and not reduced, sometimes much reduced; stamens not exceeding the (1 line long) petals; capsule deltoid, 2 lines broad, the valves gibbous or navicular, very bluntly if at all beaked; pedicels 8 to 13 lines long, the stipe 1 line long or less.—Alkaline soil, e. of the Sierra Nevada from Lassen Co. to Inyo Co., and s. throughout the Mohave Desert. May-June.

3. *C. brevipes* Wats. Diffusely branched from the base, 2 to 10 in. high; leaves subsessile; leaflets linear, 4 to 6 lines long, or the upper leaves simple and similar to the leaflets; flowers solitary in the axils of nearly all the leaves; petals obovate,  $\frac{3}{4}$  line long; stamens shorter than petals; capsule 2 lines broad, broader than long, its valves produced into short but distinct horns; pedicel and stipe recurved, 1 to 2 lines long.—Alkaline shores, salt meadows or washes: Mohave Desert n. to Owens Lake and e. to western Nev. May-July. Habit suggestive of an annual Suaeda.

4. *C. obtusifolia* Torr. & Frem. MOHAVE STINKWEED. Plants diffusely branched, 5 to 10 in. high, or the trailing stems  $\frac{1}{2}$  to 3 ft. long, with ascending branchlets; leaflets somewhat succulent, obovate, pubescent, 2 to 8 lines long, the apex with a mucro or hair; pedicels 3 to 4 lines long; calyx lobes ovate, pilose-ciliate; corolla bright lemon yellow or pale orange; petals oblong, hispidulose on back of blade, narrowed to a short broad claw,  $2\frac{1}{2}$  lines long, all 4 turned to upper side of flower or 2 of them spreading horizontally right and left; stamens raised on a torus, exserted; capsule 3 to  $4\frac{1}{2}$  lines broad, its valves conical, produced into a long and narrow beak; stipe in fruit 3 lines long, reflexed upon its pedicel.—Colorado and Mohave deserts, n. to Inyo Co.; e. to western Ariz. June-Aug. Doves feed on the seeds. Var. PUBÉSCENS Aven Nelson. Herbage densely pubescent with short

spreading hairs.—S. Nev. (*C. pubescens* Nelson.)

### 5. *WISLIZENIA* Engelm.

Erect rank-scented annuals. Leaves with 3 leaflets and with minute deciduous bristles for stipules. Flowers yellow. Stamens with long much-exserted filaments. Stipe in fruit refracted upon the pedicel. Fruit 2-seeded and didymous; each valve closely contracted upon its seed and falling away with it, therefore like a nutlet. (Dr. A. Wislizenius, who collected in early days in California.)

1. *W. refracta* Engelm. JACKASS-CLOVER. Fig. 405. Branching, 1 to 2 (or 6) ft. high; leaflets obovate to oblong, 4 to 9 lines long, rather longer than the petiole; raceme dense, in age usually much elongated; petals  $1\frac{1}{2}$  lines long; stamens and ovary exserted; pods  $1\frac{1}{2}$  to 2 lines broad, the lobes strongly divergent and crested or toothed at apex, the cells separated by a partition with a single rather large perforation; stipe in fruit 2 to 4 lines long; style persistent and bristle-like.—Sacramento to Lathrop and s. in the San Joaquin Valley as an immigrant; native along the Colorado River, thence e. to N. Mex. A bee plant in the San Joaquin and often called Stinking Mustard because of its strong odor.

405. *Wislizenia refracta* Engelm.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 2$ ; c, capsule  $\times 4$ .

### 6. *OXYSTYLIS* Torr. & Frem.

Annual. Leaves with 3 leaflets, long-petioled. Flowers in head-like axillary clusters. Ovary with short stout stipe; style very long, subulate, becoming indurated and spinescent. Fruit 2-seeded and didymous, the valves separating as obovate nutlets with thin soft covering. (Greek oxus, sharp, and stulis, column or style.)

1. *O. lutea* Torr. & Frem. Stem stout, erect, usually simple, 1 to 3 ft. high, flowering from the base; leaflets oval,  $\frac{3}{4}$  to  $1\frac{1}{2}$  lines long; fruit little over 1 line long, fruiting style spine-like, 3 to 4 lines long—Death Valley region.

## CRUCIFERAE. MUSTARD FAMILY

Herbs with alternate leaves, no stipules and the flowers in terminal bractless racemes. Sepals and petals 4, regular and distinct. Petals commonly with claws, the blades spreading in the form of a cross. Stamens 6, commonly tetradynamous (4 long and 2 short), sometimes subequal, sometimes 4 or 2. Ovary superior, 2-celled by a thin partition stretched between the parietal placentae; style 1, stigma 2-lobed or 1. Fruit a 2-celled capsule, the 2 valves separating from below upwards, leaving behind the placentae and partition, or often 1-celled and indehiscent, or breaking up transversely into 1-seeded joints. Capsule long and narrow (a silique) or short and roundish (a silicle), commonly termed a "pod" and either terete, 4-sided, compressed (flattened parallel to the partition), or obcompressed (flattened contrary to the partition). Seeds in each cell in 1 row or 2 rows. Embryo always curved, the caulicle folded upon the back of one of the cotyledons (incumbent) or along the edge of the cotyledons (accumbent).—Herbage always with the

characteristic mustard-like or pungent juice. Some *Streptanthus* species have a somewhat irregular flower. *Tropidocarpum* has a leafy raceme.

# I. POD DEHISCENT BY VALVES.

## A. Pod a silique (linear-elongated to oblong, several times longer than wide).

Pods not stipitate, or on a very short or obscure stipe ( $\frac{1}{2}$  to 1 line long).

Racemes leafless and bractless.

Pod not beaked or merely tipped with the persistent style.

Stems from annual or perennial roots or root-crowns.

Valves 1-nerved (sometimes also more or less veined.)

Seeds in 1 row in each cell (except 2 species in no. 4 and several in no. 14).

Flowers yellow; at least the stem leaves pinnatifid.

Leaves lobed; flowers small.

Pods terete; annuals. . . . . 4. *SISYMBRIUM*.

Pods somewhat quadrangular, pointed; perennial. . . . . 9. *BARBAREA*.

Leaves entire or merely dentate, at least not lobed; flowers large, orange or yellowish. . . . . 15. *ERYSIMUM*.

Flowers white or whitish (rarely yellowish) to purple or purplish.

Petals with a broad limb, not crisped or twisted.

Pod teretish; flowers white or pale yellow; leaves pinnately divided into small segments; tufted perennial. . . . . 13. *SMELOWSKIA*.

Pods flattened; flowers commonly rose-purple or white; leaves dentate or entire, a few species pinnately lobed or pinnatifid.

Pods not horned at apex; seeds winged or wingless. . . . . 14. *ARABIS*.

Pods 2-horned at apex; seeds winged. . . . . 16. *MATTHIOLA*.

Petals commonly with narrow limb.

Sepals mostly greenish; petals white or yellowish, rarely purple or roseate, the blade not crisped; filaments distinct; stigma entire or obscurely 2-lobed; pods terete or nearly so; seeds not winged. . . . . 2. *THELYPODIUM*.

Sepals mostly colored, commonly purple; petals purple or white, rarely yellow, the blade often crisped, often narrower than the claw; filaments distinct or the upper 1 or 2 pairs connate; stigma entire to deeply 2-lobed; seeds winged or wingless. . . . . 3. *STREPTANTHUS*.

Seeds in 2 rows in each cell.

Pods terete; flowers yellow or white. . . . . 10. *RADICULA*.

Pods strongly flattened; flowers purplish. . . . . 17. *PARRYA*.

Valves not nerved; leaves pinnate or simple. . . . . 11. *CARDAMINE*.

Stems from tuberous rootstocks, naked below; flowers white. . . . . 12. *DENTARIA*.

Pods produced into a beak beyond the valves; flowers yellow, with 4 green glands; pods terete. . . . . 8. *BRASSICA*.

Racemes leafy; leaves pinnatifid; annual. . . . . 18. *TROPIDOCARPUM*.

Pods on a long stipe (5 to 10 lines long); flowers yellow. . . . . 1. *STANLEYA*.

## B. Pod a silicle (globose, orbicular or oblong, little more than once, twice or thrice as long as wide).

Pods not turgid.

Pods flattened parallel to the broad partition.

Flowers in racemes; seeds not winged.

Pods 1 or 2-seeded; low altitudes. . . . . 27. *ALYSSUM*.

Pods many-seeded; seeds in 2 rows in each cell; mostly alpine or subalpine. . . . . 30. *DRABA*.

Flowers solitary on naked scapes; seeds with a broad membranous wing. . . . . 26. *PLATYSPERMUM*.

Pods flattened contrary to the narrow partition.

Seeds 2 to several in each cell.

Herbage glabrous; leaves undivided. . . . . 22. *THLASPI*.

Herbage pubescent; leaves pinnately incised or parted.

Flowers white, 1 line long; pods 1 to 4 lines long. . . . . 28. *CAPSELLA*.

Flowers yellowish, 6 lines long; pods 3 to 9 lines long. . . . . 19. *LYROCARPA*.

Seeds solitary in each cell.

Pods regularly dehiscent.

Pods with pubescent valves and cord-like margins, notched both at base and apex. . . . . 21. *DITHYREA*.

Pods with glabrous or pubescent valves, notched or obtuse at apex, not notched at base; winged or not winged at apex. . . . . 24. *LEPIDIUM*.

Valves of the pods falling as closed or nearly closed nutlets, very rugose....  
23. CORONOPUS.

Pods more or less turgid.

Terrestrial plants.

Pods subglobose or obovate; herbage pubescent.....20. LESQUERELLA.

Pods pear-shaped with a narrow margin; herbage glabrous or nearly so.....  
29. CAMELINA.

Aquatic plants; pods oblong; leaves linear-subulate.....25. SUBULARIA.

## II. POD INDEHISCENT, OR AT LEAST NOT DEHISCENT BY VALVES.

Pods elongated, breaking transversely into 1-seeded indehiscent joints.

Flowers showy; pods several-seeded, commonly with constrictions between the seeds.....7. RAPHANUS.

Flowers small; pods 2-seeded, jointed in the middle.....6. CAKILE.

Pods flattened, orbicular to obcuneate, 1-seeded, wholly indehiscent.

Pods margined all around with a wing; stems mostly erect.

Flowers in long racemes; pods orbicular.....32. THYSANOCARPUS.

Flowers crowded in rather short racemes, the racemes corymbose-paniculate;  
pods elliptical.....5. ISATIS.

Pods not winged; stems slender, diffuse.....31. ATHYSANUS.

### 1. STÁNLEYA Nutt.

Tall perennial glabrous herbs, or sometimes woody at base, with coriaceous leaves and large yellow flowers in elongated terminal racemes. Calyx long, cylindric; sepals spreading or reflexed. Petals oblong or spatulate with slender claws. Stamens equal; filaments long-exserted; anthers linear, curved or coiled. Stigma small, sessile, entire. Pod linear-elongated, terete, long-stipitate, its valves 1-nerved; seeds in one row; cotyledons incumbent. (Lord Edward Stanley, English ornithologist, first half 19th century.)

Petals bright yellow, the blade broader than the woolly claws.....1. *S. pinnata*.  
Petals light yellow, glabrous, the blade scarcely wider than upper part of claw...2. *S. elata*.

1. *S. pinnata* (Pursh.) Britt. Plants 2 to 3½ ft. high, the long erect branches from stout woody bases 4 to 6 in. high; leaves glaucous, variable, the lower commonly coarsely lyrate-pinnatifid or sometimes entire, 3 to 8 in. long, long-petioled, the upper less divided, or lanceolate and entire, short-petioled; pedicels 2 to 4 lines long; sepals greenish yellow; petals bright yellow, the oblong blade 2½ to 4 lines long, the claw woolly pubescent, as long or longer than blade and dilated downwards; filaments puberulent toward base; pods 1½ to 2½ in. long, a line wide, spreading, curved like a sickle; stipe 5 to 10 lines long.—Dry plains and foothills, 1000 to 4500 ft.: Mohave Desert, w. to Santa Barbara Co., n. to the upper San Joaquin Valley and Inyo Co.; e. to Neb. and Tex. It is remarkably capparidaceous in habit and in certain points of flower structure.

2. *S. elata* Jones. Plants 2 to 6 ft. high, branching toward the top; leaves coriaceous, ovate-lanceolate, entire or sometimes with few small lobes at the base, 4 to 10 in. long, contracted at the base to a short petiole; racemes 1 to 2 ft. long; sepals petal-like, enlarged to a spatulate blade 2 lines wide; petals light yellow, of about equal length but narrower and less conspicuous; filaments woolly from the middle to the base; pods filiform, 3 to 4 in. long, ½ line in diameter.—Panamint Range; Inyo Mts.; n. to western Nev.

### 2. THELYPÓDIUM Endl.

Ours mostly coarse erect annuals or biennials. Basal leaves mostly petioled, the cauline petioled, or sessile-auriculate. Flowers white or pale yellow, rarely purple or roseate, the racemes often dense. Petals with narrow claw, the exserted limb narrow or obovate. Stamens tetradynamous, often exserted; filaments never united; anthers narrowly linear, curved. Stigma small, circular and entire or obscurely 2-lobed. Pod terete, slender, short-stipitate or sessile. Seeds oblong, somewhat flattened, not winged or scarcely so. Cotyledons incumbent. (Greek *thelus*, female, and *pus*, foot or support, the ovary more or less stipitate.)

Cauline leaves not sagittate nor auriculate-clasping; annual or biennial.

Flowers spreading in a dense spike-like raceme; fruiting racemes dense; petals white,  
2¼ to 3 lines long; herbage glabrous; transmontane biennials.

Cauline leaves sessile, entire; racemes short, compact.....1. *T. integrifolium*.

- Cauline leaves petioled, irregularly laciniate or entire, the upper subentire; racemes much elongated.....2. *T. laciniatum*.  
 Flowers in a raceme, the raceme soon lax; fruiting racemes commonly lax; annuals.  
 Flowers ascending; mostly Coast Ranges and coastal S. Cal.  
 Cauline leaves, at least the upper, sessile; flowers 4 to 5 lines long; pods ascending; herbage glabrous or nearly so.....3. *T. flavescens*.  
 Cauline leaves petioled or mostly petioled; flowers  $1\frac{1}{2}$  to 2  $\frac{1}{4}$  lines long; herbage as if glabrous or subglabrous, but commonly with scattered hairs.  
 Calyx purple or purplish; pods ascending or deflexed...4. *T. lemmonii*.  
 Calyx green or yellowish; pods commonly reflexed or divaricate-spreading.....5. *T. lasiophyllum*.  
 Flowers soon reflexed; pods with a beak 1 to 3 lines long; leaves all petioled; southern deserts.....6. *T. longirostris*.  
 Cauline leaves sagittate or auriculate-clasping; annuals.  
 Pods ascending, not torulose or scarcely so.  
 Raceme very dense and spike-like; n. and e. of Sierra Nevada.....7. *T. brachycarpum*.  
 Raceme not dense or spike-like.  
 Petals spatulate, 2 times as long as the sepals; Lassen and Modoc Cos.....8. *T. howellii*.  
 Petals linear-oblongate,  $1\frac{1}{4}$  to  $1\frac{1}{2}$  times as long as the sepals; San Bernardino Mts.....9. *T. stenopetalum*.  
 Pods declined-spreading, markedly torulose; branches elongated-serpentine; deserts...10. *T. cooperi*.

1. *T. integrifolium* Endl. Stem simple or branched only above, 3 to 4 ft. high; basal leaves ovate-lanceolate, entire or shallowly repand-dentate, 1 to 6 in. long, drawn down into petioles nearly as long; upper leaves linear-lanceolate, sessile (the lower ones sometimes auriculate), acute, erect; flowers white, crowded in subcapitate racemes, the racemes 3 to 4 in. long, several in a terminal panicle; racemes little elongated in fruit, the pods therefore crowded; pods slender, torulose, curved upwards, 1 in. long, strongly divaricate on their (1 to 3 lines long) pedicels; stipe  $\frac{1}{4}$  to  $\frac{1}{2}$  line long.—Moist situations, Mohave Desert; e. to Col., n. to eastern Wash.

2. *T. laciniatum* (Hook.) Endl. Stems stout,  $1\frac{3}{4}$  to  $2\frac{1}{2}$  ft. high; leaves deltoid-ovate to oblong or oblong-lanceolate, irregularly segmented and toothed, a little fleshy,  $1\frac{1}{4}$  to 8 in. long, the petioles  $\frac{1}{2}$  to as long; racemes very dense,  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. long; flowers white; pods very slender, spreading or horizontally divaricate,  $1\frac{1}{4}$  to 6 in. long; pedicels 1 to 2 lines long.—Valleys and foothills, Inyo Co.; n. to western Nev. and e. Ore. and Wash.

3. *T. flavescens* (Hook.) Wats. Stem erect, 1 to 4 ft. high, simple or with several much elongated simple branches from below the middle; herbage glaucous and glabrous, or somewhat hispidulous; leaves ovate to oblong-lanceolate, irregular or somewhat erosely toothed or laciniate, sometimes with two or three pairs of broad salient lobes below the middle, 4 to 8 in. long, the lowest on petioles 1 to  $1\frac{1}{4}$  in. long, the uppermost linear-lanceolate, sharply serrate or denticulate, 1 to 4 in. long, sessile; flowers pale yellow; petals usually much exceeding the sepals, the claw broad and the undulate blade narrow; ovary commonly hairy, rarely quite glabrous; pods ascending,  $1\frac{1}{4}$  to 3 in. long,  $\frac{3}{4}$  line wide.—Inner Coast Range valleys from Solano Co. to Monterey Co.

4. *T. lemmonii* Greene. Stems 1 to  $1\frac{3}{4}$  ft. high; lower leaves oblong, repand-dentate, 2 to 5 in. long, contracted to a petiole  $\frac{1}{2}$  to 1 in. long; upper leaves lance-linear, attenuate at both ends, sessile; sepals purple with broad white margins; petals pale purple with deeper veins, cuneate-oblong, narrowed below to a short claw; anthers yellow or purple; pods slender, 2 to  $2\frac{1}{4}$  in. long; pedicels a little hairy.—Inner South Coast Range from w. Fresno Co. to s. San Luis Obispo Co. (*Caulanthus anceps* Payson.)

5. *T. lasiophyllum* (H. & A.) Greene. Fig. 406. Stem erect, simple or branching above, 1 to 5 ft. high; herbage hispid with scattered hairs or nearly glabrous above; lower leaves sinuately pinnatifid with mostly acute denticulate or entire segments, 2 to 10 in. long, the upper lanceolate, less lobed or merely denticulate, all petioled, or the upper rarely sessile; raceme very densely flowered, much elongated in fruit; flowers white, yellowish, or sometimes roseate; pedicels 1 line long; sepals oblong, scarcely the length

of the narrow petals; pods straight or somewhat curved, at first spreading, soon strictly deflexed, 2 to 4 in. long,  $\frac{1}{4}$  to  $\frac{1}{2}$  line wide.—Open foothills, 50 to 2000 ft.: coastal S. Cal.: Coast Ranges and their bordering plains, mostly toward the interior; n. to Wash. Apr. Var. *INALÉNUM* Rob. Pods slender, erect or spreading.—Solano Co. to San Luis Obispo Co. Var. *RIGIDUM* Rob. Plant rigid, often glabrous; pods stout, rigid, divaricate or deflexed-spreading; pedicels  $\frac{1}{2}$  line long.—Glenn Co. to e. Contra Costa Co. Var. *UTAHENSE* Jepson n. comb. Leaves thin, the lobes rounded (mostly acute in the species).—Colorado and Mohave deserts; e. to Utah. (*T. utahensis* Rydb.)

6. *T. longirostris* (Wats.) Jepson n. comb. Stems much-branched, 1 to  $1\frac{1}{2}$  ft. high; leaves lanceolate to linear-lanceolate, the lower repand-dentate, the upper entire, all contracted to a short petiole, the whole 1 to  $2\frac{1}{2}$  in. long; flowers 2 to  $2\frac{1}{2}$  lines long, soon reflexed, borne on slender pedicels  $\frac{1}{2}$  to 1 line long; sepals green, or somewhat purplish-tinged, scarious-margined; petals pale yellow or pinkish, narrow, blade very short, narrower than the expanded summit of the claw; pods curved or straight, divaricate or deflexed, nerved, 1 to  $1\frac{1}{2}$  in. long,  $\frac{1}{4}$  to  $\frac{1}{2}$  line wide, tapering to a beak 1 to 3 lines long; seeds winged.—Mohave and Colorado deserts, n. to Monterey Co. and to Inyo Co. (*Streptanthus longirostris* Wats. *Streptanthella longirostris* Rydb.)

7. *T. brachycarpum* Torr. Stem erect, simple or branched, stoutish,  $1\frac{1}{2}$  to 3 ft. high; herbage glabrous or sparsely hirsute below; cauline leaves narrow-lanceolate, mostly entire, sagittate-clasping, 1 to  $2\frac{1}{2}$  in. long, the basal oblong or oblanceolate, sinuate-toothed or pinnatifid, 1 to  $4\frac{1}{2}$  in. long, on petioles half as long; racemes spike-like, very dense; pedicels in fruit 1 to  $1\frac{1}{2}$  lines long; flowers white,  $2\frac{1}{2}$  to 3 lines long; petals linear, nearly twice as long as the sepals; stamens exserted; pods slender, somewhat knotted, sharply beaked, ascending, 6 to 12 lines long, in age spreading.—Mountain sides and valleys, 4800 to 7200 ft., north end and east slope of the Sierra Nevada from Siskiyou Co. to Inyo Co.; e. to Nev. May-Aug.

8. *T. howellii* Wats. Biennial; stem simple or branching, erect,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  ft. high; herbage glabrous and glaucous, or hirsute near the base; basal leaves entire or repand, with the winged petiole toothed; cauline leaves linear to lanceolate, sagittate-clasping, erect,  $\frac{3}{4}$  to  $2\frac{1}{2}$  in. long; flowers white, flesh color or purple,  $3\frac{1}{2}$  to  $4\frac{1}{2}$  lines long; sepals saccate, oblong, acuminate, white-margined, the lateral pair strongly hooded or horned at apex; petals narrowly linear with crisped limb; stamens with the filaments of the 2 longer pairs connate; anthers sagittate, strongly curled after anthesis; pods slender, nearly erect, 1 to 2 in. long, tipped by the rather slender style  $\frac{1}{2}$  line long.—Valley meadows, Lassen and Modoc Cos.; n. to eastern Ore.

9. *T. stenopetalum* Wats. Stem simple or branching from the base, 1 to 2 ft. high; herbage glabrous and glaucous; leaves oblong to lanceolate or

406. *Thelypodium lasiophyllum* Greene; a, b, types of basal leaves  $\times \frac{1}{4}$ ; c, upper leaf  $\times \frac{1}{4}$ ; d, infl.  $\times \frac{1}{2}$ ; e, fr. branch  $\times \frac{1}{2}$ .

linear, auriculate-clasping, 1 to 2 in. long, the basal obovate, scarcely petioled; flowers narrow, 4 to 5 lines long; petals white or pinkish, narrow-oblongate, little exserted; pods slender, ascending,  $1\frac{3}{4}$  to  $2\frac{1}{4}$  in. long.—Stony slopes, San Bernardino Mts., 6500 ft.

10. *T. coöperi* Wats. Stem slender, simple, flexuous, 8 to 14 in. high, or branched and developing elongated tortuous or even serpentine branchlets, the whole 2 to 3 ft. long; herbage glabrous; leaves disappearing early, oblong-obovate to linear-oblong or linear-lanceolate, mostly entire, the cauline sagittate-clasping, the basal contracted to a short petiole, the whole 1 to  $2\frac{1}{2}$  in. long; flowers narrow, 3 to 4 lines long; sepals greenish, turning purplish; petals yellow, aging white with purple center, about  $1\frac{1}{2}$  times as long as the sepals; pods terete, torulose, especially on upper half, commonly falcate, attenuate at apex, glabrous, widely divaricate,  $\frac{3}{4}$  to 1 in. long; style 1 to  $1\frac{1}{4}$  lines long; pedicels  $\frac{1}{2}$  to 1 line long.—Desert mesas: Inyo Co. s. through the Mohave Desert to the Colorado Desert; e. to Ariz. Apr.

### 3. *STREPTANTHUS* Nutt.

Annual herbs, or some biennial or perennial. Basal leaves commonly toothed or pinnatifid, the cauline similar or entire, often sagittate-clasping. Calyx with 2 of the sepals or all saccate at base, the calyx thus ovoid or broad at base and contracted above, or by the spreading of the tips becoming somewhat flask-shaped; or not at all saccate and quite subcylindric. Petals purple, white or pinkish, rarely pale yellow, commonly with a narrow undulate or crisped limb and channeled claw, the upper pair sometimes longer (as in no. 21). Stamens tetradynamous, or in 3 unequal pairs, the filaments all distinct, or the longer pairs united, or only the uppermost pair united. Pod narrowly linear, flattened parallel to the partition (rarely obcompressed) or terete; valves 1-nerved or rarely carinate. Seeds in 1 row, flat, winged or wingless. (Greek streptas, twisted, and anthos, flower, in reference to the petals.)

*A. Stigma 2-lobed; petals plane or somewhat crisped; stem erect, simple or branched; seeds mostly wingless, sometimes narrowly winged.*

Pods terete or slightly compressed.

Cauline leaves petioled; filaments of equal length, all distinct; perennials (or no. 1 biennial).—Subgenus *CAULANTHUS*.

Stem commonly branching, leafy up to the inflorescence.

Leaves coarsely toothed or pinnatifid; petals little exceeding the sepals; herbage glabrous above, below densely hairy.....1. *S. pilonius*.

Leaves entire; petals nearly twice as long as the sepals; herbage glabrous.....2. *S. glaucus*.

Stem naked above the base or bearing a few reduced or bract-like leaves; lowest leaves mostly lyrate-pinnatifid; herbage glabrous.

Calyx densely white-wooly; stem simple, strongly inflated.....3. *S. crassicaulis*.

Calyx glabrous; stems 1 or several from the base, simple.....4. *S. major*.

Cauline leaves sessile, auriculate-clasping; filaments in pairs, of unequal length; annuals.—Subgenus *PARACALANTHUS*.

One or 2 pair of filaments connate.

Filaments of 2 pairs of stamens connate; pods erect; stem inflated or very succulent.....5. *S. inflatus*.

Filaments of 1 pair of stamens connate; stem not inflated.

Pedicels glabrous; pods erect.....6. *S. lemmonii*.

Pedicels hairy; pods reflexed or reflexed-spreading.....7. *S. coulteri*.

Filaments all distinct.

Pedicels glabrous; raceme with few remote flowers; flowers purplish.....8. *S. amplexicaulis*.

Pedicels hirsute; raceme with several flowers; flowers yellowish.....9. *S. simulans*.

Pods strongly obcompressed, sword-like; filaments all distinct; cotyledons trifid; annuals.—Subgenus *STANFORDIA*.....10. *S. californicus*.

*B. Stigma circular and entire or only shortly 2-lobed; petals commonly with channeled claw, the blade crisped, usually narrow.*

Filaments all distinct; annuals (except no. 14 and one var. in no. 15), all erect, or sometimes diffuse in nos. 15 and 16.—Subgenus *PLEIOCARDIA*.

Plants hispid; leaves linear to oblong, the lobes or teeth commonly salient.....11. *S. heterophyllus*.

- Plants glabrous and glaucous.  
 Branches of inflorescence without bracts; cauline leaves auriculate-clasping; sepals dull purplish or green, apex slightly bearded; petals with ovate claw contracted to a ligulate blade; stamens nearly equal; pedicels less than 3 lines long.  
 Flowers 3 to 4 lines long; pods 1 line broad.  
 Cauline leaves oblong to lanceolate, acute, with auriculate base, not crowded. .... 12. *S. campestris*.  
 Cauline leaves cordate, crowded on the stem. .... 13. *S. barbatus*.  
 Flowers 5 to 6 lines long; pods 2 lines broad; lower leaves broadly spatulate-obovate; the cauline oblong-ovate. .... 14. *S. cordatus*.  
 Branches of inflorescence bearing round- to lanceolate-cordate bracts; petals with expanded blade; stamens in 3 unequal pairs.  
 Lower leaves oblong-spatulate, crenately toothed or lobed; mostly montane.  
 Pods recurved-spreading; plants  $\frac{1}{2}$  to 3 or 4 ft. high; common, of wide range. .... 15. *S. tortuosus*.  
 Pods erect; plants 2 to 7 in. high; rare and local. .... 16. *S. gracilis*.  
 Lower leaves pinnately divided, the segments linear-filiform. .... 17. *S. diversifolius*.  
 Filaments of upper pair of stamens connate, bearing reduced anthers; inflorescence non-bracteate; petals with linear obtuse crisped blade; erect annuals.—Subgenus EUCLISIA.  
 Plants glabrous and often glaucous.  
 Leaves broad; pods torulose. .... 18. *S. breweri*.  
 Leaves narrow; pods not torulose.  
 Calyx with the sepals in pairs, the outer pair sub-orbicular with upper sepal banner-like, exceeding other flower parts, the inner or lateral pair, ovate, acute. .... 19. *S. polygaloides*.  
 Calyx with the 3 upper sepals approximate or connivent at tips, and lower, free. .... 20. *S. niger*.  
 Plants hispid, at least below.  
 Calyx commonly glabrous.  
 Racemes loose; 3 upper sepals approximate or connivent at tips, the lower free. .... 21. *S. glandulosus*.  
 Racemes dense, secund; 2 upper sepals approximate or connivent. .... 22. *S. secundus*.  
 Calyx more or less hispid, with sepal tips distinct and free.  
 Plants 5 to 12 in. high; raceme ending in a purple spot; leaves oblong-lanceolate. .... 23. *S. insignis*.  
 Plants 3 to 5 in. high; raceme without terminal spot; leaves obovate. .... 24. *S. hispidus*.

1. *S. pilosus* (Wats.) Jepson n. comb. Stems  $1\frac{3}{4}$  to  $3\frac{1}{2}$  ft. high; leaves pinnately parted into ovate or oblong lobes (the lobes irregularly lobed or toothed),  $1\frac{1}{4}$  to 5 in. long, the petioles about half as long; raceme lax; flowers 4 to 5 lines long; sepals elliptic, green or purple, white-membranous-margined; petals whitish, scarcely exerted; pods slender, flexuous, ascending or widely divaricate,  $2\frac{1}{2}$  to 5 in. long; pedicels  $2\frac{1}{2}$  to 4 lines long.—Sandy soil, deserts: Inyo Co.; e. to Nev., n. to Ore. and Ida. Apr.-May. (*Caulanthus pilosus* Wats.)

2. *S. glaucus* (Wats.) Jepson n. comb. Stems stout, branching, 1 to  $1\frac{1}{2}$  ft. high; leaves orbicular to roundish obovate or ovate, entire or subentire,  $\frac{3}{4}$  to  $3\frac{1}{2}$  in. long, the upper lanceolate, all on petioles  $\frac{1}{3}$  to  $\frac{2}{3}$  as long; flowers 5 to  $5\frac{1}{2}$  lines long; sepals elliptic,  $\frac{1}{2}$  as long as the oblong obtuse petals; pods slender, 3 to 6 in. long, on pedicels 3 to 5 lines long.—Rocky slopes in the desert, 5000 to 7500 ft.: White Mts.; e. to Nev. (*Caulanthus glaucus* Wats.)

3. *S. crassicaulis* Torr. Stems simple, strongly inflated,  $1\frac{1}{2}$  to  $3\frac{1}{4}$  ft. high, the leaves mainly in a basal tuft, the cauline few and reduced; leaves ovate or oblong and obtuse to lanceolate and acute, entire above, but with 1 or 2 pair of salient oblong or linear lobes at or towards the base, 1 to 3 in. long, the petioles 1 to  $1\frac{1}{2}$  times as long, sometimes bearing one or two supplementary leaflets; flowers 5 to 7 lines long, spreading on pedicels  $\frac{1}{2}$  to 1 line long; calyx densely white-woolly, sometimes glabrate in age and then purple; petals dark purple, white-margined; pods slender, ascending,  $3\frac{1}{2}$  to  $4\frac{3}{4}$  in. long.—Desert gulches or gravelly slopes, 5000 to 7500 ft.: Inyo Co.; e. to Utah. May-June. (*Caulanthus crassicaulis* Wats.)

4. *S. major* (Payson) Jepson n. comb. Stems 1 or few from a leafy-tufted perennial root-crown, simple, 1 to 2 ft. high; the cauline leaves few and reduced or almost none; leaves oblong to lanceolate, mostly obtusish, entire

407. *Streptanthus inflatus* Greene; a, habit  $\times \frac{1}{2}$ ; b, fl.  $\times 1\frac{1}{2}$ ; c, petal  $\times 2$ ; d, pod  $\times \frac{3}{4}$ .

obtuse or merely subacute, entire or denticulate, sessile-auriculate,  $1\frac{1}{2}$  to 5 in. long; racemes at first very dense; pedicels glabrous or hispid, 2 to 4 lines long; flowers ascending, spreading or almost horizontal, at first deep purple, becoming white; sepals glabrous or nearly so; stamens exserted a little; pods 2 to  $4\frac{1}{4}$  in. long, ascending or erect.—Dry hills: Mohave Desert; n. to western Fresno Co. Mar.-May. (*Caulanthus inflatus* Wats.)

6. *S. lemmöni* (Wats.) Jepson n. comb. Stems 1 to  $1\frac{3}{4}$  ft. high; herbage glabrous; leaves ovate to lanceolate, cordate-clasping, entire or only obscurely denticulate,  $1\frac{1}{4}$  to  $3\frac{1}{4}$  in. long, the basal oblong-oblongate, coarsely toothed to entire; flower buds deep purple; raceme rather loose, the flowers deflexed or pendulous on pedicels 2 to 4 lines long; flowers  $5\frac{1}{2}$  to  $6\frac{1}{2}$  lines long; petals dark-purple-veined; pods erect, stout, 2 to 4 in. long; stigmas spreading conspicuously.—Rocky banks, San Luis Obispo Co. (*S. parryi* Greene.)

7. *S. coulteri* (Wats.) Greene. Fig. 408. Stems simple or branching, 1 to 3 ft. high; herbage thinly hispid; leaves oblong to ovate or lanceolate, pinnately parted or lobed to dentate or entire, sagittate-clasping, 1 to  $2\frac{1}{2}$  in. long, the basal on short winged petioles; racemes at first with a terminal black spot (consisting of the crowded black-purple flower

above, but with 1 or 2 pairs of lobes at base, or merely dentate, or wholly entire, 1 to 2 in. long, on petioles about as long; flowers glabrous, ascending, 5 to 6 lines long, on pedicels  $\frac{1}{2}$  line long; calyx blue-purple; petals whitish, dark-purple-veined; pods erect,  $3\frac{1}{2}$  in. long.—Desert slopes of ranges in and bordering the Mohave Desert; e. to Utah. (*Caulanthus major* Payson.)

5. *S. inflatus* (Wats.) Greene. Fig. 407. Stem very stout, becoming strongly hollow-inflated, 1 to  $2\frac{1}{2}$  ft. high; herbage glabrous (rarely a little hispid at base); cauline leaves erect, oblong-ovate to elliptic or oblong,

408. *Streptanthus coulteri* Greene, a, portion of leafy stem  $\times \frac{2}{3}$ ; b, fl. branchlet  $\times \frac{2}{3}$ ; c, fl.  $\times 1\frac{1}{2}$ .

buds), soon becoming elongated and lax; flowers 6 to 7 lines long, spreading or pendulous, on pedicels 1 to  $2\frac{1}{2}$  lines long; pedicels and calyx more or less bristly; calyx at first deep purple, becoming greenish; petals white with dark veins, widely spreading; filaments of longest pair of stamens united about  $\frac{1}{2}$  or  $\frac{3}{4}$  their length; pods stoutish, reflexed or reflexed-spreading,  $2\frac{1}{2}$  to 3 in. long.—Interior foothills, 1000 to 4000 ft.: Madera Co. to n. Los Angeles Co. (*Caulanthus coulteri* Wats.)

8. *S. amplexicaulis* (Wats.) Jepson n. comb. Stem very slender, a little flexuous, 7 to 12 in. high; leaves broadly obovate to elliptic-oblong, shallowly sinuate-dentate and obtuse, or the upper entire and acute, auriculate- or cordate-clasping, 1 to  $3\frac{1}{2}$  in. long, the lowest somewhat narrowed at base or subpetiolate; flowers few and remote in the raceme, purplish, ascending; pedicels 3 to 6 lines long, spreading; pods 3 in. long.—San Bernardino and San Antonio mountains, n. to Antelope Valley, 1500 to 8500 ft. May-June. (*Caulanthus amplexicaulis* Wats.)

9. *S. simulans* (Payson) Jepson n. comb. Stems simple or branching from the base, 1 to  $1\frac{3}{4}$  ft. high; herbage hispid below, glabrous above or with a few scattering hairs; basal leaves obovate to oblong-oblancoolate, dentate,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, scarcely petioled, the cauline linear-oblong or lanceolate, dentate, sagittate-clasping; flowers yellowish, 4 lines long; pedicels hispid,  $\frac{1}{2}$  to  $1\frac{1}{2}$  lines long; pods reflexed,  $1\frac{3}{4}$  to 2 in. long.—San Jacinto Mts. to Balcan Mts. (*Caulanthus simulans* Payson.)

10. *S. californicus* (Wats.) Greene. Stems branching from the base, 8 to 9 in. high; herbage glabrous (or with a few scattered bristles below); leaves oblong to oblong-ovate, cordate-sessile, dentate, 1 to  $1\frac{1}{4}$  in. long; pedicels hispidulose, 1 to 3 lines long; flowers pendulous, 3 to 4 lines long; sepals purple-tipped, white membranous below; petals white, purple-veined; pods obcompressed and strongly flattened, somewhat sword-like, erect or pendulous, 1 to  $1\frac{1}{2}$  in. long; style 1 to  $1\frac{1}{4}$  lines long.—Plains at the head of the San Joaquin Valley and neighboring foothills. Mar.-Apr. (*Stanfordia californica* Wats.)

11. *S. heterophyllus* Nutt. Stems usually simple,  $1\frac{1}{4}$  to  $2\frac{1}{4}$  ft. high; herbage hirsute; leaves  $1\frac{1}{2}$  to  $3\frac{1}{2}$  in. long, oblong or linear to lanceolate, dentate with triangular or subulate teeth, or pinnately and shallowly lobed, the lobes linear to oblong, usually remote and often salient, the uppermost sometimes entire, all sagittate-clasping except the basal; flowers  $2\frac{1}{2}$  to  $3\frac{1}{2}$  lines long; calyx greenish to dark-purple, the petals white, dark-purple-veined; pedicels 2 to 4 lines long; pods abruptly reflexed, 2 to  $2\frac{3}{4}$  in. long, somewhat 4-angled; style  $\frac{1}{2}$  line long.—Coastal foothills from Santa Barbara Co. to San Diego Co.

12. *S. campéstris* Wats. Stem 2 to 4 ft. high; leaves oblong, irregularly dentate or denticulate, the teeth setose-tipped, contracted at base to a winged petiole, 5 to 6 in. long; cauline leaves oblong to lanceolate, auriculate-clasping; flowers darkish purple, 4 to 5 lines long; sepals bristle-tipped; pods spreading and curved, 3 to 6 in. long, 1 line broad.—Montane, 4000 to 5000 ft.: San Jacinto Mts. to the Cuyamaca Mts. Var. *BERNARDINUS* Johnston. Leaves thickish, spatulate-obovate, contracted to a short petiole, 1 to  $1\frac{1}{2}$  in. long, entire, not ciliate nor setose; flowers pale white, 3 lines long.—San Bernardino Mts. (*Agianthus bernardinus* Greene.)

13. *S. barbatus* Wats. Stems simple, erect,  $1\frac{1}{2}$  to 2 ft. high; leaves cordate, sessile and clasping, obtuse, all similar and nearly equal, crowded, 5 to 9 lines long; flowers purple, 3 to 4 lines long; sepals obtusish, setosely bearded near the apex; pods spreading, curved,  $1\frac{1}{4}$  to 2 in. long, 1 line wide; pedicels 1 line long.—Sandy bottoms, upper Sacramento River.

14. *S. cordatus* Nutt. Stems stout, arising from a simple or branched root-crown, 10 in. to 3 ft. high; basal leaves broadly spatulate-obovate, denticulate or dentate, especially toward the summit, and often setose-ciliate,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, on petioles  $\frac{1}{4}$  to as long; cauline leaves cordate-ovate to oblong, mostly obtuse and entire, sessile, 1 to  $2\frac{1}{4}$  in. long; flowers 6 lines long; petals  $1\frac{1}{2}$  times as long as the sepals, with ovate claw contracted above to

409. *Streptanthus tortuosus* var. *orbiculatus* Hall; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 2$ .

Var. *SUFFRUTESCENS* Jepson n. comb. Coarse biennial 1 to 2 ft. high, the stems half-woody at base.—Hood's Peak Range; Sierra foothills in Calaveras Co. (*S. suffrutescens* Greene). Var. *FLAVESCENS* Jepson n. var. Flowers yellow.—Sawtooth Range (Coyote Pass trail, Jepson 982, type). Var. *ORBICULATUS* Hall. Fig. 409. Stems many from the base, 3 to 6 or 9 in. high; herbage glabrous and glaucous; flowers smaller ( $2\frac{1}{2}$  to 4 lines long), darker purple.—High montane, 7000 to 10,500 ft.: Sierra Nevada; high North Coast Ranges from Humboldt Co. to Siskiyou Co. (*S. orbiculatus* Greene.)

16. *S. grácilis* Eastw. Stem simple or with delicate branches from near the base, 2 to 7 in. high; lower leaves orbicular to spatulate, sinuate-dentate to pinnately lobed, 2 to 6 lines long, on petioles 1 to 3 times as long; upper cauline leaves mostly sessile, oblong to ovate, toothed or entire, auriculate-clasping,  $2\frac{1}{2}$  to 6 lines long; racemes 1 to 3 in. long, bearing below 1 or 2 small ovate sessile bracts ( $1\frac{1}{2}$  to 2 lines long); flowers  $3\frac{1}{2}$  to 4 lines long; sepals rose-purple, the tips membranously margined, spreading; petals lavender-purple to pink, with slender claw exserted, the blade broad, purple-veined; upper pair of filaments longest; pods erect, slender,  $1\frac{1}{2}$  to 2 in. long.—Disintegrated granite, 10,000 ft., region of the Kings-Kern divide, Sierra Nevada.

a ligulate blade; pods ascending or spreading, 2 to  $3\frac{1}{4}$  in. long,  $1\frac{1}{2}$  to 2 lines broad; pedicels short (2 to 4 lines long).—Mountain valleys and slopes, Plumas Co. to Modoc Co.; e. to Col.

15. *S. tortuosus* Kell. Stems 1 to 4 ft. high, sometimes reduced and 3 to 6 in. high; lower leaves obovate to spatulate-obovate,  $\frac{1}{2}$  to 1 in. long, contracted at base to a petiole as long, upward becoming oblong- to ovate- or orbicular-cordate, entire, sessile and clasping, mostly  $\frac{1}{4}$  to  $1\frac{3}{4}$  in. broad; sepals purplish, connivent; petals rose-purple or white and purple-veined,  $2\frac{1}{2}$  to 6 lines long; pods recurved-spreading,  $1\frac{1}{2}$  to  $4\frac{3}{4}$  in. long, 1 line wide.—Montane, 2000 to 7000 ft.: Sierra Nevada from Tulare Co. to Shasta Co., thence s. in the outer and middle Coast Ranges to Monterey Co. Var. *OBLONGUS* Jepson n. var. Stem tall (2 to 3 ft. high), openly branched; leaves of the main stem long-oblong,  $1\frac{1}{3}$  to  $3\frac{3}{4}$  in. long.—W. Siskiyou Co. to n. Trinity Co. (Burnt Ranch, Tracy 6099, type).

410. *Streptanthus diversifolius* Wats.; a, habit  $\times \frac{1}{2}$ ; b, fl.  $\times 2$ ; c, pod  $\times \frac{1}{2}$ .

17. *S. diversifolius* Wats. Fig. 410. Stem erect and slender, branching above, 10 to 22 in. high; cauline leaves very narrowly linear, pinnately divided into a few remote narrowly linear or filiform segments, or sometimes linear and entire; bracts of the inflorescence broadly cordate, long caudate at apex,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; sepals pale with short recurved tips; petals yellow, white or pinkish, 3 to 4 lines long, the blade orbicular; anthers long, sagittate; pods reflexed, about 3 in. long,  $\frac{3}{8}$  line broad; pedicels  $\frac{1}{2}$  to 2 lines long.—Sierra Nevada foothills, 1000 to 4700 ft., from Amador Co. to Tulare Co.

18. *S. bréwéri* Gray. Fig. 411. Stems branching from near the base,  $\frac{3}{8}$  to 2 ft. high; leaves broadly ovate and acute to narrowly lanceolate, denticulate or entire, sessile, 1 to  $2\frac{1}{2}$  in. long, the lowest broadly spatulate to cordate-orbicular, with a short winged petiole; flowers 3 to 5 lines long, erect, short-pedicel; sepals acuminate, the tips slightly spreading; upper petals white or delicately veined with purple, the lower dark-purple-veined or dark-purple tipped with white; upper pair of filaments connate, dark purple, conspicuous; pods ascending, slightly curved, torulose,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long,  $\frac{1}{2}$  line wide.—Middle and inner Coast Ranges: Lake Co. to San Benito Co.

411. *Streptanthus breweri* Gray;  
habit  $\times \frac{1}{4}$ .

19. *S. polygaloides* Gray. Stem slender, simple or branched, 1 to 3 ft. high; leaves filiform, entire, some sagittate-clasping; flowers very shortly pedicel, yellowish or purple, 3 lines long; calyx very broad; upper and lower sepals suborbicular, mucronate, unequal, the broad upper sepal resembling the banner in a papilionaceous flower; lateral sepals lanceolate, acuminate; petals with expanded claw and narrowed blade, the lower 3 spreading, the upper one erect; stamens in 3 unequal pairs; upper pair of filaments connate to the summit, exserted, bearing small but pollen-bearing anthers; pods 1 to  $1\frac{1}{2}$  in. long,  $\frac{1}{2}$  line wide, at length reflexed.—Sierra Nevada foothills, 2000 to 3000 ft., from Nevada Co. to Mariposa Co. (*Microsemia polygaloides* Greene.)

20. *S. niger* Greene. Similar to no. 21; stem stout,  $1\frac{1}{2}$  to 3 ft. high; leaves linear; racemes loose, flexuous; pods ascending, 1 to 2 in. long, on pedicels 6 to 12 lines long.—Hills at Tiburon, Marin Co. Apr.

21. *S. glandulosus* Hook. JEWEL FLOWER. Stem nearly simple or with ascending branches from an erect axis, 1 to 2 ft. high; herbage more or less hispid; lower leaves oblanceolate, coarsely and often saliently toothed, at least the basal slender-petioled, the upper lanceolate to linear, toothed or entire, sessile and auriculate-clasping, the teeth callous-tipped; flowers 5 to 6 lines long; calyx commonly deep purple, 3 upper sepals approximate or connivent at tips, the lower one free from the others and usually spreading; petals purple, or white with conspicuous purple veins, the upper pair commonly longer and darker; claws broad, the blades curved-spreading; longest pair of filaments often connate for their entire length and with reduced anthers; pods curved, more or less spreading, glabrous or hispid, 2 to 3 in. long, 1 line wide; pedicels 4 to  $4\frac{1}{2}$  lines long; seeds narrowly winged.—Middle altitudes in the Coast Ranges from Sonoma and Solano Cos. to San Luis Obispo Co. Var. *ALBIDUS* Jepson n. comb. Stems very stout; herbage

412. *S. secundus* Greene;  
fl. branchlet  
x  $\frac{3}{8}$ .

glabrous and glaucous above, some scattered pubescence only below; raceme strictly bilateral; sepals white-margined and -tipped, purplish below; petals with conspicuous crisped blade, white with purplish veinlets; pods erect, stout.—Foothills of Santa Clara Valley. Var. *PULCHÉLLUS* Jepson n. comb. Stem generally branching, 4 to 12 in. high; herbage pubescent throughout; leaves oblong-linear to oblong-lanceolate, with opposite salient teeth; raceme often subsecund; pedicels hairy, 1 to 2 lines long; sepals commonly very slightly hispid; pods commonly a little hispid, at least the lower ones.—Dry ridges, Marin Co. (*S. pulchellus* Greene.)

22. *S. secundus* Greene. Fig. 412. Stems 10 to 16 in. high; herbage similar to no. 21; racemes rather dense, secund; calyx as if 2-lipped, the 2 upper sepals approximate and larger than the 2 lower; petals white; seeds wingless.—Lower mountain slopes, Marin Co. to Lake Co.

23. *S. insignis* Jepson n. sp. Branching from the base,  $\frac{1}{2}$  to 1 ft. high; herbage bristly-pilose; raceme with a conspicuous dark purple spot or tuft formed by the elongated calices of sterile flowers; pedicels hispid, 1 to 2 lines long; flowers 4 to 5 lines long, similar to no. 21; calyx with scattered short bristles; stigma evidently 2-lobed; pods bristly-hispid, erect or reflexed.—Stony mt. slopes, inner South Coast Range in San Benito, Monterey and w. Fresno Cos. (Warthan, A. Eastwood, type.)

24. *S. hispidus* Gray. Dwarfish, hispid throughout, branching, 3 to 6 in. high; leaves obovate, coarsely toothed, all sessile except the very lowest,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long, the basal crowded; raceme sub-secund; sepals hispid with brownish hairs; petals purplish with white margins, 3 to 4 lines long; pods erect or ascending, very hispid,  $1\frac{1}{2}$  to 3 in. long, 1 line wide, the pedicels  $\frac{1}{2}$  to 1 line long.—Summits of the inner South Coast Range peaks: Mt. Diablo; Mt. San Carlos.

#### 4. *SISÝMBRIUM* L.

Erect annuals with pinnatifid or finely dissected leaves, the base not clasping or auriculate. Flowers small ( $\frac{2}{3}$  to 1 line long), yellow. Sepals oblong or linear, equaling or exceeding the claws of the petals. Pod linear or oblong, terete or nearly so, the valves more or less distinctly 3-nerved; stigma sessile or the style very short. Cotyledons incumbent. (Greek *sisymbrium*, the ancient name of some plant of this family.)

Pods subulate, closely appressed; seeds in 1 row; leaves pinnatifid. . . . . 1. *S. officinale*.  
Pods spreading.

Pods elongated-linear or thread-like, 2 to 4 in. long; seeds in one row; leaves pinnately parted, dimorphic, the lower with broad lobes, the upper with filiform lobes; plants very rigid in age. . . . . 2. *S. altissimum*.

Pods  $\frac{1}{4}$  to  $1\frac{1}{4}$  in. long; leaves pinnate or bi- or tri-pinnate, not dimorphic on one plant. Seeds in 1 row.

Leaves bi- or tri-pinnately dissected, with linear or linear-lanceolate segments; pods 9 to 15 lines long. . . . . 3. *S. sophia*.

Leaves pinnate with oblong pinnatifid segments; pods ( $1\frac{1}{2}$  or) 4 to 8 lines long. . . . . 4. *S. incisum*.

Seeds in 2 rows.

Leaves with finely dissected segments; pods glabrous, 2 to 5 lines long. . . . . 5. *S. pinnatum*.

Leaves with oblong pinnatifid segments; pods sparsely pubescent, 7 to 9 lines long. . . . . 6. *S. cumingianum*.

1. *S. officinale* (L.) Scop. HEDGE MUSTARD. Stem rigid, 1 to 4 ft. high, with divaricate branches above; herbage a little rough-hispid; leaves lyrate and often somewhat runcinately pinnatifid or pinnately parted with dentate or coarsely toothed segments, petioled, the lowest rosulate and 4 to 10 in. long; pods terete, 6 lines long, tapering from base to summit, nearly sessile, closely appressed to the axis in a long slender raceme.—Very common weed of waysides and waste places; nat. from Eur. Apr.-May.

2. *S. altissimum* L. TUMBLING MUSTARD. Stems erect, much branched, 2 to 3 ft. high; herbage nearly glabrous or sparsely hirsute below; lower leaves large, petioled, the lobes  $\frac{1}{4}$  to 1 in. broad, entire or dentate; upper leaves reduced, with linear or filiform segments; pods spreading, linear or subfiliform, 3 to 4 in. long, on stout pedicels.—Introduced European weed, established in widely scattered localities throughout the state. The difference between the broad lobes of the basal leaves and the filiform divisions of the upper leaves is very striking.

3. *S. sòphia* L. FLIX-WEED. Stem branching above the base,  $1\frac{1}{4}$  to  $1\frac{3}{4}$  ft. high; herbage finely pubescent with branched hairs; leaves finely bi- or tri-pinnately dissected, the segments linear or lance-linear,  $\frac{1}{2}$  to  $1\frac{1}{2}$  lines long; pedicels filiform, spreading, 3 to 5 lines long; pods ascending, narrowly linear,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; seeds in 1 row.—European weed, introd. in Siskiyou and Modoc Co.; rare with us.

4. *S. incisum* Engelm. Fig. 413. Stems 1 to  $2\frac{1}{2}$  ft. high; herbage stellate-puberulent, obscurely glandular; leaves thin, pinnate (or the upper leaflets not distinct); leaflets incised-pinnatifid, 3

413. *Sisymbrium incisum* Engelm.; a, leaf  $\times \frac{1}{2}$ ; b, infl.  $\times \frac{1}{2}$ ; c, fl.  $\times 3$ ; d, pod  $\times 2$ ; e, dehiscent pod  $\times 2$ .

414. *Sisymbrium pinnatum* Greene; a, habit  $\times \frac{1}{2}$ ; b, fl.  $\times 3$ ; c, pod  $\times 2$ ; d, dehiscent pod  $\times 2$ .

to 14 lines long; pods 6 to 8 lines long, straight or upwardly curved, exceeding the spreading pedicels; seeds in 1 row (sometimes indistinctly in 2 rows); pods with a distinct style ( $\frac{1}{4}$  to  $\frac{3}{8}$  line long).—Montane, 7000 to 11,500 ft.: San Bernardino Mts.; Sierra Nevada from Tulare Co. to Placer Co.; Yollo Bolly Mts.; e. to Tenn., n. to Saskat. Var. *SÖNNEI* Rob. Pods 3 lines long, on pedicels about as long.—Montane, Nevada Co. to Sierra Co. Var. *HARTWEGIANUM* Wats. Pods shorter,  $1\frac{1}{2}$  to 2 lines long, on somewhat appressed or nearly erect pedicels.—East slope or easterly areas of the Sierra Nevada in Tulare and Inyo Cos.; White Mts.; e. to Col., n. to B. C., s. to Mex.

5. *S. pinnatum* (Walt.) Greene. TANSY MUSTARD. Fig. 414. Stem  $\frac{3}{4}$  to 2 ft. high; herbage ashy-tomentulose or puberulent, sometimes glabrate and green; leaves pinnately or bipinnately dissected; segments elliptic to linear-oblong,  $\frac{1}{4}$  to 1 line long; pods oblong to linear, acute at each end, 2 to 5 lines long, shorter than the slender spreading or divaricate pedicels; seeds in 2 rows; style very short ( $\frac{1}{2}$  line long) or almost

none.—Desert or arid slopes and mesas, 1250 to 8500 ft.: n. end and e. slopes or summits of the Sierra Nevada, head of the San Joaquin Valley, s. to the Mohave and Colorado deserts, thence west to cismontane S. Cal.; more common southward in our range than northward; e. to Va.

6. *S. cumingianum* F. & M. Closely resembling stout forms of *S. incisum*; stem stouter, simple, 3½ ft. high, pubescent with short branched hairs; leaves densely canescent-tomentose: pods narrow, abruptly pointed, sparsely pubescent with branched hairs, 7 to 9 lines long; seeds in 2 rows, tightly compressed.—Mohave and Colorado deserts, and bordering southerly or westerly ranges.

##### 5. *ÍSATIS* L.

Ours a biennial or perennial herb. Flowers small, yellow, the racemes crowded in small paniced corymbs. Pod 1-celled, 1-seeded, indehiscent, winged and strikingly like a samara or ash fruit. (The classical name).

1. *I. tinctoria* L. DYERS WOAD. Stems branching from or near the base, 1 to 2 (or 3) ft. high; herbage somewhat glaucous, glabrous or the lower leaves sparingly ciliate along the midrib; basal leaves oblong-ovate to lanceolate, entire or remotely serrate, 3 to 4 in. long, on petioles nearly as long; cauline leaves sessile, sagittate at base; flowers 1 to 1½ lines long; stigma broad, sessile; pods 4 to 7 lines long on slender pedicels, erect at first but eventually pendent, becoming dark purple at maturity.—European plant, naturalized in Siskiyou Co., a troublesome pest in Scott Valley, springing up from the root when cut down; known as Marlahan Mustard.

##### 6. *CAKILE* L.

Maritime branching annual with fleshy leaves and rather small purplish or white flowers. Pod fleshy, or when ripe, dry and corky, 1-celled, jointed in the middle, the 2 joints 1-seeded, the upper joint at length deciduous, the lower one persistent. Cotyledons accumbent. (Arabic name.)

1. *C. edéntula* (Bigel.) Hook. var. *californica* Fer. SEA ROCKET. Stems decumbent, often 2 ft. long; leaves oblanceolate or narrowly obovate, crenate or shallowly sinuate-toothed; pods 1 in. long or less, the lower segment cylindrical, the upper ovoid and acuminate narrowed to a flattened truncate often retuse beak.—Sea beaches from San Diego to Humboldt Bay; n. to B. C. Introduced. June-Sept.

##### 7. *RÁPHANUS* L. RADISH

Coarse much-branched annuals or biennials. Lower leaves lyrate pinnate or pinnatifid, shortly petioled. Flowers large, purple or yellow, or becoming white. Petals long-clawed. Pod thick, beaked by the stout style, 1-celled, filled with spongy or corky tissue, lightly constricted between the seeds or even moniliform, indehiscent or eventually breaking transversely into 1-seeded joints. Seeds subglobose; cotyledons conduplicate. (Greek raphanos, quick-appearing, the seeds promptly germinating.)

1. *R. sativus* L. WILD RADISH. Branching widely, 2 to 5 ft. high; herbage nearly glabrous or hispid with scattered hairs; lower leaves pinnately parted, crenate, the terminal segment large and round, the lateral segments smaller, ovate or oblong, sessile with the upper side adherent to the midrib, the lower lobe free; upper leaves mostly toothed, or with a few small lateral segments; flowers 8 to 9 lines broad, purple or white; pods 1 to 3 in. long, 3 to 4 lines broad, with one to several constrictions, 2 to 3-seeded, or the body of the pod globose and 1-seeded.—Common weed of waste places in towns and villages; nat. from Eur.

*R. RAPHANISTRUM* L. Jointed Charlock. Flowers yellow or white; pods moniliform, (1 or) 4 to 10-seeded.—Native of Eur., occasionally adventive: San Jacinto Valley; Pacific Grove; San Francisco; Berkeley; Elk Grove; Yosemite.

8. *BRÁSSICA* L. MUSTARD

Annuals, either glabrous or sparsely hispid with coarse hairs, the lower leaves usually lyrate pinnatifid or pinnate, the upper disposed to be more or less entire. Flowers large, yellow. Lateral sepals more or less gibbous at base. Petals with long claw and abruptly spreading limb. Papilla-like glands 4, green, alternating with the claws of the petals. Pods terete, terminating in a stout beak; valves 1 to several-nerved. Seeds in 1 row, globose; cotyledons conduplicate, incumbent.—All of our species are naturalized weeds. (The Latin name for cabbage.)

Pods ascending on spreading pedicels.

Stem-leaves auriculate or cordate-clasping; beak terete. . . . . 1. *B. campestris*.

Stem-leaves petioled or merely sessile; beak flattish. . . . . 2. *B. arvensis*.

Pods closely appressed to the stem.

Stems glabrous or nearly so; pods somewhat quadrangular, the beak short. 3. *B. nigra*.

Stems retrorse-hispidulose; pods terete, the beak  $\frac{2}{3}$  as long as the body, commonly containing a seed. . . . . 4. *B. adpressa*.

1. *B. campestris* L. "COMMON YELLOW MUSTARD." Erect, sparingly branched, 1 to 6 ft. high; herbage succulent, glaucous, and glabrous save for some bristle-bearing pustules on the upper surface of the lower leaves; cauline leaves all sessile and clasping by an auricled base, the lower ones irregularly serrate or denticulate, and pinnatifid or pinnate with the terminal segment very large and the lateral segments sessile by a broad base and more or less decurrent on the rachis, the upper ones lanceolate and entire; flowers 6 to 8 lines broad; pods terete,  $1\frac{1}{4}$  to  $2\frac{1}{2}$  in. long, narrowed into a subulate beak, tipped with a flat stigma.—European weed, abundant throughout Cal. Feb.-Apr.

2. *B. arvensis* (L.) B.S.P. CHARLOCK. One to 2 ft. high, the herbage light green, hispid with scattered hairs; leaves pinnatifid, lobed or merely toothed, the upper rhombic, petioled or sessile by a narrow base, not clasping; petals 4 to 6 lines long; pods glabrous, ascending or erect, 1 to  $1\frac{1}{2}$  in. long, with 3 to 8 seeds in each cell; beak flattish,  $\frac{1}{3}$  as long as the body, often containing a seed; valves nerved.—Native of Eur., sparingly naturalized. Apr.

3. *B. nigra* (L.) Koch. BLACK MUSTARD. Stems 3 to 6 or even 12 ft. high; herbage dark green (not glaucous), glabrous or with some scattered stiff hairs; leaves all petiolate, the lower lyrate pinnatifid or divided, terminal segment very large, shallowly lobed and sharply dentate; upper leaves less lobed or the uppermost linear and entire and commonly drooping or pendulous; racemes long and dense; petals  $3\frac{1}{2}$  lines long, much longer than the sepals; pods closely appressed to the axis of the raceme, torulose, indistinctly 4-sided, beaked by the style; seeds nearly black, highly pungent.—European weed, everywhere common; very abundant in interior grainfields. May-July.

4. *B. adpressa* Boiss. Stems  $1\frac{1}{2}$  to 3 ft. high; herbage hispidulose, retrorsely so on the stems and petioles; leaves pinnately parted, or the uppermost merely lobed or subentire; flowering racemes subcapitate, much elongated in fruit; pods closely appressed to the axis, 5 to 7 lines long, the beak  $\frac{2}{3}$  to  $\frac{1}{2}$  as long as the body, constricted beyond the valves and bearing a single seed in the constricted portion.—Introd. from Eur. along the coast, Berkeley to Los Angeles, and spreading into the interior.

*B. ALBA* (L.) Boiss. White Mustard. Pods on spreading pedicels, bristly, the broad sword-shaped beak equaling or longer than the body; seeds few, large.—Native of Eur., adventive in grainfields: Surf; Byron. *B. ERÜCA* L. Garden Rocket. Somewhat succulent; flowers  $\frac{1}{2}$  to  $\frac{3}{4}$  in. broad, variously colored, the petals strongly veined; pods erect-appressed,  $\frac{3}{4}$  in. long, the stout flat beak  $\frac{1}{2}$  as long as the body.—Adventive from Eur.; Yreka; San Luis Obispo.

*Diploëxis* DC. Herbs similar to *Brassica*. Leaves toothed or pinnatifid. Flowers yellow. Pod linear-elongated, flat or flattish, short-beaked, the valves mostly 1-nerved; seeds in 2 rows in each cell. 1. *D. tenuifolia* DC. Wall

Rocket. Perennial; stems leafy; flowers 5 to 6 lines long; pods 1 to 1½ in. long.—Native of Eur., adventive at Pasadena and Santa Ana. 2. *D. MURÆLIS* DC. Sand Rocket. Annual; leaves mostly basal; flowers 2 to 2½ lines long; pods 1 to 1½ in. long.—Native of Eur., adventive at San Bernardino.

#### 9. *BARBAREA* R. Br.

Perennial herbs similar to the yellow-flowered *Radiculas*. Stem angular. Leaves lyrate or pinnatifid. Flowers yellow. Stamens 6, distinctly tetradynamous. Pod linear, somewhat quadrangular, abruptly terminated by a pointed style, the valves strongly 1-nerved or carinate. Seeds in 1 row, turgid, not margined. (Named after St. Barbara.)

1. *B. vulgaris* (L.) R. Br. WINTER CRESS. Stems erect, rather stout, 10 to 16 in. high; herbage glabrous; basal leaves elliptic, sometimes cordate at base, ¾ to 2 in. long, with or without small supplementary lobes borne along the petiole; cauline similar, pinnatifid, with the terminal lobe largest and often oblong-lanceolate; raceme terminal and solitary or with several from the upper axils; petals narrowly obovate or oblanceolate, the blade scarcely narrowed into a claw, about 3 lines long, twice or nearly twice as long as the yellow sepals; pods 1½ in. long.—Along streams in the hills or mts., 300 to 9500 ft.: Coast Ranges; Sierra Nevada from Calaveras Co. to Tulare Co.; s. to S. Cal.; n. to Wash., e. to the Atlantic; Eur.

#### 10. *RADÍCULA* Hill

Nearly or quite glabrous herbs, sometimes growing in water, mostly in wet places. Leaves toothed or pinnatifid or pinnately divided. Flowers small, white or yellow. Sepals spreading in anthesis. Petals scarcely clawed. Stigma capitate, nearly sessile. Pod linear or oblong, terete or nearly so, valves mostly 1-nerved. Seeds minute, in 2 rows; cotyledons accumbent. (Diminutive of Latin, *radix*, radish.)

Flowers white; petals distinctly clawed, nearly twice the length of the sepals; perennial. .

1. *R. nasturtium-aquaticum*.

Flowers yellow; petals scarcely clawed, little longer than the sepals.

Pods linear, curved upward; annual. . . . . 2. *R. curvisiliqua*.

Pods oblong, turgid, straight.

Low diffuse plants; perennial. . . . . 3. *R. sinuata*.

Plants erect, tall; biennial. . . . . 4. *R. palustris*.

1. *R. nasturtium-aquaticum* (L.) Britt. & Rendle. WATER CRESS. Stems ascending or prostrate at base and rooting at the nodes; herbage glabrous; leaflets or segments 3 to 9, ovate or nearly round, the terminal always the largest, or the lowest leaves without lateral leaflets; flowers white, 2 to 2½ lines broad; petals nearly twice the length of the sepals; pods divaricately spreading, ½ to 1 in. long, the pedicels ⅔ to as long.—Abundant in slow-flowing creeks (especially where not bordered by trees) and about springs in the mts.; nat. from Eur.

2. *R. curvisiliqua* (Hook.) Greene. WESTERN YELLOW CRESS. Fig. 415. Stems several to many from the base, diffuse (rarely erect), 3 to 7 in. long (rarely to 1 or 1½ ft. long); leaves pinnatifid or pinnately parted (the segments varying from linear and commonly entire to oblong or ovate and either entire, toothed or pinnatifid), mostly ¾ to 2 in. long, or the lowest or basal often 3 to 12 in. long; pods linear, terete, more or less curved, 2½ to 7 lines long, the pedicels ½ to 1½ lines long.—Frequent in stream beds, margins of pools and marshy places throughout Cal., 10 to 7500 ft.; n. to B. C., e. to Wyo., s. to L. Cal. Exceedingly variable in foliage.

3. *R. sinuata* (Nutt.) Greene. Stems decumbent or prostrate, branching, pale green, puberulent, 4 to 6 in. long; leaves more or less narrowly oblong or oblanceolate, usually deeply sinuately and regularly pinnately parted, the segments subequal, oblong to deltoid, entire or coarsely toothed; pods ovate to oblong, rounded at apex or pointed, 1½ to 2½ lines long, on pedicels 1½ to 2 lines long, style usually ½ to ¾ line long.—Montane, 5000 to 6000 ft.: San Bernardino Mts.; Sierra Nevada; n. to Saskat., e. to Ark. Var *TRUNCATA* Jepson n. var. Habit and leaves similar to the species; pods

oblong,  $1\frac{1}{2}$  to  $1\frac{3}{4}$  lines long, truncate, the style very short.—San Gabriel Mts. (Crystal Lake, Peirson 2450, type). Var. *INTEGRA* Jepson n. var. Leaves narrowly obovate to broadly oblong, not lobed, sparingly dentate or subentire; pods oblong-ovate, turgid,  $1\frac{1}{2}$  to 2 lines long, on pedicels  $\frac{3}{4}$  line long.—Montane, 6000 to 10,200 ft., ranges e. of the Sierra Nevada from Inyo Co. (Silver Cañon, White Mts., Jepson 7354, type) to Modoc Co.

4. *R. palustris* Moench. MARSH CRESS. Biennial; stem erect, simple or mostly branched above, 2 to 5 ft. high, usually glabrous; leaves broadly oblanceolate or narrowly oblong in outline, coarsely toothed or, if deeply pinnatifid, mostly on the lower part of the blade, the lobes often irregularly dentate; pods oblong, turgid, 2 to 3 lines long, obtuse, the pedicels nearly as long; style  $\frac{1}{4}$  to  $\frac{1}{2}$  line long.—Marshy places near streams, widely distributed in Cal., but not common; n. to B. C., e. to the Atlantic; Eur., Asia.

415. *Radicula curvisiliqua* Greene; a, habit  $\times \frac{1}{2}$ ; b, fl.  $\times 4$ ; c, pod  $\times 2$ .

#### 11. CARDÁMINE L. BITTER CRESS

Ours erect herbs with leafy stems. Leaves pinnate, the basal in a rosette. Flowers white or pinkish. Very near *Dentaria* and scarcely separable, but the flowers smaller (in ours 1 to 3 lines long) and pods narrower. (Ancient Greek name of some species of cress.)

Leaves simple, undivided; petals 2 to 3 lines long; perennials.

Stems many from an ascending, much-branched caudex; flowers white or pinkish; dwarf plants. .... 1. *C. bellidifolia*

Stem simple or branched above, from a running rootstock; flowers white; plants 1 to 2 ft. high. .... 2. *C. lyallii*

Leaves at least the cauline, with 3 to many pinnate leaflets; flowers white.

Some basal leaves simple, the cauline 3 to 5-foliate; petals  $2\frac{1}{2}$  to 3 lines long; perennial. .... 3. *C. breweri*

Basal leaves pinnate.

Flowers rather large; petals  $2\frac{1}{2}$  to 3 lines long; perennial. .... 4. *C. gambelii*

Flowers smaller; petals 1 to 2 lines long; annuals or biennials.

Leaflets mostly roundish; capsules 8 to 20-seeded. .... 5. *C. oligosperma*

Leaflets mostly oblong or linear; capsules 20 to 30-seeded. .... 6. *C. pennsylvanica*

1. *C. bellidifolia* L. Scape-like peduncles and leaves caespitose on the branched root-crown, the plants 2 to 6 in. high; herbage glabrous; leaves ovate or elliptic, 3 to 9 lines long, on slender petioles 2 to 3 times as long; flowers few; pods erect, 10 to 15 lines long.—High peaks of n. Cal., 7000 to 8000 ft.: Lassen Peak; Mt. Shasta; Medicine Lake; n. to Alas., e. to N. Eng.; Eur., Asia.

2. *C. lyallii* Wats. Stem erect from a rootstock, simple or branched, 10 to 15 in. high; herbage glabrous; leaves all simple, 6 to 8, reniform to cordate, subentire or shallowly sinuate, 1 to  $2\frac{3}{4}$  in. broad; pods erect on spreading pedicels  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; style very short.—Montane, 5500 to 6000 ft.: Placer Co. to Siskiyou Co.; n. to Ore., e. to northern Nev. June-July.

3. *C. breweri* Wats. Stems from a slender rootstock, erect or decumbent at base, 7 to 16 in. high; herbage glabrous or nearly so; leaves 3 (or to 7)-foliolate, or the basal mostly simple; terminal leaflet usually round-cordate, entire to shallowly lobed; lateral leaflets usually smaller and rounded, the

upper more oblong or lanceolate; pods 8 to 13 lines long,  $\frac{1}{2}$  to  $\frac{3}{4}$  line wide, ascending or erect on pedicels 4 to 7 lines long; style almost none.—Montane, 4000 to 8500 ft.: Sierra Nevada from Tulare Co. to Modoc Co.; and near sea-level at Humboldt Bay; n. to Wash., e. to Wyo.

4. *C. gambélii* Wats. Stems rather stout, 2 to 4 ft. long, decumbent and rooting at base; herbage glabrous or sparingly soft-villous; leaflets 4 to 6 pairs, broadly ovate to narrowly oblong, cuneate at base, acute, 1 or 2-toothed on each side, 4 to 9 lines long; raceme very dense, becoming elongated; pods 9 to 10 lines long, on divaricate pedicels nearly as long; style slender, 1 line long.—Swamps, cismontane s. Cal., 1000 to 3000 ft., from Santa Barbara Co. to San Diego Co.; s. to Mex.

5. *C. oligosperma* Nutt. Stems branched from the base or simple, 3 to 14 in. high; herbage hispidulous or glabrous; leaves pinnate (the basal in a rosette),  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long (including the petiole); leaflets 5 to 11, little unequal, with a notch in each side toward the apex, 1 to 4 lines long, petiolulate; petals much surpassing the sepals; pods 6 to 9 (or 12) lines long; valves separating while still green-herbaceous; pedicels 1 to 2 lines long, little accrescent in fruit.—Under oaks and other trees in openly wooded country, 20 to 700 ft.: Coast Ranges from Monterey Co. to Humboldt Co.; n. to B. C.

6. *C. pennsylvanica* Muhl. Annual or biennial; stems simple or branched, 8 to 20 in. high; herbage glabrous or nearly so; leaflets 7 to 13, mostly oblong or linear, but those of the lowest leaves suborbicular, mostly sessile; pods suberect, on spreading pedicels 3 to 6 lines long.—Moist places, chiefly in the shade, 3000 to 4000 ft.: e. Nevada Co.; n. to Alaska, e. to the Atlantic.

## 12. DENTARIA L. TOOTHWORT

Glabrous perennials. Stems and one or two long-petioled basal leaves from tuberous rootstocks, the stems rarely branched and sparingly leafy. Flowers in a raceme, large, white or rose-tinted. Sepals equal at base, erect or nearly so. Petals with slender claws and ovate spreading limb, much longer than the sepals. Pod linear, flattened, parallel to the partition, stout, attenuate above into the slender style, the valves and partitions not nerved; seeds wingless. (Latin, dens, a tooth, the rootstocks toothed in some species.)

Style 1 to 3 lines long.

Cauline leaves more or less scattered along stem, compound or simple; flowers in a raceme. . . . . 1. *D. integrifolia*.

Cauline leaves simple, approximate beneath the corymbose raceme. . . . . 2. *D. corymbosa*.

Style 5 lines long. . . . . 3. *D. macrocarpa*.

1. *D. integrifolia* Nutt. MILK-MAIDS. Stems mostly one from the rootstock, erect, 6 to 21 in. high, the herbage rather fleshy; leaves thickish, the leaves or leaflets entire; basal leaves simple or trifoliate, the leaves or leaflets orbicular, ovate or reniform,  $\frac{1}{2}$  to  $2\frac{3}{4}$  in. long; cauline 3 or 5-foliate, the leaflets orbicular to lanceolate or linear; raceme mostly single; corolla white, 6 lines broad; sepals green or dull red; pods flattened, 1 to  $1\frac{1}{2}$  in. long, terminating in a stout style  $1\frac{1}{2}$  to 2 lines long.—Valley floors or wet hillsides, always in open situations, 50 to 500 ft.: Coast Ranges from Monterey Co. to Marin Co., often whitening low moist fields in Mar.-Apr. Var. CALIFORNICA (Nutt.) Jepson. Leaves larger (1 to  $2\frac{3}{4}$  in. long) and thinner, more commonly denticulate, sometimes pale purple beneath; flowers white or pale rose-color.—Shady banks or rich woods or thickets, 200 to 8700 ft., common in the hill country throughout cismontane Cal. (*D. californica* Nutt.) Var. TRACYI Jepson n. var. Leaves a very dense deep purple beneath, the basal smaller than in var. californica; flowers deep rose-pink, slightly smaller.—Woods, Van Duzen River, Humboldt Co. (Blue Slide, Tracy 5426, type). Var. CARDIOPHYLLA Jepson n. comb. Leaves all undivided.—Vaca Mts.: Plumas Co. (Syn. Fl. 1:155). (*Cardamine cardiophylla* Greene.) Var. PACHYSTIGMA Wats. Raceme sessile or nearly so.—Plumas Co.

2. *D. corymbosa* Jepson n. sp. Plants 5 to 8 in. high; herbage glabrous; leaves all simple, mostly orbicular in outline, coarsely dentate or sometimes

lobed, especially at apex, 1 to 1½ in. long; basal leaves round-cordate; cauline leaves mostly 2 or 3, approximate on upper part of stem; fruiting raceme corymbose, the lower pedicels 1 to 1½ in. long; pods 1 to 1½ in. long, not including the (2 to 3 lines long) style.—High peaks of the inner North Coast Ranges, 5500 to 7000 ft., from Yollo Bolly Mts. to n. Lake Co. Flowers unknown. (South Yollo Bolly, Jepson, type.)

3. *D. macrocarpa* Nutt. Similar to no. 1; style 5 lines long.—Plumas Co. to Del. Norte Co.; n. to Ore.

### 13. *SMEŁÓWSKIA* C. A. Mey.

Low caespitose perennials with stellate-pubescent herbage. Leaves deeply pinnatifid or bipinnatifid. Flowers in racemes, small, white, yellowish or purplish-tinged. Anthers slightly sagittate at base. Pods oblong-lanceolate or lanceolate, more or less obcompressed, the valves strongly keeled; style short. (Timotheus Smielowski, Russian botanist, 19th century.)

Herbage densely whitish-pubescent; leaf segments soft, obtuse; pods somewhat obcompressed but subteretish.....1. *S. calycina*.

Herbage greenish, thinly pubescent; leaf segments rigid, acute; pods obcompressed, distinctly though not strongly flattened.....2. *S. fremontii*.

1. *S. calycina* (Desv.) C. A. Mey. Plants 1½ to 4½ in. high; herbage densely whitish-pubescent; leaves chiefly in a basal tuft, ½ to 1½ in. long, pinnately divided into linear or oblong segments 2 to 3 lines long; flowers white with rose-color veins, 1 to 2 lines long; pods linear, 3 to 5 lines long.—Montane, n. Sierra Nevada (Lassen Peak, se. Shasta Co.); e. to Col., n. to Alas.; Siberia.

2. *S. fremontii* Wats. Stems erect, tufted on the root-crown, 2 to 5½ in. high; herbage greenish, thinly pubescent; leaves 1 to 1½ in. long, divided into linear-subulate segments 3 lines long; flowers white or lemon-yellow; pods linear-oblong, 2½ to 5 lines long.—Hills and mountain valleys east of the Sierra Nevada crest from Plumas Co. to Modoc Co.; n. to Ore.

### 14. *ÁRABIS* L. ROCK CRESS

Ours erect and often tall annuals or biennials, or caespitose perennials. Flowers rose-purple, white or yellowish white. Sepals greenish or purplish, erect and equal, or the lateral pair slightly saccate at base. Petals obovate or spatulate, with narrow claw and flat blade, commonly much exceeding the sepals. Pods flattened parallel to the partition, the valves more or less 1-nerved. Seeds more or less winged; cotyledons accumbent. (Name from the land Arabia.)

#### A. LEAVES ALL PINNATELY PARTED.

Plants decumbent, branching from base, hirsute; mainland.....1. *A. virginica*.

Plants erect, slender, branching above, glabrous; insular.....2. *A. filifolia*.

#### B. LEAVES ENTIRE, OR TOOTHED, OR ONLY THE BASAL PINNATELY PARTED.

##### 1. Seeds nearly marginless; basal leaves broad, mostly spatulate to obovate.

Pods semi-terete, strictly erect; herbage glaucous, glabrous except at base....3. *A. glabra*.

Pods flattened, ascending or divaricate; herbage not glaucous.

Flowers greenish-white; herbage hirsute.....4. *A. hirsuta*.

Flowers crimson or rose-purple, showy; herbage commonly glabrous but the leaves ciliate with forked hairs.....5. *A. blepharophylla*.

##### 2. Seeds wing-margined; pods flattened or flattish.

Cauline leaves petioled, entire, the basal ones repand.....6. *A. repanda*.  
Cauline leaves sessile.

Pods narrowly linear.

Herbage glabrous or somewhat pubescent below; pods mostly ascending.

Cauline leaves many, auriculate-clasping; biennial, or perennial with slender branches to the caudex.....7. *A. drummondii*.

Cauline leaves merely sessile; perennial with very stout caudex.....

8. *A. cognata*.

Herbage pubescent; pods spreading or reflexed.

Pods glabrous; flowers 3 to 4 lines long; cauline leaves entire or merely toothed.

Caudex simple or with few branches, rarely woody....9. *A. holboellii*

- Caudex with branches several to many, woody.  
 Plants 2 to 7 in. high.  
 Pedicels glabrous; high Sierra Nevada. . . . . 10. *A. lemmonii*.  
 Pedicels pubescent; Coast Range peaks. . . . . 11. *A. breweri*.  
 Plants 7 to 18 in. high.  
 Basal leaves obovate to broadly oblanceolate, repand-dentate. .  
 . . . . . 12. *A. gracilipes*.  
 Basal leaves linear to narrow-oblanceolate, entire. . . . .  
 . . . . . 13. *A. perennans*.  
 Pods pubescent; flowers 4 to 6 lines long; cauline leaves pinnately incised. .  
 . . . . . 14. *A. subpinnatifida*.  
 Pods broadly linear to oblong or elliptic, flattened; leaves entire.  
 Pods pendent or deflexed; plants 7 to 14 in. high.  
 Herbage canescent.  
 Pods linear,  $1\frac{1}{2}$  lines wide, pubescent; stigma sessile. . . . . 15. *A. pulchra*.  
 Pods oblong, rounded at each end,  $\frac{1}{4}$  in. wide, glabrous; stigma  $\frac{1}{2}$   
 line long. . . . . 16. *A. glaucovalvula*.  
 Herbage glabrous; style  $\frac{1}{2}$  line long. . . . . 17. *A. suffrutescens*.  
 Pods erect; plants 1 to 7 (or rarely 12) in. high.  
 Style  $\frac{1}{4}$  to  $\frac{1}{2}$  line long or stigma sessile; herbage green.  
 Basal leaves not densely crowded, about 1 in. long. . . . . 18. *A. platysperma*.  
 Basal leaves in a very dense tuft, 3 to 6 lines long. . . . . 19. *A. inamoena*.  
 Style 2 to  $2\frac{1}{2}$  lines long; herbage canescent. . . . . 20. *A. parishii*.

1. *A. virginica* (L.) Trel. Annual or biennial, nearly glabrous; stems several from the base, decumbent or ascending, 7 to 15 in. high; leaves deeply pinnatifid with nearly uniform oblong or linear few-toothed or entire segments; flowers small, white; pods linear, spreading,  $\frac{3}{4}$  to 1 in. long, 1 line broad, on pedicels 1 to 2 lines long, beaked by a short pointed style; valves faintly veined or obscurely 1-nerved at base; seeds in 1 row.—Lower San Joaquin Valley to S. Cal.; s. to L. Cal.

2. *A. filifolia* Greene. Delicate annual; stem erect, slender, branching above, 8 to 12 in. high; herbage glabrous, somewhat glaucous; leaves pinnately divided with filiform lobes,  $\frac{3}{4}$  to 1 in. long; flowers roseate or purple; petals roundish-obovate, narrowed to a claw,  $2\frac{1}{2}$  to 3 lines long, about twice as long as the sepals; pods ascending or somewhat spreading, almost filiform-linear, acute,  $1\frac{1}{4}$  to  $1\frac{1}{2}$  in. long; seeds in one row.—Santa Cruz Isl.

3. *A. glabra* (L.) Bernh. TOWER MUSTARD. Stems bluish green, erect, simple (very rarely branched), 2 to 4 ft. high from a biennial root; herbage glaucous and glabrous but often hispidulous at base; basal leaves broadly spatulate to narrow-obovate, coarsely dentate or merely denticulate,  $1\frac{1}{4}$  to  $4\frac{1}{2}$  in. long, soon withering; cauline leaves ovate to lanceolate, entire, clasping by a sagittate base; petals dull white, 2 to 3 lines long, little exceeding the sepals; pods strictly erect or even appressed to the stem, straight, 3 to 4 in. long,  $\frac{1}{2}$  to  $\frac{3}{4}$  line wide, on pedicels 3 to 5 lines long; seeds in 2 rows, narrowly winged or wingless.—Foothills and mts., 100 to 4700 ft.: Coast Ranges, Sierra Nevada, and cismontane S. Cal., widely distributed and not rare, but the plants commonly solitary; n. to Can., and e. to N. Eng.; Eur., Asia, Aust. Apr.

4. *A. hirsuta* Scop. HAIRY ROCK CRESS. Biennial; stems erect, simple or strictly branched, 1 to 3 ft. high; herbage deep green, rather sparsely hirsute; leaves entire or sparingly dentate, the basal oblanceolate to elliptic oblong on short petioles, winged, 1 to 3 in. long, the cauline oblong to lanceolate, sessile by a subcordate base; petals white, 2 to 4 lines long; pods linear-filiform,  $1\frac{1}{2}$  to 2 in. long,  $\frac{1}{2}$  to  $\frac{1}{2}$  line wide, erect, on slender pedicels 2 to 5 lines long; valves faintly nerved below the middle and more or less veined; style scarcely any; seeds in one row, suborbicular, very narrowly margined.—Widely scattered in Cal., but rare; e. to Ga., n. to Alas.; Eur., Asia.

5. *A. blepharophylla* H. & A. ROSE CRESS. Stems few or several from the crown of a perennial root, 4 to 12 in. high; herbage deep green, most commonly glabrous; leaves dentate or entire, ciliate with forked hairs, the basal broadly spatulate to obovate, obtuse, the few cauline oblong, sessile; flowers large and fragrant; sepals often colored, broad, 2 to 3 lines long, one pair more or less saccate at base and broader than the other pair; petals rose-purple, 5 to 7 lines long; pods erect or ascending, nearly straight, 1 to  $1\frac{1}{2}$  in. long, 1 line wide; valves veined, 1-nerved; seeds in 1 row.—Rocky

hillsides and ridges near the sea: Marin Co. to Monterey Co. Mar.-Apr. Var. *MACDONALDIANA* Jepson n. comb. Stems 3 to 5 in. high; herbage glabrous; petals oblanceolate, truncate, 4 lines long; stamens with broad filaments the upper and lower pairs exceeding the sepals, the lateral pair much shorter.—Nw. Mendocino Co. (*A. macdonaldiana* Eastw.)

6. *A. repánda* Wats. Stem from a biennial root,  $1\frac{1}{4}$  to  $1\frac{3}{4}$  (or  $2\frac{1}{4}$  ft. high, branching above the base; herbage stellate-pubescent, or the hairs at base simple and longer; leaves (the basal ones somewhat rosulate) obovate to oblanceolate, repandly few-toothed or nearly entire, 2 to  $4\frac{1}{4}$  in. long; flowers dull white, small; sepal pairs unequal in breadth; petals narrow, approximate, 2 to 3 lines long, a little exceeding the sepals; pods recurved-spreading, 1-nerved at base,  $2\frac{1}{2}$  to  $3\frac{1}{4}$  in. long; pedicels 1 to 2 lines long; seeds in one row, elliptical, broadly winged.—Montane, 6000 to 8500 ft.: Sierra Nevada from Mariposa Co. to Tulare Co., thence w. to the San Emigdio Range and s. to the San Gabriel and San Jacinto mountains.

7. *A. drummondii* Gray. Stems erect, stout, leafy, mostly simple, 1 to 2 ft. high, one to several from a biennial root, or sometimes a shortly branched caudex; basal leaves oblanceolate, entire, mostly glabrous, with ciliate margins,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; cauline leaves glabrous; petals white to rose-color, 3 to 4 lines long; pods erect, crowded,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long, 1 line wide; seeds narrowly winged, 1 line long.—Sierra Nevada from Fresno Co. to Siskiyou Co.; e. to Rocky Mts., n. to Can. Passes by intergrades into var. *LYALLII* Jepson n. comb. Perennial; stems slender,  $\frac{1}{2}$  to 3 (or sometimes 12) in. high, many from the slender branches of a loosely branched caudex; basal leaves 3 to 6 (or 10) lines long; petals  $1\frac{1}{2}$  to 3 lines long; pods shorter and narrower.—Montane, 9600 to 11,600 ft.: frequent in the Sierra Nevada from Tulare Co. to Modoc Co.; n. to B. C., e. to Mont. and Utah. (*A. lyallii* Wats.)

8. *A. cognáta* Jepson n. sp. Stems slender, one to many, 2 to 4 in. high, arising from the crown of a very stout and densely scaly caudex; herbage glabrous; basal leaves crowded, oblanceolate,  $\frac{3}{4}$  to 1 in. long, 2 to 3 lines wide, tapering gradually to a slender petiole as long or longer than the blade; cauline leaves obovate, sessile; flowers rose-purple,  $3\frac{1}{2}$  lines long; fruiting pedicels slender, 3 to 7 lines long; pods divaricately spreading,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, 1 line wide; seeds winged at apex,  $\frac{1}{2}$  line long.—Montane, 5700 to 7800 ft.: Sierra Nevada from Mariposa Co. to Plumas Co. (Mt. Elwell, C. M. Wilder, type).

9. *A. holboëllii* Hornem. Plants 9 to 12 in. high; herbage green, finely stellate-pubescent; flowers white; raceme one-sided, the pods pendulous or reflexed; seeds in one row, sometimes imperfectly in 2 rows, narrowly wing-margined.—Boreal North America. Var. *RETROFRÁCTA* Jepson n. comb. Biennial; stem usually solitary, erect, simple or branched, 7 to 12 in. high, pubescent with simple or forked hairs; leaves pubescent with hairs more or less forked to stellate; basal leaves oblanceolate, repand-dentate,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, the cauline linear-oblong, acute, entire,  $\frac{1}{2}$  to 1 in. long; flowers purple or white, 2 to 3 lines long; pods linear, straight or arcuate,  $1\frac{1}{2}$  to 2 in. long, more or less reflexed or spreading on hairy or rarely pubescent pedicels, seldom strictly secund.—Montane, 3500 to 6000 ft.: nw. Mendocino Co. to Siskiyou and Modoc Cos.; n. to Wash., e. to Ida. (*A. retrofracta* Graham.) Var. *FÉNDLERI* Wats. Fig. 416. Biennial; stems 1 or several from the base, simple or branched, 2 to 3 ft. high, pubescent below with rather coarse simple

416. *Arabis holboëllii* var. *fendleri* Wats.; habit x  $\frac{1}{2}$ .

417. *Arabis holboellii* Hornem. var. *arcuata* Jepson; habit  $\times \frac{1}{2}$ .

*secunda* Howell.) Var. *ARCUATA* Jepson n. comb. Fig. 417. Stems usually simple and erect, 1 to 2½ ft. high from a perennial caudex; herbage stellate-pubescent throughout; basal leaves linear-oblancoate, mostly acute, entire or repand-dentate, 1 to 1½ or 2¼ in. long, the petioles often ciliate; cauline leaves linear to lanceolate, mostly entire; flowers 3 to 3½ lines long, mostly dark red; pods curved or nearly straight, 2 to 3¾ in. long, ¾ to 1½ lines wide, acute, spreading or deflexed on divaricate pubescent or pilose pedicels 2 to 5 lines long.—Mountains, 2500 to 6000 ft.: South Coast Ranges; Sierra Nevada from Yosemite to Tulare Co.; cismontane S. Cal.; s. to L. Cal. (*A. arcuata* Gray.)

10. *A. lemmönii* Wats. Stems few to many from a branched perennial crown, 3 to 9 in. high; herbage pubescent, occasionally glabrous above; lower leaves spatulate to oblanceolate, petioled, 3 to 6 or 8 lines long, covered with a fine but dense whitish felt, the hairs short with the several branches rebranched; flowers light purple, 2 to 3 lines long; pods glabrous, straight or nearly so, 1 to 1½ in. long, widely

or forked hairs; basal leaves oblanceolate, dentate, ¾ to 1½ in. long; cauline leaves oblong-lanceolate, ¾ to 1¼ in. long; flowers pink, 3 lines long; pods straight, or slightly curved, 2½ to 3¾ in. long, typically rather closely reflexed, usually secund on glabrous pedicels.—Montane, 4000 to 9000 ft.: Sierra Nevada from Siskiyou Co. to Tulare Co.; White Mts.; San Gabriel Mts.; San Bernardino Mts.; thence e. to N. Mex. Var. *SECUNDA* Jepson n. comb. Biennial or perennial; stems simple, several from the base or solitary, branched above, 8 to 18 in. high; herbage densely pubescent below, scantily pubescent above; leaves 1 to 1½ in. long, the basal petioled, oblanceolate, repand-toothed, the cauline sagittate-clasping, oblong-linear, repand or entire; flowers white, 3½ lines long, becoming pendent on pubescent pedicels; pods narrow, secund, deflexed, 1½ to 2½ in. long.—N. Humboldt Co. and w. Siskiyou Co.; n. to Wash. (*A.*

418. *Arabis breweri* Wats., habit  $\times \frac{1}{2}$

spreading or recurved; pedicels glabrous, seeds narrowly winged, in one row.—Rocky places, 8500 to 11,000 ft.: White Mts.; Sierra Nevada from Tulare and Inyo Cos. to Shasta Co.: n. to B. C., e. to Mont. and Wyo. It is very near *A. breweri* in habit and character, but the stems are more slender and the leaves grayer.

11. *A. breweri* Wats. BREWER ROCK CRESS. Fig. 418. Stems many from the much branched crown of a stout woody root, 2 to 6 in. high; herbage pubescent, the hairs seldom more than 3-forked; lower leaves broadly spatulate, entire, or rarely with 1 or 2 teeth, 3 to 10 lines long, the petioles ciliate; upper leaves lanceolate to oblong, sessile by a subcordate base or obtusely auriculate; flowers bright red-purple or nearly white, 3 to 4 lines long, the pedicels and purplish calyx more or less pubescent; pods spreading and arcuate, glabrous,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long, 1 line broad; seeds orbicular, narrowly winged, in one row or nearly so.—Rocky summits of mountain peaks in the Coast Ranges from Siskiyou Co. to Santa Clara Co.

12. *A. gracilipes* Greene. Stems 2 to several, 7 to 14 (or 16) in. high, from the loosely branched crown of a perennial root, hairy-pubescent below, glabrous above; basal leaves loose, obovate, long-petioled, repand-dentate, thinly pubescent with 3 to 4-branched hairs, 1 to  $1\frac{1}{2}$  in. long; later leaves oblanceolate or the upper cauline oblong to lanceolate, sessile; sepals very thinly pubescent with 3 to 4-branched hairs or almost glabrous; petals narrow with purple blade; pods glabrous,  $1\frac{1}{4}$  to  $2\frac{1}{2}$  in. long, spreading on very slender glabrous pedicels  $\frac{1}{4}$  to 1 in. long; seeds in one row.—Mts. of the Colorado and Mohave deserts, n. to Inyo Co., e. to Ariz. (*A. arcuata* var. *longipes* Wats.)

13. *A. perennans* Wats. Stems several, erect from a usually branching and somewhat woody root-crown, 1 to  $1\frac{1}{2}$  ft. high; herbage stellate-canescenscent, or stellate-puberulent and greenish, or glabrous above; basal leaves narrow-oblanceolate, 1 to 2 in. long, the petioles sometimes ciliate; cauline leaves linear to lanceolate; raceme rather loose; flowers reddish or pale, 2 to 3 lines long; calyx and pedicels stellate-pubescent to glabrous; pods glabrous, rarely thinly puberulent, straight or nearly so, 1 to 4 in. long, 1 line wide, widely spreading or recurved on pedicels 2 to 6 lines long; stigma small, sessile; seeds in 2 rows, orbicular, very narrowly margined.—Mountain ranges in and bordering the Colorado and Mohave deserts, n. to Inyo Co.; e. to Utah and Ariz.

14. *A. subpinnatifida* Wats. Stems simple, 1 or few from a biennial or perennial root, 8 to 12 in. high; herbage (especially the leaves) canescent or almost silvery; basal leaves tufted, very narrowly linear-oblanceolate, entire or toothed, petioled, 1 to 2 in. long, the cauline lanceolate, unequally or saliently incised, sometimes merely toothed, or the uppermost entire; flowers rose-color or white, 5 to 7 lines long; pods pubescent, slightly curved, 2 to 3 (or 5) in. long, 1 to  $1\frac{1}{2}$  lines wide, attenuate to a short style, and pendent upon recurved or spreading puberulent or hairy pedicels 2 to 5 lines long; seeds in 1 row, as broad as the partition, winged.—Mts. of Siskiyou Co.; sw. Ore. to n. Nev. Var. *BECKWITHII* Jepson n. comb. Stouter; leaves less strongly toothed or entire.—E. slope Sierra Nevada, Siskiyou and Modoc Cos. s. to Inyo Co. It approaches *A. pulchra*. (*A. beckwithii* Wats.)

15. *A. pulchra* Jones. Stems erect, leafy, 12 to 15 in. high, few or several from a branching woody crown; herbage stellate-canescenscent throughout or glabrate; lower leaves narrowly oblanceolate and petioled, 1 to 2 in. long, the upper linear-lanceolate, sessile; raceme rather dense; flowers usually large, soon spreading or reflexed; petals 4 to 6 lines long, rose-color, about twice as long as the pubescent sepals; pods pendent, finely pubescent,  $1\frac{1}{2}$  to  $2\frac{1}{4}$  in. long,  $1\frac{1}{2}$  lines wide, on pedicels 1 to 6 lines long; stigma sessile; valves 1-nerved, veined; seeds small, in 2 rows, orbicular, winged.—Mts. and higher slopes on the borders of the Mohave and Colorado deserts; e. to Col.

16. *A. glaucoválvula* Jones. Fig. 419. Stems several from a branching woody crown, branched above, 7 to 14 in. high; herbage canescent; leaves mostly basal, oblanceolate, petioled, 1 to 2 in. long, the cauline few, linear to lanceolate, reduced and sessile; flowers rather large, purple, in one-sided racemes; sepals ovate, woolly-pubescent with scarious margins; pods deflexed, glabrous, glaucous, narrow-oblong, rounded at each end, 1-nerved and veiny,  $1\frac{1}{4}$  to  $1\frac{5}{8}$  in. long,  $\frac{1}{4}$  in. wide, on pedicels 2 to 4 lines long; style stout and rather prominent; seeds in 2 rows with broad membranous wings, 2 lines broad.—Gravelly mesas, 2200 to 5000 ft.: Inyo Co.; e. Mohave Desert.

17. *A. suffrutéscens* Wats. Stems several, 7 to 14 in. high, from a branching woody caudex; herbage glabrous, or the basal leaves sparsely ciliate; basal leaves oblanceolate, cauline lanceolate, the lower scarcely auriculate; flowers few, 3 lines long, purplish; pods  $1\frac{1}{2}$  to 2 in. long,  $1\frac{1}{2}$  to 3 lines broad, pendulous on pedicels 4 to 9 lines long; valves 1-nerved, veined; seeds in 2 rows.—Dry or stony situations, e. and n. of the Sierra Nevada crest from Placer Co. to Siskiyou Co.; rarely

419. *Arabis glaucoválvula* Jones; a, habit  $\times \frac{1}{2}$ ; b, seed  $\times 1\frac{1}{4}$ .

collected in Cal.; n. to Wash.

420. *Arabis platysperma* Gray; a, habit  $\times \frac{1}{2}$ ; b, fl.  $\times 3$ ; c, petal  $\times 3$ ; d, stamen from behind  $\times 3$ ; e, dehiscent pod  $\times \frac{1}{2}$ ; f, seed  $\times 3$ .

18. *A. platyspérma* Gray. Fig. 420. Stems erect or ascending from a slender branching rootstock,  $2\frac{1}{4}$  to 12 in. high; herbage glaucous, finely pubescent or hispidulous or glabrous; basal leaves oblanceolate, narrowed to a short petiole,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, the upper oblong- to linear-lanceolate, sessile; petals at first white, changing to rose-color, 2 to 3 lines long, the sepals  $\frac{1}{2}$  to nearly as long, glabrous or hispid towards apex; pods erect or a little spreading, 1 to 2 in. long,  $1\frac{1}{2}$  to 2 lines broad, tipped with a short stout style; valves distinctly veined, 1-nerved toward the base; seeds in 1 row, orbicular, winged all around (or nearly so) with a broad scarious membrane.—High montane slopes, 7000 to 13,000 ft.: inner North Coast Ranges; Sierra Nevada; San Gabriel Mts.; San Jacinto Mts. June. Var. *HOWELLII* Jepson n. comb. Seeds in 2 rows.—Siskiyou Mts. (s. Ore.); White Mts. (*Arabis howellii* Wats.)

19. *A. inamoëna* Greene. Stems scape-like, arising from the dense basal leaf rosettes of the branched caudex, 1 to  $1\frac{1}{2}$  in. high; leaves narrowly oblanceolate, 2 to 5 lines long, about  $\frac{1}{2}$  line

wide, hispid, persistent for 1 to 3 years in dense whorls below the leaves of the season; pods similar to no. 18.—Whitney plateau, s. Sierra Nevada, 8500 to 10,000 ft.

20. *A. parishii* Wats. Stems slender, simple, erect, 1 to 5 in. high, several to many from the densely tufted crown of a simple or branched caudex; herbage finely stellate-pubescent; basal leaves numerous, linear-oblongate, entire, 2 to 5 (or 7) lines long, the cauline few and linear, or none; petals rose-color, 3 to 4 lines long, twice as long as the purplish sepals; pods glabrous, 7 to 9 lines long, 1 to 1½ lines wide, ascending on pedicels 2 to 3 lines long; style filiform, 2 to 2½ lines long; valves 1-nerved and veined; seeds in 1 row, elliptical, narrowly winged.—San Bernardino Mts., 6500 to 9800 ft.

#### 15. *ERYSIMUM* L. WALL FLOWER

Erect stoutish biennials or perennials, simple or with few branches. Leaves narrow, entire or dentate. Flowers large, orange to light yellow. Sepals narrow, equal at base or the lateral saccate. Petals with slender claws and obovate blades. Pods linear, flattened, with 1-nerved valves, or quadrangular. Seeds in 1 row, numerous, not margined. (Greek name of a garden plant.)

Stems simple above the base.

Flowers cream-color or yellowish; pods flattened parallel to the partition; littoral.....

Flowers orange; pods 4-sided; montane.....  
 1. *E. capitatum*.  
 2. *E. asperum*.  
 Stems profusely branched from the base; flowers yellow; pods 4-sided; insular.....  
 3. *E. insulare*.

1. *E. capitatum* (Dougl.) Greene. Biennial; stems stout, erect, ½ to 1½ ft. high, leafy; herbage puberulent; leaves narrowly oblong, gradually contracted to a petiole, entire or repand-dentate, 1 to 3 in. long; flowers cream-color to yellowish, rarely white, at first sub-capitate, the axis elongating in fruit and becoming a raceme; pods spreading or divaricate, 1½ to 3½ in. long, 1½ lines wide, abruptly short-pointed; valves flattish, 1-nerved; seeds broadly oblong to orbicular sometimes with narrow margin.—Along the coast from Los Angeles to Del Norte Co.; n. to Wash.

2. *E. asperum* (Nutt.) DC. WESTERN WALL FLOWER. Biennial or perennial; stems erect, simple or branching above, 1 to 2½ ft. high, densely leafy below; herbage strigulose, the hairs often stellately 3-parted; leaves narrow (2 to 6 lines wide and 3 to 6 in. long, or the uppermost shorter), entire or sharply dentate, the lower slender-petioled; flowers orange, 8 to 10 lines in diameter; pods 4-sided, ascending or widely spreading, commonly 3 to 4 in. long, 1 line wide; seeds oblong, turgid, often slightly winged at one end.—Common on rocky hills and mountains throughout Cal. Mar-Apr. Var. *PERENNE* Wats. Perennial; stems more slender, often tufted, 5 to 15 in. high; flowers lemon-yellow; pods thinner, flattened, tapering at apex.—Subalpine, 8000 to 12,000 ft., Sierra Nevada from Mariposa Co. to Tulare Co.

3. *E. insulare* Greene. Stem stout, profusely branched, woody at base; leaves long linear, crowded, attenuate and often recurved at the tip, 1½ to 2½ in. long; raceme short; seeds not margined.—Sandy slopes, San Miguel and Santa Rosa islands.

*E. REPANDUM* L. Annual, branched above; leaves linear-lanceolate, repand-dentate; flowers yellow, 2 to 3 lines long; pods 4-sided, 2½ in. long, rigid, horizontal, spine-like.—Introd. from Eur.; troublesome in alfalfa fields in Modoc Co., becoming a tumbleweed; sometimes miscalled Russian Thistle.

*E. CHERIANTHOIDES* L. Erect, branching above; leaves lanceolate, entire or slightly dentate, short-petioled; flowers pale yellow, 2 lines long; pods 4-sided, ¾ to 1 in. long, ascending on slender spreading pedicels 4 lines long.—Adventive along railroad, Placer Co.; introd. from Eur.

#### 16. *MATTHIOLA* R. Br.

Stout stellate-tomentose herbs with oblong or linear leaves. Flowers usually purple, sweet-scented; petals with long claws and broad showy blades.

Pod large, linear, nearly terete or compressed; stigmas thickened or horned at the back. (Peter Andrew Matthioli, 1500-1577, Italian physician and celebrated botanist.)

1. *M. incana* (L.) R. Br. GARDEN STOCK. Stems erect, branched above, 2 ft. high; leaves entire or sinuately dentate, 4 to 7 in. long; flowers  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. broad; pods  $2\frac{1}{2}$  to 4 in. long; seeds thin, flat, circular, wing-margined. —Native of Eur.; naturalized along the seashore bluffs of San Diego and Orange Cos.

#### 17. *PARRYA* R. Br.

Perennial herbs, with basal leaves and flowering stems borne on the crown of a simple or branched caudex. Flowers purple or rose-colored, the clusters showy. Stigma 2-lobed. Pod very strongly flattened, produced at apex into a prominent acute or attenuate point, the valves 1-nerved. Seeds in 2 rows, convex or turgid. (Capt. W. E. Parry, British navigator, who discovered the first-known species while on quest of the Northwest Passage.)

Pods divaricately spreading; flowering stems 2 to 3 times as long as the leaves. . . . .

1. *P. menziesii*.

Pods ascending; flowering stems scarcely exceeding the leaves. . . . . 2. *P. eurycarpa*.

1. *P. menziesii* (Hook.) Greene. Plants 3 to 6 in. high, the flowering scapose stems and the leaves caespitose on a thick caudex, the caudex simple or with few short branches; leaves spatulate or oblanceolate, acute or obtuse, densely stellate-tomentose, entire, drawn down to a petiole at base, 1 to 4 in. long; racemes many-flowered; pods ensiform, attenuate to the short style, 1 to  $1\frac{1}{2}$  in. long, glabrous, 2 to 4-seeded; pedicels 3 to 4 lines long, both the pedicels and the pods spreading horizontally.—Montane, 4000 to 9600 ft.: e. slope of the Sierra Nevada from Inyo Co. to Modoc Co., w. to Siskiyou Co., thence s. to Mendocino Co.; w. Nev. to Ore. Var. *GLABRA* Jepson n. var. Plant entirely glabrous.—Lake City Mt., Modoc Co. (C. C. Bruce 2250, type).

2. *P. eurycarpa* (Gray) Jepson n. comb. Plants 1 to 2 in. high, the flowering stems and leaves caespitose on a slender branched caudex; herbage stellate-pubescent; leaves oblanceolate, 4 to 6 lines long; raceme few-flowered; pods oblong-ovate, acute, glabrous,  $\frac{3}{4}$  to 1 in. long, 3 to 5 lines broad; style  $\frac{1}{2}$  line long; seeds oval, the seed-coat covered with silvery-white more or less crisped scales or processes.—Subalpine slides, 11,500 to 14,300 ft.: Sierra Nevada from Tulare Co. to Tuolumne Co.; White Mts.; n. to Ida. (*Draba eurycarpa* Gray.)

#### 18. *TRÓPIDOCÁRPUM* Hook.

Erect or diffusely spreading annuals with pubescent herbage, pinnatifid leaves and leafy racemes of rather small yellow flowers. Sepals concave, ovate-oblong, spreading. Petals cuneate-obovate. Stamens tetradynamous; anthers roundish. Style slender, sometimes short. Pod completely or partially 2-celled, or 1-celled, strongly flattened contrary to the narrow partition, or only the upper part flattened, or somewhat inflated; valves 2 to 4, opening from above; seeds in 2 to 4 rows. (Greek tropis, keel, and karpos, fruit, in reference to the carinate valves of the capsule.)

Plants, when robust, with mostly straggling branches; pods 2-valved and 2-celled. . . . .

1. *T. gracile*.

Plants commonly erect; pods 4-valved and 1-celled. . . . . 2. *T. capparideum*.

1. *T. gracile* Hook. Stems erect or at last very diffuse, 5 to 14 in. long; leaves pinnatifid, the segments commonly linear, acutish, cleft or entire; leaves of the inflorescence similar but reduced; pedicels axillary, 3 to 10 lines long, spreading; stamens very unequal; pods linear, strongly obcompressed throughout, tardily dehiscent, 1 to  $1\frac{1}{2}$  in. long; seeds in 2 rows.—Plains and low hills bordering the Great Valley; South Coast Ranges; Inyo Co. and s. through the Mohave Desert to San Diego Co. Var. *DUBIUM* Jepson n. comb. Pods 1-celled below, the partition persistent in the upper third or fourth; otherwise like the species.—West side of the San Joaquin Valley and s. to coastal S. Cal. (*T. dubium* Dav.)

2. *T. capparideum* Greene. Stem stoutish, erect, 8 to 10 in. high, simple or sparingly branched; foliage as in *T. gracile*, the upper leaves somewhat more deeply parted and with longer subentire segments; pods linear-oblong, 7 to 10 lines long, 2 lines wide, somewhat inflated, 1-celled, conspicuously 6-nerved, tipped with a short style; valves 4, the dehiscence beginning at the apex: seeds in 4 rows.—Alkaline soil, Mt. Diablo range and bordering plains.

### 19. *LYROCÁRPA* Hook. & Harv.

Erect herbs, ours perennial, with somewhat flexuous branches and stellate-

421. *Lyrocarpa coulteri* Hook. & Harv.;  
a, basal leaf  $\times \frac{1}{2}$ ; b, cauline leaf  $\times \frac{1}{2}$ ;  
c, fl.  $\times 1$ ; d, fr. branchlet  $\times \frac{1}{2}$ .

pubescence. Leaves toothed or runcinately pinnatifid. Sepals linear-oblong, sharply acute, strongly connivent. Petals in ours linear-elongated. Style short or none. Stigma rather large. Pod in ours fiddle-shape, flattened contrary to the narrow partition. (Greek lyra, a lyre, and karpos, fruit.)

1. *L. coulteri* Hook. & Harv. Fig. 421. Stems several, woody at base,  $1\frac{1}{2}$  to 2 ft. high; flowers in a loose raceme, maturing slowly, sweet-scented; sepals stellate-tomentose, strongly connivent  $\frac{1}{4}$  their length, becoming distinct from below; petals tawny yellow, lance-linear, 6 to 8 lines long, tapering to a long, slender claw; seeds 2 to several in each cell, round, flat.—Western Colorado Desert; s. to L. Cal. and Sonora.

### 20. *LESQUERÉLLA* Wats.

Low herbs, ours stellate-pubescent throughout. Flowers usually yellow. Style slender; stigma entire or nearly so. Pod globose-inflated to obovate; cells 2 to 15-seeded; seeds flattened; cotyledons accumbent. (Leo Lesquerex, distinguished American paleobotanist and bryologist, 1805-1889.)

Annual; basal leaves not forming a rosette; pods globose, as if glabrous but minutely pubescent under a lens; style a little shorter than the pod. . . . . 1. *L. palmeri*.  
Perennial; basal leaves in a rosette; style equaling or slightly longer than the pods; pedicels straight or straightish.

Pods globose or subglobose, thinly pubescent; flowers yellow, 3 lines long. . . . . 2. *L. kingii*.  
Pods flattened on the margins, ovate, densely pubescent; flowers deep yellow, 4 lines long. . . . . 3. *L. occidentalis*.

1. *L. palmeri* Wats. Stems slender, mostly erect; leaves oblong-oblanccolate, narrowed to a slender petiole; pedicels ascending, horizontal or recurved, usually sigmoid; ovules 4 to 6 in each cell; pods  $1\frac{1}{2}$  lines in diameter.—E. Colorado and Mohave deserts; e. to Ariz., s. to L. Cal.

2. *L. kingii* Wats. Stems ascending or decumbent, 2 to 7 in. long; basal leaves suborbicular to elliptic, entire or 1 to 3-dentate on each side, drawn down to petiole 1 to  $1\frac{1}{2}$  times as long; cauline leaves oblanceolate; pods 2 to 3 lines in diameter, the cells 2 to 4-ovuled.—East side of the Sierra Nevada (or its northern crests) from Inyo Co. to Modoc Co., 5000 to 11,500 ft.

3. *L. occidentalis* Wats. Stems erect or ascending, 3 to 9 in. high, from the crown of a stout taproot; leaves entire, the basal orbicular to elliptic, varying to oblanceolate, narrowed to petioles  $1\frac{1}{2}$  to 2 times as long, the cauline spatulate; flowers 3 to 4 lines long; pods somewhat flattened, ovate, acutish, 2 to 4 lines long; cells 4-ovuled.—East side and north end of the

Sierra Nevada from Placer Co. to Siskiyou Co., thence s. to Lake Co.; n. to Ore.

## 21. DITHYREA Harv.

Ours an annual herb with finely pubescent herbage. Sepals stellate-tomentose, connivent above, forming a closed tube. Petals white or tinged with purple, conspicuous, broadly spatulate, with spreading blades and slender claws. Stamens 6; anthers linear, sagittate. Pod strongly obcompressed and didymous, that is notched both above and below, the lobes suborbicular, with a distinct cord-like margin. Style almost none, crowned by a large helmet-shaped stigma. (Greek, *dis*, two, and *thureos*, shield, referring to the flattened twin fruit.)

422. *Dithyrea californica* Harv.; a, habit  $\times \frac{1}{2}$ ; b, fr. branchlet  $\times \frac{1}{2}$ ; c, pod  $\times 2$ .

1. *D. californica* Harv. SPECTACLE POD. Fig. 422. Stems several from the base, spreading or ascending, 4 to 10 in. or  $1\frac{1}{2}$  ft. high, very brittle at the joints; leaves thickish, ovate or oblong-ovate shallowly and somewhat sinuately few-toothed, 1 to  $3\frac{1}{4}$  in. long, the basal on petioles nearly as long, the cauline nearly sessile and somewhat cuneate at base; racemes very dense; flowers sweet-scented, 4 to 5 lines long, on pedicels scarcely 1 line long; pods with a tomentose-margined border, 3 to 4 lines broad. —Sandy soil in the deserts: Inyo Co., Mohave and Colorado deserts; s. to Mex., e. to Nev. Var. *MARITIMA* Dav. Leaves mostly orbicular, sinuate to entire, thicker, distinctly fleshy, more densely canescent-tomentose; racemes very dense; pods more densely pubescent. — Coast sand dunes from Los Angeles Co. to San Luis Obispo Co.

## 22. THLASPI L.

Herbs with undivided leaves, the cauline ones auriculate-clasping. Flowers in ours white. Sepals short, oval, obtuse. Petals obovate or oblanceolate. Anthers short, oval. Pods obcompressed, in ours obcuneate, obovate or orbicular, the valves often winged, especially towards the apex. Seeds 2 or several in each cell; cotyledons accumbent. (Greek *thlan*, to crush, on account of the strongly flattened pods.)

Perennial; pod obovate; seed smooth..... 1. *T. alpestre*.  
Annual; pod orbicular; seed rugose..... 2. *T. arvense*.

1. *T. alpestre* L. Fig. 423a. Stems commonly many from a branching perennial crown, 3 to 8 in. high; leaves mostly in a basal tuft, round-obovate to oblanceolate, 3 to 6 lines long, narrowed to slender petioles 1 to 2 times as long, the cauline ovate to oblong, sessile-auriculate; raceme rather dense; flowers white, 2 to 3 lines long; petals rather spreading, twice the length of the sepals; pods narrowly obovate or obcuneate, 3 to 4 lines long, twice as long as wide, retuse or truncate at apex, flattened toward the margin, the summit narrowly winged; style slender,  $\frac{1}{2}$  to nearly 1 line long. — Northern mts., 3800 to 4000 ft.: Humboldt, Trinity, and Siskiyou Cos., e. to Plumas Co. Var. *CALIFORNICUM* Jepson n. comb. Fig. 423b, c, d. Four to 12 in. high; raceme looser; pods truncate to retuse at apex. — N. Humboldt Co. (*T. californicum* Wats.)

2. *T. arvense* L. PENNY CRESS. Annual, erect, 8 to 14 in. high; often branched above; leaves  $\frac{1}{2}$  to 2 in. long, rather remotely toothed; the basal spatulate, the cauline oblong, obtuse; flowers smaller than in *T. alpestre* and with narrower petals; pods orbicular, or nearly so,  $\frac{1}{2}$  in. in diameter, strongly obcompressed, broadly winged, the apex deeply notched; style very short.—Introd. from Eur., adventive in Modoc and Los Angeles Cos. Also called French Weed.

*Ionopsidium acáule* (Desf.) Rehb. Annual, 2 to 2 $\frac{1}{2}$  in. high; stem short, rather densely leafy, each axil bearing a long naked one-flowered peduncle; leaves ovate, entire, 2 lines long, long-petioled; pods obcompressed, flattened, round-ovate, 2 lines long.—Adventive at Ferndale, Humboldt Co.; native of Portugal.

423. *Thlaspi alpestre* L.; a, pod  $\times 2$ ; var. *californicum* Jepson; b, habit  $\times \frac{1}{2}$ ; c, fr. raceme  $\times \frac{1}{2}$ ; d, pod  $\times 2$ .

### 23. CORONOPUS Ludwig.

Prostrate heavy-scented annuals, with pinnatifid leaves and short racemes of minute greenish white flowers. Sepals oval, spreading. Stamens 6 or often only 4 or 2. Pod small, more or less didymous, flattened contrary to the narrow partition, the surface strongly wrinkled or tuberculate; valves falling away at maturity from the persistent axis as closed or nearly closed nutlets. Cotyledons incumbent. (Greek korono, crown, and pous, foot, because of the shape of the leaves.)

1. *C. didymus* (L.) Sm. WART CRESS. Stems numerous, freely branching, diffuse or prostrate, 1 to 2 ft. long; leaves  $\frac{1}{2}$  to 1 in. long, pinnately parted into entire or sharply toothed segments; pods small, about 1 line broad, notched both above and below, thus appearing transversely 2-lobed or didymous, each lobe turgid and finely wrinkled.—South American weed, naturalized near dwellings in n. Cal.

*C. PROCUMBENS* Gilib. Swine Cress. Pods notched above, obscurely didymous, strongly roughened and cristate-muricate.—Adventive at San Francisco; native of Eur. (*C. ruelli* All.)

### 24. LEPIDIUM L. PEPPER-GRASS

Low annuals, rarely perennials, with toothed or pinnatifid leaves and very small flowers ( $\frac{1}{2}$  to 1 or 2 lines long). Petals white, rarely yellow, sometimes none. Stamens 6, 4 or 2. Pod an orbicular, ovate or broadly oblong silicle, strongly obcompressed, and commonly notched or lobed at the more or less winged apex; valves acutely carinate, the cells 1-seeded. Style present or none. (Greek lepidion, a little scale, the pods flattened.)

#### A. Style distinctly developed and persistent.

Pods not notched at apex or indistinctly notched.

Flowers yellow; pods orbicular. . . . . 1. *L. jaredi*.

Flowers white.

Pods cordate; leaves ovate to ovate-lanceolate, denticulate, auriculate-clasping at base. . . . . 2. *L. draba*.

Pods elliptic; leaves deeply toothed or pinnatifid, petioled. . . . . 3. *L. montanum*.

Pods notched at apex.

Flowers white or nearly so.

Herbage pubescent; annual or biennial herbs.

Pods thick, winged; upper leaves oblong, sagittate-clasping, denticulate. . . . . 4. *L. campestre*.

- Pods thin, not winged, merely notched at apex; upper leaves cordate-clasping, entire. . . . . 5. *L. perfoliatum*.  
 Herbage glabrous; perennial herbs; leaves not clasping, the upper ones linear; desert species.  
 Stems woody below; silicle obcordate. . . . . 6. *L. fremontii*.  
 Stems herbaceous; silicle oval. . . . . 7. *L. alyssoides*.  
 Flowers bright yellow; plant prostrate. . . . . 8. *L. flavum*.
- B. Style none, the stigma sessile or subsessile; annuals.*
- Pods notched but not winged.  
 Pedicels terete or only slightly flattened.  
 Plants prostrate or diffuse; petals none; leaves pinnatifid, the lowest bipinnatifid. . . . . 9. *L. bipinnatifidum*.  
 Plants erect.  
 Petals none; var. *californicum* of. . . . . 10. *L. virginicum*.  
 Petals present.  
 Cauline leaves oblanceolate, dentate, the basal sometimes pinnatifid with ovate-acute segments. . . . . 10. *L. virginicum*.  
 Cauline leaves pinnate or bipinnate with ovate or lanceolate segments. . . . . 11. *L. robinsonii*.  
 Pedicels very much flattened.  
 Herbage hirsutulose; petals minute or none; pods pubescent, at least on the margins. . . . . 12. *L. lasiocarpum*.  
 Herbage glabrous or sparingly pubescent; petals present; pods glabrous. . . . . 13. *L. nitidum*.
- Pods winged at apex with two lobes or teeth and  
 Conspicuously reticulate; dwarfs with mostly prostrate or decumbent stems; wings or teeth approximate or parallel and  
 Nearly as long as the body. . . . . 14. *L. latipes*.  
 Very short. . . . . 15. *L. dictyotum*.  
 With finer reticulations, the teeth divergent. . . . . 16. *L. oxycarpum*.
1. *L. járedi* Bdg. Slender glaucous pubescent annual 4 to 8 in. high, with narrow lanceolate entire or somewhat toothed leaves and branched rather loose inflorescence; pedicels filiform, 5 lines in length; flowers yellow, a little over 1 line long; pods glabrous, not retuse until by incipient dehiscence.—Goodwin, San Luis Obispo Co.; Riverdale, Fresno Co.
2. *L. drāba* L. HOARY CRESS. Perennial from deep-seated roots; herbage grayish; stems several from the ground, 12 to 16 in. high, leafy below, branching above and bearing a panicle of racemes; leaves large, ovate, sagittate-clasping at base and with scattered minute teeth on the margin; pods somewhat cordate, neither winged nor notched at apex.—Garden plant, nat. from Eur. Var. *AURICULATUM* Thell. Leaves narrow; pod elliptic, pubescent.—Los Angeles.
3. *L. montānum* Nutt. Biennial; stem branching above or often from the base, 10 to 14 in. high; herbage minutely pulverulent to shortly hirsute; leaves pinnatifid (sometimes bipinnatifid), the segments ovate to oblong-elliptic or rarely linear; upper leaves toothed or rarely entire; flowers in dense racemes; pods elliptic, varying to ovate or orbicular, obscurely notched at apex, 1 to 1½ lines long, on spreading pedicels twice as long.—Mountain valleys, Siskiyou Co. (rare in Cal.); n. to Ore., e. to Col. and Tex.
4. *L. campēstre* R. Br. POOR-MAN'S PEPPER. Annual or biennial; stems 1 or several from the base, erect, 9 to 14 in. high, very leafy up to the inflorescence; herbage hoary-pubescent; cauline leaves oblong, mostly sagittate-clasping, denticulate, crowded, 1 to 3½ in. long; basal leaves pinnately lobed, long-petioled; pedicels horizontally spreading, equaling or a little shorter than the pods; pods broadly ovate, thick, squamulose, winged all around, 2½ lines long; style scarcely exerted from the narrow notch at apex.—European species, locally established in the Lake Tahoe region.
5. *L. perfoliatum* L. Diffusely branching, 1 to 2 ft. high; lower leaves bipinnatifid with linear lobes; upper leaves round-ovate, cordate-clasping, entire; pedicels spreading; pods rhombic-orbicular, minutely notched.—Introd. from Eur., sparingly naturalized.
6. *L. fremontii* Wats. Fig. 424. Rounded low evergreen bush, the stems woody below, ¾ to 2 ft. high; herbage glabrous and glaucous; leaves narrow, linear, acute, 1 to 2 in. long, entire or with 1 or 2 pairs of linear salient lobes or teeth; racemes very numerous; flowers on slender spreading pedicels;

petals  $1\frac{1}{2}$  to 2 lines long; pods thin, light-colored, shallowly obcordate with broad rounded lobes, rounded or often pointed at the base, 3 lines long.—Arid rocky slopes, abundant in the Mohave Desert, s. to the Colorado Desert, n. to Inyo Co.; e. to Col.

7. *L. alyssoides* Gray. Stems several from a perennial base; herbage glabrous; leaves linear, entire,  $\frac{1}{2}$  to 1 or  $1\frac{1}{4}$  in. long or the lower ones pinnately parted into 5 to 11 oblong or oval entire or incised lobes about 1 line long; racemes dense, white-flowered; flowers about 1 line long; fruiting pedicels 2 to 3 lines long; pods oval, 1 line long.—Plains and mesas, e. Mohave Desert; e. to Col. and Tex.

8. *L. flavum* Torr. YELLOW PEPPER-GRASS. Prostrate or decumbent annual, 4 to 16 in. broad, very brittle at the joints; herbage glabrous, yellow-green; leaves slightly fleshy, the basal rosulate, oblong-oblancheolate in outline, regularly pinnatifid with short rounded lobes and narrow acute sinuses, the cauline oblancheolate to obovate, pinnatifid, sparingly toothed, or entire; racemes short and dense, subcapitate; pods glabrous, finely reticulated, bifid at the apex, the teeth acute, the sinus open; style half as long as the body of the pod.—Sandy bottoms of desert washes or dry pool beds: Mohave and Colorado deserts and Inyo Co.; Nev. to Mex. Mar.-Apr.

425. *Lepidium bipinnatifidum* Desv.; pod x 5.

9. *L. bipinnatifidum* Desv. WAYSIDE PEPPER-GRASS. Fig. 425. Stems 3 to 6 in. long, freely branching from the base, diffuse or even prostrate, the plants often closely matting the ground; herbage light green, puberulent or glabrate; leaves pinnatifid or the lowest bipinnatifid; racemes numerous, dense and rather narrow; petals none; pods round, nearly  $1\frac{1}{2}$  lines long, glabrous, faintly reticulate, the teeth at the apex short and obtuse; fruiting pedicels ascending,  $\frac{1}{2}$  to 1 line long.—Common in hard beaten soil by paths and waysides, Coast Ranges and Great Valley; nat. from S. Am.

10. *L. virginicum* L. TALL PEPPER-GRASS. Fig. 426. Stem erect,  $\frac{3}{4}$  to 2 ft. high, simple below, paniculately branching above and bearing numerous racemes 2 to 8 in. long, rarely with several stems from the base; herbage glabrous to sparingly pubescent; leaves oblancheolate, varying to narrow-ovate, sharply serrate (the basal sometimes pinnatifid), narrowed at base to a petiole, 1 to 3 in. long; rameal leaves linear, serrate only towards the apex or entire, shorter; petals white; stamens 2; pods orbicular or nearly so,  $1\frac{1}{2}$  lines long, notched at the very narrowly winged apex; pedicels  $1\frac{1}{2}$  to 2 lines long, widely (or even horizontally) spreading.—Moist valleys and stream bottoms throughout Cal.; e. to the Atlantic. It passes into the var. *PUBESCENS* Thell. Herbage and pods roughish pubescent.—Providence Mts. Var. *CALIFORNICUM* Jepson n. var. Stems usually several from the base; herbage puberulent to almost glabrate; petals none; stamens 2.—E. Cal., especially in the desert region (Barstow, Jepson 6623).

11. *L. robinsonii* Thell. Stems branching, commonly several from the base, diffuse or ascending, 4 to 10 in. long; herbage pubescent; leaves once or twice pinnatifid with ovate or oblong acute lobes; racemes and pods similar to *L. lasio-*

424. *Lepidium fremontii* Wats.; pod x 5.

426. *Lepidium virginicum* L.; pod x 5.

carpum, but the latter glabrous.—Cismontane S. Cal. Perhaps only a leaf form of *L. lasiocarpum*.

12. *L. lasiocarpum* Nutt. Stems many from the base, decumbent or ascending, 3 to 6 (or 10) in. long; herbage hirsutulose or hirsute; leaves obovate to oblanceolate, toothed, incised or less commonly pinnatifid; racemes many; pedicels distinctly flattened, horizontally spreading,  $1\frac{1}{2}$  lines long; sepals broadly oblong, usually purple, with thin white margins; petals minute or none; pods suborbicular, thin-margined near the apex, hispid-pubescent upon both faces or at least upon the edge, or sometimes (especially near the coast) quite glabrous.—Coast of S. Cal.; Colorado and Mohave deserts; Inyo Co.; e. to Tex., s. to Mex.

427. *Lepidium nitidum* Nutt.;  
pod  $\times 5$ .

13. *L. nitidum* Nutt. COMMON PEPPER-GRASS. TONGUE-GRASS. Fig. 427. Branching from or near the base, 1 to 10 in. high, the branches mostly simple; herbage glabrous or sparingly pubescent; leaves  $\frac{1}{2}$  to 4 in. long, pinnatifid with rachis ligulate and bearing entire or lacinately toothed discrete lobes, the terminal lanceolate lobe often enlarged or prolonged; upper leaves often entire; petals white, less than 1 line long, obovate, without distinct claw; stamens 6, but the 2 shorter mere rudiments; pods round with a narrow margin, abruptly notched at apex,  $1\frac{1}{2}$  to 2 lines long, plane on the upper face, convex on the lower, glabrous and shining, often dark purple.—Common everywhere on the Cal. plains, low hills and in the valleys; n. to Wash. Feb.-Apr.

14. *L. latipes* Hook. DWARF PEPPER-GRASS. Fig. 428. Stems 1 to several from the base, very thick and stout, 1 to 2 in. long, recurved-prostrate or erect; herbage slightly pubescent; leaves 3 to 5 in. long, linear and entire, or pinnatifid with few segments, the segments remote, lanceolate or linear, often toothed, 3 to 7 lines long, the rachis ligulate, commonly dilated into a terminal lanceolate lobe; racemes very dense, often capitate,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; petals broadly spatulate, greenish, rounded at the apex, 1 line long, much exceeding the short sepals; pods broadly oblong or oval,  $2\frac{1}{2}$  to 3 lines long, 2 lines broad, strongly reticulated, sparingly pubescent or glabrous, winged at apex with two broad acute teeth nearly as long as the body, the sinus between the teeth or wings a narrow cleft.—Alkaline flats, beds of winter pools or balsas on the plains or in the valleys: Coast Ranges and Great Valley to coastal S. Cal. Mar.-May.

428. *Lepidium latipes* Hook.;  
pod  $\times 5$ .

429. *Lepidium dictyotum* Gray;  
pod  $\times 5$ .

15. *L. dictyotum* Gray. Fig. 429. Branches several or numerous from the base, decumbent, or at length ascending, 1 to 7 in. long; leaves pinnate with ligulate rachis and few remote linear segments, or quite entire; herbage hirsutulose; raceme rather dense with ascending flattened pedicels; petals little exceeding the sepals or wanting; pods elliptic, finely reticulated, pubescent or glabrous,  $1\frac{1}{2}$  to 2 lines long with short obtuse wings or teeth at the summit, the sinus narrower, linear.—Alkaline soils: Livermore and San Joaquin valleys to S. Cal.; Ore., Wash. and Ida. Mar.-Apr.

16. *L. oxycarpum* T. & G. Fig. 430. Stems very slender, branched from the base, the branches elongated, erect or ascending, 4 to 6 in. long, bearing flowers more than half their length; leaves narrow, linear and subentire, or pinnate with a few acute linear segments; sepals very unequal, caducous,  $\frac{1}{2}$  line long; petals none; stamens 2; pods roundish, glabrate,

430. *Lepidium oxycarpum*  
T. & G.;  
pod  $\times 5$ .

finely reticulated,  $1\frac{1}{4}$  lines long, tipped with 2 very short and acute widely divergent teeth; sinus rounded but often triangular; pedicels widely spreading or retrocurved, very slender, flattened, 1 to  $1\frac{1}{2}$  lines long, often longer than the pod.—Borders of salt marshes or in alkaline soils, San Francisco Bay region. Var. *ACUTIDENS* Jepson n. comb. Fig. 431. Raceme elongated, loose, the pedicels erect or spreading; pods glabrous or slightly pubescent, lightly reticulated, 2 to  $2\frac{1}{2}$  lines long, the teeth at apex widely divergent, lanceolate and wing-like, commonly as long as the elliptic body; pedicels rather shorter than the pod.—Alkaline soil: San Diego Co.; Livermore Valley; lower San Joaquin Valley; Sacramento Valley; Lassen and Siskiyou Cos. (*L. dietzotum* var. *acutidens* Gray.)

431. *Lepidium oxycarpum* var. *acutidens* Jepson; pod  $\times 5$ .

## 25. SUBULÀRIA L. AWLWORT

Small aquatic perennials. Stem simple, scape-like, with a cluster of linear-subulate leaves at base. Flowers minute, white, loosely racemose. Stamens 6, scarcely unequal; anthers oval. Stigma sessile, slightly 2-lobed. Pod elliptic or obovate, scarcely flattened, the valves convex, 1-ribbed on the back. Seeds few, in 2 rows in each cell. (Latin *subula*, an awl, in reference to the leaves.)

1. *S. aquática* L. Stems 1 to 4 in. high, arising from a dense cluster of bright white root fibers; leaves unequal, erect or slightly spreading, thickish at the base,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; scape flowering from below the middle, the submersed flowers minute, cleistogamous; pods 1 to  $1\frac{1}{2}$  lines long, upon short spreading pedicels.—Submersed or growing on muddy banks of ponds, lakes or running water: Sierra Nevada from Mono Co. to Sierra Co., 7000 to 10,000 ft.; n. to Brit. Am.; Eur., Asia.

## 26. PLATYSPÉRMUM Hook.

Low glabrous annual with the leaves in a basal rosette. Flowers minute, solitary on naked scapes. Sepals equaling the white petals. Pod suborbicular, flattened parallel to the broad partition. Seeds reticulated, broadly winged, in 2 rows. (Greek *platys*, broad, and *sperma*, seed.)

1. *P. scapigerum* Hook. Fig. 432. Scapes 1 to  $4\frac{1}{2}$  in. high; leaves lyrate pinnatifid with few lobes or reduced to a single ovate or rhombic lobe; pods 3 to 6 lines long, 8 to 12-seeded.—Moist gravelly places in montane valleys from Sierra Co. to Siskiyou Co.; Nev. to Ida.

## 27. ALÝSSUM L.

Low branching herbs with small white or yellowish flowers. Pod ovate, oblong or orbicular, flattened; cells 1 or 2-seeded. Cotyledons accumbent. (Greek, *a*, without, *lussa*, madness, in ancient times an antidote for hydrophobia.)

Pubescence of simple appressed hairs; pods marginless, pointed.....1. *A. maritimum*.  
Pubescence stellate; pods narrowly margined, slightly emarginate above.....2. *A. alyssoides*.

432. *Platyspermum scapigerum* Hook.;  
a, habit  $\times \frac{1}{2}$ ; b, fl.  $\times 2\frac{1}{2}$ ; c, seed  $\times 2$ .

1. *A. maritimum* (L.) Lam. SWEET ALYSSUM. Perennial; leaves narrowly lanceolate or linear; flowers white, 2 lines long; petals twice as long as the deciduous sepals; filaments not toothed; pods orbicular, 2-seeded.—Garden plant from Eur., occurring as an escape.

2. *A. alyssoides* L. SMALL ALYSSUM. Annual; petals yellowish white, scarcely exceeding the sepals; sepals persistent about the base of the fruit; filaments of the shorter stamens toothed at base.—Garden plant from Eur., nat. in Siskiyou Co., at one time adventive in the San Francisco Bay region.

## 28. CAPSELLA Medic.

Slender annuals with pinnatifid leaves and small white flowers. Petals small, little exceeding the sepals. Pod obcordate or elliptical, strongly or scarcely at all flattened, several-seeded; valves carinate. Seeds not winged; cotyledons incumbent. (Latin capsella, a little box.)

Pods obcordate, or cuneate-triangular in outline with retuse apex, strongly flattened. . . . .

Pods elliptic-oblong, scarcely flattened, entire at the apex. . . . . 1. *C. bursa-pastoris*.  
2. *C. procumbens*.

1. *C. bursa-pastoris* (L.) Moench. SHEPHERD'S PURSE. Stems erect, simple or branching, 3 to 18 in. high, sparsely hispid; basal leaves in a spreading rosette; lower leaves petioled, pinnatifid, rarely entire, the terminal lobe largest; upper leaves merely dentate, sessile-auriculate; petals  $3\frac{1}{4}$  to  $1\frac{1}{2}$  lines long; pedicels elongating in fruit, 4 lines long; pods obcordate,  $2\frac{1}{2}$  to 3 lines broad, many-seeded, strongly flattened.—Common in pastures, orchards and by waysides; nat. from Eur. Variable in foliage and shape of pod.

2. *C. procumbens* (L.) Fries. Stems several from the base, erect or ascending, 3 to 6 in. high; leaves oblanceolate or spatulate, or the lower or all more or less pinnatifid; flowers minute,  $\frac{1}{2}$  line long or less; sepals ovate-elliptic, thin-margined, about equaled by the petals; pods elliptic-oblong, entire at the apex, 1 to  $1\frac{1}{2}$  lines long; pedicels filiform, in fruit 2 to 4 lines long and divaricately spreading.—Alkaline soil: S. Cal. to Alameda, Tulare, and Inyo Cos.; n. to B. C.; Eur., Asia.

## 29. CAMÉLINA Crantz

Erect annual with sagittate-clasping leaves. Flowers small, light yellow, in a loose raceme. Pods obovate or pear-shaped, beaked with the persistent style; valves convex with flattened edges forming a narrow margin; seeds several in each cell; cotyledons incumbent. (Greek camai, dwarf, and linon, flax.)

1. *C. sativa* Crantz. FALSE FLAX. Stem simple or branching above, 1 to 3 ft. high, leafy, nearly glabrous; leaves oblong to lanceolate, entire or dentate; pods  $3\frac{1}{2}$  to 4 lines long, 2 to  $2\frac{1}{2}$  lines broad.—Old World weed of grain fields, occasional in Cal. The seeds were used as a source of oil in Europe before the introduction of cottonseed oil (Erythea 2:157).

## 30. DRABA L.

Low herbs with a pubescence of simple, forked or stellate hairs. Flowers white or yellow, in racemes. Petals entire, notched or bifid. Style short or slender; stigma simple or very slightly lobed. Pod oval to oblong or linear-oblong, flat; partition thin-membranous. Seeds in 2 rows, neither margined nor winged. Cotyledons accumbent or rarely incumbent. (Greek drabe, a name of Dioscorides for some cress.)

*A. Annuals; lower altitudes (except no. 4).*

Petals not entire; pods straight.

Petals deeply 2-cleft; flowers white; pods glabrous. . . . . 1. *D. verna*.

Petals retuse,

Little exceeding the sepals; flowers yellowish, becoming white; pods puberulent. . . . . 2. *D. nemorosa*.

Nearly twice as long as the sepals; flowers white; pods pubescent or glabrous. . . . . 3. *D. cuneifolia*.

Petals entire, obtuse or truncate; flowers yellow; pods glabrous, usually a little curved. . . . . 4. *D. stenoloba*.

*B. Perennials; alpine or subalpine plants with branched densely leafy caudex.*

Leaves not carinate, soft.

Style  $\frac{1}{4}$  to  $\frac{1}{2}$  line long.

Flowers yellow; leaves loosely or thinly pubescent or ciliate.

Flowering stems leafy; leaves oblong-linear; pods pubescent, not twisted...

5. *D. aureola*.

Flowering stems naked; leaves broadly spatulate or oblanceolate.

Leaves ciliate, surface hairs simple or forked; branches of caudex densely leafy throughout; pods pubescent or glabrous, undulate or twisted.....6. *D. lemmonii*.Leaves stellate-pubescent, not ciliate; branches of caudex leafy only at tip; pods glabrous, not twisted.....7. *D. nivalis*.Flowers white; flowering stems few-leaved; leaves oblong, canescent; pods pubescent, often twisted; stigma subsessile.....8. *D. breweri*.

Style 1 to 2 lines long.

Flowering stems mostly with reduced leaves, commonly much branched; corolla pale yellow, about 1 line long.....9. *D. corrugata*.

Flowering stems naked, simple; corolla deep yellow, 2 to 4 lines long.....

10. *D. howellii*.

Leaves carinate by the prominent midnerve, becoming rigid with reflexed margin.

Racemes produced beyond the leaves; pods mostly flattened.....11. *D. glacialis*.Racemes mostly hidden by the leaves; pods about as thick as broad...12. *D. douglasii*.

1. *D. verna* L. WHITLOW GRASS. Stems 2 to 4 (or 6) in. high, naked, several from a rosulate cluster of leaves; leaves ovate or oval, toothed near the apex, sessile or nearly so, 2 to 6 lines long; petals cleft nearly or quite to the middle, 1 line long, nearly twice as long as the acutish sepals; pod oval, 2 to 3 lines long.—Lake Co. to Siskiyou Co.; introd. from Eur.

2. *D. nemorosa* L. Stems slender, several from the base,  $1\frac{3}{4}$  to 4 (or 12) in. high; pubescent below; leaves basal and sub-basal but rarely rosulate, ovate to oblong-lanceolate, 2 to 9 lines long; slightly dentate; stems usually flowering from near the base; flowers yellow, becoming whitish, petals slightly retuse; calyx somewhat villous; pods elliptic to narrow-oblong, minutely pubescent,  $2\frac{1}{2}$  to 6 lines long, much shorter than the divaricate pedicels (6 to 9 lines long).—Thickets and woods, Siskiyou Co.; n. to B. C., e. to Ont.; Eur., Asia.

3. *D. cuneifolia* Nutt. Stems several to many from the base, ascending or diffuse, 2 to 10 in. high; leaves basal (or mostly basal), oblanceolate to obovate, entire or serrately few-toothed, stellate-pubescent,  $\frac{1}{4}$  to  $1\frac{1}{4}$  in. long; racemes rather dense, borne on mostly naked stems commonly as long or longer; pods linear-oblong to narrow-elliptic, pubescent (the hairs forked or occasionally simple) or glabrous, 3 to 6 lines long, exceeding the pedicels.—Dry sandy soil, Colorado Desert; e. to Tex. and Ill. Var. *INTEGRIFOLIA* Wats. Stems 1 to several from the base, flowering from near the base, usually with a few leaves below as well as basal; racemes loose, commonly longer than in the species; pods as in the species or glabrous.—Dry sandy soil of the foothills and valleys of cis-montane S. Cal.; e. to Ariz.; s. to Mex. Var. *CALIFORNICA* Jepson n. var. Stems strictly erect, nearly naked, flowering from about the middle or a little below, 3 to  $5\frac{1}{2}$  in. high, the leaves in a dense basal tuft; herbage and pods puberulent; petals obtuse or obscurely notched; pods oblong-lanceolate, 3 to  $3\frac{1}{2}$  lines long, ascending.—North Fork Crooked Creek, White Mts., Inyo Co. (Jepson 7261, type).

433. *Draba stenoloba* Ledeb.; a, habit  $\times \frac{1}{2}$ ; b, fl.  $\times 2\frac{1}{2}$ ; c, fr. branchlet  $\times \frac{1}{2}$ ; d, pod  $\times 2$ .

4. *D. stenóloba* Ledeb. Fig. 433. Stems several from a basal tuft, erect or lax, 5 to 13 in. high,  $\frac{3}{4}$  to 3 (or 5) in. high in dwarf forms; herbage more or less villous and the leaves often ciliate; leaves mostly in a subrosulate basal tuft, oblong-obovate or oblanceolate, thin,  $\frac{1}{2}$  to  $\frac{3}{4}$  (or  $1\frac{1}{2}$ ) in. long (or only 2 to 3 lines long in the alpine dwarfs), the one or two cauline ones ovate to oblong-lanceolate; fruiting raceme very open; flowers yellow, becoming white in age; sepals glabrous or sparingly pilose; petals entire, obtuse or truncate, sometimes purplish; pods linear, usually a little curved, acute, glabrous, 4 to 7 lines long, equal to or shorter than the spreading or divaricate pedicels.—Subalpine, 7000 to 12,000 ft.: Sierra Nevada from Tulare Co. to Modoc Co.; White Mts.; e. to Rocky Mts., n. to Alas.

5. *D. auréola* Wats. Fig. 434. Stems simple, 2 to 4 in. high, crowded with leaves at base, arising from a simple or branched caudex; herbage rather densely stellate-pubescent throughout; basal leaves oblanceolate, obtuse, entire, 6 to 8 lines long, the cauline oblong, shorter; flowers yellow; raceme densely crowded in flower and fruit; calyx glabrous; pods broadly oblong, obtuse, pubescent, not twisted, 4 to 5 lines long, on spreading pedicels 2 to 3 lines long; style short ( $\frac{1}{2}$  line long), stout.—Known only from three volcanic peaks (7000 to 11,000 ft.): Lassen Peak, Cal.; Three Sisters, Ore.; Mt. Rainier, Wash.

434. *Draba aureola* Wats.; a, habit  $\times \frac{1}{2}$ ; b, fl.  $\times 2\frac{1}{2}$ ; c, pod  $\times 2$ .

6. *D. lemmónii* Wats. Scapes 1 to  $3\frac{1}{4}$  in. high, pilose or glabrous, rising from a compact leafy cushion of the much-branched caudex; leaves thick, spatulate to oblong-obovate, mostly very obtuse, conspicuously ciliate, the surface glabrous or sparingly hirsutulose with simple or forked hairs, 2 to 5 lines long; raceme short; flowers yellow, 2 lines long; sepals somewhat villous or subglabrous; pods ovate to broadly lanceolate, more or less undulate or twisted, pubescent or glabrous, 3 to 4 lines long, on slender spreading pedicels 1 to 2 or 4 lines long.—Alpine peaks in the Sierra Nevada from Alpine Co. to Tulare Co., 9000 to 13,000 ft., rooting in clefts of rocks; w. Nev. to e. Ore.

7. *D. nivális* Lilj. var. *californica* Jepson n. var. Caudex rather loosely branched, its branches of the season producing a rosette of leaves at apex and the next season slender, naked flowering stems, 3 to 4 in. high; leaves oblanceolate, acutish, obscurely repand, usually with a pair of short teeth toward the apex, slightly thickened, thinly stellate-pubescent, not ciliate, 3 to 7 lines long; flowers bright yellow,  $2\frac{1}{2}$  lines long; sepals  $\frac{1}{2}$  line long, glabrous, thinly margined, yellow; stamens less than  $\frac{1}{2}$  the length of the petals; pods linear-lanceolate, acuminate, generally slightly oblique, glabrous,  $4\frac{1}{2}$  lines long; style slender,  $\frac{1}{4}$  to  $\frac{1}{2}$  line long.—Mineral King, Tulare Co., 9000 ft. (T. Brandegee, type).

8. *D. bréweri* Wats. Alpine dwarf, the stem 1 to 4 in. high, arising from a densely leafy cushion; herbage hoary throughout with a dense stellate pubescence; basal leaves oblong, obtuse, entire or rarely sparingly toothed, 2 to 4 lines long; the cauline ones few, oblong-ovate; flowers white, 1 to  $1\frac{1}{2}$  lines long; sepals oblong; pods linear-oblong, obtusish, often twisted, pubescent, 2 to 3 lines long, on short ascending pedicels; stigma sessile or nearly so.—Alpine rocky slopes and summits, 12,000 to 13,000 ft.: Sierra Nevada from Siskiyou Co. to Tulare Co.; White Mts. Var. *SUBLÁXA* Jepson n. var. Stems 4 to 7 in. high; pubescence thinner; lower leaves less crowded, oblance-

olate, toothed or entire, thinner, 6 to 9 lines long; pods oblong-lanceolate to lanceolate, acute or acuminate, 3 to 4 lines long.—Saddle between Mt. Dana and Mt. Gibbs (Chesnut & Drew, type).

9. *D. corrugata* Wats. Fig. 435. Stems several from the crown of a simple or somewhat branched root-crown, 2 to 9 in. high; herbage loosely pubescent with branching hairs; leaves in a dense basal tuft, few or much reduced on the flowering stems, oblong-ob lanceolate to narrow-obovate, obtusish, entire,  $\frac{1}{4}$  to 1 (or 2) in. long; flowers pale yellow; sepals pubescent; petals narrowly linear-cuneate,  $1\frac{1}{4}$  lines long, notched at apex; pods lanceolate to broadly oblong, acute or obtuse, pubescent, much corrugated and twisted, 2 to 5 lines long on pedicels 1 to 5 lines long; style 1 line long.—Alpine at 9500 to 11,500 ft., but descending to forest areas at 8000 ft.; San Gabriel, San Bernardino and San Jacinto mountains.

10. *D. howellii* Wats. Flowering stems naked, 2 to 4 in. high, arising from the densely leafy cushion of a much-branched caudex; herbage finely soft-pubescent throughout; leaves in very dense rosettes, broadly spatulate or oblong, mostly very obtuse,  $1\frac{1}{2}$  to 2 lines long; flowers large (3 to 4 lines long), in a loose raceme, deep yellow; pods oblong, often somewhat oblique or subfalcate, acute at each end, pubescent, 2 to 4 lines long, the style slender, 1 to  $1\frac{1}{2}$  lines long; pedicels  $2\frac{1}{2}$  to 4 lines long.—Siskiyou Mts.; Marble Mt.

435. *Draba corrugata* Wats.; a, habit x  $\frac{1}{2}$ ; b, infl. x  $\frac{1}{2}$ ; c, fl. x  $2\frac{1}{2}$ ; d, pod x 2.

11. *D. glacialis* Adams. Fig. 436. Flowering stems naked, slender,  $\frac{1}{4}$  to  $2\frac{1}{2}$  in. high, pilose or glabrate, few-flowered, arising from the dense cushion of the much-branched caudex; leaves linear, in dense terminal rosettes on the branches of the caudex, 1 to 2 (or 3) lines long, mostly grayish pubescent; flowers yellowish, fading white; sepals sparingly villous or glabrous; pods ovate to ovate-oblong, acute, rounded (or sometimes acute) at base, strongly flattened or rarely a little thickened, usually finely pubescent, 1 to 3 lines long, on pedicels 1 to 6 lines long; style  $\frac{1}{4}$  to  $\frac{1}{2}$  line long; seeds 2 to 4 or 6.—Alpine summits and high ridges, in rocky places, 11,600 to 13,300 ft.: Sierra Nevada from Mariposa Co. to Placer Co.; White Mts., Inyo Co.; e. to Rocky Mts., n. to B. Am.; Eur., Asia. Var. *PECTINATA* Wats. Taller (3 to  $4\frac{1}{2}$  in. high) and with greener glabrous ciliate-pectinate leaves.—Castle Peak, Nevada Co.; Mt. Lola; Lake City Pass, Modoc Co.

436. *Draba glacialis* Adams; a, habit x 1; b, fl. x  $2\frac{1}{2}$ ; c, pod x 2.

12. *D. douglasii* Gray. Flowering stems  $\frac{1}{2}$  to 1 in. high, arising from

the crown of a branched and densely leafy caudex; leaves narrowly linear, firm or even somewhat cartilaginous, pubescent, or glabrate except the ciliate margins, 3 to 6 lines long; flowers white; pods ovate, acuminate,  $1\frac{1}{2}$  to 2 lines long, pubescent with simple hairs; valves becoming strongly convex; style slender,  $\frac{1}{2}$  to 1 line long; ovules 2 (rarely 4) in each cell, pendent from near the apex of the cells; seeds large.—Alkaline or wet places in high mts., rare: San Bernardino Mts.; Nev. to Wash.

### 31. *ATHYSANUS* Greene

Low annual, leafy below, the short stem divided at or near the base into few or many simple elongated filiform branches or racemes which are unilaterally flower-bearing throughout. Herbage pubescent with 2 to several-forked spreading hairs. Flowers minute, promptly reflexed or recurved. Petals linear or none. Stamens 6, nearly or quite equal; filaments slender. Pod small, orbicular, indehiscent, or dehiscent only after falling, 1-celled, or 2-celled by a thin partition, wingless; cotyledons accumbent (Greek *a*, without, and *thusanos*, fringe, the fruit wingless.)

Pods plane, numerous on the racemes; seed 1.....1. *A. pusillus*.  
Pods twisted at maturity; racemes lax, the pods often distant 1 in. or more; seeds mostly 8 to 11, the valves eventually separating.....2. *A. unilateralis*.

1. *A. pusillus* (Hook.) Greene. Fig. 437. Plants 4 to 6 or 12 in. high; racemes 3 to 9 in. long; leaves broadly oblong, nearly entire or with 1 to 3 coarse teeth on each side, 2 to 5 (or 12) lines long; flowers  $\frac{3}{4}$  line long, on pedicels twice as long; ovary 1-celled; ovules 2 to 4, only one maturing, that attached at base of the pod; fruiting pedicels recurved, 1 to 3 lines long; pods orbicular, strongly flattened,  $\frac{3}{4}$  to 1 line long, hispid all over with hooked hairs.—Gravelly plains and foothills, 50 to 4000 ft.: cismontane S. Cal.; Sierra Nevada; Coast Ranges; n. to B. C. and Ida. Common.

437. *Athysanus pusillus* Greene; a, habit  $\times 1$ ; b, c, leaf variations  $\times 1$ ; d, pod  $\times 4\frac{1}{2}$ .

2. *A. unilateralis* (Jones) Jepson. Stem short; racemes lax, diffuse, or horizontal and trailing, in age rigid and wiry, 6 to 18 in. long; leaves cuneate-obovate to oblanceolate, 4 to 12 lines long, fow-toothed or entire; flowers 1 line long on pedicels  $\frac{1}{2}$  as long; pods round-oval, 1 to  $2\frac{1}{2}$  lines long, hispidulous, twisted when mature, the pedicels thick, recurved,  $\frac{1}{2}$  to 1 line long.—Hillsides and valleys of the inner Coast Ranges from w. Fresno Co. to w. Colusa Co.; s. to L. Cal., n. to Ore. Apr.

### 32. *THYSANOCARPUS* Hook.

Slender erect annuals. Flowers minute, white or purplish. Sepals ovate, spreading. Petals spatulate. Stamens 6, subequal, with slender filaments. Ovary 1-celled, 1-ovuled, becoming an indehiscent

fruit. Pod much flattened and winged, orbicular in outline, the body disk-shaped or plane on one side and convex on the other, the wing with small holes or perforations or with radiating nerves ("rays") or toothed. (Greek *thusanos*, fringe, and *karpos*, fruit.)

Fruiting pedicels more or less recurved their whole length; rays of the wing broad.

Leaves oblong-lanceolate, the basal rosulate, pinnatifid or toothed.....1. *T. curvipes*.

Leaves linear to oblong-linear, the basal entire or with divaricate salient segments, not rosulate.....2. *T. laciniatus*.

Fruiting pedicels straight or recurved only at tip; rays of the wing linear.....3. *T. radians*.

1. *T. curvipes* Hook. FRINGE-POD. Fig. 438. Slender, 1 to 1½ ft. high, more or less pubescent or hirsute; cauline leaves linear or lanceolate, sessile and auricled at base, the upper entire, the lower dentate or denticulate; basal leaves often narrowed at base to a petiole, commonly sinuate-pinnatifid, with triangular acute or acuminate lobes; pods obovate varying to round-obovate, pubescent or glabrous, 1½ to 3½ lines long, often very convex on one side; wing narrow, rather crowded with broad rays, entire.—Frequent in the open hill country of Cal., 100 to 5000 ft.: n. to B. C. and Ida. Var. *ERADIATUS* Jepson n. var. Wing of pod membranous, without rays. —Deserts, Inyo Co. (Panamint Range, Jepson 7040, type) s. to the Colorado Desert. Var. *LONGISTYLUS* Jepson n. var. Style ½ to ¾ line long (in the species ½ to ⅓ line long), persistent. —Sierra Nevada, 3000 to 3500 ft., from Mariposa Co. to Tulare Co. (Jepson, type). Var. *ÉLEGANS* Rob. Lace-pod. Stem rather stout, with few branches, 14 to 22 in. high; lower leaves repand-toothed or entire; pod nearly orbicular, 3 to 4½ lines long, the body densely tomentose or glabrous; wing with large ovoid perforations between the rays (or sometimes non-perforate), the margin membranous and entire.—Foothills throughout cismontane Cal. (*T. elegans* F. & M.)

438. *Thysanocarpus curvipes* Hook.; a, fr. branchlet x 1; b, base of plant x 1; c, pod x 2.

2. *T. laciniatus* Nutt. Stems 8 to 15 in. high; herbage glabrous or the stems sometimes sparingly hirsutulose; leaves thinner than in nos. 1 and 3, linear, subentire or deeply pinnatifid into remote narrowly linear segments, those near the base not forming a dense or persistent rosette; racemes 1 to 8 in. long; pods obovate, elliptic or orbicular, distinctly reticulated, commonly but not always glabrous, 1 to 2 lines long; wing entire, crenate-toothed or perforated; pedicels slender, spreading and deflexed.—Open hills, 50 to 1500 ft.: S. Cal.; South Coast Ranges; e. to Ariz., s. to L. Cal. It passes by intergrades into the next var. Var. *EMARGINATUS* Jepson n. comb. Cauline leaves not auricled; pods nearly circular, 2 to 2½ lines long, glabrous, the wing scarious, destitute of radiating nerves or these very short, deeply or slightly emarginate at the apex.—Inner Coast Range; Sierra foothills in Calaveras Co. (*T. emarginatus* Greene.) Var. *CRENATUS* Brew. Wing notched between the ends of the rays.—South Coast Ranges and S. Cal. Var. *CONCHULIFERUS* Jepson n. comb. Four to 8 in. high; herbage glabrous, glaucous; leaves linear or lance-linear, sagittate-auriculate, runcinately toothed or parted; teeth 2 to 4 pairs; racemes densely many-flowered, 1 to 2 in. long; pedicels 2 to 3 lines long, spreading, little recurved; pods markedly boat-shaped, glabrous; wing parted into spatulate lobes or the lobes coherent above leaving oblong perforations.—Santa Cruz Isl. (*T. conchuliferus* Greene.)

439. *Thysanocarpus radians* Benth.; pod x 2.

3. *T. radians* Benth. Fig. 439. Stems ½ to 1½ ft. high; basal leaves runcinate-pinnatifid, the cauline ovate-lanceolate, auriculate-clasping; pods orbicular, 4 lines broad, glabrous or tomentose, the edge of the body divided into radiating spoke-like nerves which disappear abruptly just within the margin of the white-membranous wing; pedi-

cels straight, spreading, abruptly recurved at the very summit.—Low hills or rolling plains, infrequent, but widely distributed in the North Coast Ranges and in the Sacramento Valley and bounding foothills. Apr.-May.

**SARRACENIACEAE. PITCHER**  
**PLANT FAMILY**

Herbs. Leaves basal, with pitcher-like petioles and lid-like blades, the cavity containing a liquid with properties similar to gastric juice. Flowers borne on a scape. Sepals 5, persistent. Petals 5. Stamens many. Ovary superior, 3 to 5-celled. Fruit a loculicidal capsule. Seeds numerous.

**1. DARLINGTONIA Torr.**

Scapes 1-flowered, the flower pendulous. Petals with a small ovate tip (the blade) and a larger elliptic or oblong lower portion (the claw). Sepals rotate. Stamens 13 to 15, in a single circle. Stigmas 5, rotate on a short style which arises from the umbilicate-truncate apex of the ovary. (William Darlington, 1782-1863, Pennsylvania botanist.)

440. *Darlingtonia californica* Torr.; a, habit x  $\frac{1}{4}$ ; b, petal x  $\frac{1}{2}$ ; c, pistil x  $\frac{1}{2}$ ; d, stamen x  $1\frac{1}{2}$ ; e, capsule x  $\frac{1}{4}$ .

**1. D. californica Torr. CALIFORNIA PITCHER PLANT. CALF'S HEAD. Fig. 440.** Plants greenish-yellow,  $\frac{2}{3}$  to  $1\frac{1}{4}$  (or 3) ft. high; leaves enlarged upward into

441. *Drosera rotundifolia* L.; a, habit x  $\frac{1}{2}$ ; b, leaf x 2; c, fl. x 2; d, petal x 4; e, pistil x 4.

a rounded hood, one side of the hood with a circular orifice covered above by a 2-forked appendage; sepals yellowish-green with irregular purplish lineations,  $1\frac{3}{8}$  to 2 in. long; petals dark purple, heavily veined, narrow-ovate,  $1\frac{1}{8}$  to  $1\frac{1}{4}$  in. long; stamens 3 lines long; ovary cuneate-obovoid; capsule obovatish-oblong, 1 to  $1\frac{1}{8}$  in. long.—Marshy meadows and along streams, 3000 to 6000 ft.: Plumas Co.; Shasta Co.; Siskiyou Co.; Del Norte Co.; n. along the Oregon Coast Range as far as Coquille Pt.

**DROSERACEAE. SUNDEW FAMILY**

Perennial glandular herbs of bogs. Leaves in a basal rosette. Flowers hypogynous, white. Ovary 1-celled; styles 1 to 5; ovules numerous on parietal placentae. Capsule 3-valved.

**1. DRÓSERA L. SUNDEW**

Herbage brownish or reddish. Leaves long-petioled, the blade covered with numerous stout glandular hairs. Flowers borne on a naked scape in a 1-sided raceme. Calyx 5-parted, persistent. Petals 5, distinct or slightly united, hypogynous. Stamens 5. Styles 2 to 5, usually 3, often 2-parted so as to appear twice as many. (Greek droseris, dewy, the glands dew-like.)

Leaf-blades orbicular or broader than long. .... 1. *D. rotundifolia*.  
 Leaf-blades 4 to 8 times longer than broad. .... 2. *D. longifolia*.

1. *D. rotundifolia* L. Fig. 441. Scapes  $3\frac{1}{2}$  to 8 in. high; leaves spreading, suborbicular; petals only a little exceeding the sepals.—Marshy spots in the Sierra Nevada from Tulare Co. to Siskiyou Co., thence s. (near the coast) to Mendocino Co.; N. Am., Eur., Asia.

2. *D. longifolia* L. Scapes 3 to 6 in. high; leaves erect, obovate-spatulate; petals nearly twice as long as the sepals.—Sierra Co. to Plumas Co.; n. to Brit. Am.; Eur., Asia.

### CRASSULACEAE. STONE-CROP FAMILY

Succulent glabrous herbs. Leaves in ours entire, without stipules. Flowers in cymes or rarely solitary, small, regular, and usually perfect. Sepals, petals and pistils of the same number (usually 5 in ours), the stamens as many or twice as many. Petals generally somewhat perigynous, distinct or united into a short tube, usually persistent. Fruit consisting of free or somewhat united one to many-seeded follicles. Receptacle usually with nectar-bearing scales, one behind each pistil.

Leaves opposite; stamens as many as the petals; diminutive annuals. .... 1. TILLAEA.  
 Leaves alternate; stamens twice as many as the petals.

Annuals; carpels 1-seeded. .... 2. SEDELLA.

Perennials; carpels several to many-seeded.

Flowers solitary; root tuberous. .... 3. CONGDONIA.

Flowers many, in cymes.

Flowering stems arising from corms. .... 4. HASSEANTHUS.

Flowering stems not arising from corms.

Flowers imperfect; flowering stems arising from a short caudex; leaf rosettes none. .... 5. RHODIOLA.

Flowers perfect; flowering stems arising from leaf rosettes.

Petals commonly spreading, at least at tip; mostly mat-like plants with branching rootstocks. .... 6. SEDUM.

Petals commonly erect, often closely approximate at tip; coarse plants with thick basal leaf rosettes borne on a simple or branched caudex. .... 7. COTYLEDON.

#### 1. TILLAEA L.

Diminutive much-branched glabrous annuals with opposite leaves. Flowers very small, clustered or solitary in the axils of the leaves, subsessile or short-pedicellate. Sepals, petals, stamens, and carpels 3 to 5 (in ours usually 4). Petals distinct, or united only at the very base. Carpels distinct, erect, 1 to 12-seeded. (Michael Angelo Tilli, Italian botanist.)

Flowers solitary in the axils; petals twice the length of the sepals; carpels 8 to 10-seeded; aquatic or of muddy bottoms. .... 1. *T. aquatica*.

Flowers densely clustered in the axils; petals and sepals subequal; carpels 1 or 2-seeded; terrestrial. .... 2. *T. erecta*.

1. *T. aquatica* L. Stems usually decumbent and rooting at the lower nodes, rebranched, 1 to 3 in. long; leaves oblong, 2 to 3 lines long, connate; sepals  $\frac{1}{2}$  line long, twice exceeded by the greenish oblong petals; carpels 8 to 10-seeded.—Muddy ground, widely distributed in Cal., but not common; N. Am., Eur. Var. *DRUMMONDII* Jepson n. comb. Pedicels elongating in fruit and finally exceeding the leaves.—Muddy places, uncommon in Cal.: Napa Valley; San Francisco; Lake Pilarcitos, San Mateo Co. (*T. drummondii* T. & G.)

2. *T. erecta* H. & A. Fig. 442. Plants diffusely branched and tufted, becoming reddish with

442. *Tillaea erecta* H. & A.; a, habit x 1; b, branchlet x 5.

age, floriferous nearly to the base, 1 to 3 in. high; leaves ovate or oblong, connate, 1 to  $1\frac{1}{2}$  lines long; sepals  $\frac{1}{2}$  line long, equaling or somewhat exceeding the narrowly lanceolate petals; carpels usually 1 (occasionally 2)-seeded.—Common in dry commonly sandy ground, 20 to 2000 ft., throughout cis-montane Cal.; n. to Ore., s. to L. Cal.; Chile. (*T. minima* Miers.) Var. *ERÉMICA* Jepson n. var. Plants very slender; pedicels as much as  $1\frac{1}{2}$  lines long.—Vallecito, w. Colorado Desert (Jepson 8636, type).

## 2. *SEDELLA* Britt. & Rose

Diminutive annuals. Leaves small, ovate to oblong-ovate, very fleshy, resembling rice-grains. Flowers in cymes. Calyx 5-toothed, the teeth triangular. Petals 5, linear to ovate-lanceolate, united at base. Stamens 10. Carpels erect. (Diminutive of *Sedum*.)

1. *S. pumila* (Benth.) Britt. & Rose. Stems slender, 1 to 4 in. high, with a few opposite or subopposite ascending branches of about equal length and hence the plant flat-topped; leaves few, 2 to  $2\frac{1}{2}$  lines long; cyme with 2 or 3 racemose branches; petals yellow, 1 to  $1\frac{1}{2}$  lines long, spreading in anthesis but later becoming erect; sepals minute.—Foothills, 300 to 3000 ft.: Sierra Nevada from Tulare Co. to Butte Co.; Napa Range. Var. *CONGDONII* Jepson n. comb. Sepals toothed; petals averaging a little smaller, reddish outside; suture of carpels with a fringe of glands.—Mariposa and Tulare Cos. (*S. congdoni* Britt. & Rose.)

## 3. *CONGDONIA* Jepson n. gen.

Diminutive herb with very slender tuber-bearing rootstock. Stem scapoid, naked or with 1 or 2 inconspicuous leaves on the upper fourth, bearing a single terminal erect flower. Leaves ovate, relatively thin, closely imbricated in basal rosettes. Petals white, ovate, united for about  $\frac{1}{2}$  their length into a tube. Carpels erect, several-seeded. Seeds rubescent. (J. W. Congdon of Mariposa Co., acute-minded collector of the Sierran flora.)

1. *C. pinetorum* (Bdg.) Jepson n. comb. Stems very slender,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. high; leaves sessile, 1 to  $1\frac{1}{2}$  lines long; petals  $1\frac{1}{2}$  to 2 lines long.—East slope of the Sierra Nevada near Mammoth, Mono Co. (*Sedum pinetorum* Bdg.)

## 4. *HASSEANTHUS* Rose

Stems one to several from globose or oblong corms. Leaves not in rosettes; basal leaves linear; stem leaves narrowly ovate, flattish. Flowers yellow or white, in a cyme, the 2 or 3 branches secund, widely spreading. Petals united at base into a short tube. Carpels widely spreading. (Dr. H. E. Hasse, local collector in the Santa Monica Mts., and Greek anthos, flower.)

1. *H. variegatus* (Wats.) Rose. Stems 1 to 6 in number, 4 to 9 in. high; corms 1 to 3; lower leaves linear, turgid, a trifle flattened, green, 1 to  $2\frac{1}{2}$  in. long,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  lines wide; stem leaves 2 to 3 lines long; petals bright yellow.—Clay depressions or rocky soil, lower foothills or mesas, seaward S. Cal., 100 to 2000 ft. (*Sedum variegatum* Wats.) Var. *BLOCHMANAE* Jepson n. comb. Petals white with a purplish-brown midvein.—Near the sea, San Luis Obispo Co. to San Diego Co. (*S. blochmanae* Eastw.)

## 5. *RHODIOLA* L.

Perennial herbs. Stems several from a short scaly caudex crowning a stout root. Leaves flat, comparatively thin, distributed equally up the stem, not in rosettes. Flowers dioecious or polygamous, borne in a very dense cyme, the branches not secund. Sepals and petals usually 4 and stamens 8. Petals in ours dark purple, spreading a little. Carpels erect, dark purple. (From Greek rhodon, a rose, referring to the rose-scented roots.)

1. *R. rosea* L. var. *integrifolia* Jepson n. comb. WESTERN ROSEROOT. Stems erect, 3 to 6 in. high; leaves ovate to oblong-ovate, entire or obscurely den-

tate, sessile by a broad base, 5 to 12 lines long,  $2\frac{1}{2}$  to 4 lines wide, green; flowers  $1\frac{1}{2}$  to  $2\frac{1}{2}$  lines long.—Alpine, 9500 to 12,500 ft., Sierra Nevada from Tulare Co. to Eldorado Co.; n. to Alas., e. to Rocky Mts. (*Rhodiola integrifolia* Raf.)

#### 6. SÈDUM L. STONE-CROP

Ours perennial herbs. Flowers usually yellow but often white or reddish-tinged, disposed in a cyme composed of about 2 or 3 racemose secund branches. Petals 5, distinct or a little united at the base. Stamens 10. Carpels distinct or nearly so, several-seeded. (Latin *sedeo*, to sit, on account of the lowly habit.)

Carpels widely divergent, their outer and finally lower edges almost horizontal or at right angles with the pedicel; leaves becoming scarious upon drying; rootstocks horizontal, usually branched, giving rise to two kinds of erect or ascending shoots: (a) flowering stems (leafy below), and (b) short densely leafy branches which are deciduous and propagating.

Leaves oblong to oblong-ovate, 3 to 6 lines long, broadest a little below the middle; Coast Ranges and s. Sierra Nevada. . . . . 1. *S. radiatum*.

Leaves linear-lanceolate, 5 to 11 lines long, broadest at the base; Lassen and Modoc Cos. . . . . 2. *S. douglasii*.

Carpels erect or suberect; leaves not becoming scarious upon drying; plants commonly spreading by well developed horizontal rootstocks; rootstocks branching, the branches ending in dense leaf rosettes and so forming mat-like plants.

Leaves terete, green; leaf rosettes ovate. . . . . 3. *S. stenopetalum*.

Leaves spatulate, often glaucous; leaf rosettes close, flat.

Petals distinct or nearly so, yellow or white; cyme mostly flat-topped. . . . . 4. *S. spathulifolium*.

Petals united for  $\frac{1}{4}$  to  $\frac{1}{2}$  their length, yellow and usually white-margined, or white; cyme mostly elongated or thyrsoïd. . . . . 5. *S. obtusatum*.

Petals united for  $\frac{1}{4}$  to  $\frac{1}{2}$  their length, yellow and usually white-margined, or white; cyme mostly elongated or thyrsoïd. . . . . 5. *S. obtusatum*.

1. *S. radiatum* Wats. Stems 3 to 7 in. high; leaves thin, flattened, oblong to oblong-ovate, 3 to 6 lines long and 1 to  $1\frac{1}{2}$  lines wide, a little wider than the broad sub-clasping base, white-membranous and nerved on drying; petals bright yellow, widely spreading, 3 to 4 lines long.—Rocky situations, 1500 to 4500 ft.: Coast Ranges from Humboldt Co. to Monterey Co.; s. Sierra Nevada (Tulare Co.). Differing from *S. douglasii* in its range and in the size and shape of its leaves, but manifestly a very close relative of it.

2. *S. douglasii* Hook. Stems 3 to 8 in. high; leaves linear-lanceolate, more or less flattened, 5 to 11 lines long,  $1\frac{1}{2}$  lines wide, the much dilated base scarious-sheathing; petals as in no. 1.—Rocky places, Lassen and Modoc Cos.; n. to Canada.

3. *S. stenopetalum* Pursh. Stems erect, 3 to 6 in. high, simple; leaves terete, green, 2 to 4 lines long, in close ovate clusters; cymes rather close, sparsely branched; petals bright yellow, or at times with a dark midvein, spreading, 3 to 4 lines long.—Mts. of Modoc and Siskiyou Cos., 7000 to 10,000 ft.; n. to Alb., e. to Rocky Mts.

4. *S. spathulifolium* Hook. Stems erect, 4 to 8 in. high, simple; leaves broadly spatulate, glaucous or occasionally green, 5 to 10 lines long,  $2\frac{1}{2}$  to  $3\frac{1}{2}$  lines wide, the apex rounded, with a small acumination; stem leaves smaller and oblongish; cyme dichotomously branched, 1 to 2 in. wide, somewhat less high; petals widely spreading, yellow or white, 3 to 4 lines long.—Usually gregarious on shaded moss-covered rocks in the foothills, 200 to 5000 ft., throughout cismontane Cal.; n. to B. C. It is our most common species of Crassulaceae.

5. *S. obtusatum* Gray. Stems erect, leafy, 3 to 6 in. high; leaves broadly spatulate, thick, green, 5 to 12 lines long, 2 to 3 lines wide; stem leaves linear-spatulate to oblong; cyme elongate or thyrsoïd, sometimes flat-topped; petals oblong-lanceolate, the upper portion spreading or recurving, united for  $\frac{1}{4}$  to  $\frac{1}{2}$  of their length into a distinct tube, brownish yellow (and usually with a well defined white margin) or white, 3 to 5 lines long.—Growing over rocks in the mts., 4500 to 12,000 ft.: Sierra Nevada from Tulare Co. to Nevada Co.; Coast Ranges from Mendocino Co. to Siskiyou Co. Very close to *S. oreganum* Nutt. of Oregon and perhaps not specifically distinct.

## 7. COTYLÉDON L. LIVE-FOR-EVER

Perennial herbs. Flowering stems with reduced or scale-like leaves, arising from the leaf axils of a conspicuous basal rosette. Leaves of the rosette thick and fleshy. Flowers disposed in cymes, their second branches racemose or thyrsoid. Petals white, yellow, orange or reddish, united at base or below the middle, erect or with the tips a little spreading. Stamens 10, borne on the tube. Carpels many-seeded. (Greek kotule, a shallow cup, referring to the rosettes.)

Carpels erect, usually distinct.

Rosettes very large (6 to 8 in. wide), raised on a stout caudex 2 to 6 in. high; plant densely white-mealy; leaves 2 to 2½ in. wide; seaward belt, S. Cal. ....

1. *C. pulverulenta*.

Rosettes medium-sized (¼ to 3 in. wide), white-glaucous to green, borne at the ground on a very short caudex; leaves ¼ to 1½ in. wide.

Pedicels stout, shorter than the flowers; flowers yellow.

Rosettes globose, very compact; leaves very thick; sea bluffs or headlands. .

2. *C. farinosa*.

Rosettes somewhat flat-topped, less dense; leaves less thick; seaward belt, San

Francisco to San Luis Obispo. .... 3. *C. caespitosa*.

Pedicels slender, equaling or exceeding the flowers.

Flowers yellow or orange, sometimes turning reddish in age; cismontane Cal.

4. *C. laxa*.

Flowers reddish from the first; S. Cal. back of seaward belt. 5. *C. lanceolata*.

Carpels widely spreading, slightly united at base.

Leaves lanceolate, distinctly flattened; inflorescence cymose or thyrsoid. . 6. *C. viscida*.

Leaves linear, terete or subterete, flattened strongly only near the base.

Inflorescence mostly open, commonly a thyrsoid cyme. .... 7. *C. edule*.

Inflorescence a round-topped cyme, densely flowered. .... 8. *C. densiflora*.

1. *C. pulverulenta* (Nutt.) Baker. CHALK LETTUCE. Plants stout, 2½ to 4 ft. high, covered with a dense white mealy powder; flowering stems very stout, densely leafy; basal rosettes rather loose and flattish, their leaves broadly spatulate, usually acuminate, spreading, 3 to 6 in. long, 2 to 2½ in. wide; stem leaves ovate or suborbicular, sessile or clasping, 1 to 1½ in. wide; branches of the cyme 2 or 3, mostly simple, widely spreading, 6 to 9 in. long; flowers red, narrow; pedicels 1 to 3 lines long.—Dry rocky slopes, 20 to 2000 ft., sea-bluffs or mostly near the sea: Los Angeles Co. to San Diego Co.; s. to L. Cal. Due to their large size and chalky-white color, the plants of this species are striking features of the rocky hillsides of the seaward belt of S. Cal.

443. *Cotyledon farinosa* Baker; a, habit x ½; b, fl. x 1; c, gland x 6.

2. *C. farinosa* Baker. BLUFF LETTUCE. Fig. 443. Plants glabrous, glaucous, 5 to 12 in. (or to 2½ ft.) high; rosettes dense, subglobose; leaves linear or oblong, rather thick for their width, 1 to 2 in. long, ½ to ¼ as wide, usually widest at the base; stem leaves numerous, broad, somewhat clasping, 5 to 6 lines wide; flowers cream-white, on very short stout pedicels; cyme usually compact.—Bluffs along the ocean: Monterey Co. to Del Norte Co. (*Sedum cotyledon* Jacq.)

3. *C. caespitosa* Haw. Fig. 444. Plants green or somewhat glaucous, ¾ to 1¾ ft. high; rosettes usually rather loose; leaves 2 to 3 (even 6) in. long, 6 to 11 lines wide, above the middle a trifle wider than at the base, not so conspicuously thick as in no. 2; flowers yellow or pale, on stout pedicels; cyme with close or elongated branches.—Rocky ground near

the coast from San Luis Obispo Co. to San Francisco.

4. *C. laxa* (Lindl.) Brew. & Wats. ROCK LETTUCE. Plants 7 to 12 in. high, green or glaucous; rosettes loose; leaves oblong to lanceolate, evidently wider above than at base, 1 to 3 in. long,  $\frac{1}{2}$  to 1 in. wide, relatively thin-nish; flowers clear yellow or orange but frequently turning reddish on drying; pedicels slender, some of them equaling or exceeding the flowers; cyme dichotomous, rather loose.—Rocky ground, 300 to 5500 ft.: back of the coast in middle Cal. and eastward to the Sierra Nevada. The only species over the interior and montane portion of middle Cal. Var. *PANICULATA* Jepson n. comb. Cyme paniculate (the main axis with a terminal and several lateral peduncled cymes).—Mt. Hamilton Range. (*C. caespitosa* var. *paniculata* Jepson.) Var. *SETCHELLII* Jepson. Stem branched from above the middle, the branches racemose, elongated.—Mt. Hamilton foothills. Var. *CYMOSA* Jepson n. comb. Plants 10 to 14 in. high; leaves oblong-lanceolate, 4 to  $4\frac{1}{2}$  in. long.—Napa Valley. (*C. cymosa* Baker.) Var. *NEVADENSIS* Jepson n. comb. Plants small, 3 to  $4\frac{1}{2}$  (or to 10) in. high, with small cymes; leaves often very broad.—Montane, 2250 to 8500 ft.: San Bernardino and San Gabriel mountains; Mt. Diablo; Sierra Nevada. (*C. nevadensis* Wats. *Dudleya pumila* and minor Rose.)

5. *C. lanceolata* (Nutt.) Brew. & Wats. DESERT SAVIOR. Plants 8 to 15 in. high, commonly glaucous; rosettes not dense; leaves spreading or ascending, narrowly lanceolate, scarcely widened above, 2 to 4 in. long, 2 to 8 lines wide, some outer ones often oblong; flowers reddish, usually drying very dark; branches of the cyme commonly few,  $2\frac{1}{2}$  to 4 in. long, the flowers discrete, sometimes rather few relatively; pedicels 4 to 6 lines long.—Rocky ground, 1000 to 4000 ft.: Santa Barbara Co. to San Diego Co.; s. to L. Cal. Var. *SAXOSA* Jepson n. comb. Plants 5 to 6 in. high; calyx brick red.—Panamint Mts. (*C. saxosa* Jones.)

6. *C. viscida* Wats. Stems 10 to 17 in. high; leaves of the rosette lanceolate, flat, attenuate upwards from a very broad (6 to 8 lines wide) sessile base, 2 to 3 in. long, glabrous but very viscid; cyme flat topped or elongated and thyrsoid; petals yellowish and usually somewhat reddish.—Rocks near the sea: San Juan Capistrano Hot Sprs.; Oceanside. Var. *INSULARIS* Jepson n. comb. Plants not viscid, usually glaucous.—Dry cliffs, Santa Barbara Isls. (*Stylophyllum insulare* Rose.)

7. *C. edulis* (Nutt.) Brew. Plants 1 to  $1\frac{1}{2}$  ft. high; leaves linear-attenuate, subterete, glaucous, dilated and flattened at base, 2 to 3 in. long; stem leaves small; cyme paniculate, 2 to 9 in. long, or reduced to 1 or 2 spreading branches; petals yellowish.—Dry cliffs, San Diego Co. Var. *ATTENUATA* Jepson n. comb. Slender, less robust.—Sw. San Diego Co. (Initial Monument); s. to L. Cal. (*C. attenuata* Wats.)

8. *C. densiflora* (Rose) Fedde. Plants 6 to 9 in. high, very white-glaucous; cyme compound, rounded, densely flowered,  $2\frac{1}{2}$  to 4 in. wide; petals white or pinkish.—San Gabriel Mts., 900 to 2000 ft.: Fish Cañon (F. W. Peirson). (*Stylophyllum densiflorum* Rose.)

444. *Cotyledon caespitosa* Haw.; a, base of plant  $\times \frac{1}{3}$ ; b, fl. stem  $\times \frac{1}{3}$ ; c, fl.  $\times 1$ ; d, gland  $\times 6$ .

**SAXIFRAGACEAE. SAXIFRAGE FAMILY**

Perennial herbs or shrubs. Flowers perfect, perigynous, usually white, often red, never blue, borne in racemes, panicles or cymes, or solitary. Calyx 5-lobed or -cleft. Petals commonly 5, sometimes 4 to 8. Stamens 5 or 10, sometimes 3, or 8 to 20, or numerous. Ovary partly or wholly inferior, or superior, 1 to 5-celled, the styles or stigmas as many as the cells or placentae, the latter either parietal or axile. Fruit a capsule, follicle, or berry. Seed with endosperm.

**A. Fruit a capsule; ovary superior or partly inferior.**

Styles 2 (3 in no. 7), distinct; leaves alternate or mostly basal (in no. 12 opposite, in ours), without stipules (but see nos. 4 and 7); herbs.—Tribe SAXIFRAGAE.

Sterile filaments none.

Ovary 2-celled and placentae axile, or carpels 2 and distinct.

Stamens 10; ovary slightly inferior or free.

Leaves ovate, oblong or lanceolate to linear.

Petals ovate to roundish; flowers appearing with or after the leaves; stems from rootstocks or fibrous roots.....

1. SAXIFRAGA.

Petals spatulate; flowers appearing before the leaves; stems from a corm-like root.....

2. JEPSONIA.

Leaves peltate, 1 to 2 ft. broad.....

3. PELTIPHYLLUM.

Stamens 5.

Petals deciduous; ovary  $\frac{1}{2}$  to  $\frac{3}{4}$  adherent to the calyx....

4. BOYKINIA.

Petals persistent; ovary superior.....

5. BOLANDRA.

Ovary 1-celled with 2 parietal placentae alternate with the styles or stigmas.

Petals 5.

Stamens 10.

Petals entire, almost filiform; capsule early and unequally 2-valved to the base.....

6. TIARELLA.

Petals usually laciniate or toothed; capsule equally 2-valved.

Petals white or pink, clawed; styles 3; rootstocks slender, tuberos.....

7. LITHOPHRAGMA.

Petals red, sessile; styles 2; rootstock stout, not tuberos.....

8. TELLIMA.

Stamens less than 10.

Petals cleft or pinnatifid; stamens 5 (in ours).....

9. MITELLA.

Petals entire.

Calyx campanulate or turbinate; stamens 5; capsule 2-beaked with the styles but not lobed.....

10. HEUCHERA.

Calyx tubular; stamens 3; capsule deeply 2-lobed, the beaks strongly diverging.....

11. TOLMIEA.

Petals none; stamens 8.....

12. CHRYSOSPLENIUM.

Sterile filaments present; ovary 1-celled with 3 or 4 parietal placentae opposite as many stigmas; fertile stamens 5.....

13. PARNASSIA.

Styles 3 to 5, distinct, or more or less united into one; fruit a capsule; leaves opposite, without stipules; shrubs.—Tribe HYDRANGAE.

Stamens 20 to numerous; seeds numerous; styles persistent.

Styles 3 to 5, distinct at least at apex; ovary inferior, completely 3 to 5-celled; capsule obconic or obovoid.....

14. PHILADELPHUS.

Style 1, short; ovary half-inferior, imperfectly 5 (2 to 8)-celled; capsule conic or ovoid.....

15. CARPENTERIA.

Stamens less than 20; styles 3 to 5.

Styles persistent; stamens 10; calyx-lobes pubescent; flowers (in ours) pink, in cymes.....

16. JAMESIA.

Styles deciduous; stamens 8 to 12; calyx-lobes glabrous; flowers white, in racemes.

17. WHIPPLEA.

**B. Fruit a berry; ovary wholly inferior.**

Leaves alternate, with stipules; styles 2, or more or less united into one; shrubs.—Tribe RIBESIAE.....

18. RIBES.

**1. SAXIFRAGA L. SAXIFRAGE**

Herbs, the leaves entirely or mainly in a basal cluster. Flowers white, in panicles or close clusters. Calyx cohering with the base of the ovary or almost free, 5-cleft or -parted. Petals entire, commonly deciduous. Stamens 10. Styles 2. Capsule 2-beaked, 2-celled, opening down or between the beaks, or sometimes the fruit consists of 2 nearly separate follicles. Seeds numerous. (Latin saxum, a rock, and frango, to break.)

Stems with the leaves all basal or nearly so.

Perennials.

Caudex not bulbous.

Petals deciduous; stems scape-like, naked.

Leaves rounded or cordate, petioles longer than the blade...1. *S. aestivalis*

- Leaves not rounded or cordate.  
 Petioles distinctly shorter than the blades.  
 Flowers in a terminal cluster; plants 2 to 5 in. high...  
 2. *S. nivalis*.  
 Flowers in an elongated panicle; plants 1 to 3 ft. high...  
 3. *S. integrifolia*.  
 Petioles broad, mostly as long as, or longer than the blades.  
 Petals not spotted; filaments not petaloid...  
 4. *S. virginensis*.  
 Petals with 2 yellow-green spots near the base; filaments petaloid...  
 5. *S. marshallii*.  
 Petals persistent; stems with 1 to 3 small remote leaves above the basal ones; basal leaves cuneate...  
 6. *S. fragarioides*.  
 Caudex scaly. Bearing bulblets; stems scape-like.  
 Leaves rounded, lobed, the petioles several times longer than the blades; sepals reflexed.  
 7. *S. mertensiana*.  
 Leaves obovate, entire or merely denticulate; sepals not reflexed...  
 8. *S. nidifica*.  
 Delicate annual; scape simple or often paniculate; plants 2 to 8 in. high...  
 9. *S. bryophora*.  
 Stems leafy; caespitose alpine plants...  
 10. *S. tolmiei*.

445. *Saxifraga aestivalis* Fisch.; a, base of plant  $\times \frac{1}{2}$ ; b, fl. stem  $\times \frac{1}{2}$ ; c, fl.  $\times 3$ ; d, stamen  $\times 6$ .

1. *S. aestivalis* Fisch. Fig. 445. Scape 9 to 18 inches high, this and the leaves from a short creeping rootstock; herbage glabrous or somewhat pubescent; leaves reniform to round-cordate, almost equally dentate,  $\frac{3}{4}$  to  $2\frac{1}{2}$  in. broad; panicle open, narrow; carpels purple.—Along brooks, 7000 to 9600 ft.: San Bernardino Mts.; Sierra Nevada from Tulare Co. to Lassen Peak; Yollo Bolly Mts. to Trinity Mts.; n. to Alas.

446. *Saxifraga integrifolia* Hook.; a, base of plant  $\times \frac{1}{2}$ ; b, infl.  $\times \frac{1}{2}$ ; c, fl.  $\times 2$ ; d, capsule  $\times 2$ .

2. *S. nivalis* L. Plants mostly purplish, 2 to 5 in. high; leaves oblong-ovate or spatulate-obovate, 3 to 9 lines long, coarsely dentate to entire; flowers small, capitate; petals oblong or spatulate, little exceeding the erect calyx-lobes; stamens filiform; styles very short.—High montane, 10,000 to 11,200 ft., Sierra Nevada, from Fresno Co. to Nevada Co.; n. to the arctic. July-Oct.

3. *S. integrifolia* Hook. Fig. 446. Scapes stoutish, 12 to 22 in. high; herbage roughly glandular-pubescent to almost glabrous; leaves obovate to lanceolate-spatulate, 2 to 7 in. long, mostly narrowed at base to a short margined petiole; flowers in small thick clusters in a narrow thyrselike

panicle.—Swamps or marshy meadows, 3500 to 7400 ft., Sierra Nevada from Tulare Co. to Siskiyou Co. June-Aug. Var. *SIERRAE* Cov. Leaves without petiole-like base.—Mts. of Tulare Co.

4. *S. virginíensis* Michx. var. *californica* Jepson. Scape 6 to 11 in. high; herbage pubescent with scattered hairs, the hairs often gland-tipped; leaves ovate to elliptic, rather serrate, somewhat undulate,  $\frac{1}{2}$  to 2 in. long; panicle open; lobes of the calyx ovate, becoming reflexed; filaments not dilated; carpels almost distinct.—Shaded rocky places in the hills, 500 to 6000 ft.; Coast Ranges and Sierra Nevada, s. to the San Bernardino and Santa Monica mountains. Mar.-June. Var. *NAPÉNSIS* Jepson n. comb. Petals none.—Napa Range. (*S. napensis* Small.)

5. *S. marshallii* Greene. Plants 4 to 12 in. high; scape and leaves from a short caudex; leaves oblong or ovate, rather coarsely dentate,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long.—Montane, 5000 to 7000 ft., Humboldt and Siskiyou Cos. May-June.

6. *S. fragarioides* Greene. Stems 4 to 8 in. high, arising from a short stout caudex; caudex simple or branched, crowning the stout root; herbage glandular-pubescent; leaves cuneate, dentate at apex (or above the middle), the sides entire,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; petioles disjoining roughly from the blade in age, persistent on the caudex; cymes disposed in a narrow panicle; calyx lobes finally reflexed; petals 1 line long, clawed, becoming reflexed; ovary about half-inferior.—Montane, 5500 to 6500 ft., nw. Cal. (Trinity Mts.; Salmon Mts.; Marble Mt.); n. to southern Ore.

448. *Saxifraga tolmiei* T. & G.; a, habit  $\times \frac{1}{2}$ ; b, fl.  $\times 2$ ; c, stamen  $\times 4$ ; d, capsule  $\times 2$ .

447. *Saxifraga bryophora* Gray; a, habit  $\times \frac{3}{4}$ ; b, bulblet  $\times 3$ ; c, long. sect. of fl.  $\times 3$ ; d, stamen  $\times 6$ .

7. *S. merténsiana* Bong. Plants 4 to 14 in. high; petioles and scapes glandular-hairy; leaves orbicular, cordate at base, crenately toothed,  $\frac{3}{4}$  to  $3\frac{1}{4}$  in. broad; petioles scarious-dilated at base, 1 to 6 in. long; panicle open, often bearing granule-like bulblets in the axils; flowers pendulous after anthesis (the slender pedicels recurved only at the very tip); calyx-tube very short, its lobes oblong, reflexed in fruit; filaments dilated toward the summit, white and petal-like; carpels half-united or a little more.—Woods near the coast, Marin Co. to Humboldt Co.; n. to Alas. Mar.-May.

8. *S. nidifica* Greene. Like no. 3 but the plants small, 5 to 12 in. high, the roots embedded in a mass of bulblets; leaves narrowed to a broad petiole, both together  $\frac{1}{2}$  to  $2\frac{1}{2}$  in. long.—Montane, 5000 to 8000 ft., Sierra Nevada and n. to Siskiyou Co. Rather rare. June.

9. *S. bryophora* Gray. Fig. 447. Plants 2 to 8 in. high, the scape ending in a

raceme or very slender panicle; leaves linear-oblong, acute, 3 to 8 lines long; pedicels soon deflexed; flowers solitary and terminal, those along the axis or branches of the inflorescence replaced by leaf-buds or bulblets which fall to the ground and reproduce the species vegetatively; petals 2-spotted toward the base.—High montane, in moist gravelly soil, 8000 to 11,200 ft., Sierra Nevada from Tulare Co. to Tuolumne Co. and Mt. Shasta. July-Sept.

10. *S. tólmiei* T. & G. ALPINE SAXIFRAGE. Fig. 448. Plants 2 to 5 in. high, the stems leafy, diffusely branching, forming dense tufts; leaves linear, closely imbricated on the short branches, sessile, 3 to 5 lines long; cymes disposed in a corymbose panicle or close cluster; filaments dilated at the summit.—High montane, 9000 to 10,000 ft., Sierra Nevada from Tulare Co. to Mariposa Co., Lassen Peak and Mt. Shasta; n. to B. C. July.

## 2. JEPSÓNIA J. K. Small

Perennial herbs with basal leaves and scapes from corm-like roots. Flowers few in a cyme terminating a naked scape, appearing in the autumn before the leaves. Leaves round-cordate, crenate and shallowly crenate-lobed. Calyx 5-toothed, its tube short-cylindric, the base with a honey-bearing area within. Petals inserted by short claws nearly in the sinuses, rotately spreading. Stamens 10, those opposite the sepals dehiscing their pollen very early. Carpels free from the calyx, united, their styles bearing kidney-shaped stigmas. (Willis Linn Jepson, author of a Flora of California.)

1. *J. párryi* (Torr.) Small. Scapes 3 to 10 in. high; leaves when mature  $\frac{3}{4}$  to 2 in. wide; flowers  $2\frac{1}{4}$  lines long; calyx truncatish at base, with 10 purple nerves, the alternate ones forking at the sinuses, a branch proceeding to the apex of each adjacent lobe; petals ovatis, white, purple-nerved beneath, 2 lines long; ovary with fine brownish nerves.—Moist places in the dry hills, flowering in Nov. and Dec. after the fall rains begin.—San Diego to San Jacinto Valley; Santa Rosa and Santa Cruz Isls. Var. *HETERÁNDRA* Jepson n. comb. Fig. 449. Calyx acutish at base.—Sierra Nevada foothills from Mariposa Co. to Tuolumne Co. (*J. heterandra* Eastw.)

449. *Jepsonia parryi* var. *heterandra* Jepson; a, fl. stems and corm x  $\frac{1}{2}$ ; b, leaves x  $\frac{1}{2}$ ; c, long. sect. of fl. x 3; d, capsule x 2.

## 3. PELTIPHÝLLUM Engler

Coarse herb with thick fleshy horizontal rootstocks, the flowers appearing before the leaves. Leaves orbicular-peltate, cupped at center, all basal, the petioles stipular. Scapes naked, surpassing the leaves. Flowers white, in terminal, simple or paniculately compound cymes. Calyx-tube joined to lower part of the pistils, the lobes reflexed in age. Stamens 10. Pistils 2, almost distinct. Follicles almost, but not quite, distinct, turgid, spreading. (Greek pelti, peltate, and phullon, leaf.)

1. *P. peltátum* (Torr.) Engler. Fig. 450. Stout plant 1 to 4 ft. high; leaves 1 to 2 ft. broad, 9 to 15-lobed, irregularly serrate, the petioles 1 to  $3\frac{1}{2}$  ft. high; flowers 6 to 7 lines broad.—Banks of rapid mountain streams, 1400 to

5600 ft., Sierra Nevada from Tulare Co. to Siskiyou Co., thence s. in the Coast Ranges to Humboldt Co.; n. to central Ore. June-July. The stout fleshy petioles, with the epidermis peeled off, were eaten by the native tribes and regarded as a delicacy. (*Saxifraga peltata* Torr.)

#### 4. *BOYKINIA* Nutt.

Perennial herbs with creeping rootstocks. Stems simple, bearing a few alternate leaves and paniculate or corymbose cymes of white flowers. Calyx-tube turbinate or subglobose or ovate,  $\frac{1}{2}$  to  $\frac{3}{4}$  adherent to the 2-celled ovary. Petals linear to elliptic, entire, with a short claw, deciduous. Stamens 5, short. Styles 2. Capsule 2-beaked. (Dr. Boykin of Georgia.)

Flowers secund; corolla slightly irregular; petals narrow, obtuse at apex; ovary half inferior.—Subgenus *THEROFON*.

Petals cuneate-oblong,  $1\frac{1}{2}$  to 2 lines long, 2 to 3 times as long as the calyx-lobes; leaves with stipules. . . . 1. *B. elata*.

Petals linear-spatulate, 1 line long, little longer than the calyx-lobes; leaves without stipules. . . . 2. *B. rotundifolia*.

Flowers in terminal corymbose cymes; corolla regular; petals broad; ovary almost wholly inferior.—Subgenus *HEMIEVA*.

Rootstock or caudex stout, vertical, not bulblet-bearing; leaves incised; stipules foliaceous, conspicuous. . . . 3. *B. major*.

Rootstock very short, vertical, crowded with bulblets; leaves with 3 nearly distinct leaflets; stipules none. . . . 4. *B. ranunculifolia*.

1. *B. elata* (Nutt.) Greene. Fig. 451. Stem slender, erect,  $1\frac{1}{4}$  to 2 ft. high; herbage a little hairy, the petioles and stems very rusty-hairy at base; leaves thin-membranous, shallowly lobed or incised, serrate, 1 to 4 in. broad; petioles long, dilated at base and bearing stipule-like bristles or subulate lobes; flowers slightly irregular, borne in a panicle of secund racemes; lower portion of calyx-tube glandular-hairy, upper portion nerved or somewhat ridged; calyx in age urn-shaped; calyx-lobes lanceolate-triangular.—Woods near the coast, Santa Lucia Mts. to Del Norte Co. (*B. occidentalis* T. & G.)

451. *Boykinia elata* Greene; a, habit  $\times \frac{1}{2}$ ; b, long. sect. of fl.  $\times 2\frac{1}{2}$ .

450. *Peltiphyllum peltatum* Engler; a, infl.  $\times \frac{2}{3}$ ; b, fl.  $\times 1\frac{2}{3}$ .

2. *B. rotundifolia* Parry. Stems slender, 1 to 2 ft. high, stems and petioles glandular-hirsutulous; leaves round-cordate, very shallowly lobed, denticulate, 2 to 7 in. broad; petioles bristly at base, the bristles sometimes pinnately branched; calyx 10-nerved, hirsutulous, more or less glandular.—Montane, 2500 to 5000 ft.: San Gabriel Mts.; San Bernardino Mts.

3. *B. major* Gray. Fig. 452. Stem coarse and stout, 2 to 3 ft. high;

herbage somewhat glandular-scarious; leaves roundish-cordate, 4 to 8 in. broad, 5 to 9-cleft, the divisions coarsely incised and toothed; lowest stipules membranous, the upper foliaceous, partly clasping the stem, often unequal in size and unlike in shape, 5 to 20 lines broad, those at the middle of the stem broadest; calyx-tube at first hemispherical, soon subglobose or urn-shaped, the lobes triangular, acute; petals obovate or roundish ovate,  $2\frac{1}{2}$  lines long.—Wet meadows in woods, 3000 to 5500 ft.; Sierra Nevada from Mariposa Co. to Butte Co.; Humboldt Co. to Siskiyou Co.; n. to southern Ore.

4. **B. ranunculifolia** (Hook.) Greene. Stem 3 to 8 in. high; leaves with 3 almost distinct leaflets; leaflets broader than long or somewhat fan-shaped, mostly 3-lobed at apex, often with 1 or 2 supplementary lobes or teeth, 3 to 8 lines broad; flowers 3 lines long, in a compact or open cyme.—Montane, 5000 to 6000 ft., Plumas Co. (Spanish Peak) to the Siskiyou Mts.; n. to B. C. (*Saxifraga ranunculifolia* Hook.)

452. *Boykinia major* Gray; a, leaf  $\times \frac{1}{4}$ ; b, fl. stem  $\times \frac{1}{2}$ ; c, long. sect. of fl.  $\times 2$ .

#### 5. **BOLÁNDRA** Gray

Perennial herbs with bulblet-bearing rootstocks and leafy stems. Leaves thin, palmately-veined. Flowers loosely paniculate. Calyx cup-shaped. Petals greenish with purple border, narrowly lanceolate-attenuate. Pistils 2, lightly joined and free from the calyx. (Dr. H. N. Bolander, botanist of the California Geological Survey from 1865 to 1870.)

1. **B. californica** Gray. Fig. 453. Stems slender, 6 to 9 in. high, puberulent, the leaves glabrous; leaves round-cordate,  $\frac{1}{2}$  to  $1\frac{3}{4}$  in. broad, 5-cleft, the segments rounded and shallowly lobed or toothed; petioles 2 to 4 in. long; upper cauline leaves reduced, ovate, toothed, sessile; flowers 3 lines long; calyx-lobes and petals recurving.—Montane, wet rocks, 5000 to 8400 ft., Mariposa Co. to Lake Tahoe.

#### 6. **TIARÉLLA** L. FALSE MITRE-WORT

Perennial herbs with white flowers in a terminal raceme or panicle. Calyx adherent only to very base of

453. *Bolandra californica* Gray; a, habit  $\times \frac{1}{2}$ ; b, long. sect. of fl.  $\times 2\frac{1}{2}$ .

ovary, its lobes ovate. Petals linear-subulate with short claws, inconspicuous. Stamens 10, long and slender. Ovary 1-celled, compressed, 2-horned, the horns tapering into the long filiform styles. Capsule membranous, early dehiscent; valves unequal, one becoming elongated, the other remaining short. Seeds few at the base of each parietal placenta. (Diminutive of Greek tiara, a high cap, in allusion to the pistil.)

1. *T. unifoliata* Hook. Stems several, sparingly leafy,  $\frac{3}{4}$  to 2 ft. high; leaves roundish or ovate, 3 to 5-lobed, cordate at base, 1 to 4 in. broad, the lobes crenate; cauline leaves 2 or 3; basal leaves long-petioled (3 to 9 in.); panicle 3 to 9 in. long; calyx lobes minutely ciliate.—Cañons and woods near the coast, 200 to 2000 ft., Santa Cruz Mts. to Humboldt Co.; n. to Mont. and Alas.

#### 7. LITHOPHRAGMA Nutt.

Perennial herbs, the rootstocks tuberous or with grain-like bulblets. Stems simple, bearing a simple terminal raceme of several white or pink flowers. Leaves chiefly basal, their petioles with stipule-like dilations at the base. Calyx-tube adherent to the base or lower half of the ovary. Petals inserted in the sinuses of the calyx, cleft or toothed or entire, usually a little unequal. Stamens 10, included. Ovary 1-celled, with 3 parietal placentae and 3 very short styles. Capsule conical. Seeds numerous. (Greek lithos, rock, and phragma, fence, referring to the habitat.)

Petals white, entire or toothed; basal leaves crenate or shallowly lobed.

Calyx-tube turbinate; petals mostly 3-toothed at apex, the central tooth rather larger; ovary half free from the calyx.....1. *L. affinis*.

Calyx-tube shortly campanulate, broad.

Calyx-tube acutish at base; petals entire; ovary half-free from calyx.....

2. *L. cymbalaria*.

Calyx-tube rounded or truncate at base; petals toothed or entire; ovary almost wholly free from calyx.....3. *L. heterophylla*.

Petals pink or pinkish, palmately cleft into 3 equal lobes or sometimes 5 or 7-parted; basal leaves twice palmately divided.

Calyx broadly campanulate, acute at base.....4. *L. tenella*.

Calyx clavate.....5. *L. parviflora*.

1. *L. affinis* Gray. WOODLAND STAR. Stems 9 to 16 in. high, hispidulous, the hairs spreading and glandular; basal leaves often bronze-brown, roundish in outline and crenately lobed, varying into the cauline; cauline mostly parted into 3 broad divisions which are deeply incised or merely toothed; pedicels about equaling the turbinate calyx; raceme 7 to 10-flowered.—Open ground or open woods of the foothills, 150 to 2000 ft., common: Coast Ranges; Sierra Nevada. (Tellima affinis Bol.)

2. *L. cymbalaria* T. & G. Stems filiform, 10 to 17 in. high; basal leaves round-reniform, 3 to 5-lobed, 2 to 9 lines broad; cauline leaves mostly only a pair, these opposite or nearly so; flowers few, the slender pedicels exceeding the calyx; calyx broad, often with an obscure brownish or constricted band below the lobes; petals entire or nearly so.—Coastal, South Coast Ranges from San Luis Obispo Co. to San Diego Co. (Tellima cymbalaria Walp.)

3. *L. heterophylla* T. & G. Stems 1 to 2 ft. high; herbage hirsutulose or somewhat scabrous-pubescent, sometimes glandular at base; leaves roundish, crenately lobed,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. broad, the cauline very variable but mostly 3-parted with the divisions incised or toothed; pedicels mostly shorter than the calyx, often very short; calyx campanulate, truncate or rounded at base; sparingly puberulent; petals with 1 or 2 stout teeth on each side.—Shady ground in the hills, 500 to 3000 ft.: Coast Ranges; s. Sierra Nevada (Tulare Co. to Kern Co.); San Gabriel Mts.; San Bernardino Mts. (Tellima heterophylla H. & A.) Var. *BOLÁNDERI* Jepson. Leaves mostly very shallowly lobed; petals entire or with a small tooth on each side.—Lower foothills: Coast Ranges; Sierra Nevada. Var. *SCABRÉLLA* Jepson n. comb. Herbage and calyx scaberulous-glandular; petals entire.—Montane, 2000 to 9500 ft.: Sierra Nevada. (Tellima scabrella Greene.)

4. *L. tenella* Nutt. Stems slender, 4 to 13 in. high, roughish with short glandular hairs; leaves mostly reddish-purple beneath, roundish in outline, 3 to 5-lobed, the lobes again deeply lobed and toothed, often cuneiform; pedicels as long as calyx; calyx-tube with a ring-like swelling at middle, bearing within a circular yellow gland; calyx campanulate, its tube acutish at base; petals pinkish, 3 to 3½ lines long, palmately cleft into 3 equal lobes or the lateral lobes smaller.—Mountain slopes, 2000 to 3000 ft.: San Antonio Mts.; San Bernardino Mts.; Sierra Nevada from Kern Co. to Siskiyou Co., thence sw. to Humboldt Co.; n. to B. C., e. to Rocky Mts. and n. The petals are rotate, whereas in *L. heterophylla* they are usually a little ascending. (*Tellima tenella* Walp.)

5. *L. parviflora* (Pursh) Nutt. Similar to no. 4; calyx clavate, 3½ lines long, its tube rusty glandular-pubescent, somewhat annular-dilated at the middle; petals pink, 3-lobed, 4½ lines long.—Little Chico Creek, Butte Co.; n. to B. C., e. to Col. Very rare in Cal. (*Tellima parviflora* Hook.)

#### 8. TELLIMA R. Br.

Perennial herbs with horizontal rootstocks. Stems simple, with a long terminal raceme of many flowers. Calyx inflated-campanulate, 10-nerved. Petals whitish, changing to red, sessile by a broad base, laciniate-pinnatifid, reflexed. Stamens 10. Ovary almost completely inferior, with 2 parietal placentae alternate with 2 styles. Capsule conical. (Name an anagram of *Mitella*.)

1. *T. grandiflora* (Pursh) Dougl. FRINGE-CUPS. Stems 1½ to 3½ ft. high, hirsute with spreading hairs, as also the petioles; leaves roundish in outline, cordate at base, shallowly 3 to 5-lobed, serrate or crenate, 2 to 4 in. broad, the basal on petioles 2 to 9 in. long; flowers 3 to 4 lines long.—Woods, in or near the Redwood belt, Santa Cruz Mts. to w. Siskiyou Co.; n. to Alas. Apr.-May.

#### 9. MITELLA L.

Perennial herbs with rootstocks. Leaves all basal, the slender scape-like stems ending in a spike-like raceme of small flowers. Calyx-tube about half-coherent with the ovary. Petals cleft. Stamens (in ours) 5, the filaments very short. Styles 2, short. Capsule opening before the seeds are ripe, the valves short and broad, forming a narrow rim to the pod. (Diminutive of the Latin *mitra*, a cap, in allusion to the pod.)

Petals whitish, palmately 3-cleft at apex; calyx broadly turbinate, its lobes triangular-lanceolate with acute sinuses, erect or little spreading; stamens erect; anthers ovate; styles simple; raceme 1-sided.

Leaves obscurely lobed, crenate.....1. *M. trifida*.

Leaves commonly 3-lobed above, not crenate.....2. *M. diversifolia*.

Petals greenish, pinnately cleft into capillary divisions; calyx dish-shaped or saucer-shaped, its lobes short and broad with obtuse sinuses, spreading (the limb, therefore, merely undulate); stamens inflexed; anthers reniform; styles 2-lobed; raceme not 1-sided.

Stamens opposite the sepals (as in the two preceding).

Leaf-blades mainly glabrous.....3. *M. breweri*.

Leaf-blades with scattered white hairs.....4. *M. ovalis*.

Stamens opposite the petals.....5. *M. pentandra*.

1. *M. trifida* Graham. Plants 8 to 17 in. high; scapes and petioles retrorsely more or less hispid; leaves round-cordate, crenate, obscurely lobed, short-hispid with scattered hairs or glabrous, ¾ to 2 in. broad; calyx-lobes whitish; petals linear, 3-cleft at apex.—Montane, 6000 ft., Haypress Mdw., Siskiyou Co.; n. to Saskat.

2. *M. diversifolia* Greene. Plants 10 to 16 in. high; pubescence as in no. 1; leaves round-ovate in outline, cordate at base, most of them angularly 3-lobed above, the margin otherwise subentire, 1 to 2 in. long; calyx-lobes whitish; petals linear-cuneate, 3-cleft at apex.—Montane, 6000 ft.: Trinity Summit; w. Siskiyou Co.; n. to Wash.

454. *Mitella breweri* Gray; a, habit  $\times \frac{1}{2}$ ;  
b, fl.  $\times 3\frac{1}{2}$ ; c, open capsule  $\times 8\frac{1}{2}$ .

to *M. breweri*; petioles hairy, scapes glabrous; leaf-blades hispidulose with scattered hairs or glabrous; calyx-tube purple within; petals smaller, pinnately divided into about 5 to 7 capillary divisions; capsule 2 lines broad.—High montane, 6000 ft., Haypress Mdw., w. Siskiyou Co.; n. to Saskat., e. to Col.

#### 10. *HEUCHERA* L. ALUM ROOT

Perennial herbs with stout rootstocks. Leaves mostly basal, rounded and shallowly lobed. Flowering stems scape-like, bearing a panicle of small flowers in cymose clusters. Calyx-tube adnate to the lower  $\frac{1}{2}$  of the ovary. Petals white, very small, clawed, entire, inserted on the throat of the calyx, or sometimes none. Stamens 5, ours with slender filaments. Capsule 1-celled, with 2 parietal placentae, dehiscent between the 2 beaks. (J. H. Heucher, 1677-1747, German professor of medicine.)

Inflorescence spike-like; stamens shorter than the calyx-lobes.

Calyx 1 to  $1\frac{1}{2}$  lines long; petals present; se. Cal. . . . . 1. *H. novomexicana*.

Calyx 2 to 3 lines long; petals none; ne. Cal. . . . . 2. *H. cylindrica*.

Inflorescence paniculate; stamens equal to or exceeding the calyx-lobes.

Petioles 1 to 8 in. long; leaf-blades 1 to 4 in. long.

3. *M. breweri* Gray. Fig. 454. Plants 6 to 12 in. high; petioles and scapes with scattered rusty hairs; leaves round-cordate, shallowly lobed and crenate,  $1\frac{1}{2}$  to 3 in. broad, glabrous on the upper surface, nearly so below; pedicels 1 to 3 lines long; petals pinnately divided into 5 to 7 rather remote capillary divisions; capsule 1 line broad.—Montane, 7000 to 11,000 ft., Sierra Nevada from Tulare Co. to Sierra Co.; n. to B. C.

4. *M. ovalls* Greene. Plants 6 to 14 in. high; scapes and petioles rather densely pilose with downwardly turned hairs; leaves round-ovate with cordate base, hirsute with scattered but rather conspicuous white or brown hairs,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. wide; pedicels 1 line long; petals pinnately divided into 3 capillary divisions (sometimes one lateral division wanting, often two wanting and the petals thus linear-subulate), or sometimes into 5 divisions (acc. to Greene).—Low ground, river bottoms or wet banks, Humboldt coast. It propagates by stolons and forms a carpet in moist places.

5. *M. pentandra* Graham. Similar

455. *Heuchera novomexicana* Wheelock; a, habit  $\times \frac{1}{2}$ ; b, long. sect. of fl.  $\times 5$ .

- Calyx turbinate, greenish,  $\frac{1}{2}$  to  $1\frac{1}{4}$  lines long; puberulent. . . 3. *H. micrantha*.  
 Calyx hemispheric, reddish, 1 to 2 lines long, densely hairy. 4. *H. pilosissima*.  
 Petioles  $\frac{1}{2}$  to 3 in. long; leaf-blades  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; calyx reddish or purplish, the lobes greenish-tipped. . . . . 5. *H. rubescens*.

1. *H. novomexicana* Wheelock. Fig. 455. Plants 6 to 12 in. high, glandular-puberulent; scapes slender; leaves 4 to 8 lines broad, roundish-cordate, the lobes roundish, ciliate; petioles  $\frac{1}{2}$  to 2 in. long; calyx turbinate to campanulate, yellowish; petals white, inconspicuous.—White Mts.; e. to N. Mex.

2. *H. cylindrica* Dougl. Plants 6 to 10 in. high, hirsutulose; scapes stoutish; leaves reniform or slightly cordate, 6 to 10 lines broad, hispidulous, the rounded lobes mucronate; petioles hirsute; calyx greenish, campanulate, puberulent; petals none.—Montane, 9000 ft., Modoc Co. n. to B. C. Var. *GLABELLA* Wheelock. Scapes and petioles puberulent or subglabrous; leaves 3 to 6 lines broad, truncate, glabrous, except the ciliate margins; spikes denser; calyx less hairy, yellowish.—Modoc Co.; n. to B. C. (*H. glabella* T. & G.)

3. *H. micrantha* Dougl. Fig. 456. Plants 1 to 3 ft. high; petioles and stems pilose-hirsute, the leaves hirsutulous and the inflorescence glandular-puberulent; leaves round- or ovate-cordate, 2 to 4 in. long, obtusely lobed and crenately toothed; flowers in an ample loose panicle; calyx shorter than the slender pedicels; petals narrowly oblong, curving, rather shorter than the calyx.—Near the coast, 100 to 1500 ft., Monterey Co. to Humboldt Co.; Sierra Nevada, 2200 to 7000 ft., from Tulare Co. to Butte Co. and n. to Siskiyou Co.; n. to Wash.

4. *H. pilosissima* F. & M. Plants 1 to 2 ft. high; herbage very glandular-villous; flowers in close clusters, the panicle less ample than in no. 3; calyx globular, exceeding or almost equaling the pedicel.—Near the coast, Monterey Co. to Humboldt Co.

5. *H. rubescens* Torr. Plants 5 to 12 in. high, the scapes sparingly hirsutulose or nearly glabrous; leaves  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. broad, round-cordate, shallowly lobed, the lobes crenate with subacute teeth, the teeth ciliate, bristle-tipped; panicle open or narrow; calyx 2 to 3 lines long, its tube turbinate-cylindric, becoming urnshaped in age; petals linear to narrow-oblongate; stamens as long as or longer than the petals.—Montane on rocks, 6000 to 10,000 ft., e. slope of the Sierra Nevada in Mono Co., rare or occasional on the w. slope; e. to Utah. Var. *PARISHII* Jepson n. comb. Leaf-lobes of the older leaves mostly very short and rounded, entire or sparingly toothed; calyx-tube cylindric-turbinate,  $2\frac{1}{2}$  to 3 lines long.—San Bernardino Mts. (*H. parishii* Rydb.) Var. *ÉLEGANS* Jepson n. comb. Similar to var. *parishii* but calyx bright purple; flowers 3 to 4 lines long; calyx-tube cylindric or in age a little urnshaped; stamens not exerted.—San Gabriel Mts. (*H. elegans* Abrams.) Var. *PRINGLEI* Jepson n. comb. Leaves 4 to 8 lines broad, truncatish at base; petioles short ( $\frac{1}{2}$  to  $\frac{3}{4}$  or rarely to 2 in. long).—Montane, mostly 6000 to

456. *Heuchera micrantha* Dougl.; a, habit  $\times \frac{1}{4}$ ; b, fl.  $\times 4$ .

10,000 ft., w. slope Sierra Nevada from Tulare Co. to Siskiyou Co. (*H. pringlei* Rydb.)

### 11. *TOLMIEA* T. & G.

Perennial herb. Stems ending in a raceme. Leaves chiefly basal. Petals 5 or 4, filiform, subulate, elongated, inserted in the sinuses of the calyx, recurved, persistent. Calyx tubular, with 5 unequal lobes (2 large, 3 small), deeply cleft down one side, with protruding pistil. Stamens 2 or 3, with broad filaments, inserted in throat of calyx opposite the upper and lateral lobes. Calyx narrow. Ovary free from the calyx, long-oblong, attenuate at base, 2-cleft at apex; placentae 2, parietal; styles 2, slender. Capsule membranous, with 2 diverging equal beaks, tapering at base. (Dr. W. F. Tolmie, medical officer of the Hudson Bay Co. at Fort Vancouver in 1832 and after, botanical collector.)

1. *T. menziesii* (Pursh) T. & G. Fig. 457. Stems slender,  $1\frac{1}{2}$  to  $2\frac{1}{4}$  ft. high; leaves round-cordate or cordate-ovate, lobed, irregularly serrate,  $1\frac{1}{4}$  to  $3\frac{1}{2}$  in. broad; flowers 4 lines long.—Woods along the coast, Mendocino Co. to w. Siskiyou Co.; n. to Alas. (*Leptaxis menziesii* Raf.)

457. *Tolmiea menziesii* T. & G.; a, leaf  $\times \frac{1}{3}$ ; b, fl. stem  $\times \frac{1}{3}$ ; c, fl.  $\times 3$ ; d, capsule  $\times 1\frac{1}{2}$ .

### 12. *CHRYSOPLERIUM* L. GOLDEN SAXIFRAGE

Low herbs with leafy stems, ours perennial and with opposite leaves. Flowers solitary, small, greenish-yellow. Calyx rotate, 4-lobed. Petals none. Stamens 4 or 8. Capsule 1-celled, with 2 parietal placentae. (Greek *chrysos*, gold, and *splen*, spleen, the plants used medicinally.)

458. *Chrysosplenium glechomaefolium* Nutt.; a, fl. branchlet  $\times 1$ ; b, fl.  $\times 5$ ; c, stamen  $\times 15$ .

1. *C. glechomaefolium* Nutt. Fig. 458. Stems ascending, 5 to 10 in. long; leaves roundish, crenate, truncatish and entire at base, 3 to 7 lines long; flowers  $1\frac{1}{2}$  to 2 lines broad.—Mucky ground in shade, Mendocino and Humboldt coast; n. to B. C.

### 13. *PARNASSIA* L. GRASS OF PARNASSUS

Glabrous perennial herbs with entire leaves in a basal tuft. Stems scape-like, bearing a single terminal white flower and commonly a single small sessile leaf. Sepals slightly united at base. Petals greenish- or yellowish-veined, each bearing at base a cluster of gland-tipped sterile filaments. Stamens 5, alternate with the petals. Ovary 1-celled; stigmas 4 (or 3),

sessile, opposite the same number of placentae. Capsule 3 or 4-valved, the valves placenta-bearing along their middle. (Called Grass of Parnassus by Dioscorides, from Mt. Parnassus.)

Petals entire, not clawed, many-veined; leaves ovate, cuneate at base.....

1. *P. palustris*.

Petals fimbriate at the basal sides, clawed, few-veined.

Leaves oval; petioles 6 to 12 lines long, broad; staminodia 2 lines long; bract ovate.....

2. *P. cirrata*.

Leaves cordate to reniform; petioles 2 to 5 in. long; staminodia  $\frac{1}{2}$  line long; bract cordate.....

3. *P. fimbriata*.

1. *P. palustris* L. var. *californica* Gray. Fig. 459. Scape 9 to 16 in. high; leaves round-ovate to elliptic, 1 to  $1\frac{3}{4}$  in. long, contracted at base into a petiole; petals oval or obovate, 6 to 9 lines long; sterile filaments capillary, 20 to 24 in a set, united to the middle. — High montane, wet meadows, 6300 to 11,000 ft., Sierra Nevada from Tulare Co. to Eldorado Co. and n. to Mt. Shasta; near the coast, 1500 to 2500 ft., Santa Cruz Mts. and Mt. Tamalpais and n. to southwestern Ore.

2. *P. cirrata* Piper. Similar to no. 1; rootstock more slender; petals not so broad. — Montane, uncommon:

460. *Philadelphus lewisii* var. *californicus* Gray; a, fl. branchlet x  $\frac{1}{2}$ ; b, capsule x 2.

459. *Parnassia palustris* var. *californica* Gray; a, habit x  $\frac{1}{4}$ ; b, long. sect. of fl. x  $\frac{3}{4}$ ; c, gland x  $1\frac{1}{2}$ ; d, cross sect. of ovary x  $2\frac{1}{2}$ .

North Fork San Gabriel River; Mt. San Bernardino; upper Sacramento River.

3. *P. fimbriata* König. Also similar to no. 1; leaves  $\frac{3}{4}$  to  $1\frac{3}{4}$  in. broad. — Mountain meadows, Warner Mts., Modoc Co.; n. to Alas., e. to Col.

#### 14. *PHILADELPHUS* L. SYRINGA. MOCK ORANGE

Deciduous shrubs with opposite leaves. Flowers white, showy, in ours in a terminal raceme or thyrses. Calyx-limb 4 or 5-parted, valvate in the bud, persistent. Petals 4 or 5, convolute in the bud. Stamens 20 to 40. Ovary inferior, in ours 4-celled; styles 4 (3 to 5), distinct above the middle or at apex. Capsule loculicidally 4-valved, the valves commonly splitting a little at apex between the partitions; placentae projecting from above the middle of the axis, bearing many seeds. (Name of an Egyptian King, the application not obvious.)

1. *P. lewisii* Pursh var. *californicus* Gray. Fig. 460. Loosely branching, 4 to 11 ft. high; herbage varying from

glabrous or with very slight trace of pubescence to markedly hairy; leaves ovate, acute, commonly entire or a little dentate,  $1\frac{1}{2}$  to 3 in. long, on petioles 2 to 4 lines long; flowers  $\frac{3}{4}$  to 1 in. broad; petals 4, elliptic; styles 2 or 3, distinct for the upper  $\frac{2}{3}$  or at apex.—Foothills and lower mountains, 800 to 4500 ft.: coastal mts. of s. Cal.; Sierra Nevada. Var. *GORDONIANUS* Jepson n. comb. More pubescent; leaves more freely dentate.—Along the coast, Humboldt and Del Norte Cos.; n. to B. C. (*P. gordonianus* Lindl.) The slender shoots of both varieties were used as arrow shafts for war and the chase by the native tribes.

#### 15. *CARPENTÉRIA* Torr.

Shrub with opposite entire leaves and white flowers in a terminal cyme. Calyx 5 (or 6)-parted, its very short tube adnate to middle of ovary. Petals

461. *Carpentaria californica* Torr.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, cross sect. of ovary  $\times 1$ .

5 or 6 (to 8). Stamens numerous (150 to 200). Ovary incompletely 5 (2 to 8)-celled, that is, with 5 (2 to 8) partitions originating on the walls and approximating but not united in the axis (unless at base), the inner margins bearing on each side a placental plate; placental plates projecting into the incomplete "cells" (2 plates to each "cell"), and bearing numerous ovules on both surfaces. Style one, short, bearing commonly 10 longitudinal stigmatic ridges, each pair of ridges representing a 2-lobed stigma. Capsule broadly conical, loculicidal. (Professor Carpenter of Louisiana.)

1. *C. californica* Torr. Fig. 461. Erect, 3 to 8 ft. high; leaves oblong, tapering to base and apex, the margins somewhat revolute, green and glabrous above, white-tomentulose beneath, 2 to 4 in. long, short-petioled; flowers 2 to  $2\frac{1}{2}$  in. broad; petals orbicular, rotately spreading.—Sierra Nevada foothills, 2000 to 3000 ft., between the San Joaquin River and Kings

River: Backbone Creek; Grapevine Spring; Sycamore Creek. Local species.

#### 16. *JAMESIA* T. & G.

Shrubs with opposite deciduous leaves. Flowers in terminal cymose clusters. Calyx 5-lobed, its tube joined to lower part of the ovary. Petals spreading. Stamens 10, the alternate shorter; filaments dilated. Ovary conical, with 3 to 5 parietal placentae; styles 3 to 5. Capsule incompletely 3 to 5 or 7-celled. Seeds many, striate-reticulate. (Dr. Edwin James, botanist and historian of Long's expedition to the Rocky Mts., 1820.)

1. *J. americana* T. & G. var. *californica* Jepson n. comb. Low shrub  $\frac{1}{2}$  to 3 ft. high, with shreddy gray or reddish bark, the young parts and calyces pubescent; leaves roundish to ovate, coarsely serrate, green and pubescent above, pale and densely strigose beneath,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, on short or sometimes long petioles; flowers deep pink; calyx-lobes narrow-ovate, acute, rarely obtuse; petals oblong or obovate,  $3\frac{1}{2}$  lines long; capsule (including the persistent styles) 5 lines long, surpassing the now lanceolate calyx-lobes.—Granite cliffs and rocky cañon walls, 8500 to 12,000 ft.: s. Sierra Nevada from Palisade Creek, Fresno Co., to Kern Cañon, Sawtooth Range and Mt. Whitney; Panamint Mts. (*Edwinia californica* Small.)

#### 17. *WHIPPLEA* Torr.

Small low under-shrub with opposite leaves. Flowers small, white, in short racemes on a terminal naked peduncle. Calyx-tube wholly adnate to the

lower portion of the ovary which is about  $\frac{3}{8}$  free. Stamens 8 to 12, those opposite the petals somewhat shorter, the filaments all dilated at the base or below the middle. Ovary 3 to 5-celled, with a single suspended ovule in each cell; styles 3 to 5, distinct, subulate, deciduous. Capsule septicidally dehiscent into 3 to 5 cartilaginous 1-seeded portions which open down the ventral suture. (Lieut. A. W. Whipple, U. S. Army, commander of the Pacific Railroad Expedition from the Mississippi River to Los Angeles in 1853 and 1854.)

1. *W. modesta* Torr. Stems slender, diffuse or trailing; herbage and calyx-tube pubescent; calyx-lobes glabrous; leaves ovate or oval-ovate, 3-nerved, crenate above the middle,  $\frac{3}{4}$  to  $1\frac{3}{4}$  in. long, short-petioled; racemes capitate or nearly so, about 4 to 9-flowered, the flowers soon becoming somewhat greenish; petals oblong or ovate, contracted at base,  $\frac{3}{4}$  to  $1\frac{1}{4}$  lines long, larger than the linear calyx-lobes; capsule globular.—Woods and thickets, Coast Ranges from Monterey Co. to Solano and Humboldt Cos.; n. to Ore.

#### 18. *RIBES* L. GOOSEBERRY. CURRANT

Shrubs, either unarmed or prickly. Leaves alternate, palmately lobed, the stipules adnate or none. Flowers in racemes or solitary, the pedicels with bractlets. Calyx-lobes, petals and stamens 5 in all ours except *R. speciosum*. Calyx-tube adnate to the 1-celled ovary and more or less produced beyond it. Petals inserted on the throat of the calyx, the stamens alternating with them. Placentae 2, parietal. Styles 2, distinct or more or less united; stigma terminal. Fruit a berry. (Ancient Arabic name.)

##### A. Stems unarmed; berry spineless; peduncles bearing a several to many-flowered raceme.—Subgenus *RIBESIA* (Currants).

Flowers yellow; leaves convolute in the bud.....1. *R. aureum*.  
Flowers red, white, or greenish; leaves plaited in the bud.

Calyx-tube cylindric or campanulate.

Flowers white or greenish white.

Calyx-tube cylindric,  $2\frac{1}{2}$  to 3 times as long as broad; berry crimson.....

2. *R. cereum*.

Calyx-tube campanulate, 1 to nearly 2 times as long as broad; berry black..

3. *R. viscosissimum*.

Flowers pink or red.

Calyx-lobes erect in anthesis, the calyx-tube bowl-shaped....4. *R. nevadense*.

Calyx-lobes rotate or recurving in anthesis.

Style glabrous; leaves thinnish.....5. *R. sanguineum*.

Style pubescent; leaves thickish.....6. *R. malvaceum*.

Calyx-tube rotately spreading or saucer-shaped; leaves resinous-dotted below.

Leaves maple-like, deciduous.

Stems ascending; ovary with stalked glands.....7. *R. laxiflorum*.

Stems erect; ovary with sessile glands.....8. *R. bracteosum*.

Leaves leathery, evergreen.....9. *R. viburnifolium*.

##### B. Stems bearing spines at the nodes below the leaves and often prickly; berry spiny or spineless; peduncles mostly 1 to few-flowered.—Subgenus *GROSSULARIA* (Gooseberries).

Flowers 5-merous; petals much shorter than the calyx-lobes; calyx-lobes reflexed in flower, later erect; stamens exerted or not exerted.

Calyx-tube rotately spreading or saucer-shaped; berry with gland-tipped hairs.

Leaves glabrous or nearly so; berry black.....10. *R. lacustre*.

Leaves very glandular-sticky; berry red.....11. *R. montigenum*.

Calyx-tube cylindric or campanulate.

Styles hairy; ovary and berry glabrous and spineless.

Stamens longer than the calyx-lobes.....12. *R. divaricatum*.

Stamens shorter than the calyx-lobes.....13. *R. inerme*.

Styles glabrous.

Berry spineless, sometimes glandular-hairy.

Ovary and berry glabrous.

Calyx-tube  $1\frac{1}{4}$  to 2 times as long as the calyx-lobes.....

14. *R. leptanthum*.

Calyx-tube  $\frac{3}{4}$  to as long as the calyx-lobes....15. *R. quercetorum*.

Ovary and berry more or less hairy.....16. *R. velutinum*.

Berry spiny.

Anthers lanceolate to linear, apiculate or constricted at apex; stamens

$1\frac{1}{2}$  to 2 times longer than the petals.

Calyx-tube much longer than broad.

Berry with long glandless spines, sometimes also with very

short glandular ones.....17. *R. roezlii*.

- Berry with very short regular gland-tipped spines..... 18. *R. amarum*.  
 Calyx-tube as broad or nearly as broad as long.  
 Calyx lurid purple to greenish white.  
 Leaves glabrous or nearly so and non-glandular; ovary with mostly equal non-glandular bristles..... 19. *R. californicum*.  
 Leaves mostly pubescent and mostly glandular below; ovary with long and short more or less gland-tipped bristles..... 20. *R. menziesii*.  
 Calyx dull white; leaves and especially petioles more or less viscid-glandular ..... 21. *R. victoris*.  
 Anthers oval or elliptic, not apiculate at apex.  
 Stamens scarcely exceeding the petals; calyx greenish-white; berry with very unequal spines; leaves pubescent..... 22. *R. binominatum*.  
 Stamens twice as long as the petals; calyx crimson or red; berry with subequal spines.  
 Leaves glabrous or nearly so.  
 Calyx-tube about as broad as long; berry with long glandless spines..... 23. *R. marshallii*.  
 Calyx-tube longer than broad; berry with very short glandular spines..... 24. *R. lobbi*.  
 Leaves soft pubescent, commonly with intermixed short bristly hairs..... 25. *R. sericeum*.  
 Flowers 4-merous, red, showy; petals as long as the calyx-lobes; calyx-tube short, swollen into a ring or annulation, its lobes erect; stamens long-exserted. 26. *R. speciosum*.

1. *R. aureum* Pursh. GOLDEN CURRANT. Shrub 4 to 8 ft. high, nearly glabrous, not glandular; leaves  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. broad, 3 to 5-lobed, mostly obtuse or truncate at base, the lobes rounded, entire or few-toothed or incised; racemes about 1 in. long, loose, with few to several flowers, the bracts foliaceous; flowers golden yellow, spicy fragrant; calyx salverform, its

462. *Ribes cereum* Dougl.; fl. branchlet  $\times 1$ .

2. *R. cereum* Dougl. Fig. 462. Low broad much branched bush 1 to 3 or 5 ft. high; foliage pleasantly but somewhat heavily fragrant; leaves minutely glandular,  $\frac{3}{4}$  to 1 in. (less commonly  $\frac{1}{2}$  to  $1\frac{1}{4}$  in.) wide, shallowly 3 (or 5)-lobed or cleft, the lobes serrate or incised; racemes drooping, 2 to 9-flowered; flowers 4 to 5 lines long; calyx white or pinkish, tubular, its short lobes rotate, white; stamens included, with very short filaments, inserted high on the tube; petals white, very small, the blade transversely oblong with a very short broad claw; berry crimson, glabrous, or with minute gland-tipped hairs; 3 lines in diameter.—High montane, 6200 to 12,050 ft.: Mt. Shasta and Modoc Co. south through the Sierra Nevada to Mt. Pinos and the San

slender tube 2 to 3 times the length of the oval lobes; lobes  $1\frac{1}{2}$  to 2 lines long; stamens not surpassing the petals; ovary glabrous; berry yellow, crimson or black, 2 to 3 lines long.—Moist land or banks of streams or lakes, interior plateau, e. of the Sierra Nevada from Inyo Co. to Siskiyou Co.; n. to B. C., e. to Rocky Mts. Var. *GRACILLIMUM* Jepson n. comb. Flowers "scentless"; calyx-tube more slender and its lobes shorter ( $1\frac{1}{2}$  to 2 lines long).—Coastal: Wildcat Creek, Contra Costa Co.; Mt. Hamilton Range; Templeton; s. to Glendora and Riverside. (*R. gracillimum* Cov. & Britt.)

463. *Ribes viscosissimum* Pursh; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 1$ ; c, fr.  $\times 1$ .

Gabriel, San Bernardino and San Jacinto mountains; e. to Rocky Mts., n. to B. C.

3. *R. viscosissimum* Pursh. Fig. 463. Leafy shrub 1 to 3 ft. high, with reddish shreddy bark and fragrant foliage; herbage glandular-hispidulose and also puberulent, especially on the branchlets and petioles; leaves cordate-rounded, shallowly 3-lobed with rounded lobes and open sinuses, crenate,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. broad; racemes ascending, short, somewhat corymb-like, 3 to 13-flowered; bracts oblong, conspicuous; flowers 8 lines long; pedicels 2 to 5 lines long; calyx greenish or pinkish, its tube nearly as broad as long, its oblong lobes at least  $\frac{1}{2}$  length of tube; petals dull white, broadly ovate, very obtuse, their tips approximate and so narrowing the opening a little; stamens not exceeding the petals; ovary covered with gland-tipped hairs; berry black, more or less glandular-bristly.—High mountains, 8000 to 9500 ft.: Sierra Nevada from Tulare Co. to Mariposa Co.; e. to Rocky Mts., n. to B. C.

463. *Ribes viscosissimum* Pursh.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 2$ ; c, fr.  $\times \frac{1}{2}$ .

Passing by intermediate states into the var. *HALLII* Jancz. Calyx purple-tipped; ovary glabrous; berry with a bloom.—Sierra Nevada from Mariposa Co. n. to Modoc Co., thence w. to Mt. Shasta and Trinity Summit.

4. *R. nevadense* Kell. Fig. 464. Slender diffuse or erect shrub 3 to 6 ft. high; foliage and racemes similar to *R. sanguineum*, but the flowers very much shorter; calyx reddish, 1 to 2 lines long, its tube short and broad, almost bowl-shaped, its lobes erect; petals white, slightly shorter than the calyx-lobes; style very short; berry blue-black but covered with a white bloom.—Higher mountains, 4500 to 7000 ft.: North Coast Ranges from Trinity Co. to Siskiyou Co.; Sierra Nevada from Shasta Co. to Tulare Co.; s. to the San Gabriel, San Bernardino and San Jacinto mountains.

Nevada from Shasta Co. to Tulare Co.; s. to the San Gabriel, San Bernardino and San Jacinto mountains.

5. *R. sanguineum* Pursh. FLOWERING CURRANT. Stems slender, erect or spreading, 4 to 9 ft. high; bark brownish, shreddy; foliage sticky when young; leaves roundish-cordate in outline, 3-lobed or with 2 supplementary lobes, rather finely serrate,  $1\frac{1}{2}$  to 3 in. broad, green above, pale pubescent or tomentulose beneath; stipules glandular-bristly; racemes erect, rather long-peduncled; bracts crimson; flowers blood red, 6 to 7 lines long; calyx funnelform, its lobes ascending; petals short-spatulate; ovary sprinkled with short stipitate glands, otherwise glabrous, rarely puberulent; berry blue-black, with bloom, 4 to 5 lines in diameter.—High montane: Siskiyou and Del Norte Cos.; n. to B. C. Var. *GLUTINOSUM* Loud. Fig. 465. Racemes drooping; flowers deep or pale pink.—Cañons or on northward slopes near the coast from San Luis Obispo Co. to Berkeley and Mt. Tamalpais and n. to Del Norte Co.; common. Var. *DEDUCTUM* Jepson n. comb. Six to 16 ft. high; leaves thin; flowers pale or whitish, few in a mostly loose drooping raceme; berry ripening slowly.—Very dense shade of forests: San Mateo Co.; Berkeley; Eureka. Local ecological form, perhaps not of even varietal value. (*R. deductum* Greene.)

465. *Ribes sanguineum* var. *glutinosum* Loud.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 1$ ; c, fr.  $\times \frac{1}{2}$ .

6. *R. malvaceum* Sm. Stems stout, usually many from the base, strictly erect and compact, 4 to 6 ft. high; leaves thick, conspicuously rugulose, slightly glandular-scabrous above, more or less white-tomentulose beneath,  $\frac{3}{4}$  to  $2\frac{1}{4}$  in. broad; flowers rose-color, very pale pink or whitish, 4 to 5 lines long; calyx broadly cylindric, its lobes rotate or spreading; petals very broad, truncate; ovary white-hairy and with short gland-tipped hairs; berry ripening very rapidly, glaucous, somewhat hispidulous or hairy, the pulp soft and sweet.—Wooded or dry open hills: inner North Coast Range from Tehama Co. to Mt. Diablo; Marin Co.; s. to coastal S. Cal. Dec.-Apr. Var. *VRIDIFOLIUM* Abrams. Foliage greener than in the species and inflorescence more glandular.—San Gabriel Mts. Var. *INDECORUM* Jancz. Flowers whitish, nearly sessile,  $2\frac{1}{2}$  to  $3\frac{1}{2}$  lines long; style very short.—Dry chaparral belt, Ventura Co. to San Diego Co.

7. *R. laxiflorum* Pursh. Stems decumbent or ascending, 3 to 8 ft. long; leaves roundish cordate in outline, nearly glabrous above, pubescent beneath,  $2\frac{1}{2}$  to 5 in. broad, 5-lobed or with 2 supplementary lobes at base, serrate; racemes erect,  $1\frac{1}{2}$  to 4 in. long; pedicels  $2\frac{1}{2}$  to 6 lines long; bracts lanceolate; flowers purplish; calyx saucer-shaped, 3 lines broad; petals minute, fan-shaped, truncate or retuse, short-clawed; ovary, pedicels and rachis whitish pubescent, the former densely, the latter two lightly sprinkled with long-stalked glands; berry black, 2 to 3 lines long, with a few long-stalked glands.—Wet places in woods, Humboldt Co.; n. to B. C. and Alas.; Siberia. Apr.

8. *R. bracteosum* Dougl. STINK CURRANT. Tall erect shrub 4 to 8 or 14 ft. high; leaves large, deeply 5-lobed with doubly serrate divisions, 2 to 8 or 10 in. broad, nearly glabrous but the upper side minutely strigulose, the under side sprinkled with resin dots; petioles long; racemes erect, 5 to 7 in. long, with numerous (30 or more) "greenish-white" flowers; bracts persistent, filiform or lanceolate, the lower petioled; calyx rotately expanding or saucer-shaped; petals minute; stamens very short; berry black, covered with a bloom, resin-dotted, 4 lines long.—Stream banks and bottoms along the coast: Mendocino Co. to Del Norte Co.; n. to Ore. and Alas. May-June.

9. *R. viburnifolium* Gray. Straggling evergreen bush; leaves glabrous, leathery, oval, rounded at apex or sometimes retuse, entire or sparsely crenate, 9 to 14 lines long, sprinkled beneath with resin dots; racemes erect; pedicels long, filiform; flowers small, pink; calyx rotate; petals minute,  $\frac{1}{4}$  as long as the calyx-lobes; stamens very short; berry glabrous.—Santa Catalina Isl.; L. Cal.

10. *R. lacustre* Poir. SWAMP GOOSEBERRY. Stems prostrate or ascending, 3 to 4 ft. long; spines at the nodes 3, the stems prickly or sometimes naked; leaves nearly or quite glabrous,  $\frac{3}{4}$  to  $2\frac{1}{4}$  in. broad, deeply and incisely 3 or 5-lobed with mostly open sinuses, the lobes incised and serrate; racemes at first erect, later recurving, 1 to 2 in. long, with 7 to 12 greenish flowers on pedicels 2 to 3 lines long; calyx saucer-shaped; stamens about the length of the petals, minute; ovary with scattered gland-tipped prickles, otherwise glabrous; berry black, 2 lines broad, with weak gland-tipped bristles.—Cold wet mountain meadows, 5000 to 6000 ft., Humboldt Co. to Siskiyou Co.; n. to Alas., e. to N. Eng.

11. *R. montigenum* McCl. Fig. 466. Low or straggling, much branched, 1 to 2 ft. high, the stems with 1 to 3 or 4 spines at the nodes, the internodes bristly-prickly or nearly naked; herbage short-pubescent, glandular-sticky; leaves small (4 to 8 lines broad), 3 to 5-parted, the lobes incised; flowers reddish brown, peduncles short; racemes 5 to 7-flowered,

466. *Ribes montigenum* McCl.; a, fl. branchlet  $\times 1$ ; b, fl. from above  $\times 2$ .

the pedicels very short; calyx greenish, fading pinkish, its tube saucer-shaped,  $2\frac{1}{2}$  to 3 lines broad; petals dull crimson or deep red, fan-shaped,  $\frac{1}{2}$  line long; stamens inserted in the sinuses of the glandular 5-lobed disk, very short; ovary hairy and with glandular prickles intermixed; berry light red with scattered gland-tipped or rarely glandless bristles or sometimes smooth,  $2\frac{1}{2}$  lines in diameter.—Dry slopes on high mountains, 7500 to 12,500 ft.: San Gabriel, San Bernardino and San Jacinto mountains; Sierra Nevada from Tulare Co. to Placer Co. and n. to Siskiyou Co.; e. to Rocky Mts., n. to B. C.

12. *R. divaricatum* Dougl. STRAGGLY GOOSEBERRY. Fig. 467. Shrub 4 to 6 ft. high, with very long straggling branches; bark whitish or dull gray; herbage glandular when young; spines at the nodes 1, sometimes 3; leaves green and only minutely pubescent above, pubescent or puberulent and usually pale beneath,  $\frac{3}{4}$  to  $1\frac{1}{2}$  (or  $2\frac{1}{4}$ ) in. broad, 3 to 5-cleft, truncate or subcordate at base, rarely rounded; racemes drooping, loosely 3 to 5-flowered, sometimes 2 or 6-flowered; pedicels 3 to 4 lines long, with a small roundish bract at base; flowers 3 to 5 lines long; calyx-lobes broadly oblong, obtuse,

467. *Ribes divaricatum* Dougl.; a, fl. branchlet  $\times 1$ ; b, long. sect. of fl.  $\times 4$ ; c, fr. cluster  $\times 1$ .

green without, dull purple within, longer than the bowl-shaped tube; petals white, fan-shaped, plane,  $\frac{1}{2}$  to 1 line long; stamens and style exserted, the latter deeply cleft, densely long-villous at the middle; ovary and berry glabrous and spineless.—Shaded cañon bottoms and flats: Coast Ranges, mostly near the coast, from San Bernardino Valley to Humboldt Co.; Shasta Co. to Lassen Co.; n. to B. C.

13. *R. inérme* Rydb. Stems slender, often simple, 2 to 5 ft. high; bark whitish; spines at nodes 1 to 3, short (1 to 2 lines long) or none; prickles none; leaves quite glabrous or sparingly pubescent, especially beneath, 1 to 2 in. broad, subcordate, 5-cleft, the lobes incisely toothed; petioles usually with a few scattered bristles; flowers 1 to 3, nodding, greenish or purplish, 3 lines long; ovary and calyx characteristically glabrous, the calyx-tube about as long as the lobes; stamens twice as long as the minute petals; style villous below the middle; ovary glabrous; berry smooth, glabrous,

dark purple, 4 lines in diameter.—Mountains, 3500 to 8000 ft.: Sierra Nevada from Tulare Co. n. to Modoc and Siskiyou Cos.; e. to Rocky Mts., n. to Alb. and B. C. The berries make an agreeable sharp sauce and are prized by the mountaineers. Var. *KLAMATHENSE* Jepson n. comb. Leaves villous; calyx hirsute; berry black (ex char.).—Siskiyou Co.; s. Ore. (*Grossularia klamathensis* Cov.)

14. *R. leptanthum* Gray var. *lasianthum* Jepson n. comb. Freely, intricately and rigidly branched, forming low round bushes 1 to 3 ft. high; bark white, shreddy; stems with 1 to 3 slender spines at the nodes, rarely with prickles; leaves minutely puberulent or nearly glabrous, 4 to 6 lines wide, roundish, deeply cleft, the petioles pubescent; racemes 1 or 2 (rarely 3 or 4)-flowered; calyx yellow, its tube cylindrical, 3 to 4 lines long (2 to 3 times as long as broad), hairy-pubescent; petals yellowish, equaling the stamens, often annular-dilated above the ovary; ovary glabrous; berry smooth, crimson,  $2\frac{1}{2}$  to  $3\frac{1}{2}$  lines in diameter.—High mountains, 7000 to 10,000 ft.: Sierra Nevada from Tulare Co. to Nevada Co. (*R. lasianthum* Greene.)

15. *R. quercetorum* Greene. Bush 2 to 4 ft. high; stems not at all or sparingly bristly; spines mostly solitary; leaves deeply cleft and incised-toothed, finely puberulent, rarely subglabrous, usually minutely glandular, 4 to 6 lines broad; flowers 3 to 4 lines long; calyx-lobes little longer than the petals; calyx yellow, minutely puberulent, its tube nearly as broad as long in early anthesis; petals a little longer than the stamens; style glabrous, undivided; ovary and berry glabrous and smooth; berry  $2\frac{1}{2}$  to 3 lines in diameter.—Foothills, on open oak-covered or rocky slopes, Sierra Nevada from Tuolumne Co. to Kern Co.; South Coast Ranges from Monterey Co. southward; in or near the San Jacinto Range and southwards.

16. *R. velutinum* Greene. Similar to *R. leptanthum*; leaves minutely and often densely pubescent; calyx yellow, its tube very short (1 line long), as broad as or broader than long in the fresh flower; ovary lightly or densely hairy, the hairs sometimes gland-tipped and bristle-like.—Mountain slopes, mostly of the interior plateau, 3000 to 8200 ft.: Trinity Co. to Siskiyou Co., e. to Modoc Co., thence s. on the e. side of the Sierra Nevada to Mt. Pinos; Ore. to Utah and Ariz. Var. *GLANDULIFERUM* Jepson n. comb. Berry densely (sometimes sparsely) covered with long gland-tipped hairs, and also more or less finely pubescent.—Siskiyou, Tulare and Kern Cos. (*R. glanduliferum* Hel.)

468. *Ribes roezlii* Regel.;  
fl. and part of stem  $\times 1\frac{1}{2}$ .

17. *R. roezlii* Regel. Fig. 468. Stout shrub 2 to 3 or 5 ft. high and half again or twice as broad, with many long diffusely spreading branches; nodes with 1 to 3 spines; prickles none; leaves pubescent or glabrous, 3 to 5-cleft into toothed lobes, 6 to 11 lines broad; pedicels 1 (or 2)-flowered; flowers dull red, 6 to 8 lines long; calyx dull red, puberulent, often densely whitish-pubescent, its tube  $1\frac{1}{2}$  to 2 times longer than broad, as long or nearly as long as the lobes; petals white, involute, over half as long as the stamens; ovary densely white-hairy or at least pubescent, the long bristles intermixed with some short gland-tipped bristles; bristles pubescent or short-pilose; berry yellowish, pinkish or purplish, or becoming deep red-brown when ripe, 6 to 7 lines in diameter, beset with long stout more or less pubescent spines.—Mountain slopes and cañon valleys, 3500 to 7000 ft.: mts. of coastal S. Cal.; Mt. Pinos; Sierra Nevada (the most common gooseberry at middle altitudes); n. to Modoc Co., thence w. to Humboldt Co. Var. *CRUENTUM* Rehd. Leaves more commonly glabrous; calyx glabrous; ovary glabrous, densely covered with long glabrous bristles which are set about at base with a rather dense layer of stippled glands; spines of the berry numerous, non-glandular and non-pilose.—North Coast Ranges, in the middle and inner ranges. Berry somewhat suggestive of a small chinquapin bur. (*R. cruentum* Greene.)

469. *Ribes californicum* H. & A.; a, fl. branchlet  $\times \frac{2}{3}$ ; b, long. sect. fl.  $\times 2\frac{2}{3}$ .

glandular; flowers solitary (sometimes 2), 4 to 5 lines long; pedicels with a couple of shallowly lobed bracts at middle; calyx greenish, dull white, or sometimes purplish-tinged, glabrous, rarely puberulent, sometimes the lobes tipped with a few pilose hairs; petals white,  $\frac{1}{4}$  to  $\frac{1}{2}$  as long as the stamens; ovary glabrous or sometimes puberulent, covered with rather long bristles, sometimes interspersed with shorter gland-tipped bristles; berry usually small, 3 to 4 or 5 lines in diameter, the spines slender.—Hills or narrow cañon flats, most characteristic of dry exposed or rocky slopes, central Coast Ranges from Monterey Co. to Mendocino Co. Jan.-Apr. Var. *OLIGACANTHUM* Jepson n. comb. Berry with strikingly few spines, the spines strong and conspicuously scattered, or smooth and unarmed.—Santa Cruz Mts. to Monterey Co. Armed and smooth berries may be found on a single branchlet. (*R. oligacanthum* Eastw.) Var. *HESPERIUM* Jepson n. comb. Calyx reddish-purple; petals nearly as long as the filaments; ovary and berry glabrous or sometimes puberulent, densely covered with slender spines; all the spines non-glandular, or a few shorter ones gland-tipped.—S. Cal. mts. Related in the color and size of its flower to *R. menziesii* and in its spiny bur-like fruit to *R. roezlii* var. *cruentum*. It has one or more points of difference with several allied species but no one character different at once from all of them. (*R. hesperium* McCl.)

20. *R. menziesii* Pursh. CAÑON GOOSEBERRY. Fig. 470d. Tall openly branched shrub, 4 to 8 ft. high; stems with mostly 3 spines at the nodes, usually densely prickly and more or less glandular-pubescent; leaves 3 to 5-cleft, serrate, subcordate at base, subglabrous above, pubescent and glandular beneath, 1 to  $1\frac{1}{2}$  in. broad; pedicels 1 or 2-flowered; flowers 5 to 6 lines long; calyx more or less glandular-pubescent or -hairy, its lobes lurid-purple, 3 to 4 lines long, closely reflexed; petals white, waxy, involute, often crenulate, 2 lines long, over half as long as the stamens; style exceeding the stamens, 2-cleft at apex; ovary pubescent and densely bristly, the bristles all or mostly gland-tipped; berry 5 to 7 lines in diameter, the numerous spines very short ( $\frac{1}{2}$  to 1 line long), more or less glandular.—Cañons and flats near the coast from San Luis Obispo Co. to Humboldt Co.; n. to southern Ore. Jan.-Mar. Var. *SENILE* Jepson n. comb. Ovary markedly white-pilose between the bristles.—Santa Cruz Mts. (*Grossularia senilis* Cov.) Var. *HYSTRIX*

18. *R. amarum* McCl. Similar to *R. menziesii* but the stems not prickly; flowers 6 to 8 lines long; calyx funnelform, puberulent and somewhat stipitate-glandular, its tube twice as long as broad, its lobes broad, red-purple; petals nearly as long as the filaments; ovary very densely covered with very short gland-tipped bristles, also somewhat glandular and often puberulent; berry 5 to 6 lines in diameter, densely covered with short stout spines; skin of berry tough, nauseous; spines more or less glandular,  $\frac{1}{4}$  to  $1\frac{1}{2}$  lines long.—Mountain cañons, 1000 to 4000 ft.: coastal S. Cal., n. in the Sierra Nevada to Mariposa Co.

19. *R. californicum* H. & A. HILLSIDE GOOSEBERRY. Fig. 469. Compact shrub, with more or less flexuous branches,  $2\frac{1}{2}$  to 4 ft. high; nodal spines 3 (or 1); prickles none; leaves  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. broad, 3 to 5-cleft, crenate, glabrous or nearly so, and non-

Jepson n. comb. Stems often densely setose-spiny; nodal spines yellow, often very stout and long (mostly 6 to 11 lines); leaves chartaceous.—Santa Lucia Mts., along the coast. (*R. hystrix* Eastw.) Var. *LEPTOSMUM* Jepson n. comb. Fig. 470a, b, c. Stems without prickles or sparingly prickly; stamens about twice the length of the petals; ovary very densely and evenly

470. a, *Ribes menziesii* var. *leptosmum* Jepson; fl. branchlet x 1; b, long. sect. fl. x 2; c, berry x 1; d, *R. menziesii* Pursh; berry x 1.

covered with stiped glands (in the extreme form as if tessellated), soon developing into unequal gland-tipped bristles.—Hill cañons about San Francisco Bay. (*Grossularia leptosma* Cov.)

21. *R. victoris* Greene. VICTOR'S GOOSEBERRY. Low bush  $1\frac{1}{2}$  to 2 ft. high, the slender stems with 1 to 3 weak spines at the nodes, the newer branches prickly; foliage sparsely strigulose or hirsutulous and more or less viscid-glandular, especially on the petioles; leaves  $\frac{1}{2}$  to 1 in. broad, crenately incised, 5-lobed, the lower pair of lobes much smaller; pedicels 5 lines long, 1 or 2-flowered; flowers 5 to 6 lines long; sepals dull white; petals clear white, about  $\frac{2}{3}$  the length of the stamens; ovary covered with stiped glands, sometimes as if tessellated; berry mostly oval, golden yellow, 6 to 8 lines in diameter, very densely covered with slender but short glandular spines.—Shady cañons, Marin, Sonoma and Napa Cos. Var. *GREENEIANUM* Jepson n. comb. Leaves  $1\frac{1}{4}$  to  $1\frac{3}{4}$  in. broad; pedicels slender, 1 to  $1\frac{1}{4}$  in. long; flowers 7 to 9 lines long; petals about  $\frac{1}{2}$  the length of the stamens.—Cañons, e. slope of the Vaca Mts. (*R. greencianum* Hel.) Var. *MINUS* Jepson n. comb. A form of the rocky hills with smaller flowers (4 to 5 lines long).—Hood's Peak and Napa ranges. (*R. menziesii* var. *minus* Jancz.)

22. *R. binominatum* Hel. Stems trailing, not bristly, 2 to 4 ft. long; nodal spines 3, unequal; leaves 3 to 5-cleft,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. broad, glabrous or weakly pubescent and often glandular above, more or less silky-pubescent beneath;

calyx greenish white, villous, 4 to 5 lines long, its tube very short, the lobes twice as long; stamens little exceeding the petals; berry usually glandular, covered with stout-based yellowish spines of very unequal length.—Montane, 5000 to 6000 ft., uncommon: Tulare Co.; Siskiyou Co.

23. *R. marshallii* Greene. Low, spreading, sometimes forming almost mat-like colonies 3 to 7 ft. across; flowers similar to those of *R. lobbii*; calyx-tube bowl-shaped, as broad or broader than high; calyx-lobes crimson, 2 lines broad, 6 to 7 lines long; anthers glandless; ovary white-woolly, with non-glandular bristles imbedded in the tomentum; berry subglobose, 6 to 7 lines in diameter, covered with long glandless spines.—Montane, 6000 to 7000 ft., n. Humboldt Co. to w. Siskiyou Co.

24. *R. lobbii* Gray. Bush 2 to 3 ft. high; herbage sparingly glandular-pubescent; spines at nodes 3; leaves  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. broad, 3-lobed and serrate, sparsely hispidulose; peduncles 1 to 3-flowered; flowers pendulous, 10 to 11 lines long; calyx crimson or Turkish red, sparingly hairy outside, its tube cylindric, longer than broad; calyx-lobes long-oblong, somewhat spreading or recurved-coiling, longer than the tube; petals involute, yellow; stamens and style much exserted; anthers densely glandular-dotted on the back; ovary densely covered with stipitate glands as if tessellated, half-sheathed or closely subtended by a truncate bract; berry oval, 6 to 8 lines long, densely covered with gland-tipped short spines.—Montane, 5500 to 6500 ft., n. Humboldt Co.; n. to B. C.

25. *R. sericeum* Eastw. Stems very prickly, the prickles bristle-like; herbage with a short-pilose whitish pubescence; leaves thinnish, deeply 3 (or 5)-cleft; raceme (1 or) 2-flowered, on peduncles  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; peduncles slender, white-pilose and bristly with gland-tipped bristles; flowers 9 to 11 lines long; sepals red, sparingly villous; petals rather less than half as long as the stamens; anthers drab or tan-color, not apiculate; ovary densely covered with gland-tipped bristles and intervening white hairs; berries often large (8 to 11 lines in diameter).—Santa Lucia Mts., mostly along the coast.

26. *R. speciosum* Pursh. Tall evergreen shrub 4 to 10 ft. high; branches prickly or almost smooth; spines at nodes 3, very stout (5 to 8 lines long); leaves small (6 to 8 lines long, rarely to 1 or  $1\frac{1}{2}$  in. long), coriaceous, nearly evergreen, roundish elliptic to obovoid, roundish or cuneate at base, slightly 3-lobed or -toothed at apex; peduncles 1 or 2-flowered; flowers crimson, 5 to 6 lines long; calyx crimson, its lobes erect, 4 to 5 lines long, the tube above the ovary very short (1 line long), forming a swollen ring; petals involute, narrow, truncate, almost as long as the calyx-lobes; stamens exserted, 8 to 11 lines; anthers oval; ovary densely bristly, the bristles with discoid glands at tip; berry dry, very bristly.—Near the coast, Santa Clara Co. to Monterey Co. and s. to San Diego Co.

#### CROSSOSOMATACEAE. CROSSOSOMA FAMILY

Glabrous shrubs with alternate entire leaves. Flowers regular, solitary, terminal, borne on short naked peduncles arising from winter buds. Calyx 5-lobed, persistent. Petals 5, white. Stamens 15 to 50, inserted in 3 or 4 ranks on a thin disk lining the open calyx-tube; filaments somewhat dilated. Stigma capitate. Follicles 2 to 9, contracted at base into a short or obscure stipe. Seeds several, furnished with a fimbriate aril. Endosperm slightly fleshy; embryo curved.

##### 1. CROSSOSOMA Nutt.

The only genus. (Greek *krossoi*, fringe, and *soma*, body, in reference to the aril.)

Leaves scattered; petals roundish, scarcely clawed.....1. *C. californicum*.  
Leaves fascicled; petals oval or obovate, distinctly clawed.....2. *C. bigelovii*.

1. *C. californicum* Nutt. Shrub 3 to 6 ft. high, or somewhat arboreous and up to 15 ft. high; leaves scattered, oblong (or sometimes obovate), tapering slightly to the somewhat obtuse mucronate apex, tapering more strongly to

the shortly-petioled base,  $1\frac{1}{2}$  to  $3\frac{1}{2}$  in. long; flowers numerous, 10 to 14 lines broad; sepals round-ovate, obtuse, scarious-margined; petals obliquely roundish, crinkled; stamens about 40 to 50; follicles 3 to 7 (or 9), oblong-cylindric, 6 to 10 lines long, 20 to 25-seeded.—Catalina Isl. Also on Guadeloupe Isl. May.

2. *C. bigelovii* Wats. Erect bush 3 to 4 ft. high, with slender branches and short rigid branchlets; leaves mostly fascicled, glaucous, ovate-oblong, sometimes obovate, obtusish and apiculate, 4 to 9 lines long, subsessile; peduncles 3 lines long; flowers white or purplish,  $3\frac{1}{2}$  to 5 or 8 lines broad; petals oval or obovate, with cuneate claw; stamens 15 to 21 "or 30"; follicles 2, rarely 3 or 1, 2 to 5-seeded, 3 to 4 lines long.—Rocky cañons in the Colorado Desert, 100 to 700 ft.; e. to Ariz., s. to L. Cal. Apr.

### PLATANACEAE. PLANE FAMILY

Trees with large alternate palmately lobed leaves. Buds concealed in the hollow base of the petiole. Bark falling away in thin plates. Flowers small, greenish, in dense ball-like heads, monœcious. Sepals and petals none. Stamens and pistils in separate heads, crowded on a globose fleshy receptacle. Stamens with long anthers and very short filaments. Pistils with interspersed bracts; ovary 1-ovuled; style 1. Fruit a small nut.

471. *Platanus racemosa* Nutt.; a, branchlet with string of balls  $\times \frac{1}{6}$ ; b, pistil  $\times 6$ ; c, stamen  $\times 6$ .

#### 1. PLÁTANUS L. PLANE TREE

The only genus. (Greek *platus*, broad, referring to the ample leaves.)

1. *P. racemosa* Nutt. WESTERN SYCAMORE. Fig. 471. Tree 40 to 90 ft. high, often leaning; leaves 3 to 5-lobed, usually cordate or truncate, thick and firm, tomentose, 4 to 9 in. long, the lobes usually entire.—Stream bottoms and river banks in dry country: Great Valley and bordering foothills; South Coast Ranges; coastal S. Cal.

### ROSACEAE. ROSE FAMILY

Herbs, shrubs or trees. Leaves alternate, commonly with stipules. Flowers regular, commonly perfect, solitary or in clusters. Calyx 5 (or 4)-lobed. Petals 5, rarely none. Stamens 10 to numerous, rarely fewer, usually indefinite, inserted with the petals on the calyx or on the edge of a disk that lines the calyx-tube. Pistils 1 to many, simple, distinct and free from the calyx, or united into a 2 to 5-celled ovary which is nearly or completely inferior. Fruit a pod (follicle), an achene, a drupe, a cluster of drupelets (as in a blackberry) or a pome. Seeds with straight embryo; endosperm usually none.—The calyx in certain genera appears double by reason of a row of bractlets borne at or near the sinuses. *Coleogyne* and *Lyonothamnus* have opposite leaves.

#### A. Ovary superior.

#### 1. FRUIT DEHISCENT, CONSISTING OF 2 TO 5 DRY PODS OR FOLLICLES; TREES, SHRUBS OR HERBS.—TRIBE SPIRÆÆ.

Flowers perfect.

Calyx-lobes deciduous; leaves opposite, dimorphic; trees.....1. LYONOTHAMNUS.

Calyx-lobes persistent; leaves alternate; shrubs.

Stamens distinct; erect shrubs.

Leaves simple.

Pods inflated, dehiscent, 2 to 4-seeded; flowers white...2. PHYSOCARPUS.

Pods not inflated.

Stamens well exserted; flowers mostly rose-color; pods several-seeded, dehiscent.....3. SPIRÆÆ.

Stamens scarcely exserted; flowers creamy-white; pods 1-seeded, tardily dehiscent or indehiscent.....4. HOLODISCHUS.

- Leaves compound, the leaflets minute.....5. CHAMAEBATIARIA.  
 Stamens united at base; leaves dissected; decumbent shrub.....6. LUETKEA.  
 Flowers dioecious; tall herb.....7. ARUNOUS.

## 2. FRUIT INDEHISCENT; SHRUBS OR HERBS.

a. *Ovary becoming an achene (or drupelet in no. 8.)*—TRIBE ROSEAE.

Pistils more than 1, commonly many to numerous; achenes more than 1; leaves compound or pinnately lobed.

Pistils becoming drupelets which are coherent on a convex receptacle and form a fruit called a "berry"; leaves compound or simple; shrubs or bushes...8. RUBUS.

Pistils becoming dry achenes.

Pistils borne on a flat or convex receptacle.

Calyx lobes with 5 alternate bractlets (rarely absent in no. 11).

Style deciduous from the achene; receptacle conic; herbs (except one species in no. 10).

Receptacle fleshy; leaves 3-foliolate.....9. FRAGARIA.

Receptacle dry; leaves pinnate or palmate, the leaflets rarely 3....

10. POTENTILLA.

Style persistent on the achene.

Leaves pinnate; receptacle conic or hemispheric; achenes and styles strongly deflexed; herbs.....11. GEUM.

Leaves pinnately lobed; receptacle flat; achenes and styles not deflexed; shrubs.....12. FALLUGIA.

Calyx-lobes without bractlets; achene with a long feathery tail.13. COWANIA.

Pistils disposed on the inside of a globose or urn-shaped calyx-tube which is lined by a thin disk or receptacle, in fruit termed a "hip"; leaves pinnate; stems prickly.....14. ROSA.

Pistil only one.

Leaves compound.

Low bush; leaflets numerous, minute.....15. CHAMAEBATIA.

Herbs.

Leaves pinnate.

Calyx prickly; perennials.

Petals yellow; prickles of calyx hooked at tip.....16. AGRIMONIA.

Petals none; prickles of calyx straight but retrorsely barbed.....

17. ACAENA.

Calyx not prickly; petals none; annuals or perennials.18. SANGUISORBA.

Leaves palmately divided; petals none; diminutive annuals.....

19. ALCHEMILLA.

Leaves simple; shrubs.

Achene with long feathery tail; petals none.....20. CEROCARPUS.

Achene not tailed; leaves small, mostly fascicled.

Leaves entire, narrow.

Petals white; leaves needle-like; branches not spinescent.....

21. ADENOSTOMA.

Petals none; leaves narrowly oblanceolate; branches spinescent.....

22. COLEOGYNE.

Leaves cuneate, 3-toothed or -lobed above; petals pale yellow...23. PURSHIA.

b. *Ovary becoming a drupe; trees or shrubs with simple leaves and caducous stipules.*—  
 TRIBE DRUPEAE.

Pistils 5; drupes 1 to 5; flowers dioecious.....24. OSMARONIA.

Pistil 1; drupe solitary; flowers perfect.....25. PRUNUS.

## B. Ovary inferior, 2 to 5-celled, enclosed in and mostly adherent to the fleshy calyx-tube; fruit a pome; trees and shrubs.—TRIBE POMEAE.

Leaves compound; flowers in compound corymbs; fruit coral red, berry-like...26. SORBUS.

Leaves simple.

Foliage evergreen, coriaceous; flowers small, numerous, in a corymbose panicle; fruit bright red, berry-like.....27. PIOTINIA.

Foliage deciduous.

Flowers in corymbs

Branches not thorny; styles united at base; fruit a pome.....28. PYRUS.

Branches with stout thorns; styles distinct; fruit drupe-like, containing 2 to 5 bony stones.....29. CRATAEGUS.

Flowers not in corymbs; branches not thorny; fruit berry-like containing several cartilaginous seeds.

Flowers 1 to 3 in a sessile umbel; petals spreading; styles 2.....

30. PERAPHYLLUM.

Flowers several in a raceme; petals erect; styles 5.....31. AMELANCHIER.

## 1. LYONOTHÁMNUS Gray

Evergreen tree with thin bark exfoliating in long loose strips and opposite dimorphic petioled leaves. Flowers numerous in a much-branched terminal panicle. Petals 5 and stamens 13 to 16, inserted on the margin of the woolly disk lining the hemispheric 5-lobed calyx-tube. Pistils 2, distinct, each with a spreading style and capitate stigma. Fruit consisting of two

woody 4-seeded carpels dehiscent ventrally and partly dehiscent dorsally. (The sur-name of W. S. Lyon of Los Angeles, the discoverer, combined with Greek *thamnos*, shrub.)

1. *L. floribundus* Gray. CATALINA IRONWOOD. Slender tree 20 to 55 ft. high, with narrow crown; leaves Oleander-like, linear, nearly entire or pinnately cut, petioled, 3 to 5 in. long, or often pinnately compound with 2 to 5 leaflets similar in shape and size to the simple leaves; flowers white, 3 lines broad, in terminal clusters 3 to 6 in. broad; petals orbicular, sessile, white, crenulate-edged.—Insular species, confined to Santa Catalina, San Clemente, Santa Rosa and Santa Cruz Isls.

## 2. *PHYSOCÁRPUS* Maxim. NINE-BARK

Deciduous shrubs with reddish brown shreddy bark. Leaves simple; stipules deciduous. Flowers white, in corymbs terminating lateral leafy branchlets. Calyx campanulate, 5-cleft. Petals rounded, equal. Stamens 20 to 24. Pistils

1 to 5, mostly 3, somewhat united toward the base, becoming as many inflated 2 to 4-seeded pods dehiscent along both sutures. Seeds with copious endosperm. (Greek *phusa*, bellows or bladder, and *karpos*, fruit.)

472. *Physocarpus capitatus* Ktze.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, long. sect. fl.  $\times 2$ .

1. *P. capitatus* (Pursh) Ktze. NINE-BARK. Fig. 472. Erect or straggly shrub 3 to 5 ft. high; leaves roundish or ovate, 3-lobed and irregularly serrate, glabrous, or stellate-pubescent beneath, 1 to 3 in. long, on petioles  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; leaves of sterile shoots similar but larger; corymbs hemispherical,  $\frac{3}{4}$  to 1 in. high; petals  $1\frac{1}{2}$  to 2 lines long; pods divergent, commonly 3 to 4 lines long.—Common along streams in the hills, or often gregarious on steep north slopes, 500 to 4500 ft.: Santa Cruz Mts. to Humboldt Co. and Mt. Shasta, thence s. at scattered stations in the Sierra Nevada; n. to B. C.

## 3. *SPIRÆA* L. SPIRÆA

Shrubs with simple deciduous leaves, short petioles and no stipules. Flowers white or rose-colored, small (about  $\frac{3}{4}$  to  $1\frac{1}{2}$  lines long), numerous, crowded, in terminal corymbs, panicles or spikes. Stamens 10 to 50, much-exserted. Pods commonly 5, not inflated, few- to several-seeded. (Greek *speira*, a band, wreath.)

Erect shrubs; leaves not in rosettes.

Flowers rose-pink, in narrow panicles; leaves white-tomentose beneath. . . . . 1. *S. douglasii*.

Flowers pale purple, in corymbs; leaves glabrous. . . . . 2. *S. densiflora*.

Prostrate shrubs, somewhat herb-like, with leaves in close dense rosettes; flowers white, in dense cylindrical spikes. . . . . 3. *S. caespitosa*.

1. *S. douglasii* Hook. Erect, 2 to 6 ft. high, with stoutish branches and reddish brown bark; leaves oblong, serrate at apex, green above, white-tomentose beneath, 1 to 3 (or in shade even 4) in. long; panicles narrow, usually elongated, 2 to 5 in. long; calyx-lobes mostly reflexed; petals ovate.—N. Cal. mts., about 5000 ft.: Plumas Co. to Modoc Co., w. to seashore at Humboldt Co., thence n. to B. C.

2. *S. densiflora* Nutt. Fig. 473. Erect, 1 to 3 ft. high with reddish bark; leaves elliptic to ovate, sharply and often unequally serrate, but entire towards the rounded base,  $\frac{5}{8}$  to 1 (or  $2\frac{1}{2}$ ) in. long; corymbs terminal, roundish,  $\frac{3}{4}$  to 2 in. broad; calyx-lobes erect; petals roundish obovate.—

High mts., often in clefts of granite rocks, 6000 to 9000 ft.: Sierra Nevada from Tulare Co. to Lassen Peak, thence w. to Mt. Shasta and Salmon Mts.; n. to B. C. July. (*S. betulaeifolia* Bot. Cal.)

3. *S. caespitosa* Nutt. Stems prostrate, woody, densely clothed with rosulate tufts of leaves and forming matted plants  $\frac{1}{2}$  to 3 ft. broad; flowering stems ascending, scape-like, with few small leafy bracts, 3 to 4 in. high; leaves oblong-obovate, entire, acute, densely silky, 2 to 3 lines long; spikes  $\frac{3}{4}$  to 2 in. long; petals narrow-obovate.—Limestone rocks, desert ranges, 4000 to 7000 ft.: Providence Mts.; Panamint Mts.; s. Sierra Nevada; e. to Rocky Mts., n. to southern Ore. May. (*Petrophytum acuminatum* Rydb.)

#### 4. *HOLODISCUS* Maxim.

Deciduous shrubs with toothed or lobed leaves and no stipules. Flowers creamy-white, small, numerous in terminal panicles. Petals 5, rounded. Stamens 20, on a ring-like perigynous disk. Pistils 5, distinct. Pods hairy, 1-seeded, tardily dehiscent or indehiscent. (Greek *holo*, whole, and *diskos*, a disk, some related genera with lobed disks.)

1. *H. discolor* (Pursh) Maxim. CREAM BUSH. Fig. 474. Shrub 3 to 6 ft. high; leaves ovate to ovate-elliptic in outline, green above, whitish beneath with soft hairs, coarsely serrate or incised above the entire broadly cuneate (or sometimes subtruncatish) base,  $\frac{3}{4}$  to 3 in. long, on petioles 2 to 6 lines long; panicle ample, 3 to 8 in. long, often half drooping in anthesis; flowers  $1\frac{1}{2}$

lines long; follicles about 1 line long.—Cañons in the hills, 5 to 4000

ft., from Los Angeles through the Coast Ranges to Siskiyou Co.; occasional in the Sierra Nevada, 3500 to 6600 ft.; n. to B. C. June. Var. *DUMOSUS* Dippel. Lower, more compact; leaves 3 to 7 lines long; panicle narrow, less diffuse.—Rocky places, high montane, 6000 to 9000 ft.: mts. of S. Cal.; Panamint Range; Sierra Nevada; Yollo Bolly Mts. July. Var. *GLABRESCENS* Hel. Diffuse, 2 to 4 ft. high; leaves sparingly pubescent and glandular-dotted, especially beneath.—Mt. Shasta; n. to Ore., e. to Utah.

#### 5. *CHAMAEBATIARIA* Maxim.

Glandular pubescent and aromatic deciduous shrub. Leaves twice pinnate with numerous minute leaflets. Stipules entire. Flowers large, white, in a terminal racemose panicle. Stamens about 30 to 50, included. Pods 5, coriaceous, several-seeded, dehiscent down the ventral suture and half way down the back. (Resembles *Chamaebatia*.)

473. *Spiraea densiflora* Nutt.; fl. branchlet  $\times 1$ .

474. *Holodiscus discolor* Maxim.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 3$ ; c, fr.  $\times 7\frac{1}{2}$ .

475. *Chamaebatiaria millefolium* Maxim.; fl. branchlet  $\times 1$ .

linear lobes. Stamens about 20; filaments united at base. Pistils 5 (or 4 or 6). Pods coriaceous, 2-valved. (Count F. P. Luëtke, 1797–1882, commander of a Russian exploring expedition in the arctic.)

1. *L. pectinàta* (Pursh) Ktze. Flowering stems 4 to 5 in. high; leaves 5 to 7 lines long, including the broad petiole; flowers white, 3 to  $3\frac{1}{2}$  lines broad.—High slopes near perpetual snow: Siskiyou Co. (Mt. Shasta; above Cold Spr., West Fork Woolly Creek); n. to Alas.

#### 7. *ARÚNCUS* L. GOAT'S BEARD

Tall perennial herbs. Leaves two or three times pinnate, without stipules. Flowers white, dioecious, borne in long slender spikes, the spikes disposed in a large compound panicle. Follicles usually 3, at length reflexed, commonly 2-seeded. (Latin *aruncus*, the beard of a goat, says Pliny.)

1. *A. sylvéster* Kost. GOAT'S BEARD. Erect, 2 to 3 ft. high, glabrous; leaflets thin, ovate or oblong-lanceolate, irregularly serrate, acuminate,  $1\frac{1}{2}$  to 5 in. long; flowers 1 line broad; petals obovate; stamens much exserted. — Along streams in cañons: Shasta, Trinity, n. Humboldt and Del Norte Cos.; n. to Alas., e. to Alleghanies; Eur., Asia.

#### 8. *RÛBUS* L.

Ours bushes, prickly or unarmed, the stems erect, or long and trailing or climbing. Leaves simple, or pinnately compound

476. *Rubus parviflorus* Nutt.; a, fl. branchlet  $\times \frac{1}{4}$ ; b, fr.  $\times \frac{1}{2}$ .

1. *C. millefólium* (Torr.) Maxim. DESERT-SWEET. Fig. 475. Stout, erect, branching,  $2\frac{1}{2}$  to 6 ft. high; axis of inflorescence and pedicels heavily glandular, the foliage less glandular, sparingly soft-pubescent; leaves oblong-lanceolate in outline, 1 to  $1\frac{3}{4}$  in. long; flowers 4 to 6 lines broad; petals orbicular.—Desert slopes, 5500 to 9500 ft.: e. side Sierra Nevada from Inyo Co. to Shasta and Modoc Cos.; Panamint Range; White Mts.; n. to southern Ore., e. to Wyo. and Ariz. Herbage very fragrant.

#### 6. *LUËTKEA* Bong.

Low, herb-like plant, the woody stems decumbent or creeping, the flowering stems erect, ending in a raceme. Leaves bi-

ternately parted into

with 3 to 5 leaflets. Calyx 5-parted, without bractlets. Petals 5. Stamens numerous. Pistils many, crowded on an elevated receptacle, becoming drupelets which are united to each other and form the aggregate fruit called a blackberry or raspberry. (Latin name, allied to *ruber*, red.)

Fruit conical or hemispherical, concave beneath, the drupelets parting from the receptacle as a whole when ripe.

Stems unarmed; leaves simple, palmately lobed . . . . . 1. *R. parviflorus*.  
Stems prickly; leaves 3-foliolate.

Flowers red; leaves pubescent or silky beneath . . . . . 2. *R. spectabilis*.

Flowers white; leaves white-tomentose beneath . . . . . 3. *R. leucodermis*.

Fruit oblong, the drupelets persistent upon the receptacle; leaves mostly 3 to 5-foliolate, a few simple; stems and leaves very prickly . . . . . 4. *R. vitifolius*.

1. *R. parviflorus* Nutt. THIMBLE-BERRY. Fig. 476. Stems erect, 3 to 6 ft. high; bark eventually shreddy; leaves deciduous, circular in outline, palmately 5-lobed, cordate at base, unequally serrate, 3 to 7 in. broad, puberulent to almost glabrous, the petioles and stems hispidulose and more or less glandular; flowers about 4 to 7 in terminal corymbs, white (rarely pinkish), 1 to 2 in. broad; calyx-lobes 5, sometimes 6 or 7, ovate, terminated by a tail-like or sometimes foliaceous appendage; petals of the same number as the calyx-lobes, elliptic; berry scarlet, 6 to 8 lines broad.—Common along cañon streams and in open woods: mts. of S. Cal. and Sierra Nevada, 3000 to 7000 ft.; hill country near the coast, 50 to 2000 ft. (Santa Lucia Mts. to Del Norte Co., leaves often velvety pubescent beneath=var. *velutinus* Greene); n. to Alas., e. to Mich. and N. Mex.

2. *R. spectabilis* Pursh. SALMON-BERRY. Stems erect, 3 to 9 ft. high, with reddish brown bark and sparingly armed, or the canes (sterile shoots) very prickly; prickles short, straight; leaves 3-foliolate, deciduous; leaflets ovate, doubly serrate, often more or less lobed, 1 to 3½ in. long; flowers 1 to 3 in a cluster, 1 to 1¼ in. broad; petals red; berry ovoid, red or yellow, glabrous, 7 to 9 lines broad.—Margins of woods and along streams, vicinity of the ocean: Mendocino Co. to Humboldt Co.; n. to Alas. Var. *MENZIESII* Wats. Leaves more or less silky-pubescent beneath.—Santa Cruz Mts.; San Francisco; Tomales Bay. Passing into the usual form northward. Apr.

3. *R. leucodermis* Dougl. WESTERN RASPBERRY. Stems in the first year vigorous and erect ("canes"), bearing 5 to 7-foliolate leaves, in the second year bearing short leafy flowering branchlets with 3-foliolate leaves and bending over and becoming straggling; stems and petioles armed with prickles; herbage glaucous; leaves partly persistent through winter, the leaflets round-ovate to ovate-lanceolate, often unequal-sided at base, doubly serrate, ¾ to 3½ in. long, pubescent but green above, white with a dense close tomentum below; stipules setaceous; flowers few, corymbose, white, 6 to 8 lines broad; sepals lanceolate, long-acuminate, exceeding the petals; berry glaucous, 6 lines broad, of an agreeable flavor, either black or red.—Cañon bottoms or hill slopes: San Gabriel and San Bernardino mountains and Sierra Nevada, 2500 to 7000 ft.; near the coast from the Santa Cruz Mts. to Humboldt Co.; n. to B. C., e. to Wyo. Apr.

477. *Rubus vitifolius* C. & S.; a, compound leaf x ½; b, simple leaf x ½; c, fl. with stamens x 1; d, fl. with pistils x 1.

4. *R. vitifolius* C. & S. CALIFORNIA BLACKBERRY. Fig. 477. Evergreen bush; stems a few ft. high and more or less erect, or several to 18 ft. long and trailing over the ground or climbing over other shrubs; prickles very slender and straight, or more commonly rather short, recurved and thickened at base; leaves pubescent or almost glabrous, pinnately 3 to 5-foliolate, the leaflets ovate, doubly serrate,  $\frac{3}{4}$  to  $3\frac{1}{4}$  in. long, or sometimes a few upper leaves simple and ovate or palmately lobed; flowers  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. broad; petals 5 to 9 lines long; berry black, oblong, sweet.—Valleys and hills at low altitudes, chiefly along streams or in springy flats, very common: Coast Ranges, Great Valley, Sierra Nevada foothills and S. Cal. Apr.-May.

*R. LACINIATUS* Willd. Common Blackberry. Plants 4 to 8 ft. high; evergreen; leaflets 5 to 15, lacinate-toothed; flowers white or pale pink, in panicles; berry black.—Occasionally escaped from cult.: Tuolumne Co. Also Curry Co., sw. Ore.

### 9. *FRAGARIA* L. STRAWBERRY

Perennial herbs, the leaves and flowers in a basal tuft, giving off prostrate stems or runners. Leaves 3-foliolate, with membranous stipules and cuneate-ovate serrate leaflets. Flowers white, borne in cymes on a naked scape. Calyx persistent, bearing 5 bractlets alternate with the calyx-lobes. Petals obovate, short-clawed. Stamens about 20. Pistils numerous, distinct, borne on an elevated convex receptacle; styles lateral. Fruit berry-like, formed of the enlarged succulent receptacle which bears the minute seed-like achenes. (Name in reference to the fragrance of the berry.)

Leaves very thick and leathery, with evident reticulate veinlets; flowers very large,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. broad; sea-shore. . . . . 1. *F. chilensis*.

Leaves rather thin, occasionally rather thick, but never with evident reticulate veining; flowers smaller,  $\frac{1}{2}$  to 1 in. broad.

Achenes in deep pits in the receptacle; at least the terminal leaflet usually short-petiolate; inflorescence subumbellate, rather compact and usually shorter than the leaves; Sierra Nevada and n. Cal., above 5000 ft. . . . . 2. *F. virginiana*.

Achenes superficial or in shallow pits; leaflets subsessile; inflorescence usually irregularly branched and becoming elongate; throughout the state, 100 to 6600 ft. . . . . 3. *F. californica*.

478. *Fragaria chilensis* Duch.; habit  $\times \frac{3}{4}$ .

#### 1. *F. chilensis* (L.)

Duch. SAND STRAWBERRY. Fig. 478. Scapes several-flowered, 1 to 4 (or 8) in. high; upper surface of leaves dark green, glabrous, the herbage otherwise densely hairy; leaflets  $\frac{1}{2}$  to 1 in. long; calyx-lobes entire; petals roundish; receptacle with the achenes embedded in its surface; fruit 7 to 10 lines in diameter.—Sand-dunes, bluffs and beaches along the coast: San Luis Obispo to Humboldt Co.; n. to Alas.; Chile.

2. *F. virginiana* Duch. var. *platypétala* Hall. SCARLET STRAWBERRY. Scape 2 to 5 in. high, bearing a usually close umbellate cluster much shorter than the leaves; leaflets obovate or oblong, green, glabrous and glaucous above, below pale and sparsely pubescent, 1 to 2

in. long; petioles with spreading hairs; flowers 7 to 12 lines broad; achenes set in deep pits; fruit 5 to 7 lines broad.—Mts., 4000 to 8000 ft.: Sierra Nevada and mts. of n. Cal. Var. *SIBBALDIFOLIA* Jepson n. comb. Leaflets small (5 to 10 lines long), the apices subtruncate, 3 to 7-toothed.—High mts., 8000 to 10,000 ft.: Mt. Dana s. to Olancha Peak. (*F. siboldifolia* Rydb.)

3. *F. californica* C. & S. WOOD STRAWBERRY. Scapes 4 to 5 in. (rarely 10) high, cymosely 2-flowered; scapes and petioles pilose, the hairs ascending or spreading; leaflets thin, light green, 1 to 1½ in. long; flowers 5 to 11 lines broad; fruit globose, about 4 to 5 lines broad, the achenes borne superficially.—Openly wooded hills: Coast Ranges, Santa Cruz Co. to Humboldt Co., mostly 50 to 2000 ft.; Santa Rosa Mts. to San Bernardino Mts., 4500 to 6600 ft.; Sierra Nevada from Tulare Co. to Mt. Shasta and w. to Marble Mt., 3500 to 6000 ft. (mostly var. *CRINITA* Hall, stems and petioles densely pilose with spreading hairs). Var. *FRANCISCANA* Rydb. Leaves thicker and more strongly veined.—Exposed habitats about San Francisco Bay.

#### 10. *POTENTILLA* L. FIVE FINGER

Perennial herbs (rarely annuals or shrubs). Leaves compound, typically with serrate or cleft leaflets. Flowers white, yellow (or purple in one), in terminal cymes, rarely solitary, the cymes sometimes capitate. Calyx saucer-shaped, campanulate, or cup-shaped, cleft into 5 lobes, with as many alternate bractlets at the sinuses. Petals orbicular to linear. Stamens 5 to many, the filaments filiform or dilated. Pistils few to numerous, borne upon an elevated receptacle, becoming in fruit small turgid crustaceous achenes; styles lateral or nearly terminal, deciduous. (Diminutive of the Latin *potens*, powerful, some species used medicinally.)

##### A. Style lateral; ovules ascending; filaments filiform; perennials.

Stamens 5; petals minute; leaves 3-foliolate; achenes 10 to 15.—Subgenus *SIBBALDIA*....  
1. *P. procumbens*.

Stamens about 20 to 25; leaves pinnate.

Herbs; achenes glabrous.

Petals yellow; stems wholly creeping, rooting at the joints; leaves white-silky beneath.—Subgenus *ARGENTINA*.....2. *P. anserina*.

Petals dark-purple; stems ascending, rooting below.—Subgenus *COMARUM*.....  
3. *P. palustris*.

Low shrubs; petals yellow; achenes hairy.—Subgenus *DASIPHORA*....4. *P. fruticosa*.

##### B. Style terminal or nearly so; ovules pendulous.

I. STAMENS 15 TO 25 (10 IN NOS. 5 TO 7), INSERTED ON A DISK OR ANNULAR THICKENING NEAR THE RECEPTACLE; FLOWERS YELLOW (RARELY WHITISH OR CREAM-COLOR, IN NOS. 9 AND 13); CALYX-TUBE SAUCER-SHAPED; ACHENES NUMEROUS.—Subgenus *EUPOTENTILLA*.

###### 1. Inflorescence leafy; leaves with 3 or 5 (or 7 or 9) leaflets.

Stamens about 10; annual or biennial.

Leaves all ternate.

Leaflets oblong-cuneate.....5. *P. millegrana*.

Leaflets broadly obovate.....6. *P. biennis*.

Leaves with 5 leaflets; stamens 10.....7. *P. rivalis*.

Stamens 25 to 30; basal leaves pinnate with 3 or 5 (or 7 or 9) leaflets; perennial.....  
8. *P. saxosa*.

2. Inflorescence with few leaves or merely bracteate; flowers yellow (rarely whitish or cream-color in nos. 9 and 13); perennial herbs, the stems from a more or less branched root-crown or short caudex.

###### a. Leaves pinnate, with 5 or more leaflets.

Leaflets ovate, merely toothed, not deeply incised; herbage glandular-pubescent.....  
9. *P. glandulosa*.

Leaflets deeply incised or cleft into linear or oblong lobes.

Leaflets rather regularly cleft or incised along the sides (pinnatifid).

Stems erect or ascending; herbage grayish; leaflets with narrowly revolute margins; petals erect; White Mts.....10. *P. pennsylvanica*.

Stems ascending; herbage green; no revolute margins to leaflets; petals rotate; high mts., rare.....11. *P. drummondii*.

Leaflets cleft, incised or divided from the apex (palmatifid or tending to be so, at least in part), no revolute margins.

Herbage silvery; stems horizontally spreading or diffuse; alpine or subalpine, common.....12. *P. breweri*.

Herbage green or greenish; stems prostrate or decumbent or diffuse.

- Petioles  $\frac{1}{2}$  to  $\frac{3}{4}$  as long as blade; leaflets cleft  $\frac{1}{2}$  to  $\frac{3}{4}$  the way to base; central coast. . . . . 13. *P. hickmanii*.  
 Petioles very short ( $\frac{1}{10}$  to  $\frac{1}{6}$  as long as blade); leaflets cleft nearly to base; ne. interior plateau. . . . . 14. *P. plattensis*.
- b. Leaves palmate with 3 to 7 leaflets (all from summit of petiole); mostly montane and high-montane.
- Leaflets oblanceolate to obovate.  
 Stems decumbent; leaves with 3 to 5 leaflets, densely silky-villous.  
 Plant decumbent; stems leafy; leaflets toothed at summit; high mts. of S. Cal. and Tulare Co. . . . . 15. *P. wheeleri*.  
 Plant caespitose; stems sparingly leafy; leaflets deeply cleft into linear segments; alpine, desert ranges.  
 Leaves densely white-silky. . . . . 16. *P. pseudosericea*.  
 Leaves green above, whitish beneath. . . . . 17. *P. rubricaulis*.  
 Stems erect or ascending; leaves with 5 to 7 leaflets.  
 Leaves green on both sides, but sparingly silky-villous, the basal with petioles 1 to 3 in. long; subalpine. . . . . 18. *P. dissecta*.  
 Leaves commonly whitish or silky-gray beneath, commonly 1 to 3 in. long, the basal with petioles 3 to 9 in. long; montane at middle altitudes.  
 Leaflets divided nearly to midrib into narrowly linear segments with felt-like tomentum beneath. . . . . 19. *P. flabelliformis*.  
 Leaflets serrate or pinnatifid-serrate; villous or silky beneath or subglabrous. . . . . 20. *P. gracilis*.  
 Leaflets broadly obovate; leaves with 3 leaflets. . . . . 21. *P. flabellifolia*.
- II. STAMENS 5 TO 20, INSERTED ON THE MARGINS OR WELL UP ON THE CALYX-TUBE; NO ANNULAR DISK; LEAVES ALWAYS PINNATE; STEMS FROM A MORE OR LESS BRANCHED ROOT-CROWN OR SHORT CAUDEK; PERENNIAL HERBS.
1. *Filaments filiform (except nos. 25 and 26); petals white or yellow; stamens 5 to 20; pistils 3 to 15 (or 20 to 25); leaflets many to numerous, usually crowded or imbricated, 1 to 3 (or 4) lines long, commonly palmately cleft or divided into 2 to 4 (or 5) segments.*—Subgenus IVESIA.
- Stamens 15 to 20.  
 Petals with slender claws nearly as long as the blade; segments of leaflets linear to oblanceolate or oblong, acute or obtuse; Sierra Nevada.  
 Herbage villous but green or greenish.  
 Cauline leaves few; petals yellow. . . . . 22. *P. campestris*.  
 Cauline leaves several; petals white. . . . . 23. *P. unguiculata*.  
 Herbage white silky-villous; petals white or yellowish; cauline leaves many. . . . . 24. *P. pickeringii*.
- Petals not clawed; leaflets oval to oblong-elliptic.  
 Filaments dilated.  
 Cyme few-flowered; herbage greenish or grayish; calyx purplish; high s. Sierra Nevada. . . . . 25. *P. purpurascens*.  
 Cyme many-flowered, composed of subcapitate clusters; herbage silvery-villous; calyx green; San Bernardino Mts. . . . . 26. *P. argyrocoma*.  
 Filaments filiform; cyme open or diffuse; high montane.  
 Leaflets minute, so densely crowded that the silvery leaf is terete or worm-like; anthers opening by a pore; high montane. . . . . 27. *P. santolinoides*.  
 Leaflets less crowded, greenish; anthers opening by a slit; Mt. San Jacinto; var. callida of. . . . . 28. *P. shockleyi*.
- Stamens 5 (10 in 2 vars. of no. 29); high montane.  
 Cyme open, more or less distinctly racemose; petals white, shorter than the calyx-lobes. . . . . 28. *P. shockleyi*.  
 Cyme compact or dense or even capitate.  
 Petals exceeding the sepals before anthesis; herbage green, viscid-puberulent to subglabrate; leaflets crowded; petals yellow, commonly as broad or broader than long; common, Sierra Nevada. . . . . 29. *P. gordonii*.  
 Petals minute, never equaling the sepals; rare, Sierra Nevada.  
 Leaves silvery, terete; petioles about  $\frac{1}{4}$  or  $\frac{1}{2}$  as long as blade. . . . . 30. *P. muirii*.  
 Leaves green, flat, loosely villous; petioles about as long or a little longer than blade. . . . . 31. *P. webbertii*.
2. *Filaments dilated, at least the alternate; stamens 10, alternately long and short; pistils numerous or often only 2 to 15; flowers white (pinkish white in no. 36).*—Subgenus HOKKELIA.
- Leaflets parted or divided into 3 to 5 linear or oblong segments or divisions, mostly 1 to 3 (or 4) lines long, usually many or numerous, often crowded.  
 Stipules entire; pistils about 15.  
 Cyme dense; central coast. . . . . 32. *P. tenuiloba*.  
 Cyme lax; White Mts. . . . . 33. *P. hispidula*.  
 Stipules more or less divided or cleft.  
 Cyme congested or dense; pistils 8 to 12; leaves villous; Siskiyou region. . . . . 34. *P. daucifolia*.  
 Cyme very open and lax; pistils 2 to 5.  
 Leaves greenish; stipules twice or thrice dichotomously divided; Humboldt Co. . . . . 35. *P. laxiflora*.  
 Leaves silky; stipules 2-cleft; Del Norte Co. . . . . 36. *P. howellii*.

Leaflets merely toothed (dissected in no. 39, sometimes in no. 37), mostly  $\frac{1}{2}$  to 1 or 2 in. long, usually not crowded.

Flowers on slender drooping or recurved pedicels.....37. *P. parryi*.  
Flowers not on recurved pedicels.

Petals erect or nearly so; cyme dichotomously forked; calyx-tube deeply cup-shaped; filaments opposite the petals filiform or at least less dilated than the others.

Bractlets usually 3-toothed; stems stout; leaves not thin...38. *P. californica*.

Bractlets usually entire; stems slender; leaves thin, dissected...39. *P. elata*.

Petals spreading rotately; bractlets entire; filaments all dilated, though unequally so; calyx-tube saucer-shaped or cupulate.

Leaflets 11 to 29.

Petals truncate or retuse at apex; herbage greenish, more or less pubescent and glandular; Sierra Nevada....40. *P. douglasii*.

Petals rounded or obtuse or subacute at apex.

Dry interior ranges; herbage hoary or silky-pubescent, not glandular.....41. *P. bolanderi*.

Coastal or seashore; herbage usually more or less glandular.

Herbage greenish, pubescent.....42. *P. lindleyi*.

Herbage white-silky with short hairs.....43. *P. kelloggii*.

Leaflets 5 to 9, cuneate, commonly 3-toothed at apex; petals acute at base and apex; herbage white-silky; Sierra Nevada....44. *P. congesta*.

1. *P. procumbens* (L.) Clairv. Low matted plant, the stems 2 to 6 in. high; leaves ternate on petioles  $\frac{1}{2}$  to 2 in. long; leaflets broadly cuneate, toothed at apex, sparsely soft-hairy,  $\frac{1}{4}$  to  $\frac{3}{4}$  in. long; cymes commonly few-flowered, compact at first, becoming open in fruit; flowers 2 to 2½ lines broad; petals yellow, ovate or elliptic, shorter than the sepals; stamens 5 (or 6); achenes 5 to 20.—High montane, 8000 to 11,800 ft.: San Bernardino Mts.; Sierra Nevada from Tulare Co. to Siskiyou Co.; n. to Alas., e. to N. Eng.; n. Eur. and Asia.

2. *P. anserina* L. SILVER-WEED.

Fig. 479. Leaves and peduncles in a basal tuft on a fascicle of roots, producing slender runners, these rooting at each joint; leaves white-silky beneath, dark green above and glabrous or nearly so; leaflets 13 to 21, with smaller ones interposed, oblong, sharply serrate,  $\frac{1}{2}$  to 1½ in. long; flowers solitary on long peduncles,  $\frac{3}{4}$  to 1¼ in. broad; petals rounded, much exceeding the calyx-lobes; stamens 20 to 25; receptacle hairy.—Marshy or springy places: along the coast, 10 to 100 ft., from Los Angeles Co. to Del Norte Co.; n. to arctic Am., e. to N. Eng.; Eur., Asia. Var. ARGÉNTA Jepson n. comb. Leaves silky and usually silvery on both sides. — Arid interior: San Bernardino Mts.; e. of Sierra Nevada from Mono Co. to Siskiyou Co.; n. to Brit. Am. (*Argentina argentea* Rydb.)

3. *P. palustris* Scop. MARSH

POTENTILLA. COWBERRY. Stems stout,

ascending, often rooting at the decumbent base, glabrous below, puberulent above, with long creeping rootstock; leaves pinnate with long stipules; leaflets 5 to 7, oblong, 1 to 1¼ in. long, mostly glabrous except along the veins and margins; flowers 1 to 2 in. broad, few to several in an open cyme; calyx spreading, pubescent, purplish-green below, dark reddish-purple above; calyx-lobes  $\frac{1}{4}$  to  $\frac{1}{2}$  in. long, or becoming 1 in. long; petals very dark purple, ovate-lanceolate, 2 lines long; stamens 20 to 23, on a glandular ring; filaments

479. *Potentilla anserina* L.; a, habit x  $\frac{1}{3}$ ; b, long. sect. of fl. x 1; c, stamen x 2.

480. *Potentilla fruticosa* L.; fl. branchlet  
x 1.

rather stout, filiform, broader at base; receptacle becoming enlarged and spongy in fruit; achenes numerous, glabrous.—Cold bogs, often aquatic: n. Cal. (Del Norte, Shasta, Sierra, and Modoc Cos.); n. to Alas., e. to Lab.; Eur., Asia. Var. *VILLÒSA* Lehm. Leaves densely appressed silky-villous below.—Del Norte Co.

4. *P. fruticosa* L. SHRUBBY CINQUEFOIL. Fig. 480. Much branched shrub 1 to 4 ft. high; branchlets densely leafy, when young silky-hairy, in age with brownish shreddy bark; leaves pinnate with crowded leaflets, 4 to 7 lines broad,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long, on petioles 1 to 2 lines long, white silky-pubescent beneath; leaflets 3 to 7, oblong, entire, 2 to 5 lines long; flowers  $\frac{1}{2}$  to 1 in. broad; petals yellow, orbicular; stamens about 25.—At or about timberline, 8000 to 12,000 ft.: Sierra Nevada from Madera Co. to Lassen Co.; n. to sub-arctic regions, N. Am., Eur., Asia.

5. *P. millegrana* Engelm. Stems slender, prostrate, spreading to erect, freely branched from the base upward,  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high; herbage pubescent; leaves all ternate; leaflets cuneate-obovate, serrate-incised at apex (or above the middle),  $\frac{1}{2}$  to 1 in. long; flowers  $1\frac{1}{2}$  to 2 lines broad; petals light yellow, shorter than the calyxlobes; stamens about 10; mature achenes smooth, pale.—

Bottom lands: Estrella; Tracy; Sonoma Co.; Truckee; n. to Wash., e. to N. Mex. and Ill.

6. *P. biennis* Greene. Stems strictly erect, branched from the base or the middle,  $\frac{3}{4}$  to 2 ft. high, more or less purplish, leafy; herbage thinly pubescent and minutely glandular; leaves all ternate; leaflets broadly obovate, coarsely crenate, 6 to 11 lines long; cyme not spreading, its branches elongated and the flowers in scattered clusters or solitary in the axils of the small leaves in such a way as to appear racemose; flowers small (3 lines broad), on pedicels 2 to 4 lines long; petals yellow (or white); stamens 10; mature achenes whitish.—Moist bottom lands in ranges bordering the deserts on the west, 5000 to 8200 ft.: San Bernardino Mts., Mt. Pinos, e. to the Panamint Mts. and n. along the Sierra Nevada (chiefly east slope) to Modoc Co.; n. to Saskat.

7. *P. rivalis* Nutt. Stems coarse, erect or ascending, 1 to 2 ft. high; herbage soft-pubescent; lower leaves with 5 leaflets or the upper ternate; leaflets oblong or obovate, usually twice as long as broad, incised-serrate or crenate, 1 to  $1\frac{1}{2}$  in. long; cyme widely branched, open, leafy; flowers about  $2\frac{1}{2}$  lines broad; petals yellow, much exceeded by the bractlets; stamens about 10; ripe achenes smooth, pale.—Bottom lands, lower Sacramento and San Joaquin rivers.

8. *P. saxosa* Lem. Stems slender, ascending, 4 to 7 in. high, these and the leaves tufted; herbage glandular-pubescent; leaves pinnate; leaflets 3 to 7 (or 9), broadly ovate, or fan-shaped, crenate to deeply serrate, 3 to 6 lines long; cymes loose, few-flowered, somewhat leafy; flowers small and inconspicuous ( $2\frac{1}{2}$  to 3 lines broad), on filiform pedicels 4 to 9 lines long; bractlets ovate-acute to lanceolate, sometimes 2-cleft; petals ovate-acuminate, white or light yellow; stamens 25 to 30; achenes 8 to 10.—Rock crevices, ranges in or bordering the deserts: White Mts.; Twenty-nine Palms; Mt. San Jacinto; s. to L. Cal. (*P. rosulata* Rydb. *P. acuminata* Hall.)

9. *P. glandulosa* Lindl. Fig. 481. Stems erect, often reddish, 1 to 4 ft. high; herbage pubescent, the stems and petioles glandular; basal leaves 4 to 8 or even 15 in. long; leaflets 5 to 7 (or 9), or those of the uppermost leaves 3, roundish ovate, or obovate with cuneate base, 1 to 3 in. long; cyme lax, leafy-bracted; flowers 4 to 7 lines broad; petals pale yellow (or sometimes pale cream), obovate, rounded at apex, or orbicular, scarcely equaling the calyx; stamens 25; achenes glabrous.—Wooded hills or mt. slopes: coastal

S. Cal., 500 to 4000 ft.; Coast Ranges, 100 to 4000 ft., mostly near the coast: Sierra Nevada, 2000 to 6000 ft.; n. to Siskiyou and Modoc Cos.; far n. to B. C., e. to S. Dak. and N. Mex. Var. *WRANGELLIANA* Wolf. Stems very rank, usually very glandular, much and widely branched, 3 to 4 ft. high; basal leaves 1 ft. long including the petiole.—Wooded slopes near the coast. Var. *NEVADENSIS* Wats. Stems not reddish; herbage often less glandular; inflorescence more nearly naked; leaflets usually smaller; petals elliptic.—Montane, 5000 to 11,000 ft., high North Coast Ranges; Sierra Nevada from Shasta Co. to Tulare Co., thence w. to Mt. Pinos and s. to Palomar Mt. Var. *LACTEA* Greene. Plants 5 to 18 in. high; flowers 6 to 8 lines broad; petals white or creamy-white, exceeding the calyx.—High montane, 4000 to 10,500 ft.: Sierra Nevada from Tuolumne Co. to Tulare Co.; s. to the San Gabriel Mts. and San Jacinto Mts. (*Drymocallis gracilis* Rydb.) Var. *fissa* Jepson n. comb. Petals sulphur-yellow, 5 lines long, exceeding the calyx-lobes; herbage viscid-pubescent to subglabrous; leaves 9 to 11-foliolate.—Butte Co. to Modoc Co.; n. to Alb., e. to Colo. (*P. fissa* Nutt.) Var. *INCISA* Lindl. Caespitose; leaflets more deeply incised, or doubly serrate; flowers small, pale yellow.—Meadows, rare: Mt. Silliman; South Yollo Bolly; Nev. to Wash. and Ida. Var. *MONTICOLA* (Rydb.) Jepson n. comb. Plants reduced, 2½ to 6 in. high; stems slender, few-flowered; petals 2½ to 4 lines long.—High montane, 6500 to 8225 ft.: San Gabriel Mts.; Sierra Nevada; Warner Mts. (*Drymocallis glandulosa* var. *monticola* Rydb.)

10. *P. pennsylvanica* L. var. *strigosa* Rydb. Stems several, erect or ascending, 4 to 9 in. high; leaves chiefly basal, the stems bearing 2 or 3 reduced leaves; herbage (especially stems and under side of leaves) pilose, the spreading hairs arising from a close gray pubescence; leaves pinnate, 1 to 3 in. long, on petioles nearly as long; leaflets (5 or) 9 to 11, 8 to 11 lines long, broadly oblong, pinnately cleft to below middle into regular linear-oblong segments, the segments with revolute margins; cyme 5 to 7 (or 10)-flowered; flowers 3 to 5 lines broad; petals yellow, erect, roundish-obovate, truncatish or obtuse; stamens 11 or 16 to 19.—White Mts., e. Inyo Co.; e. to Rocky Mts., n. to Canada.

11. *P. drummondii* Lehm. Stems erect or nearly so, few-leaved, slightly hairy, 5 to 12 (or 16) in. high; herbage green, soft-pubescent; stipules ovate-lanceolate, about ¾ in. long; basal leaves pinnate, but leaflets often so crowded as to appear digitate, hairy, especially when young; petioles 1½ to 5 in. long; leaflets 5 to 9 (or 11), oblong-obovate to roundish, cuneate at base, cleft into acute teeth or sometimes unequally and rather deeply lacinate, ½ to 1¼ in. long; flowers long-pedicelled, bright yellow, 8 to 9 lines broad; petals obcordate, exceeding the calyx-lobes; stamens about 20; achenes many.—High montane, 6000 to 9000 ft.: Hockett Mdw., Tulare Co.; Placer and Nevada Cos.; n. Humboldt Co. to Siskiyou Co.; n. to B. C. Rare with us. (*P. cascadiensis* Rydb.)

12. *P. breweri* Wats. Fig. 482. Stems from a stout scaly root-crown, horizontally spreading or diffuse, 2 to 7 (or 10) in. long; herbage, especially the leaves, silky-villous or silvery; leaves pinnate, ½ to 1½ in. long, the petioles ½ to as long; leaflets 7 to 9, crowded or discrete, deeply incised, 3 to 6 lines

481. *Potentilla glandulosa* Lindl.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, leaf  $\times \frac{1}{2}$ ; c, fl.  $\times 1$ .

482. *Potentilla breweri* Wats.; a, habit  $\times \frac{1}{2}$ ; b, fl.  $\times 1$ ; c, stamen  $\times 5$ .

long; stipules broad, mostly incised; flowers 6 to 8 lines broad; petals yellow, roundish, retuse, or obcordate with obtuse sinus; stamens 20; achenes 20 to 25.—Alpine or subalpine, 7000 to 13,000 ft., in exposed situations, common: Sierra Nevada from Tulare Co. to Nevada Co.; Siskiyou Co. Var. *EXPANSA* Wats. Stems coarser, more erect, 7 to 14 in. high; leaves 2 to 6 in. long, the leaflets 7 to 11; herbage less silvery or greenish; cymes loosely expanded, the flowers on long pedicels.—Gravelly meadows, Sierra Nevada and Siskiyou Co. Var. *VIRIDIA* Jepson n. var. Herbage green.—Volcano Creek, Mt. Whitney (Jepson 4950, type).

13. *P. hickmáanii* Eastw. Stems decumbent, 2 to 4 in. long; herbage sparingly strigose; basal leaves pinnate, 1 to 2 in. long, on petioles  $\frac{1}{4}$  to  $\frac{1}{2}$  as long; leaflets 9 to 11, cuneate-obovate, digitately 3 to 4-cleft, 4 to 6 lines long; cymes few-flowered, the flowers 7 to 12 lines broad; petals golden, obcordate; stamens 20.—Along the coast, San Mateo Co. to Monterey Co.

14. *P. platténsis* Nutt. var. *millefólia* Jepson n. comb. Low, the slender stems 3 to 6 in. long; herbage sparingly pilose; basal leaves pinnate, 2 to 7 in. long, the outline with the margins nearly parallel, the petioles about 3 to 6 lines long; leaflets about 9 to 15, cleft into 3 to 5 linear acute segments, loosely hairy to glabrous, 4 to 7 lines long; cyme open; flowers about 6 lines broad; petals yellow or yellowish, obcordate, exceeding the calyx-lobes; stamens about 20; achenes 25 to 40, smooth.—Mt. valleys, Sierra Co. to Modoc Co. and e. Siskiyou Co. (*P. millefolia* Rydb.) Var. *KLAMATHÉNSIS* Jepson n. comb. Herbage grayish, the hairs spreading.—Interior plateau from ne. Shasta Co. to Klamath Co., Ore. (*P. klamathensis* Rydb.)

15. *P. wheeleri* Wats. Stems several from the base, decumbent, leafy, 1 to 6 (or 10) in. long; densely silky-villous; leaves palmate, 3 to 5-foliate; leaflets cuneate, 3 to 5-toothed at the rounded summit, 4 to 10 lines long (very unequal in size on a plant); stipules entire or nearly so; cyme much-branched, the lower flowers axillary; flowers 5 to  $5\frac{1}{2}$  lines broad; petals yellow, obcordate,  $1\frac{3}{4}$  lines long, slightly exceeding the calyx; stamens 20; achenes about 30.—High montane, 6800 to 11,400 ft.: Sierra Nevada in Tulare Co.; San Bernardino Mts.; San Jacinto Mts. Var. *PAUPÉRCULA* Jepson n. var. Alpine dwarf; stems about 1 in. long; leaflets folded, densely silky,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  lines long; cyme dense, glomerate, about 5-flowered.—Summit of Mt. San Geronio, 11,400 ft. (W. C. Blasdale, type).

16. *P. pseudosericea* Rydb. Stems spreading, 1 to 4 in. long, these and the leaves caespitose; herbage densely white-silky, lower stipules brown and scarious; leaves palmate, sometimes a little pinnate; leaflets 3 to 5 lines long, divided into linear obtuse segments; cyme few-flowered; flowers 3 lines broad; petals yellow, obovate, equalling or slightly exceeding the calyx-lobes.—High montane, 11,000 to 13,000 ft.: Olancha Peak, Inyo Co.; White Mts., Mono Co.; e. to Rocky Mts.

17. *P. rubricáulis* Lehm. Stems 2 to 3 in. long, these and the leaves tufted; leaves with 3 (or 5) terminal leaflets, often with an additional pair below; leaflets deeply cleft into linear-oblong segments, green and appressed pilose above, white-silky beneath, 4 to 7 lines long; flowers few in a subcapitate cyme,  $3\frac{1}{2}$  lines broad; petals yellow.—Alpine, White Mts., 13,200 ft.; e. to Col.

18. *P. dissécta* Pursh. Stems erect, 6 to 11 in. high; leaves mostly basal, somewhat pilose or silky, but green on both sides, digitate, or in any case

the leaflets approximate at summit of the petiole, on petioles 1 to 3 in. long; leaflets 5 to 7, oblanceolate or cuneate-obovate,  $\frac{1}{2}$  to  $1\frac{1}{2}$  or 2 in. long, pinnatifid into triangular or lanceolate teeth; flowers 7 to 9 lines broad; petals yellow, obcordate, or obovate and emarginate, about  $\frac{1}{4}$  longer than the calyx-lobes; stamens 20.—High montane, 8500 to 9500 ft.: Sierra Nevada from Tulare Co. to Mariposa and Mono Cos.; e. to Col., n. to Brit. Am.

19. *P. flabelliformis* Lehm. Stems strict, or nearly so, 2 ft. high, erect, thinly silky-strigose; leaves digitate, green above and appressed silky-hairy, white below with a felt-like tomentum, the veins silky-hairy; leaflets  $2\frac{1}{2}$  to  $3\frac{1}{2}$  in. long, pectinately divided into narrowly linear lobes, the lobes generally stiffish and with revolute margins; cyme mostly loose, sometimes dense, usually many-flowered; flowers 7 to 8 lines broad; petals yellow, obcordate, a little exceeding the calyx-lobes; stamens 20; achenes many.—Mt. valleys, Modoc Co.; e. to northern Nev., n. to B. C. and Saskat. Var. *CTENOPHORA* Rydb. Segments of leaflets broader, the margin not revolute.—Inyo Co. and n.

20. *P. gracilis* Dougl. Stems erect or nearly so, 1 to  $1\frac{1}{2}$  ft. high, villous-pubescent; leaves palmately 5 to 7-foliolate, the basal long-petioled, tufted, the cauline 1 or 2, often subsessile; leaflets obovate or oblanceolate, deeply pinnatifid-serrate with the teeth pointing upward,  $\frac{3}{4}$  to  $2\frac{1}{4}$  in. long, in the typical form with the upper surface very dark green and thinly hairy and the lower surface densely white-tomentose or silky-hairy; flowers 8 to 9 lines broad, many in a large loose cyme; petals yellow, obcordate, exceeding the sepals; stamens 20 to 29; achenes many.—Western margins of the interior great plateau or desert region, or "islands" or "tongues" associated with it, mostly 2000 to 5200 ft.: San Bernardino Mts.; Mt. Pinos; e. side of the Sierra Nevada; e. Humboldt Co.; n. to B. C. and western Mont. Somewhat rare in Cal. Closely connected by intermediate forms with the first-named variety. Var. *RIGIDA* Wats. Fig. 483. Leaflets subglabrous, or thinly or densely long-hairy below, the hairs not matted into a dense tomentum.—Montane, 3000 to 8500 ft.: San Diego Co. to Siskiyou Co., common, especially w. slope Sierra Nevada; n. to B. C. Var. *FASTIGIATA* Wats. Low, stout, tufted, the stems 5 to 10 in. high, villous; leaves silky-villous.—High montane, 4500 to 11,000 ft.: San Jacinto Mts.; Tuolumne Co. and Alpine Co. in the Sierra Nevada; e. to Rocky Mts. Var. *BLASCHKEANA* Jepson n. comb. Very robust; teeth of the leaflets elongate; leaves scantily appressed-hairy above, more thickly hairy below, the veins with longer hairs; stipules large,  $\frac{3}{4}$  in. long.—Sierra Nevada from Tulare and Inyo Cos. to Siskiyou Co.; Santa Cruz Mts.; North Coast Ranges. (*P. blaschkeana* Turcz.) Var. *HALLII* (Rydb.) Wolf. Flowers small (about 5 to 6 lines broad).—Montane, Fresno Co. (*P. hallii* Rydb.)

483. *Potentilla gracilis* var. *rigida* Wats.; a, leaf  $\times \frac{1}{2}$ ; b, fl. branchlet  $\times \frac{1}{2}$ ; c, calyx  $\times \frac{3}{4}$ .

21. *P. flabellifolia* Hook. Fig. 484. Stems slender, spreading or ascending,  $2\frac{1}{2}$  to 7 (or 14) in. high; herbage finely pubescent or glabrate; leaves few, mostly basal, on petioles  $\frac{1}{2}$  to 5 in. long; leaflets 3, thin, all sessile or nearly so, or the middle leaflet stalked,  $\frac{1}{2}$  to 1 in. long, fan-shaped, incisely

and somewhat obtusely many-toothed; cyme 1 to 3-flowered, loose; flowers 8 to 10 lines broad; petals bright yellow, deeply notched at apex,  $1\frac{1}{2}$  to 2 times as long as the calyx-lobes; stamens about 20.—High montane in pine woods or subalpine in moist meadows, 7300 to 12,200 ft.: Sierra Nevada from Tulare Co. to Modoc Co.; n. to B. C. Var. *GRAYI* Jepson n. comb. Stems 2 to 5 in. high; leaves glabrous or nearly so, on petioles  $\frac{1}{4}$  to 1 in. long; leaflets coarsely and acutely 5 to 7-toothed (the teeth somewhat triangular), 3 to 9 lines long, the terminal leaflet distinctly stalked.—Subalpine, 8000 to 9000 ft.: Sierra Nevada from Tulare Co. to Mariposa Co. (*P. grayi* Wats.)

22. *P. campestris* (Rydb.) Jepson n. comb. Fig. 485. Stems ascending or spreading, 3 to 10 in. high; herbage villous but green; basal leaves numerous, 2 to 3 lines wide, 2 to 3 in. long, on petioles  $\frac{1}{4}$  to  $\frac{1}{2}$  as long; cauline leaves few and reduced; leaflets 1 to 3 lines long, 2 to 4-divided into oblanceolate divisions; cyme compact or capitate; flowers 2 to 3 lines broad; bractlets narrow, linear-lanceolate, noticeably shorter than the lanceolate calyx-lobes; petals 5 (or sometimes 4), widely spreading, pale yellow, spatulate-ovate or rhomboid with conspicuous claw, the broad blade often truncate or slightly emarginate at apex; stamens 15 to 20; filaments filiform; pistils 10, but not all maturing.—High montane meadows, 8000 to 8500 ft., upper Kern, Kaweah and Kings rivers in the s. Sierra Nevada. (*P. utahensis* var. *campestris* Jones.)

485. *Potentilla campestris* Jepson; a, habit  $\times \frac{1}{2}$ ; b, long. sect. of fl.  $\times 3$ .

484. *Potentilla flabellifolia* Hook.; a, habit  $\times \frac{1}{2}$ ; b, long. sect. of fl.  $\times 1$ .

23. *P. unguiculata* Greene. Stems many, ascending, 5 to 15 in. high, the basal and cauline leaves 2 to 4 in. long, on petioles  $\frac{1}{3}$  to  $\frac{1}{2}$  as long; herbage villous but green; leaflets crowded, 3 or 4-cleft into linear divisions,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  lines long; cyme compact, leafy-bracted; flowers 4 lines broad; calyx rose or purplish, its segments sharply acuminate; petals white, spatulate or obovate with rounded apex, at base drawn down to a long narrow claw; stamens commonly 15, though some may be lacking; filaments filiform.—Montane, 5000 to 8000 ft., Sierra Nevada from Mariposa Co. to Fresno Co.

24. *P. pickeringii* (Torr.) Greene. Fig. 486. Stems erect or spreading, 10 to 16 in. high; herbage white silky-villous; basal leaves numerous, 4 to 7 in. long, on petioles about  $\frac{1}{2}$  as long; cauline leaves 5 to 10, 2 in. long; leaflets numerous, at first closely imbricated, 2 to 5-parted, 2 to 6 lines long, the segments oblong to oblong-elliptic; branches of the cymes with the flowers in dense terminal clusters; flowers 4 to 5 lines broad; petals white or yellowish, roundish-obovate, truncate or emarginate-mucronate, tapering to a narrow claw,  $1\frac{1}{2}$  to 2 lines long, exceeding the calyx-lobes; stamens 20; filaments filiform.—Dry valleys of the eastern summits or east side of Sierra Nevada, 4000 to 5500 ft., from Nevada Co. to Siskiyou Co.; e. to Nev. (*Horkelia sericoleuca* Rydb.)

25. *P. purpurascens* (Wats.) Greene. Stems erect, 6 to 15 in. high; herbage pubescent and somewhat villous or slightly grayish; leaves 2 to 8 in. long, on petioles  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; leaflets numerous, usually closely crowded, 2 to 4-parted, 2 to 3 lines long; cyme commonly open, few-flowered; flowers 4 lines broad; calyx purplish, bowl-shaped, about 4 lines long; bractlets small and narrow; petals white, rotate, broadly cuneate-oblong, truncate or slightly retuse, equalling the calyx;

487. *Potentilla santolinoides* Greene; a, habit  $\times \frac{1}{2}$ ; b, long. sect. of fl.  $\times 2$ .

486. *Potentilla pickeringii* Greene; a, fl. branchlet  $\times \frac{1}{2}$ ; b, leafy base of stem  $\times \frac{1}{4}$ ; c, leaf  $\times \frac{1}{2}$ ; d, leaflet  $\times 1$ ; e, long. sect. of fl.  $\times 3$ .

stamens 20, those opposite the calyx-lobes longest; filaments subulate-dilated, often scabrous or minutely pubescent; achenes 20 to 25.—Summit valleys and meadows, 6600 to 8000 ft., Sierra Nevada in e. Tulare Co. Var. *CONGDONIS* Jepson n. comb. Coarser, 13 to 24 in. high; herbage greenish, less pubescent, a little glandular; petals obtuse.—East side of the Sierra Nevada in Inyo and Mono Cos.; also Alta Mdw., Tulare Co. (*Horkeliella congdonis* Rydb.)

26. *P. argyrócoma* (Rydb.) Jepson n. comb. Stems spreading, 4 to 8 in. high, densely silky-villous; basal leaves numerous, 1 to 2 in. long, on petioles  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long; cauline leaves 1 or 2, 1 in. long; leaflets densely imbricated, 2 or 3-parted, the segments oblong-elliptic, 1 line long; cyme open or somewhat dense, its forks ending in subcapitate clusters; flowers 4 lines broad; bractlets oblong-lanceolate, half as long as the lanceolate sepals; petals white, spatulate, exceeding the sepals; sta-

mens 20; filaments somewhat dilated.—San Bernardino Mts., 6000 ft. (*Horkelia argyrocoma* Rydb.)

27. *P. santolinoides* (Gray) Greene. MOUSE TAIL. Fig. 487. Plants  $\frac{1}{2}$  to 1 ft. high, the stems slender, erect, nearly naked, subglabrous, diffusely branched above and forming an open panicle of cymes; leaves terete, densely silvery-villous, 1 to 4 in. long, on petioles 3 to 5 lines long, very numerous, the minute leaflets closely imbricated; flowers  $3\frac{1}{2}$  to 4 lines broad; petals white, orbicular, exceeding the short calyx-lobes; stamens 14 to 16; anthers purple; pistil only 1.—Montane, 7200 to 10,000 ft.: Sierra Nevada from Eldorado Co. to Kern Co.; e. Ventura Co.; San Gabriel Mts.; San Bernardino Mts.

28. *P. shockleyi* (Wats.) Jepson n. comb. Stems nearly naked, 2 to 3 in. high, these and the leaves densely tufted; leaves similar to *P. gordonii*; herbage finely glandular-puberulent, the leaflets bristle-tipped; cyme 4 or 5-flowered, distinctly racemose; flowers  $2\frac{1}{2}$  to  $3\frac{1}{2}$  lines broad; petals white, ovate, shorter than the calyx-lobes; stamens 5.—Rocky summits of high peaks, eastern crests of the Sierra Nevada from Silver Peak, Alpine Co., to Tinker's Knob, Eldorado Co. (*Ivesia shockleyi* Wats.) Var. *CALLIDA* Jepson n. comb. Stamens 20.—Tahquitz Peak, San Jacinto Mts., 8000 ft. (*P. callida* Hall.)

488. *Potentilla gordonii* Greene; a, habit  $\times \frac{1}{2}$ ; b, leaflet  $\times 3$ .

29. *P. gordonii* (Hook.) Greene. Fig. 488. Stems erect, nearly naked, 1 to 6 in. high, increasing in length  $\frac{1}{2}$  to 2 in. after anthesis; herbage minutely viscid-pubescent, or often somewhat hirsute; leaves basal, narrowly linear in outline,  $\frac{1}{2}$  to  $3\frac{1}{2}$  in. long, on petioles  $\frac{1}{5}$  to  $\frac{1}{3}$  as long; leaflets numerous, densely set, 1 to  $1\frac{1}{2}$  lines long, 3 to 5-cleft nearly to the base into obovate segments; cyme more or less dense; flowers 3 to 4 lines broad; petals yellow,  $1\frac{1}{2}$  lines long, at first almost orbicular, exceeding the sepals, becoming spatulate after anthesis and then shorter than the accrescent calyx-lobes; stamens 5.—Alpine or subalpine, 8000 to 13,000 ft.: Sierra Nevada; Mendocino and Trinity Cos.; n. to Wash., e. to Col. and Mont. Variable in size, character of pubescence and shape of leaves, which resemble those of Yarrow on a small scale. Var. *MEGALOPÉTALA* Jepson n. comb. Leaves larger (2 to 3 in. long);

petals larger (2 lines long).—Mariposa and Mono Cos., mostly lower altitude than the species. (*Ivesia megalopetala* Rydb.) Var. *SCANDULARIS* Jepson n. comb. Stems naked; pistils 5 to 10.—Alpine, 12,000 ft., White Mts. (*Horkelia scandularis* Rydb.) Var. *URSINDBRUM* Jepson n. var. Leaves grayish with a short stiff pubescence.—Bear Creek, Trinity Mts. (Alexander & Kellogg 313, type). Var. *PYGMAEA* (Wats.) Jepson n. comb. Stamens 10.—Alpine, rock crevices: Sierra Nevada in e. Tulare Co., 9000 (or to 12,000) ft. (*Ivesia gordonii* var. *pygmaea* Wats.) Var. *LYCOPODIODES* (Gray) Greene. Petals oblanceolate.—High peaks: Mt. Dana to Eagle Peak (Modoc Co.). (*Ivesia gordonii* var. *lycopodiodes* Wats.) Var. *CHAETOPHORA* Jepson n. comb. Cyme open, flat-topped; stamens 10.—High montane, Tulare Co. (*Ivesia chaetophora* Rydb.)

30. *P. müirii* (Gray) Greene. Stems slender, naked except for a pair of reduced or minute leaves at the middle, 2 to 6 in. high; herbage silvery-silky; basal leaves tufted, 1 to  $1\frac{1}{2}$  in. long, terete with the numerous minute

leaflets closely covering the axis ("mouse-tail" type), the petioles very short; cyme with 2 or 3 forks, the flowers in subcapitate clusters, or the cyme reduced to a single terminal head; flowers  $1\frac{1}{2}$  to 2 lines broad; petals yellow, oblong-spatulate,  $\frac{1}{2}$  the length of the sepals; stamens 5, the filaments filiform or subulate-filiform; achenes usually 2.—Gravelly alpine slopes, 11,000 to 11,500 ft. in the central Sierra Nevada: Mt. Conness; Mt. Hoffman; Silver Pass; Mt. Goddard. (*Ivesia muirii* Gray. *Horkelia chandleri* Rydb.)

31. *P. wébberi* Greene. Stems reddish, slender or wiry, scantily pilose, 2 to  $4\frac{1}{2}$  in. high, naked save for a pair of leaves at the middle; leaves loosely villous; basal leaves  $\frac{3}{4}$  to 1 in. long, on petioles as long; leaflets 2 to 3 lines long, approximate, 2 to 5-parted into linear acute segments; cyme subcapitate, leafy-bracted; flowers 3 to  $3\frac{1}{2}$  lines broad; petals yellow, oblanceolate, acute, shorter than calyx-lobes; stamens 5; achenes 3 or 4; receptacle densely hirsute.—Montane, 5000 ft., n. Sierra Nevada in Sierra and Plumas Cos.

32. *P. tenuiloba* (Gray) Greene. Stems ascending or erect, 5 to 12 in. high; herbage villous but more or less green; basal leaves  $1\frac{1}{4}$  to 3 in. long on petioles  $\frac{1}{2}$  to 1 in. long; leaflets 17 to 31, 2 to 3 lines long, cuneate-obovate, cleft  $\frac{1}{2}$  to  $\frac{2}{3}$  the way into about 4 linear lobes; cymes close; flowers 3 to  $3\frac{1}{2}$  lines broad; calyx with linear lobes; petals white, cuneate, notched at apex, exceeding the calyx; stamens 10; filaments oblong-dilated.—Low hills or valleys, uncommon: Coast Ranges from Sonoma Co. to San Luis Obispo Co. (*P. micheneri* Greene).

33. *P. hispídula* (Rydb.) Jepson n. comb. Stems slender, erect, 6 to 10 in. high; herbage hispid and glandular-pubescent; basal leaves  $\frac{1}{2}$  to 3 in. long, on petioles nearly half as long; cauline leaves few,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long; leaflets 16 to 21, fan-shaped or broadly cuneate, divided about half way into 4 or 5 oblong or elliptic lobes, markedly hispid, especially at the tips, 2 to 3 lines long; cyme a little lax, medium-sized, somewhat few-flowered; flowers 4 to 5 lines broad; calyx-lobes triangular-lanceolate, these and the petals rotately spreading; petals white, cuneate-obovate, at apex emarginate to rounded, exceeding the calyx-lobes; stamens 10; filaments white, broadly dilated; achenes 15.—High montane, pine slopes and meadows, 8500 to 11,000 ft.: White Mts. (*Horkelia hispídula* Rydb.)

34. *P. daucifolia* Greene. Fig. 489. Stems erect or ascending, rather rigid, 6 to 14 in. high; herbage (especially the leaves) villous; basal leaves 2 to 4 in. long, on petioles  $\frac{1}{2}$  to as long; leaflets 11 to 17, 3 to 8 lines long, 2-parted, the segments 2 or 3-cleft into linear divergent lobes; stipules 2 or 3 times divided into filiform segments, long pilose, forming a conspicuous tuft on the root-crown below the erect leaf-blades; cyme rather close or even capitate congested; flowers 5 to 7 lines broad; petals cream-color, spatulate-obovate, truncatish or obtuse, slightly exceeding the calyx-lobes; stamens 10; filaments petaloid-dilated, those opposite the calyx-lobes deltoid; achenes 8 to 12, smooth.—Shasta and Trinity Cos. to Siskiyou Co. Var. *INDICTA* Jepson n. var. Leaf segments filiform or nearly so; petals very broad (somewhat fan-shaped); filaments broadly subulate.—Crane Creek, w. Tehama Co. (Jepson 100p, type).

489. *Potentilla daucifolia* Greene; a, habit  $\times \frac{1}{2}$ ; b, long. sect. of fl.  $\times 2$ ; c, stamens  $\times 5$ .

35. *P. laxiflora* Drew. Stems ascending, slender, 9 to 12 in. high; herbage green; leaves sparsely hairy, about 2 in. long, on petioles about as long; leaflets 10 to 12 pairs,  $2\frac{1}{2}$  to 4 lines long, 2 to 4-cleft almost to base into linear-lanceolate segments; stipules of basal leaves finely 2 or 3 times dichotomously divided, villous; cyme loose, spreading, compound; flowers 4 to 5 lines broad; calyx-lobes triangular, acute, the bractlets  $\frac{1}{2}$  as long; petals white, spatulate-oblong, deeply emarginate, exceeding the calyx-lobes; stamens 10; filaments petaloid-dilated, unequal; achenes 2 or 3, light brown, smooth.—N. Humboldt Co.

36. *P. howellii* Greene. Stems slender or filiform, purplish, thinly pubescent or glabrate, 8 to 14 in. high, the leaves mostly basal, the cauline few and small; leaves slender, silvery-villous, densely crowded with leaflets, 1 to 2 in. long, on petioles  $\frac{1}{4}$  to  $\frac{1}{2}$  in. long; stipules deeply 2-cleft and hairy; leaflets 13 to 21,  $1\frac{1}{2}$  to 3 lines long, divided to the base into 2 or 3 segments, the segments oblong or oval, entire, or 1 to 3-toothed; cymes  $\frac{1}{2}$  to 3 in. broad, the flowers in clusters of 2 or 3, terminating its slender branches; flowers 3 to 4 lines broad; petals white with pinkish center, obcuneate, retuse, exceeding the calyx-lobes; stamens 10; filaments dilated; achenes 3 to 5.—Red soil, open flats, Del Norte Co.; n. to southwestern Ore.

490. *Potentilla parryi* Greene; a, habit  $\times \frac{1}{2}$ ; b, fl.  $\times 1\frac{1}{2}$ ; c, stamens  $\times 5$ .

37. *P. parryi* Greene. Fig. 490. Stems ascending, a little leafy, 4 to 8 in. high, offsetting by stolons and forming mat-like colonies 2 to 4 ft. broad; herbage soft-pubescent; leaves  $1\frac{3}{4}$  to  $2\frac{1}{4}$  in. long, on petioles  $\frac{1}{2}$  to nearly as long; leaflets about 11, cuneate, toothed at apex, 4 to 6 lines long; cyme diffuse, many-flowered; flowers 4 to 5 lines broad, on slender drooping pedicels 5 to 7 lines long; petals white, obovate, obtuse, entire or toothed laterally at apex, exceeding the calyx-lobes; achenes about 12, gray.—Moist swales in chaparral hills, 800 to 1200 ft., Sierra Nevada foothills from Amador Co. to Mariposa Co. Var. *WILDERAE* Jepson n. comb. Caespitose, 3 to 7 in. high; leaflets cuneate-obovate, usually incised with the lobes toothed; flowers 2 to  $2\frac{1}{2}$  lines broad; pedicels 2 to 5 lines long.—Santa Ana River, San Bernardino Mts., 8000 ft. (*Horkelia wilderae* Parish.)

38. *P. californica* (C. & S.) Greene. Stems stoutish, erect, rather leafy, 1 to 3 ft. high; herbage pubescent and more or less glandular; basal leaves about 6 in. long, on petioles  $\frac{1}{2}$  to as long; leaflets 9 to 21 (or the upper leaves with fewer leaflets), thickish, cuneate-obovate to orbicular or oblong, more or less doubly incised or toothed above the base,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; cyme openly 2 to 4-forked, the branches ending in dense few-flowered clusters and often with solitary flowers in the forks, or sometimes the whole inflorescence capitately congested; flowers 4 to 6 lines broad; calyx cup-shaped, 4 to 6 lines high, about equaling the petals, the calyx-tube commonly purplish or membranous; bractlets commonly exceeding the sepals, 3-toothed, or variably incised, or sometimes entire; petals oblong or spatulate, about 3 lines long; stamens 10, the filaments opposite the calyx-lobes subulate, the others filiform or nearly so.—Wooded slopes or edge of brushy thickets: Coast Ranges from Humboldt Co. to Monterey Co. Var. *FRONDOSA*

Jepson n. comb. Leaflets 5 to 9, oblong or oval, shallowly incised; petals shorter than the calyx-lobes (about  $1\frac{1}{2}$  to 2 lines long).—Contra Costa Co. to Monterey Co. (*P. frondosa* Greene.)

39. *P. elata* Greene. Stems erect,  $1\frac{1}{2}$  to 2 ft. high; herbage glandular, pilose-pubescent; basal leaves 3 to 6 in. long, on petioles  $\frac{1}{2}$  to as long; leaflets 15 to 19, thin, cuneate-obovate, 4 to 9 lines long, once or twice incisely cleft; cyme dichotomously forked, the flowers solitary or in 3s, 5 lines broad; bractlets of the calyx equaling the lobes, lanceolate; petals white, spatulate; stamens 10, 5 short and with filiform filaments, the other 5 with filaments deltoid-dilated at base.—Lower mt. slopes, 1000 to 5000 ft.: middle North Coast Ranges from Napa Co. to Lake and Mendocino Cos.; Sierra Nevada from Fresno Co. to Amador Co.

40. *P. douglasii* Greene. Stems  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high, more or less glandular-pubescent; leaves mostly sub-basal, 2 to 4 in. long, on petioles 1 to  $1\frac{1}{2}$  in. long; leaflets about 11, cuneate to cuneate-obovate, deeply toothed at apex or above the middle, 3 to 6 or rarely 9 lines long; flowers  $2\frac{1}{2}$  to 3 lines broad; calyx somewhat purplish; petals white, cuneate, truncate or retuse, exceeding the calyx-lobes; stamens 10, filaments dilated, those alternate the petals broadly dilated.—Montane, 3400 to 8200 ft.: Sierra Nevada from Fresno Co. n. to Modoc Co., thence w. to Siskiyou Co.; n. to Wash. and Ida. (*Horkelia fusca* Lindl. *P. fusca* Jepson.) Var. *TENÉLLA* Greene. Low (4 to 8 in. high), the stems glandular above; leaflets incised below the middle into linear segments.—Tulare Co. to Tehama Co., thence w. to Trinity Co.

41. *P. bolanderi* (Gray) Greene. Stems ascending, very sparingly leafy, 2 to 10 in. high, these and the leaves mainly tufted; leaves densely white-silky, 1 to 2 in. long, on petioles  $\frac{1}{2}$  to nearly as long; leaflets (11 or) 15 to 27, cuneate-obovate, 2 to 3 lines long, toothed or cleft at apex, the teeth acute; cyme open or dense; flowers 4 lines broad; calyx-lobes and bractlets lanceolate; petals oblong-spatulate, rounded and emarginate, or acute; stamens 10, filaments dilated; achenes minutely granular.—Dry hills: inner North Coast Range from sw. Colusa Co. to Lake Co. and s. to Mt. Hamilton Range and Mt. Pinos. (*Horkelia bolanderi* Gray.) Var. *BERNARDINA* Jepson n. comb. Stems mostly 10 to 15 in. high; herbage less densely pubescent; calyx 3 lines long; leaflets 3 to 4 lines long, typically longer than broad; petals emarginate or rounded at apex.—Montane, 4000 to 7500 ft.: San Gabriel Mts.; San Bernardino Mts. (*Horkelia bernardina* Rydb. *H. bolanderi* var. *parryi* Wats.) Var. *CLEVELANDII* Jepson n. comb. Stems erect, several from the short caudex, 5 to 18 in. high; herbage grayish pubescent; leaflets fan-shaped or roundish, broadly cuneate at base, deeply toothed at apex, 2 to 6 lines long, typically broader than long; flowers 5 to 6 lines broad; petals obovate, obtuse or emarginate.—Montane, 5000 to 7000 ft.: San Jacinto Mts. to Cuyamaca Mts.; s. to L. Cal. (*P. clevelandii* Greene.)

42. *P. lindleyi* Greene. Stems erect or ascending, many from the root-crown, 7 to 20 in. high; herbage pubescent, more or less glandular; leaves mostly basal, 3 to  $3\frac{1}{2}$  in. long, the petioles 1 (to 2) in. long; leaflets roundish to cuneate-obovate, sharply toothed above the base, 4 to 7 lines long; cymes with many flowers, rather crowded; flowers  $3\frac{1}{2}$  to  $4\frac{1}{2}$  lines broad; calyx-tube cupulate, the ovate bractlets smaller than the lobes; petals white, oblong-oblancoate, obtuse,  $\frac{1}{4}$  longer than the sepals; stamens 10, the filaments dilated, the alternate larger and more strongly triangular-subulate.—Near the coast, Santa Cruz Co. to Santa Barbara Co. (*P. cuneata* Baill. *Horkelia cuneata* Lindl. *P. multijuga* Fl. W. Mid. Cal.) Var. *PUBÉRULA* Jepson n. comb. Stems few, erect, 9 to 22 in. high; cymes narrow to diffuse; flowers 7 lines broad.—Valleys and lower hills, 1000 to 2000 ft.: Santa Barbara Co. to San Diego Co. and e. to the San Bernardino Valley. (*P. puberula* Greene.)

*P. TRUNCATA* (Rydb.) Jepson n. comb. Leaflets 5 to 7, obovate, truncate, finely crenate, more deeply toothed at apex; filaments broadly triangular,

491. *Potentilla congesta* var. *tilingii* Jepson; a, habit  $\times \frac{1}{2}$ ; b, fl.  $\times 3$ ; c, stamens  $\times 10$ .

clusters reduced to one; flowers on slender pedicels, 2 to  $2\frac{1}{2}$  lines broad; calyx reddish; petals white, linear-oblong or narrow oblanceolate, acute at both ends, little longer than the calyx-lobes; stamens 10, the filaments more or less dilated at base or narrowly triangular; achenes smooth or rough-lineate.—Montane, common on sandy flats or ridges of open forests, 3000 to 6500 ft.: Sierra Nevada from Tulare Co. to Modoc Co.; Coast Ranges from Lake Co. to Siskiyou and Humboldt Cos.; n. to Ore. (*Horkelia tilingii* Regel. *H. tridentata* Torr.) *P. congesta* Hook., of s. Ore., has broadly obovate petals. Both petals and filaments are, however, variable in shape.

# 11. GÈUM L.

Perennial herbs. Leaves lyrate-pinnate. Stipules adnate to the sheathing petioles. Flowers rather large, solitary or corymbose. Calyx persistent, 5-lobed, usually with 5 alternate bractlets. Stamens many. Pistils numerous, borne on a clavate or hemispheric receptacle; ovule 1. Achenes small, tipped with the elongated styles. (The Latin name.)

those opposite calyx-lobes broader than long.—Said to grow at Ramona, San Diego Co. (*Horkelia truncata* Rydb.)

43. *P. kellóggii* Greene. Too like no. 42; herbage white-silky, obscurely glandular; cymes dichotomous; leaflets broadly obovate, toothed above the cuneate base,  $\frac{1}{2}$  to 1 in. long; flowers 6 to 7 lines broad.—Along the seacoast: Alameda; San Francisco; Monterey. (*Horkelia californica* var. *sericea* Gray.) Var. *MARINÉNSIS* (Elmer) Jepson n. comb. Smaller, stems decumbent; leaflets shaggy-villous. — Sand flats, Point Reyes. (*Horkelia bolanderi* var. *marinensis* Elmer.)

44. *P. congesta* Hook. var. *tilingii* Jepson n. comb. Fig. 491. Stems ascending or erect from a decumbent base, more or less leafy below, 5 to 13 (or 17) in. high; herbage silky-villous; leaves with 5 to 9 (or 11) approximate leaflets; leaflets cuneate, varying to cuneate-elliptic or linear-oblong, usually 3-toothed at apex (otherwise entire), 4 to 6 (or 11) lines long; cyme much-branched, commonly rather open with the branches bearing capitate clusters, or the whole cyme rather dense, or the

492. *Geum macrophyllum* Willd.; a, leaf  $\times \frac{1}{4}$ ; b, fl. branchlet  $\times \frac{1}{2}$ ; c, fr. head  $\times \frac{1}{2}$ ; d, fr.  $\times 1$ .

Style jointed and kinked near the middle, the upper part deciduous, the lower hooked, naked; achenes and styles strongly deflexed in fruit; calyx-lobes reflexed.  
 Terminal leaflet round-cordate; receptacle naked or nearly so. . . . 1. *G. macrophyllum*.  
 Terminal leaflet cuneate-obovate; receptacle densely short-hairy. . . . . 2. *G. strictum*.  
 Style straight, not jointed, wholly persistent, plumose, much elongated; achenes and styles erect or spreading in fruit; calyx-lobes not reflexed. . . . . 3. *G. triflorum*.

1. *G. macrophyllum* Willd. BIG-LEAF AVENS. Fig. 492. Stems coarse, mostly solitary, bristly, leafy, 1 to 3½ ft. high; basal leaves 4 to 15 in. long (including the petiole), the leaflets incised and serrate; terminal leaflet very large, round-cordate (3 to 3½ in. long), the lateral ones downwardly smaller and with very small ones between; flowers 6 lines broad, in an open cyme; petals yellow; bractlets of the calyx small, often wanting; receptacle oblong; achene hairy above, tailed with a naked style, the persistent part hooked.—Montane, 3000 to 9000 ft.: San Bernardino Mts.; White Mts.; Sierra Nevada from Tulare Co. n. to Siskiyou Co.; n. to Alas., e. to Nfd.; Asia.

2. *G. strictum* Ait. YELLOW AVENS. Similar to no. 1; stems bristly; leaflets cuneate-obovate.—Siskiyou Co. to Lassen Co.; n. Mex. to B. C. and Nfd.

3. *G. triflorum* Willd. OLD MAN'S WHISKERS. Fig. 493. Stems clustered, simple, nearly naked, 6 to 14 in. high; herbage pilose; leaves 1½ to 7 in. long including the short petiole; leaflets many, somewhat crowded, cuneate, toothed and incised, ¾ to 1½ in. long; flowers few, broad, borne on long peduncles; calyx dull reddish; bractlets linear, 4 to 9 lines long; petals purplish; receptacle small, hemispherical; tails of the achenes plumose, at length ¾ to 1½ in. long.—Montane, 400 to 8500 ft.: high eastern summits and valleys of the Sierra Nevada from Alpine Co. to Siskiyou and Modoc Cos.; n. to Alb., e. to Nfd.

## 12. FALLÜGIA Endl.

Low deciduous shrub with pinnately lobed leaves and revolute margins. Flowers white, showy, solitary on the ends of long nearly naked peduncles. Receptacle flat. Calyx-tube short-hemispherical, the 5 ovate lobes with alternate linear bractlets. Petals orbicular. Stamens numerous, inserted in 3 rows upon the margin of the calyx-tube. Pistils numerous, glabrous. Style terminal, very villous at the base, twisted, persistent. (V. Falugi, abbot of Vallombrosa.)

493. *Geum triflorum* Willd.; a, basal leaf x ½; b, fl. branchlet x ½; c, fr. head x ½; d, fr. x 1.

1. *F. paradóxa* Endl. APACHE PLUME. Much branched, 1 to 5 ft. high; branchlets slender, elongated, with white, soon exfoliating epidermis; herbage pubescent, the under side of the leaves and the calyx usually rusty; leaves more or less fascicled, 3 to 6 lines long, cleft into 3 to 5 linear obtuse segments with revolute margins; flowers 1 to 1½ in. broad; achenes very numerous, the thread-like plumose tails 1 in. long.—Gravelly or rocky slopes: Providence Mts.; s. Nev. to Col. and Mex. May.

## 13. COWANIA Don.

Shrubs or small trees. Leaves small, pinnately lobed, coriaceous, gland-dotted. Flowers showy, solitary and terminal on the short branchlets. Calyx with broadly clavate tube. Petals orbicular or obovate, spreading. Stamens

numerous, in 2 rows. Pistils about 5 to 10, densely villous; style terminal; ovule solitary. Achenes coriaceous, striate, nearly included in the enlarged calyx-tube, tailed with the elongated plumose style. (James Cowan, British merchant and botanical amateur, died at Lima, 1823.)

1. *C. mexicana* Don var. *stansburiana* Jepson n. comb. CLIFF ROSE. Freely branching shrub, 1 to 3 ft. high; leaves tending to be fascicled on the short branchlets, 3 to 4 lines long, pinnately 3 to 5-parted into short linear lobes, dark green above, white-tomentose beneath, the margin somewhat revolute; flowers white, 6 to 9 lines broad; calyx-tube glandular-pubescent, attenuate into a short pedicel; calyx-lobes roundish; tail of the achene  $1\frac{1}{2}$  to 2 in. long.—Mesas and cañon sides; e. Mohave Desert; Death Valley region; c. to Utah, s. to Mex. June. (*C. stansburiana* Torr.) Var. *DUBIA* Bdg. Flowers perfect and staminate; stamens fewer; pistils 2 or 3; tails of the fruit short, not plumose but densely hairy.—Providence Mts.

#### 14. *ROSA* L. ROSE

Prickly shrubs with pinnate leaves and adnate stipules. Flowers large, ours mostly rose-pink, solitary or in corymbs or panicles. Calyx-tube globose or urnshaped, becoming fleshy in fruit; calyx limb 5-parted. Petals 5 (rarely 6, 7 or 8), rounded or in ours mostly obcordate, spreading, inserted with the numerous stamens on the edge of the thin disk which lines the calyx-tube within and bears toward the base the numerous distinct pistils. Ovaries hairy, becoming bony achenes. Achenes enclosed in the globose or urnshaped calyx-tube or "hip." (The Latin name.)

Calyx-lobes persistent on hips; leaflets 5 or 7, sometimes 9, mostly  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long.

Leaves resinous-pubescent beneath.....1. *R. nutkana*.

Leaves not resinous beneath; hips constricted into a short neck below calyx-lobes.

Plants 3 to 5 ft. high or more; calyx-tube mostly glabrous.

Stipules narrow, with the free tips commonly lanceolate.

Spines stout, curved; herbage mostly pubescent.....2. *R. californica*.

Spines slender, straight; herbage glabrate or nearly.....3. *R. mohavensis*.

Stipules strongly enlarged upwards and sagittate in outline.....4. *R. pisocarpa*.

Plants about  $\frac{3}{4}$  to 1 ft. high; calyx-tube mostly glandular-hispid.....5. *R. spithamea*.

Calyx-lobes deciduous from fruit; leaflets 5, 7, or 9, sometimes 11, mostly  $\frac{1}{4}$  to  $\frac{1}{2}$  (or  $\frac{3}{4}$ ) in. long.....6. *R. gymnocarpa*.

494. *Rosa californica* C. & S.; a, leaf; b, fl. branchlet; c, fr. x  $\frac{1}{2}$ .

1. *R. nutkana* Presl. Stout, 2 to 5 ft. high; prickles stout, usually straight, or sometimes unarmed; leaves resinous-pubescent beneath; stipules subequal in width from base to apex, mostly glandular-ciliate; flowers solitary or 2 to 4 together, the pedicels often prickly and glandular; calyx-tube glabrous, its lobes prolonged into foliaceous, serrate or lacinate appendages; petals obcordate,  $\frac{3}{4}$  to 1 in. long; hips globose or depressed-globose, 5 to 7 lines in diameter.—Humboldt and Siskiyou Cos.; n. to Alas., e. to Utah. May-June. The largest flowered western species. Var. *HISPIDA* Fer. Calyx-tube with gland-tipped bristles.—Eureka.

2. *R. californica* C. & S. CALIFORNIA WILD ROSE. Fig. 494. Stout, 3 to 6 ft. high; prickles few or numerous, mostly stout and recurved, usually also with one or a pair below the stipules; leaves puberulent or pubescent, especially beneath, and more or less glandular; stipules narrow, with lanceolate tips, sometimes

glandular-denticulate; flowers few to many, often 20 to 40 in a panicle; calyx-tube glabrous, its lobes mostly prolonged into foliaceous serrate appendages; petals obcordate,  $\frac{3}{4}$  to 1 in. long; pedicels hairy and more or less glandular; hips globose or ovoid, 4 to 8 lines broad, somewhat constricted below the calyx-lobes.—Common everywhere along river and creek banks and margins of springs at the lower and middle altitudes throughout Cal., often forming small thickets. May-Nov., flowering most freely in June. It is a highly variable species in pubescence, number of flowers and shape of hips. Prickles often 3 to 6 lines long at base and 3 to 5 lines high. (*R. aldersonii* Greene). Var. *ULTRAMONTANA* Wats. Tomentose but not glandular; pedicels glabrous.—E. side of the Sierra Nevada; Nev.

3. *R. mohavensis* Parish. Stems slender; nearly glabrous and non-glandular; prickles scattered, slender, mostly straight, not in pairs below the leaves; flowers solitary or in corymbs of 2 or 3; petals 7 lines long.—Desert side of the San Bernardino and San Gabriel mountains.

4. *R. pisocarpa* Gray. Slender, 3 to 5 ft. high; prickles few, slender and straight, or none; leaves green and glabrous above, paler and often puberulent beneath; stipules strongly and often abruptly dilated upwards and so inversely sagittate; flowers in corymbs or solitary; calyx-lobes prolonged into a slender terminal entire linear or lanceolate appendage, often glandular-hispid; petals obcordate, 6 to 8 lines long; hips globose, 3 to 5 lines in diameter, contracted above into a very short neck.—N. Sierra Nevada; Siskiyou Co.; n. to B. C. This, the mountain form of *R. californica*, is smaller in all its parts but is deficient in technical characters. Var. *GRATISSIMA* Jepson n. comb. Prickles straight, slender, weak; stipules often broad and often broadest at the middle; leaves thinnish, bright green, glandular, minutely pubescent; stipules not glandular-ciliate.—Tehachapi Mts.; San Gabriel and San Bernardino mountains. (*R. gratissima* Greene.) Var. *RIVALIS* Jepson n. comb. Glabrous; prickles few or none; leaflets thin, rather prominently feather-veined, 1 to  $1\frac{1}{2}$  in. long.—Van Duzen River; Long Valley, Mendocino Co. (*R. rivalis* Eastw.)

5. *R. spithamea* Wats. GROUND ROSE. Simple or sparingly branched, about 1 ft. high; prickles few, slender, straight; leaves minutely pubescent and more or less glandular, especially on the petioles; stipules narrow, acute or acuminate; pedicels, calyx-tube and -lobes usually hispid with gland-tipped hairs; flowers solitary or few; calyx with entire linear or lanceolate appendages; petals obcordate, 5 to 8 lines long; hips globose, 3 to 5 lines broad.—Open pine woods at middle altitudes in the Sierra Nevada; and higher North Coast Ranges from Elk Mt., Lake Co., to Humboldt Co. and the Trinity Mts. July. Var. *SONOMENSIS* Jepson. Sonoma Rose. Stems densely armed with stout straight or slightly recurved prickles; leaflets with the teeth minutely glandular-denticulate; flowers several in a corymb; calyx-tube very densely glandular-hispid. — Dry slopes in the outer Coast Ranges from the Santa Cruz Mts. to Mt. Tamalpais and Sonoma Co.

6. *R. gymnocarpa* Nutt. WOOD ROSE. Slender, 1 to 3 ft. high, glabrous or puberulent, the branchlets and rachis of the leaves densely armed with long slender straight prickles, or sometimes nearly unarmed; leaves 2 to 3 in. long; leaflets  $\frac{1}{4}$  to  $\frac{3}{4}$  (or 1) in. long, elliptic or roundish, obtuse or acute, doubly serrate, the minute teeth gland-tipped; flowers generally solitary or in clusters of 2 or 3; petals 5 to 7 lines long; pedi-

495. *Chamaebatia foliolosa* Benth.; fl. branchlet x 1.

cels glabrous or more frequently clothed with gland-tipped hairs, drooping or curving in fruit; calyx-lobes at length deciduous; hips ovate or pear-shaped or globose, red, 4 to 8 lines long.—Shady woods or bushy north slopes, often near streams, 400 to 5500 ft.: Coast Ranges from Monterey Co. to Humboldt Co.; Sierra Nevada from Mariposa Co. to Siskiyou Co.; n. to B. C. Var. *PINETORUM* Jepson n. comb. Calyx-lobes persistent.—Monterey coast. (*R. pinctorum* Hel.)

#### 15. *CHAMAEBÁTIA* Benth.

Low glandular-pubescent heavy-scented evergreen bush with dissected fern-like foliage. Leaves thrice pinnate, with numerous minute leaflets and very minute stipules. Flowers white, in loose terminal cymes. Stamens about 50 to 60 in several rows. Pistil one, simple; style densely villous at base; ovule one. Fruit an achene, included in the persistent calyx. (Greek *chamae*, on the ground, low, and *bates*, a bramble.)

1. *C. foliolosa* Benth. MOUNTAIN MISERY. Fig. 495. One to 2 ft. high; leaflets crowded,  $\frac{1}{2}$  line long; petals obovate, 3 to 4 lines long.—Mt. slopes, 3000 to 4000 ft.: Sierra Nevada from Nevada Co. to Kern Co., abundant in the lower part of the Yellow Pine belt, commonly gregarious and covering extensive tracts. Also called Bear-mat, Bear-clover, Tarweed, Jerusalem Oak and Running Oak. Var. *AUSTRALIS* Bdg. Leaves oblong-lanceolate in outline; ovary glabrous.—San Miguel Mt. (San Diego Co.); s. to northern L. Cal.

496. *Agrimonia eupatoria* L.; a, leaf  $\times \frac{1}{2}$ ; b, fl. branchlet  $\times \frac{1}{2}$ ; c, fr. head  $\times 2\frac{1}{2}$ .

Sierra Co.; Howell Mt.; n. Lake Co.; n. to Wash., e. to the Atlantic. (*A. gyrosepala* Wallr.)

#### 16. *AGRIMONIA* L. AGRIMONY

Perennial herbs with pinnate leaves and serrate leaflets. Flowers yellow, in racemes. Bracts 3-cleft. Calyx-tube turbinate, contracted at the throat and the upper part beset with a ring of hooked prickles, indurated in fruit and enclosing the 2 achenes; calyx-limb 5-cleft, the lobes closing over the throat after flowering. Stamens 5 to 15. Styles terminal. (Corruption of the Greek word *argema*, a disease of the eye, the plants reputed medicinal.)

1. *A. eupatoria* L. COMMON AGRIMONY. Fig. 496. Stems erect, 2 to 3 ft. high; herbage glandular, and both hirsute and puberulent; leaflets 5 or 7, with interposed smaller ones, ovate or obovate, 3 lines to  $3\frac{1}{2}$  in. long, coarsely toothed, entire at base; flowers  $2\frac{1}{2}$  lines long.—Borders of woods in the mts., 2500 to 4500 ft., widely disseminated but rare: Cuyamaca Mts.; San Bernardino Mts.;

#### 17. *ACAENA* L.

Perennial herbs with a woody base, pinnate leaves and pinnatifid leaflets. Flowers green, in more or less crowded spikes. Calyx persistent, its tube contracted at the throat, at length armed with retrorsely barbed prickles; limb in ours 5-parted, valvate, deciduous. Petals none. Stamens in ours 3 to 5. Pistil in ours 1; style terminal; stigma multifid-feathery; ovule solitary, suspended. Achene enclosed in the indurated calyx. (Greek *akaina*, a thorn, in reference to the spines on the calyx.)

1. *A. pinnatifida* R. & P. var. *californica* Jepson n. comb. Fig. 497. Stems erect with decumbent base. 5 to 13 in. high, sometimes almost naked, the leaves mostly at base or tufted on the short woody branches of the root-crown; herbage villous; leaflets 11 to 17, nearly uniform, 3 to 4 lines long, pinnately cleft into 3 to 7 segments; calyx-tube in fruit prickly, 4-angled; stamens dark purple, exserted.—Dry or rocky soil of hilltops or n. slopes near the ocean, 25 to 1500 ft.; Contra Costa and Marin Cos. to Monterey Co. May-June. (*A. californica* Bitt.)

497. *Acaena pinnatifida* var. *californica* Jepson; a, habit x  $\frac{1}{2}$ ; b, infl. x 1; c, fl. x 3; d, pistil x 6.

# 18. *SANGUISÓRBA* L. BURNET

Herbs with unequally pinnate leaves. Flowers small, perfect, polygamous or dioecious, crowded in a dense head or spike at the summit of a long naked peduncle. Calyx-tube turbinate, constricted at the throat, persistent, its 4 spreading lobes deciduous. Petals none. Stamens (in ours) 2 or 4. Pistil 1. Achene enclosed in the 4-angled dry calyx-tube. Latin sanguis, blood, and sorbere, to absorb, the plant anciently a styptic.)

Spikes mostly greenish; stigmas cleft into narrow segments (brush-like).

Leaflets incisely pinnatifid; fruiting calyx narrowly 4-winged, smooth on the faces between the angles; annual.....1. *S. annua*.

Leaflets serrate; fruiting calyx broadly 4-winged, irregularly thick-ridged and alveolate on the faces between the angles; perennial.....2. *S. minor*.

Spikes brown-purple; stigmas muricate-papillose; leaflets merely serrate; perennial.....3. *S. officinalis*.

1. *S. annua* Nutt. Stem erect, branching at or near the base, 12 to 20 (or 24) in. high; leaflets 3 to 5 lines long, incisely parted into narrow lobes; spike oblong, 4 to 6 (or 10) lines long.—Mts., 2500 to 5000 ft.: Cuyamaca Mts.; Nevada Co. to Modoc Co., thence w. to Humboldt Co.; n. to B. C.

498. *Alchemilla arvensis* Scop.; a, habit x 1; b, d. x 7; c, pistil x 6.

2. *S. minor* Scop. GARDEN BURNET. Similar to no. 1; spikes globose.—Foothills, Howell Mt.; adv. from Eur.

3. *S. officinalis* L. GREAT BURNET. Stems 2 to 3 ft. high; leaflets roundish to ovate, cordate or subcordate at base, serrate, 1 to 1 $\frac{1}{4}$  in. long; spikes 6 to 11 lines long.—Near the coast, peat bogs: Mendocino Co. to Del Norte Co.; Eur., Asia.

# 19. *ALCHEMILLA* L. LADY'S MANTLE

Ours a diminutive annual herb, with palmately-lobed leaves and sheathing stipules. Flowers minute, greenish, pediceled and fascicled in the axils. Calyx persistent, its tube pitcher-shaped; limb 4 or 5-parted and bearing an equal number of alternate bractlets, or these minute or obsolete. Petals none. Stamens 1 to 4. Pistils 1 to 4 (in ours 1), distinct, the slender style lateral or arising from near the base. Achene

ovate, smooth, concealed in the tube of the persistent calyx. (So named because valued in alchemy.)

1. *A. arvensis* (L.) Scop. Fig. 498. One to 3 in. high, the branches slender and flower-bearing throughout; herbage scantily soft hairy; leaves 2 to 3 lines long, fan-shaped, 3-parted, the segments 2 or 3-cleft; calyx  $\frac{1}{2}$  to  $\frac{2}{3}$  line long.—Low hills and plains, common throughout Cal.; nat. from Eur.

## 20. CERCOCÁRPUS HBK. MOUNTAIN MAHOGANY

Evergreen shrubs or low trees with spur-like branchlets and simple coriaceous straight-veined leaves. Flowers from winter buds, solitary or fascicled, terminal on the short branchlets. Calyx consisting of a slender pedicel-like tube abruptly expanded into the low-hemispherical deciduous 5-toothed limb. Petals none. Stamens numerous, borne in two or three rows on the calyx. Pistil 1. Fruit a villous achene enclosed in the persistent calyx-tube and surmounted by the very much elongated twisted soft-hairy style. (Greek kerkis, a shuttle, and karpos, fruit, in reference to the achene and its twisted tail.)

Flowers solitary or rarely in pairs; sessile; desert ranges.

Leaves narrowly lanceolate,  $\frac{1}{2}$  to 1 in. long. . . . . 1. *C. ledifolius*.

Leaves oblong,  $2\frac{1}{2}$  to 3 lines long. . . . . 2. *C. intricatus*.

Flowers in 2 to 15-flowered clusters, shortly pediceled.

Leaves obovate, cuneate at base; clusters commonly 2 or 3-flowered.

Flowers 3 lines broad; cismontane, abundant. . . . . 3. *C. betuloides*.

Flowers 1 to  $1\frac{1}{2}$  lines broad; San Diego Co. . . . . 4. *C. minutiflorus*.

Leaves ovate to elliptic; clusters 4 to 9-flowered; Santa Barbara Isls.

Leaves glabrous or nearly so. . . . . 5. *C. alnifolia*.

Leaves white-tomentose beneath. . . . . 6. *C. traskiae*.

1. *C. ledifolius* Nutt. DESERT MAHOGANY. MOUNTAIN MAHOGANY. Shrub or scraggy tree, usually 6 to 20 or sometimes 40 ft. high; leaves narrowly lanceolate, entire with revolute margins, coriaceous, pale or rusty pubescent below, becoming glabrous and lustrous above, somewhat resinous,  $\frac{1}{2}$  to 1 in. long, with a prominent midrib; calyx-tube in fruit 4 to 5 lines long, sessile, tail of the achene 2 to 3 in. long.—Arid slopes of ranges in and bordering the deserts or arid interior, 4000 to 8600 ft.: n. slope San Bernardino Mts. and San Gabriel Mts.; Mt. Pinos; n. along e. side Sierra Nevada to Modoc Co., thence w. to Siskiyou Co.; n. to Wash., e. to Col.

2. *C. intricatus* Wats. SMALL-LEAF MAHOGANY. Intricately branched spinescent shrub 2 to 3 ft. high; leaves dark green above, white-pubescent beneath, strongly revolute, the sides nearly meeting over the midrib,  $2\frac{1}{2}$  to 3 lines long; tails to the achene  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long.—Desert ranges, at mostly lower altitudes than no. 1; Inyo Co. (White Mts. and Panamint Range); e. to Utah.

3. *C. betuloides* Nutt. HARD TACK. Fig. 499. Spreading shrub 5 to 8 ft. high, or a small tree up to 22 ft. high; leaves obovate, serrate above the middle, cuneate and entire towards the base, conspicuously feather-veined, dark green above, pale or whitish pubescent beneath, not resinous,  $\frac{1}{2}$  to 1 in. long; clusters 2 to 6-flowered; flowers 3 lines broad; calyx strigulose-pubescent; calyx-tube in fruit reddish, 6 lines long, borne on a pedicel 1 to 4 lines long; tail of achenes 2 to 3 (or 4) in. long.—Dry slopes in the foothills

499. *Cercocarpus betuloides* Nutt.: a, fl. branchlet  $\times \frac{1}{2}$ ; b, long. sect. of fl.  $\times 3$ ; c, fr.  $\times \frac{1}{2}$ .

and mts., 500 to 4000 ft., throughout cismontane Cal.; n. to Ore., e. to Rocky Mts., s. to L. Cal. Also called Sweet Brush, Ironwood, and Birch-leaf Mahogany. Apr.-June. Var. *MACROURUS* Jepson n. comb. Leaves  $1\frac{1}{4}$  to  $2\frac{1}{4}$  in. long; calyx tomentulose.—Siskiyou Co. to Modoc Co. (*C. macrourus* Rydb.) Var. *MULTIFLORUS* Jepson n. var. Leaves 1 to  $1\frac{1}{2}$  in. long; flowers 5 to 15 in a cluster.—Santa Catalina Isl. (Avalon, Jepson 3041, type).

4. *C. minutiflorus* Abrams. Similar to no. 3; leaves elliptic, serrate near the apex, 6 to 10 lines long, glabrous on both sides, green above, yellowish beneath; flowers 1 to  $1\frac{1}{2}$  lines broad.—Hills and mesas, se. San Diego Co.; s. to L. Cal.

5. *C. alnifolia* Rydb. Too like variants of no. 3; shrub or small tree, 8 to 16 ft. high; leaves elliptic, serrate above the base, subglabrate, 1 to 2 in. long; pedicels 3 to 5 lines long.—Santa Catalina and Santa Cruz Isls.

6. *C. traskiae* Eastw. TRASK MAHOGANY. Shrub or small tree 8 to 20 ft. high; leaves elliptic to sub-orbicular or broadly ovate, serrulate towards apex, mostly obtuse,  $\frac{7}{8}$  to 2 in. long on petioles 2 to 5 lines long, densely white-woolly beneath, green and minutely pubescent above or at length glabrate, the parallel side-nerves prominent, the margin revolute in age; flowers 4 to 9 in a cluster; calyx densely white-woolly, its tube 4 to 5 lines long, its limb 4 lines broad; pedicels 1 to 3 lines long; tail of achenes 2 to  $2\frac{1}{4}$  in. long.—S. side of Catalina Isl. Remarkable for its very local habitat.

## 21. ADENOSTOMA H. & A.

Evergreen shrubs with somewhat resinous herbage and heath-like foliage. Leaves fascicled or alternate, linear, rigid, entire, small and numerous. Flowers small (1 to 2 lines long), white, crowded on the branches of a terminal and rather close pyramidal panicle. Calyx obconical, 5-lobed, 10-striate. Stamens 10 to 15, inserted 2 or 3 together, alternate with the broad spreading petals. Pistil 1. Fruit an achene, covered by the indurated calyx-tube. (Greek *aden*, gland, and *stoma*, mouth, in allusion to the calyx.)

Leaves fascicled; flowers sessile.....1. *A. fasciculatum*.  
Leaves not fascicled; flowers pediceled.....2. *A. sparsifolium*.

1. *A. fasciculatum* H. & A. CHAMISE. Fig. 500. Spreading shrub 2 to 10 ft. high, with virgate branches clothed with leaf-fascicles; old bark grayish or reddish brown, shreddy; leaves linear or rather broader towards the apex, 3 to 5 lines long; stipules minute; bracts herbaceous, much shorter than the strongly ribbed calyx; ovary obliquely truncate.—Mountain slopes and ridges, 500 to 5000 ft., the most abundant and characteristic bush in the higher foothills of cismontane Cal., commonly gregarious and often forming a distinct zone between the lower foothills and the Yellow Pine belt. June. Var. *OBTUSIFOLIUM* Wats. Leaves blunt, 2 to 3 lines long.—San Diego Co.; n. L. Cal.

2. *A. sparsifolium* Torr. RIBBON WOOD. YERBA DEL PASMO. Shrub of thin and slender habit, 10 to 15 ft. high; old bark red, shredding off freely in thin sheets; foliage-bearing branchlets clustered at the end of the branches; branchlets and leaves glandular-dotted; leaves alternate, linear, 3 to 5 lines long; stipules none; bracts scarious, exceeding the obscurely ribbed calyx; ovary truncate.—Mountain slopes and mesas, 2500 to 6000 ft.: Mt. San Jacinto to San Diego Co.; s. to L. Cal. Aug. Also called Red Shanks.

22. *COLEÓGYNE* Torr.

Widely, densely, and intricately branched spinescent shrub. Leaves opposite, small, entire, coriaceous. Flowers solitary, terminal on short branchlets and subtended by 1 or 2 pairs of 3-lobed bracts. Calyx 4-parted nearly

to base, persistent, the lobes large, yellowish within. Petals none. Stamens many, inserted externally upon the lower part of a tubular sheath or torus which encloses the ovary. Pistil 1; style lateral, conspicuously and densely villous at base, twisted, exerted, persistent. Fruit a coriaceous achene, glabrous. (Greek koleos, sheath, scabbard, and gunc, ovary.)

501. *Coleogyne ramosissima* Torr.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, long. sect. of fl.  $\times 2$ ; c, pistil  $\times 4$ .

1. *C. ramosissima* Torr. Fig. 501. One to 5 ft. high; leaves fascicled or approximate, thick, linear-oblongate, canescent, 2 to 4 lines long; torus membranous, dilated below, 5-toothed at apex, as long as the calyx, densely villous within. — Sandy or gravelly slopes, desert ranges: w. side Colorado Desert; e. Mohave Desert; Inyo Co.; e. to Col.

23. *PURSHIA* DC.

Shrubs. Leaves mostly fascicled, cuneate, 3-toothed or -lobed, with revolute margins. Flowers solitary, terminal on the short branches. Petals clawed, exceeding the calyx-lobes, pale yellow or white. Stamens 18 to 25, in one row. Pistil 1. Fruit a coriaceous oblong pubescent achene, exerted and

attenuate into the persistent style. (F. T. Pursh, 1774–1820, author of the *Flora Americae Septentrionalis*.)

Leaves without punctate glands, apparently deciduous.....1. *P. tridentata*.  
Leaves with punctate glands, apparently evergreen.....2. *P. glandulosa*.

1. *P. tridentata* DC. ANTELOPE BRUSH. Fig. 502. Diffusely branched silvery or gray shrub  $1\frac{1}{2}$  to 6 ft. high; bark gray or brown; leaves cuneate, 3-toothed at apex, thinly pubescent and green above, white-pubescent below, 3 to 8 lines long; calyx pubescent, its tube thickly sprinkled with resin granules; petals pale yellow, obovate, 3 to 5 lines long, filmy.—Arid slopes and valleys, 4000 to 7000 ft.: e. slope and e. summit valleys of the Sierra Nevada from Tulare Co. to Modoc Co., thence w. to northern Trinity Co.; n. to Ore., e. to Rocky Mts. Also called Bitter-Brush, Greasewood (Lassen Co.) and Buckbrush (Modoc Co.).

2. *P. glandulosa* Curran. Dark green shrub 2 to 4 (or 8) ft. high; bark dark red or gray; leaves nearly glabrous, with narrow petiole-like base, divided above into 3 (rarely 5) linear lobes, or sometimes merely 3-toothed, the revolute margin with conspicuous glandular dots or pustules; petals white; calyx and fruit canes-

502. *Purshia tridentata* DC.; a, fl. branchlet  $\times 1$ ; b, fr. branchlet  $\times 1$ .

cent.—Ranges in and bordering the deserts: Mohave Desert; Inyo Co.; s. Mono Co.

#### 24. OSMARONIA Greene

Shrub with simple entire deciduous leaves and caducous stipules. Flowers dioecious, white, fragrant, in nodding racemes terminating leafy branchlets. Staminate flower with spreading petals; stamens 15, in 3 rows, 10 inserted with the petals, 5 inserted lower down upon the disk lining the calyx-tube. Pistillate flower with erect petals; stamens present but abortive; pistils 5, distinct; styles short, lateral, jointed at base. Fruit consisting of 1 to 5 drupes. Drupe ovoid, 1-seeded, with a thin pulp and bony stone. (Greek, osme, fragrant, and Aronia, a Rosaceous genus proposed by Persoon.)

1. *O. cerasifórmis* (T. & G.) Greene. OSO BERRY. Fig. 503. Erect, 3 to 9 ft. high; leaves glabrous, broadly oblong, narrowed to each end, mucronate,

503. *Osmaronia cerasiformis* Greene; a, fl. branchlet x 1; b, long. sect. of stam. fl. x 3; c, long. sect. of pist. fl. x 3.

1½ to 2½ in. long when mature, short-petioled; petals 2 to 3 lines long; drupes blue-black, 5 to 7 lines long.—North slopes of cañons: near the coast from Santa Lucia Mts. to Humboldt Co., 300 to 1500 ft.; Sierra Nevada from Tulare Co. to Shasta Co., 1500 to 4000 ft. Mar-Apr. Pulp bitter but not poisonous.

#### 25. PRUNUS L. PLUM

Shrubs or small trees. Leaves simple, serrate. Flowers white, in clusters or sometimes solitary, from lateral buds borne on wood of the previous season, appearing before or with the leaves. Calyx 5-cleft, deciduous after flowering. Petals spreading. Stamens 15 to 30. Pistil 1; style terminal; ovules 2, pendulous. Drupe subglobose, usually 1-seeded; flesh sweet or bitter; stone globose or compressed, bony. (The Latin name of the Plum.)

Ovary and drupe glabrous; flowers white, in clusters; style deciduous.

Drupe subglobose or ovoid, 3 to 8 lines long; leaves folded together lengthwise in bud.—CHERRIES.

Flowers in corymbs; drupe small, bright-red. . . . . 1. *P. emarginata*.  
Flowers in racemes; drupe dark-red.

Peduncle leafy; drupe small, its flesh astringent. . . . . 2. *P. demissa*.  
Peduncle leafless; drupe large, its flesh sweetish. . . . . 3. *P. ilicifolia*.

Drupe oblong, purplish.  $\frac{3}{4}$  to 1 in. long; leaves rolled up from one edge to the other in bud; flowers in umbels.—PLUMS. . . . . 4. *P. subcordata*.  
Ovary and drupe velvety-tomentose or pubescent; flowers mostly solitary, sometimes in 2s or 3s; style more or less persistent; leaves folded together lengthwise in bud; all desert species.—ALMONDS and PEACHES.

Leaves narrow.

Flowers pediceled, light rose, 5 to 8 lines broad; leaves glabrous. . . . . 5. *P. andersonii*.

Flowers sessile, white, 2 to 3 lines broad; leaves puberulent. . . . . 6. *P. fasciculata*.

Leaves broad or roundish, glabrous; flowers white, pediceled. . . . . 7. *P. fremontii*.

1. *P. emarginata* (Dougl.) Walp. BITTER CHERRY. Fig. 504. Deciduous shrub 3 to 8 ft. high, very rarely arboreous and 20 ft. high; bark smooth, dull red; leaves ovate or more commonly oblong-obovate, mostly obtuse, finely serrulate,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, on petioles 1 to 3 lines long; blade usually with 1 or 2 glands just above junction with petiole; flowers 6 to 7 lines broad, 3 to 10 in short corymbs; drupes 4 to 5 lines long, bright red, the pulp intensely bitter.—Mountain slopes and along streams: mts. of S. Cal., 5000 to 9000 ft.; Sierra Nevada, 4000 to 8000 ft., forming extensive thickets; Coast Ranges, 500 to 5000 ft., less common; n. to Ida. and B. C. Apr.-May near the coast, June-July in the high mts.

2. *P. demissa* (Nutt.) Dietr. WESTERN CHOKE-CHERRY. Fig. 505. Erect slender deciduous shrub 2 to 10 ft. high, or rarely a small tree up to 20 ft. high; leaves oblong-ovate or more commonly oblong-obovate, acute or abruptly short-pointed, finely ser-

504. *Prunus emarginata* Walp.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times \frac{3}{8}$ ; c, fr. cluster  $\times \frac{1}{2}$ .

505. *Prunus demissa* Dietr.; a, fl. branchlet  $\times \frac{3}{4}$ ; b, fl.  $\times 2$ .

rate, 1 to  $3\frac{1}{2}$  in. long; petiole  $\frac{1}{2}$  in. long, with 1 or 2 glands just below its summit; racemes 2 to 4 in. long, terminating more or less leafy peduncles; flowers 4 to 6 lines broad; drupe red or dark purple,  $3\frac{1}{2}$  lines long, astringent.—Mountain slopes and cañons, 1500 to 6700 ft.: mts. of S. Cal.; Sierra Nevada; Coast Ranges; n. to Wash.

3. *P. ilicifolia* Walp. ISLAY. Evergreen shrub 4 to 7, or small tree up to 25 ft. high; leaves elliptic or ovate, acute or obtuse, coriaceous, spinose-toothed, 1 to 2 in. long, short-petioled; racemes 1 to  $2\frac{1}{2}$  in. long, on axillary leafless peduncles; flowers  $2\frac{1}{2}$  to  $3\frac{1}{2}$  lines broad; drupe red or dark purple, 6 to 8 lines thick, slightly obcompressed, apiculate; flesh thin, sweetish when ripe.—Mountain slopes and rich valleys, 100 to 4000 ft.: Napa Range to Santa Lucia Mts., Tehachapi Range and S. Cal.; s. to L. Cal. Also called Evergreen Cherry and

Holly-leaf Cherry. Var. *INTEGRIFOLIA* Sudw. Often a tree 15 to 45 ft. high; leaves oblong-ovate, usually entire, 3 to 6 in. long.—Santa Barbara Isls.

4. *P. subcordata* Benth. SIERRA PLUM. Deciduous shrub 4 to 8 ft. high, or a tree up to 20 ft. high, with crooked and rough gray-brown branches and more or less spinescent branchlets; leaves ovate or elliptic to almost round, obtuse or truncate at base, rarely subcordate, serrulate,  $\frac{3}{4}$  to 2 in. long, on petioles 2 to 3 lines long; flowers 6 lines broad, 2 to 4 in a cluster, on pedicels  $\frac{1}{2}$  in. long; drupe red, 9 to 11 lines long.—Cañon sides: Sierra Nevada from Tulare Co. to Modoc Co., 2500 to 4500 ft.; Coast Ranges from the Santa Cruz Mts. to Siskiyou Co., 500 to 3500 ft.; n. to Ore. Most abundant and fruiting most freely in ne. Cal. Apr. Var. *KELLÖGGII* Lem. Drupe larger, yellow, more pulpy, sweeter.—Sierra Co. to Mt. Shasta. Var. *RUBICUNDA* Jepson n. var. Two to 4 ft. high; drupe subglobose, bright red,  $\frac{3}{4}$  to  $1\frac{1}{8}$  in. long; pulp very bitter.—Willow Creek Cañon, Modoc Co. (Goldsmith, type). Var. *OREGANA* Wight. Leaves ovate, abruptly acute,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; drupe dark red, more elliptic than in the species, finely pubescent,  $\frac{3}{4}$  in. long.—Warner Mts., Modoc Co.; n. to southeastern Ore. (*P. oregana* Greene.)

5. *P. anderssonii* Gray. DESERT PEACH. Spreading divaricately branched deciduous shrub 2 to 6 ft. high with very thorny branchlets; leaves fascicled, glabrous, oblong or oblanceolate, minutely serrulate, narrowed to a short petiolar base, 4 to 10 lines long, mostly with several brownish veins; flowers solitary, 5 to 8 lines broad, on pedicels  $1\frac{1}{2}$  to 4 lines long; fruits flattened-globose and a little oblique, 6 to 7 lines long, covered with a close dark brown pubescence or indument.—Arid slopes and desert mesas: e. side of Sierra Nevada from Modoc Co. to the Panamint and Coso ranges; nw. Nev. May.

6. *P. fasciculata* Gray. DESERT ALMOND. Divaricately branched deciduous shrub with gray bark and very thorny branchlets, 2 to 6 ft. high; leaves fascicled, minutely pubescent, narrowly oblanceolate, entire or with 1 or 2 minute teeth on each side, 3 to 8 (or 10) lines long, mostly with one brownish vein; flowers more or less dioecious, solitary or fascicled on the short spurs, sessile or nearly so, 2 to 3 lines broad; fruit ovoid, acutish, light brown with a dense velvet coat of short bristly hairs, 4 to 5 lines long; flesh thin.—Desert slopes and mesas, 3000 to 6500 ft.: Mohave and Colorado deserts and bordering ranges, w. to Santa Barbara and San Luis Obispo Cos., n. to Inyo Co.; e. to Utah and Ariz. Apr.-May.

7. *P. fremontii* Wats. DESERT APRICOT. Deciduous shrub or small tree, 5 to 15 ft. high with spiny branchlets; leaves ovate or roundish, serrulate,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, on short slender petioles; flowers solitary or somewhat fascicled, 5 to 6 lines broad, pediceled; fruit oblong-ovoid or elliptic-ovoid, sparingly or minutely puberulent, 4 to 6 lines long.—Ranges in and bordering the Colorado Desert; s. to L. Cal. (*P. eriogyna* Mason.) Var. *PILULATA* Jepson n. var. Leaves orbicular, more or less truncatish or subcordate at base, 5 to 8 lines long; fruit (immature) subglobose, a little flattened, a little broader than long, 4 lines long.—Wagon Wash near Sentenac Cañon (Jepson 8769, type).

## 26. *SORBUS* L.

Deciduous trees or shrubs. Leaves pinnate with many leaflets. Flowers white, in compound cymes. Stamens about 20. Ovary inferior, 2 to

506. *Sorbus sitchensis* Roem.; fr. branchlet x  $\frac{1}{4}$ .

5-celled; styles as many as the cells, distinct. Fruit a small berry-like pome. (The Latin name.)

1. *S. sitchénsis* Roem. WESTERN MOUNTAIN ASH. Fig. 506. Many-stemmed erect nearly glabrous shrub 3 to 9 ft. high; leaves 4 to 6 in. long; leaflets 5 to 7 pairs, oblong, serrate except at base, 1 to 2 in. long; corymbs 2 to 3 in. broad; petals 2 lines long; styles villous at base; fruit coral-red, 4 lines long.—Along streams on steep slopes in the mts., 7000 to 9000 ft.: Sierra Nevada from Tulare Co. to Modoc Co., thence w. to Mt. Shasta, Salmon Summit and Marble Mt.; n. to Alas., e. to Lab. Var. *DÉNSA* Jepson n. var. Leaflets more crowded,  $1\frac{1}{4}$  to 2 in. long; corymbs denser, the pedicels and calyx-tube hairy.—Siskiyou Co. to Mariposa Co. (Stubblefield Cañon, Jepson 4530, type). (*Pyrus sambucifolia* Bot. Cal.)

## 27. *PHOTÍNIA* Lindl.

Evergreen shrub with simple coriaceous serrate leaves. Flowers white, small, numerous, in little cymes disposed in a terminal corymbose panicle. Calyx turbinate, 5-cleft. Petals spreading. Stamens (in ours) 10, in pairs opposite the calyx-teeth; filaments subulate. Pistils 2 or 3, lightly united, only lightly adherent to the fleshy calyx-tube, the thickened calyx-teeth closed over them in fruit. Fruit bright red, ovoid, berry-like. Seeds 1 or 2 in each cell. (Greek *photeinos*, shining, alluding to the foliage.)

507. *Photinia arbutifolia* Lindl.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, leaf  $\times \frac{1}{4}$ ; c, fl.  $\times 2$ ; d, fr.  $\times 1\frac{1}{4}$ .

1. *P. arbutifolia* Lindl. CHRISTMAS BERRY. TOYON. Fig. 507. Shrub, rarely a small tree, 5 to 15 ft. high; leaves oblong, acute at base and apex, dark green, lighter beneath, 2 to 4 in. long, on petioles  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long; panicle in anthesis rather dense, 2 to 3 in. high; corolla  $2\frac{1}{2}$  lines broad; fruit 3 to 4 lines long.—Rocky mountain slopes and deep soil of cañon bottoms, 10 to 3500 ft.: Sierra Nevada foothills from Butte Co. to Mariposa Co.; Coast Ranges from Humboldt and Shasta Cos. s. to San Diego Co.; s. to L. Cal. (*Heteromeles arbutifolia* Roem.) Var. *CÉRINA* Jepson n. var. Berries yellow.—San Luis Obispo Co. (Templeton, Pearl C. Jared, type) to n. Monterey Co.

## 28. *PÝRUS* L. PEAR. APPLE

Deciduous trees or shrubs with simple leaves and stipules which disappear early. Flowers in corymbs. Calyx-tube urnshaped. Petals white or pink, with claws. Stamens about 20. Ovary inferior, 2 to 5-celled, ovules 2 in each cell, the carpels chartaceous; styles as many as the cells, united at base. Fruit a pome. (Latin name of the Pear.)

1. *P. rivulàris* Dougl. OREGON CRAB APPLE. Small tree or many-stemmed shrub 10 to 30 ft. high; leaves ovate, pointed, serrate, or some 3-lobed or with a coarse tooth on each side, green above, pale, pubescent and eventually rusty beneath, 1 to  $3\frac{1}{4}$  in. long; corymbs 4 to 10-flowered; petals white, elliptical, 3 to 5 lines long; carpels commonly 3; fruits oblong or oblong-ovoid, 6 to 7 lines long, yellowish (or pinkish on one side), aging purple-black.—Near the coast: Napa Range and Sonoma Co. to Humboldt Co.; n. to Wash.

29. *CRATAEGUS* L. THORN

Thorny shrubs or trees. Leaves simple, toothed or lobed, deciduous. Flowers in ours white, heavy-scented, in short corymbs. Calyx-tube urnshaped. Petals roundish. Stamens 10 to 20. Ovary inferior, or its summit free, 2 to 5-celled, or the 2 to 5 carpels merely contiguous and not united; styles distinct. Fruit more or less drupe-like, red or purple, containing 2 to 5 bony 1-seeded nutlets, these united or separable; calyx-teeth persistent. (Greek *kratos*, strength, in reference to the wood.)

1. *C. douglasii* Lindl. WESTERN BLACK HAW. Much branched shrub 5 to 9 ft. high or sometimes a scraggly tree up to 20 or 30 ft. high; thorns stout,  $\frac{1}{2}$  to 1 in. long; twigs reddish; leaves obovate or ovate, doubly serrate above the cuneate entire base and often lobed or rarely with 1 or 2 deep slashes, 1 to 2 (or 4) in. long, on short petioles; flowers 5 to 6 lines broad; fruit black, 5 to 6 lines long.—Cañon flats, 2500 to 4000 ft., Sonoma Co. to Humboldt Co., thence e. to Modoc Co.; n. to B. C., e. to Mich. June. (*C. rivularis* Fl. W. Mid. Cal.)

30. *PERAPHYLLUM* Nutt.

Low shrub. Leaves simple, mostly fascicled at the ends of the branchlets or short spurs. Flowers appearing with the leaves, solitary or in a sessile 2 to 3-flowered umbel. Ovary inferior, 2-celled, each cell becoming incompletely divided by a false partition; styles 2. Fruit globose, fleshy. (Greek *pera*, excessively, and *phyllon*, a leaf.)

1. *P. ramosissimum* Nutt. Intricately branched, 2 to 4 ft. high, with short rigid branchlets and grayish bark; leaves oblanceolate, entire or very minutely serrate,  $\frac{1}{2}$  to  $1\frac{1}{4}$  (or  $2\frac{1}{4}$ ) in. long; flowers pale rose-color; petals roundish-obovate, spreading, 4 lines long; fruit yellowish, 4 to 5 lines in diameter.—High interior plateau, Lassen Co. to ne. Shasta Co. and Modoc Co.; n. to Ore., e. to Rocky Mts. May.

31. *AMELANCHIER* Medic. JUNE BERRY

Shrubs or small trees with simple deciduous leaves. Flowers white, in racemes. Calyx-tube campanulate, more or less adnate to the ovary, the limb 5-parted, the lobes narrow, persistent. Petals ascending. Stamens indefinite, about 20, the outer row with longer filaments. Ovary partly or wholly inferior, 5-celled, each cell in fruit divided into 2 by a partition from the back; styles 5, united below. Fruit berry-like, globose, the cells 1-seeded. (Savoy name of the Medlar.)

1. *A. alnifolia* Nutt. WESTERN SERVICE BERRY. Fig. 508. Shrub 3 to 12 ft. high; leaves mostly elliptic, sharply serrate near the apex or less commonly entire,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; petioles 4 to 6 lines long; racemes short and rather dense; petals narrowly oblong, or somewhat cuneate at base, 4 to 6 lines long; calyx tomentulose or white-hairy, more or less glabrate; fruit purplish,  $2\frac{1}{2}$  to 3 lines in diameter.—Mountain slopes: High mts. of S. Cal. and Sierra Nevada, 5000 to 8000 ft.; Coast Ranges, 100 to 6000 ft.; n. to Alas., e. to Rocky Mts. Variable as to pubescence, especially of flowering parts. The following are shadowy or wavering varieties only tentatively entered here: Var. *PÁLLIDA* Jepson n. comb. Leaves cuspidate, entire or less serrate at apex; calyx-lobes subglabrous outside.—Usually at lower and more arid situations:

508. *Amelanchier alnifolia* Nutt.; fl. branchlet x 1.

Sierra Nevada and Coast Ranges to mts. of S. Cal. (*A. pallida* Greene).  
 Var. *VENULOSA* Jepson n. comb. Leaves conspicuously veiny, serrate at apex or above middle; calyx pubescent outside.—Arid mountain slopes: Warner Mts.; San Gabriel Mts.; San Bernardino Mts. (*A. venulosa* Greene.)  
 Var. *COVILLEI* Jepson n. comb. Leaves obtuse, pointed at very apex; petals  $2\frac{1}{2}$  to 3 lines long.—Panamint Mts. (*A. covillei* Sta.)

### LEGUMINOSAE. PEA FAMILY

Herbs, shrubs, or trees. Leaves alternate, stipulate, usually compound. Leaflets 1 to many, usually entire. Calyx synsepalous, 5-toothed or -cleft (or in *Lupinus* 2-lipped), mostly persistent. Corolla with 5 petals, regular or somewhat irregular or in ours commonly papilionaceous, i. e., highly irregular and butterfly-like: the upper petal is called the banner; the lateral petals are called the wings; the two lower petals are joined by their edges to form the keel; the banner in the bud enfolds the wings which in turn cover the keel-petals; all the claws are free from one another. Petals essentially hypogynous. Stamens 10, united into a sheath around the ovary (monadelphous), or the upper stamen distinct from the others (diadelphous), or sometimes all distinct. Pistil 1, superior, 1-celled. Fruit a legume (2-valved pod), with 1 row of seeds on the ventral side, commonly opening by both the dorsal and ventral sutures, the valves twisting in opposite directions, or sometimes indehiscent. Seeds mostly kidney-shaped, without endosperm.—*Amorpha* has but one petal. *Krameria* has simple leaves without stipules, 4 stamens and an irregular corolla. *Acacia* has numerous stamens. In ours *Cytisus* and *Ulex* have no stipules. The seeds of *Cassia* have endosperm. The pod in *Astragalus* is sometimes 2-celled.

#### A. COROLLA REGULAR, OR ONLY SLIGHTLY IRREGULAR (EXCEPT IN NO. 2), NOT AT ALL PAPILIONACEOUS (OBSCURELY SO IN NO. 1); TREES OR SHRUBS.

##### Leaves simple.

Pods not spiny; stamens 10.....1. *CERCIS*.

Pods spiny; stamens 4.....2. *KRAMERIA*.

##### Leaves compound.

Calyx with perigynous disk within the tube or at base.

Leaves simply pinnate; anthers fixed by the base; fertile stamens 7...3. *CASSIA*.

Leaves bipinnate, the petiole very short or almost none, bearing one pair of pinnae; calyx 5-lobed, the lobes reflexed at maturity, deciduous; stamens 10, distinct; anthers fixed by the middle; corolla moderately large (2 to 5 lines long).

Pods flattish; petiole not spinescent at tip.....4. *CERCIDIUM*.

Pods torulose; petiole spinescent at tip.....5. *PARKINSONIA*.

Calyx without perigynous disk; corolla minute (1 to  $1\frac{1}{2}$  lines long); leaves usually twice pinnate.

Petals distinct or becoming so; stamens 10.....6. *PRONOPIS*.

Petals united below; stamens indefinitely numerous.....7. *ACACIA*.

#### B. COROLLA PAPILIONACEOUS.

##### 1. Stamens distinct.

##### Leaves palmately 3-foliolate.

Flowers yellow, in racemes; stipules conspicuous; herbs.....8. *THERMOPSIS*.

Flowers purple, solitary; stipules none; very spiny shrub.....9. *PICKERINGIA*.

Leaves bipinnate; herbs or low shrubs with racemes of yellow flowers.....10. *HOFFMANSEGGIA*.

##### 2. Stamens diadelphous or monadelphous.

a. Calyx deeply 2-lipped; stamens 5 long and 5 short, their filaments monadelphous but free at apex; anthers alternately larger and smaller.

Sides of the roundish banner turned or rolled sharply backwards; flowers mostly blue or purple, rarely white, yellow or red, in terminal racemes, mostly in whorls; leaves palmate, of 4 to many leaflets; seeds without strophiole.....11. *LUPINUS*.

Sides of banner not rolled or bent backward; flowers yellow; seeds with strophiole; introduced shrubs.

Leaves 3-foliolate, or the branches leafless; calyx herbaceous, divided half-way into 2 lips.....12. *CYTISUS*.

Leaves simple, or the branches leafless; calyx membranous, divided nearly to base into 2 lips.....13. *ULEX*.

##### b. Calyx not deeply 2-lipped.

##### Leaves compound.

Leaves 3-foliolate, the leaflets denticulate or serrulate; (see also nos. 17 and 20).

Flowers in a raceme or spike; corolla deciduous after flowering; leaves pinnately 3-foliolate.

Pod curved or spirally coiled; style subulate.....14. *MEDICAGO*.

Pod small, ovoid; style filiform.....15. *MELILOTUS*.

- Flowers in a head, rarely in a capitate umbel or short spike; corolla withering-persistent after flowering; leaves palmately 3, sometimes 4 or 5-foliate. 16. TRIFOLIUM.
- Leaves pinnate, the leaflets commonly entire.
- Leaves commonly odd-pinnate (two species palmate in Psoralea), the leaflets entire.
- Flowers in umbels, sometimes solitary; leaflets commonly 3 to many, sometimes 1 or 2.....17. LOTUS.
- Flowers in racemes or spikes; leaflets many (few in no. 20 and often in no. 19).
- Herbage glutinous or glandular-dotted.
- Pod not prickly; flowers purple or whitish or rose-color.
- Corolla of 1 petal; shrub.....18. AMORPHA.
- Corolla of 5 petals.
- Shrubs, sometimes herbs; deserts.....19. PAROSELA.
- Herbs; Sierra Nevada and Coast Ranges.....20. PSORALEA.
- Pod prickly, indehiscent; flowers yellowish.....21. GLYCYPHYZA.
- Herbage not glandular-punctate nor glutinous (viscid in 1 species of no. 24); herbs.
- Leaves and upper stipules spinose-tipped.....22. KENTROPHYTA.
- Herbage unarmed.
- Tip of keel obtuse or merely acute.....23. ASTRAGALUS.
- Tip of keel prolonged into a distinct beak.....24. OXYTROPIS.
- Leaves equally pinnate.
- Tree, spinescent; two upper calyx-teeth united.....25. OLNEYA.
- Herbs.
- Rachis not produced into a tendril; pods somewhat stipitate, septate between the seeds.....26. SESBANIA.
- Rachis produced into a branched tendril, rarely terminating in a bristle or imperfect leaflet; pods not septate between the seeds; flowers commonly in spikes or racemes.
- Style hairy all around at summit.....27. VICIA.
- Style hairy on the upper side.....28. LATHYRUS.
- Leaves simple; very spiny low shrub.....29. ALHAGI.

### 1. *CERCIS* L. JUDAS TREE

Shrubs. Flowers red-purple, in umbel-like fascicles, appearing from winter buds in advance of the simple leaves. Stipules caducous. Calyx in anthesis broader than long, with 5 broad obtuse teeth. Corolla obscurely papilionaceous; banner smaller than the wings and enclosed by them in the bud; keel-petals larger than the wing-petals and not united. Stamens 10, distinct, declined, the filaments clavate-dilated towards the base. Pod oblong, very flat, the upper suture with a winged margin. Embryo straight. (Kerkis, Greek name of the oriental Judas Tree.)

1. *C. occidentalis* Torr. WESTERN RED-BUD. Fig. 509. Stems usually clustered, 8 to 15 ft. high; leaves round, cordate at base with nearly closed sinus,  $2\frac{1}{2}$  to  $3\frac{1}{2}$  in. broad; pod 2 to  $2\frac{1}{2}$  in. long and 8 lines wide.—Foothills, 1000 to 4000 ft.; inner North Coast Ranges from Solano Co. to e. Mendocino Co. and Shasta Co., s. through the Sierra Foothills to Tulare Co. and the mts. of S. Cal.; e. to Tex. Mar.-Apr.

### 2. *KRAMERIA* L.

More or less root-parasitic shrubs with alternate simple entire leaves without stipules. Flowers purple, solitary in the axils on bracted peduncles. Sepals 5, petal-like, the lower one broadest. Petals 5, smaller than the sepals, the 3 upper parallel and approximate with very small blades and very long claws, the 2 lower reduced to short fleshy scales. Stamens 4, all on upper side of

509. *Cercis occidentalis* Torr.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 1$ ; c, pod  $\times \frac{1}{2}$ .

510. *Krameria canescens* Gray; a, fl. branchlet x  $\frac{1}{2}$ ; b, fl. x 1; c, fr. x 1.

flower, in two unequal pairs; anthers opening by a terminal pore. Ovary 2-ovuled. Pod subglobose, spiny, indehiscent, 1-seeded. (J. G. H. Kramer, Austrian army physician, 18th century, author of a key to the herbs, shrubs and trees.)

Spines on fruit barbed at apex.....

1. *K. canescens*.

Spines on fruit barbed their whole length...

2. *K. parvifolia*.

1. *K. canescens* Gray. Fig. 510. Intricately and densely branched thorny shrub  $1\frac{1}{2}$  to  $2\frac{1}{4}$  ft. high; young parts tomentose; leaves lanceolate or linear, acute, 2 to 5 lines long; peduncles bearing near middle one pair of opposite bracts; calyx 4 to 5 lines long, lightly tomentose without, deep purple within; upper sepals approximate, erect or recurving, lateral pair upwardly curving with falcate tips, the lower ones spreading downward; petals red-purple with yellowish claws; style with a white-pubescent zone at base; pod globose, 4 lines long, armed with many slender (2 lines long) spines barbed at tip.—Mohave and Colorado deserts; e. to N. Mex., s. to Mex. and L. Cal. (*K. grayi* Rose & Painter.)

2. *K. parvifolia* Benth. Similar to no. 1; peduncles bearing 2 or 3 opposite pairs of leaf-like bracts.—Mohave Desert; s. along the western borders of the Colorado Desert to L. Cal.; e. to N. Mex.

### 3. *CASSIA* L. SENNA

Herbs or shrubs with even-pinnate leaves. Flowers (in ours) yellow, in racemes. Sepals 5, distinct or nearly so. Corolla regular, with spreading petals. Fertile stamens (in ours) 7, the anthers opening by 2 pores at the apex, the 3 remaining stamens represented by short sterile filaments on the upper side of the flower. Pod usually curved, many-seeded. (Ancient Greek name.)

Herbage glabrous or nearly so; stipules and stipels none; racemes terminal.....1. *C. armata*.

Herbage finely and densely white-pubescent; stipules and stipels filiform; racemes axillary.....2. *C. covessii*.

1. *C. armata* Wats. Fig. 511. Much-branched bush 2 to 4 ft. high; shoots of the season thickish, green, almost leafless, ending in racemes 3 to 7 in. long; leaf-rachis elongated, dilated, ending in a conspicuous point, bearing 1 to 4 pairs of leaflets; leaflets distant, oblong or ovate, 2 to 4 lines long; petals roundish, bright salmon-color, 4 to 6 lines long; pods curved.—Sandy shallow washes: Colorado and Mohave deserts and n. to Inyo Co.; e. to western Ariz.

2. *C. covessii* Gray. Bush 1 to 2 ft. high; leaf-rachis short, bearing 3 pairs leaflets; leaflets elliptic, 6 to 12 lines long; racemes few-flowered, corymbose, 1 to 2 in. long; petals oblong-obovate, veined, 6 lines long; pods straight.—Sandy washes, Chuckawalla Mts., Colorado Desert; e. to Ariz.

511. *Cassia armata* Wats.; a, fl. branchlet; b, leaf; c, pod. x  $\frac{1}{2}$ .

4. *CERCÍDIUM* Tul.

Shrubs or small trees, armed with short axillary thorns. Leaves bipinnate with very short petiole bearing one pair of pinnae, each pinna with 2 or 3 equal pairs of leaflets. Flowers on jointed pedicels in axillary racemes. Petals yellow, clawed, the upper one broader than the rest, a little auricled at base of blade, and with longer claw. Stamens 10, distinct, the filaments hairy at base. Pod linear or oblong, flattish. (Greek *cercidion*, a weaver's shuttle, in reference to the fruit.)

1. *C. torreyanum* (Wats.) Sarg. PALO VERDE. Fig. 512. Tree 15 to 20 ft. high, with short trunk and smooth green bark, leafless for most of the year; flowers yellow, 6 to 9 lines broad; pods 2 to 3 in. long, often conspicuously constricted between the flat seeds.—Sandy washes or depressions in the Colorado Desert; s. Ariz. to L. Cal. and Sonora. The leaves fall soon after they appear in March, but the tree still presents a cheerful appearance on account of its bright green bark.

5. *PARKINSÓNIA* L.

512. *Cercidium torreyanum* Sarg.; a, b, c, different forms of pods  $\times \frac{1}{2}$ . Shrubs or low trees. Leaves bipinnate, the common petiole very short, or almost none, bearing one pair of pinnae, each pinna with 4 to 25 pairs of leaflets. Flowers in loose racemes. Petals yellow. Stamens 10, distinct, in 2 rows, the filaments hairy below. Pod linear-cylindric, conspicuously constricted between the seeds. (James Parkinson, 1567-1650, author of botanical treatises and herbalist to James I.)

1. *P. microphýlla* Torr. MALE PALO VERDE. Shrub 5 to 10 ft. high or a small tree up to 25 ft. high, with light green bark; branchlets spinose at tip; pinnae  $\frac{1}{2}$  to 1 in. long, in sessile pairs, the common petiole short or none; leaflets 4 to 8 pairs, elliptic,  $\frac{1}{2}$  to 1 line long; petals pale yellow, 2 to  $2\frac{1}{2}$  lines long; pods  $1\frac{1}{2}$  to 3 in. long, 1 to 3-seeded, strongly constricted between the seeds and the constrictions sometimes elongated, beaked with a long-acuminate apex and contracted at base into a cuneate stipe.—Whipple Mts. on the Colorado River; Ariz.; n. Mex.

6. *PROSÓPIS* L.

Deciduous shrubs or trees, the branches armed with spines or thorns. Leaves deciduous, bipinnate with 1 pair (rarely 2 pairs) of pinnae; leaflets in equal pairs, numerous, small, entire. Flowers small, greenish-yellow, regular, sessile, in axillary pedunculate cylindrical spikes. Calyx campanulate, with 5 short teeth, deciduous. Petals 5, very much exceeding the calyx. Stamens 10, distinct, exserted. Ovary stipitate, villos. Pod straight, curved or coiled, indehiscent, the many seeds separated by thick spongy partitions. (Greek *prosopis*, ancient name for the butter-bur.)

Pinnae with 10 to 15 pairs of leaflets; thorns axillary, in pairs, singly or none; pod straight or curving, compressed. . . . . 1. *P. juliflora*.  
Pinnae with 5 to 8 pairs of leaflets; spines in pairs, stipular; pod spirally coiled into a straight cylindric body. . . . . 2. *P. pubescens*.

1. *P. juliflora* DC. var. *glandulosa* Ckll. HONEY MESQUITE. Fig. 513. Several-stemmed or a short-trunked tree with crooked or arching branches forming a rounded or depressed crown, 10 to 20 ft. high; leaflets linear,  $\frac{1}{2}$  to 1 in. long; stipules linear and membranous; thorns 1 or 2, axillary,  $\frac{1}{4}$  to  $1\frac{1}{4}$  in. long, or sometimes absent; flowers 2 lines long, condensed in slender cylindrical spikes mostly 2 to  $3\frac{1}{2}$  in. long; stamens twice as long as the petals; pods borne in drooping clusters, 1 to 6 to each spike,

513. *Prosopis juliflora* var. *glandulosa* Ckll.; fl. branchlet  $\times \frac{1}{3}$ .

514. *Prosopis pubescens*  
Benth.; fr. spike  $\times \frac{1}{2}$ .

linear, at first flat, later becoming thickened, curved 4 to 8 in. long, 4 to 5 lines broad, irregularly constricted between the seeds which are about 3 lines long.—Colorado and Mohave deserts; local in the upper San Joaquin Valley, at San Jacinto Lake and in w. San Diego Co.; e. to Tex., s. to northern Mex.

2. *P. pubescens* Benth. SCREW-BEAN MESQUITE. Fig. 514. Shrub or small tree 10 to 35 ft. high; branches armed with stout stipular often whitish spines 2 to 6 lines long; leaves canescently puberulent; leaflets oblong, 1 to 5 lines long; flowers 2 lines long, borne in spikes 2 to 3 in. long, each spike setting 2 to 15 pods; pod coiled into a narrow straight cylindric body 1 to  $1\frac{1}{2}$  in. long; seeds less than 1 line long.—Sandy or gravelly washes or

ravines: Colorado and Mohave deserts, n. to Death Valley; e. to N. Mex.

## 7. ACACIA Willd.

Trees or shrubs with bipinnate leaves and small leaflets. Flowers minute, in ours yellow, perfect or polygamous, condensed in pedunculate cylindrical or globular spikes. Spikes solitary or fascicled in the axils or disposed in a diffuse terminal panicle. Calyx 4 or 5-toothed. Petals more or less united below. Stamens numerous, distinct or nearly so, much exserted. Pod 2-valved or indehiscent. (Greek akakie, from ako, a point, referring to the prickles.)

1. *A. greggii* Gray. CATCLAW. Fig. 515. Straggling shrub 4 to 7 ft. high, or sometimes becoming a small tree up to 15 ft. high; branches armed with scattered short but stout curved prickles, rarely unarmed; leaves deciduous, 1 to 2 in. long, with 1 or mostly 2 or 3 pairs of pinnae and 4 to 6 pairs of pale leaflets; leaflets oblong to oblong-obovate, 1 to  $3\frac{1}{2}$  lines long; flowers in cylindrical spikes  $\frac{3}{4}$  to  $2\frac{1}{4}$  in. long; pods 2 to 11-seeded, much compressed, more or less constricted between the seeds and curved or contorted, narrowed to a cuneate base, 2 to 6 in. long, or sometimes much reduced, 1-seeded and simulating a fry-pan in outline.—Washes or hillsides in the Colorado Desert, n. to the Providence Mts.; e. to Tex., s. to Mex.

## 8. THERMÓPSIS R. Br.

Perennial herbs (resembling Lupines) with commonly erect clustered stems. Leaves palmately 3-foliate, petioled, and with freeleaf-like stipules. Flowers yellow, in a terminal raceme, the pedicels subtended by persistent bracts. Calyx campanulate, deeply toothed, the

515. *Acacia greggii* Gray; a, fl. branchlet; b, c, d, different forms of pods.  $\times 1$ .

two upper teeth in ours almost completely united. Banner roundish, shorter than the oblong wings, the sides reflexed; keel nearly straight, obtuse, its petals very lightly joined, equaling the wings. Stamens distinct. Pod long, linear, flat, several-seeded. (Greek *thermos*, lupine, and *opsis*, resemblance.)

Herbage glabrous; pedicels equaling or longer than bracts.....1. *T. gracilis*.  
Herbage densely pubescent or tomentose; pedicels commonly shorter than bracts.....2. *T. macrophylla*.

1. *T. gracilis* Howell var. *venosa* Jepson n. comb. Stems branching,  $1\frac{1}{2}$  ft. high; herbage glabrous; leaflets obovate to oblong,  $1\frac{1}{4}$  to 2 in. long; stipules ovate or oblong, obtuse or acutish, longer or shorter than the petioles; racemes loose, the flowers solitary or in 2s in the axils of the bracts; pedicels equaling or longer than the bracts; pods linear, 2 to 3 in. long, on a stipe shorter than the calyx. —Trinity and Shasta Cos. May. (*T. venosa* Eastw.) Var. *VELUTINA* Jepson n. comb. Leaflets small, with a dense velvety pubescence. — Mt. Hamilton Range to S. Cal. (*T. velutina* Greene.) Var. *ARGENTATA* Jepson n. comb. One to 2 ft. high, densely silky-pubescent throughout.—Shasta and Modoc Cos. (*T. argentata* Greene.)

2. *T. macrophylla* H. & A. Fig. 516. Stems somewhat branched above, 1 to 2 ft. high; leaves silky or whitish-pubescent when young, soon glabrate, at least above; leaflets broadly or narrowly obovate and often more or less rhomboidal, acute at each end, or some obtuse at apex (even on same plant),  $1\frac{1}{2}$  to 3 or 4 in. long; stipules strongly oblique or not at all oblique, even on the same plant, longer than the petioles; upper lip of calyx slightly notched; lower calyx-teeth shorter than or as long as tube; raceme rather dense, 3 to 6 in. long; pods straight, silky, 2 to 5-seeded.—Coast Ranges, mostly toward the coast, from Monterey Co. to Mendocino Co.

516. *Thermopsis macrophylla* H. & A.; a, leaves and raceme  $\times \frac{1}{2}$ ; b, fl.  $\times 1$ ; c, fl. with corolla removed  $\times 1$ .

### 9. PICKERINGIA Nutt.

Very rigid and spiny evergreen xerophytic shrub. Leaves small, palmately 1 to 3-foliolate, nearly sessile and without stipules. Flowers large, purple, solitary, axillary and short-pedicel. Calyx campanulate with a turbinate base, the border with 5 very low broad teeth. Petals equal, the banner orbicular with reflexed sides, the wing- and keel-petals oblong, the latter distinct and straight. Stamens distinct. Pod linear, flat, stipitate, straight, several-seeded. (Charles Pickering of the Wilkes Expedition, which visited California in 1841.)

1. *P. montana* Nutt. PEA CHAPARRAL. Fig. 517. Densely branched shrub, 3 to 8 ft. high, the branchlets very spinose; leaflets obovate, entire, 2 to 6 lines long; flowers near the ends of the branchlets, rose-purple,  $\frac{3}{4}$  in. long, on very short pedicels; pedicels bearing 2 minute subulate bractlets near the middle; banner with a yellowish or whitish spot at base; stamens persistent; pod exserted on the stipe, about 2 in. long, 6 to 10-seeded, somewhat constricted between the seeds.—Characteristic chaparral shrub, 2000 to 5000 ft.: San Diego Co. and n. to Mendocino Co.; Sierra Nevada from Nevada Co. to Butte Co. May-June. The roots, as in this family generally, bear

517. *Pickeringia montana* Nutt.; a, fl. branchlet  $\times \frac{2}{3}$ ; b, fl.  $\times 1$ .

Petals 5, obovate, oval or oblong, nearly equal. Stamens 10, distinct. Ovary subsessile. Pod flat, with few or several seeds. (J. Centurius, Count of Hoffmansegg, 1766–1849, author, with J. F. Link, of a Flora of Portugal.)

Herb; leaves with several pair of pinnæ. . . . . 1. *H. densiflora*.  
Shrub; leaves with only one pair of pinnæ besides the terminal pinna. 2. *H. microphylla*.

1. *H. densiflora* Benth. CAMOTE DE RATON. Stems several from deep-seated roots, 8 to 12 in. high, with a heavy tuft of mostly basal leaves; leaves bipinnate, 3 to 5 in. long, commonly 3 to 5 pairs, the pinnæ 3 to 9 lines long, leaflets oblong, 1 to 3 lines long; flowers 5 lines long; corolla orange-red; lower margins of petals and claws with many stipitate glands; filaments puberulent, the alternate ones less heavy or glandular than the others; ovary densely covered with tack-shaped glands; pods  $1\frac{1}{2}$  in. long, straight on the ventral suture.—Hard alkaline spots: Inyo Co.; head of the San Joaquin Valley; Mohave and Colorado Deserts; s. to L. Cal. and Mex., e. to Tex. Apr.-June.

2. *H. microphylla* Torr. Bush 2 to 10 ft. high, with rush-like stems; leaves  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, with one pair of lateral pinnæ 2 to 5 lines long, the terminal pinna twice as long; racemes 4 to 5 in. long; flowers 4 lines long; filaments woolly at base; ovary with its margins and style densely hairy; pods oblong, 8 to 9 lines long.—Colorado Desert; s. to L. Cal.

## 11. LUPINUS L. LUPINE

By CHARLES PIPER SMITH

Herbs or shrubs. Leaves palmately compound, rarely unifoliate; petioles dilated at base; leaflets usually 3 to 17. Flowers racemose. Calyx 2-lipped, the lips entire, toothed, or the upper bifid, often with bractlets between the lips. Banner commonly with a ventral median sulcus, a pair of rounded umbos, the sides reflexed, the back glabrous or more or less pubescent; wings usually glabrous, rarely pubescent on the side or somewhat ciliate on the edges near the claw; keel often ciliate on the free margins. Stamens 10,

nodules, but in this species in very large clusters, resembling those on the roots of *Ceanothus thrysiflorus*.

## 10. HOFFMAN-SÉGGIA Cav.

Herbs or low shrubs, the stems from tuberous roots or a woody base. Leaves bipinnate, glandular-dotted, with very small leaflets and small stipules. Flowers and fruit more or less glandular. Flowers yellow, in naked racemes. Calyx 5-parted, the lobes nearly equal. Petals and stamens perigynous, inserted at the summit of the short calyx-tube.

monadelphous, the anthers alternately of two forms. Legume flattened. Ovules 2 to 12. Seeds with a sunken hilum. Cotyledons thick and fleshy. (Latin lupus, a wolf, these plants thought to rob the soil of its fertility.)

### A. Cotyledons sessile, connate; ovules usually 2 only; annuals.

#### 1. FLOWERS NON-VERTICILLATE; KEEL NON-CILIATE.

Pods lance-oblong, hirsute, constricted between the seeds; stems and peduncles both very short, the racemes equaled or surpassed by the foliage; seeds concave-lenticular . . . 1. *L. pusillus*.

Pods oblong or ovate, scarcely constricted between the seeds; peduncles well-developed; seeds more or less oblong.

Pods oblong, about 20 mm. long, smooth or scaly on the sides; ovules 2 to 6; flowers 10 mm. long. . . . . 2. *L. odoratus*.

Pods ovate, or not over 15 mm. long; ovules two.  
Banner suborbicular; racemes elongated; pods loosely villous on the sides. . . . 3. *L. rubens*.

Banner longer than wide.

Stems and petioles densely short- and spreading-pubescent; racemes elongated; pods smooth or scaly on the sides. . . . . 4. *L. shockleyi*.

Stems and petioles densely villous; racemes usually subcapitate; pods loosely villous on the sides. . . . . 5. *L. brevicaulis*.

#### 2. FLOWERS VERTICILLATE; KEEL CILIATE ON THE UPPER MARGINS NEAR CLAWS.

Flowers ascending to suberect in anthesis.

Banner 7 to 11 mm. wide, rounded at apex; both wing and keel petals ciliate near claws on both upper and lower margins. . . . . 6. *L. horizontalis*.

Banner 4 to 6 mm. wide, angled at apex; neither wing nor keel petals ciliate on lower margins. . . . . 7. *L. microcarpus*.

Flowers spreading in anthesis.

Flowers becoming suberect soon after anthesis, usually not secund. . . . 8. *L. subvexus*.

Flowers spreading or distinctly secund after anthesis.

Stems often fistulose; banner elliptic or oval, rarely ovate; keel sparsely ciliate or non-ciliate below; seeds smooth or roughened, but not tuberculate. . . 9. *L. densiflorus*.

Stems never fistulose; banner ovate; keel densely ciliate below; seeds uniformly dark brown and tuberculate. . . . . 10. *L. luteolus*.

### B. Cotyledons petioled after germination; ovules 2 to 12 or more.

#### I. PLANTS ANNUAL OR BIENNIAL.

##### 1. Flowers verticillate.

Keel ciliate on both upper and lower margins, near the claws only. . . . 11. *L. succulentus*.

Keel non-ciliate, or ciliate on upper margins near apex only.

Pedicels 3 to 8 mm. long; flowers 8 to 16 mm. long; banner suborbicular or wider than long; verticils four to several. . . . . 12. *L. nanus*.

Pedicels 1 to 3 mm. long.

Banner cuneate or spatulate; keel short and broad, the blunt acumen scarcely upturned. . . . . 15. *L. micranthus*.

Banner neither cuneate nor spatulate; keel slender, with long narrow acumen, often much upturned.

Pods 6 to 9 mm. wide; seeds 4 to 5 mm. long by fully 3 mm. wide. . . . . 13. *L. pachylobus*.

Pods 3 to 5 mm. wide; seeds 2 to 3 mm. long by about 2 mm. wide. . . . . 14. *L. bicolor*.

##### 2. Flowers non-verticillate.

Keel non-ciliate. . . . . 16. *L. concinnus*.

Keel ciliate on the lower free margins near claws, often also on the upper margins.

Racemes usually shorter than their peduncles. . . . . 23. *L. stiversi*.

Racemes longer than their peduncles.

Largest leaflets 15 to 25 mm. wide; whole plant with stinging hairs 2 to 5 mm. long. . . . . 17. *L. hirsutissimus*.

Largest leaflets 2 to 12 mm. wide; longest hairs not over 2 mm. long.

Keel stout, with blunt, short acumen, densely woolly-ciliate on the upper edges. . . . . 18. *L. truncatus*.

Keel with slender acute acumen.

Matured pods ascending; petals blue, lilac or purple.

Pedicels 5 to 10 mm. long; floral bracts much exceeding the buds, usually early deciduous. . . . . 19. *L. benthami*.

Pedicels 2 to 4 mm. long; bracts not much exceeding the buds, often subsistent. . . . . 20. *L. sparsiflorus*.

Matured pods deflexed; petals not at all blue.

Plants 1 to 2 dm. tall; petals orange or golden; ovules 3 to 4. . . . 21. *L. citrinus*.

Plants 2 to 4 dm. tall; petals white or pinkish; ovules 5 to 8. . . . 22. *L. deflexus*.

## II. PLANTS PERENNIAL.

1. *Pedicels short and stout, usually less than 3 mm. long; floral bracts usually persistent or tardily deciduous; racemes subspicate with flowers usually crowded; keel ciliate.*
- Banner pubescent on the back.  
 Pubescence all appressed or subappressed. . . . . 31. *L. canescens*.  
 Stems and petioles usually densely villous, at least with some widely-spreading hairs. . . . . 30. *L. leucophyllus*.
- Banner glabrous.  
 Largest leaves cauline, short-petioled.  
 Pubescence minute and closely appressed except in the inflorescence; peduncles elongated, surpassing the uppermost foliage; bracts and bractlets lanceolate. . . . . 28. *L. pratensis*.  
 Pubescence long and loose, largely spreading; peduncles short, not surpassing the uppermost foliage; bracts and bractlets linear or filiform. . . . . 29. *L. covillei*.
- Largest leaves long-petioled, usually basal.  
 Racemes capitate or subcapitate, rarely more than twice as long as wide; peduncles usually curved or bent, spreading or decumbent; stems often woody near base. . . . . 24. *L. lyallii*.  
 Racemes cylindric or conoidal, usually more than twice as long as wide.  
 Banner suborbicular; peduncles shorter than the elongated, leafy stems. . . . . 27. *L. hypolasius*.  
 Banner longer than wide.  
 Flowers 6 to 9 mm. long. . . . . 25. *L. torreyi*.  
 Flowers 10 to 13 mm. long. . . . . 26. *L. confertus*.
2. *Pedicels slender, usually 3 to 12 mm. long; floral bracts usually early deciduous.*
- a. Apex of banner normally not much reflexed from upper margin of wings; ventral median sulcus of banner deep, covering considerable of the wings.
- Plants less than 15 cm. tall, commonly shrubby and matted. . . . . 32. *L. breweri*.  
 Plants over 15 cm. tall.  
 Flowers 6 to 8 mm. long. . . . . 33. *L. meionanthus*.  
 Flowers 8 to 14 mm. long.  
 Keel non-ciliate. . . . . 47. *L. adsurgens*.  
 Keel more or less ciliate on the upper edges.  
 Wing petals rather densely pubescent on outer surface near upper distal corner; calyx-cup spurred. . . . . 34. *L. latiflorus*.  
 Wing petals not pubescent near upper distal corner, though sometimes with a few scattered villi near the claws.  
 Leaflets glabrous or glabrate above.  
 Stems without long-petioled lower leaves at flowering time, much branched above. . . . . 40. *L. corymbosus*.  
 Stems with some long-petioled lower leaves at flowering time.  
 Leaflets linear-falcate, about 2 mm. wide; keel curved. . . . . 35. *L. gracilentus*.  
 Leaflets oblanceolate, usually over 6 mm. wide; keel nearly straight. . . . . 36. *L. onustus*.  
 Leaflets permanently pubescent above.  
 Calyx-cup scarcely gibbous; pubescence largely spreading. . . . . 37. *L. ludovicianus*.  
 Calyx-cup spurred or strongly gibbous.  
 Stems with some long-petioled lower leaves at flowering time; pubescence of pedicels appressed or subappressed. . . . . 38. *L. caudatus*.  
 Stems without long-petioled lower leaves at flowering time; pubescence of pedicels widely spreading. . . . . 39. *L. inyoensis*.
- b. Apex of banner normally well reflexed from upper margin of wings; ventral median sulcus of banner usually shallow, including very little of the wings.
- Keel non-ciliate.  
 Low or tall shrubs.  
 Low shrubs with long-petioled lower leaves at flowering time; var. of. . . . . 58. *L. albifrons*.  
 Tall shrub with all leaves short-petioled. . . . . 57. *L. chamissonis*.  
 Stems herbaceous above ground.  
 Stems usually stout and fistulose, with some long-petioled lower leaves at flowering time.  
 Leaflets 10 to 17, 5 to 15 cm. long. . . . . 41. *L. polyphyllus*.  
 Leaflets 5 to 9, usually not over 8 cm. long. . . . . 42. *L. superbus*.  
 Stems not fistulose, with no long-petioled lower leaves at flowering time.  
 Banner narrow, acute at apex, median line much curved in bud, wings narrow and keel much exposed. . . . . 43. *L. albicaulis*.  
 Banner ovate to suborbicular, usually obtuse or rounded at apex, wings wider and keel largely or entirely covered.  
 Leaves densely pubescent above, often silky; banner 11 to 14 mm. wide. . . . . 46. *L. formosus*.  
 Leaves distinctly greenish above; banner 7 to 12 mm. wide.  
 Flowers 10 to 13 mm. long; petals usually bluish or purplish. . . . . 44. *L. andersoni*.  
 Flowers 14 to 16 mm. long; petals all light yellow. 45. *L. sylvestris*

Keel ciliate on the upper margins.

Keel ciliate from the claws to about the middle, but not along the acumen.

Pedicels 5 to 10 mm. long, or largest leaflets over 5 cm. long....50. *L. latifolius*.

Pedicels 2 to 4 mm. long; leaflets not over 5 cm. long.

Stems usually much branched above; stipules inconspicuous, not villous, less than 10 mm. long.....49. *L. viridifolius*.

Stems simple or nearly so, stout and fistulose; stipules villous, 15-20 mm. long.....48. *L. barbatus*.

Keel ciliate from near apex to the middle.

Stems with few or no long-petioled lower leaves at flowering time.

Leaves densely silky both sides.

Leaflets 5 to 7, appressed-silvery; banner pubescent dorsally.....63. *L. obtusilobus*.

Leaflets 3 to 5, subappressed-silky; banner glabrous....51. *L. tidestromii*.

Leaves greenish above, or plants over 3 dm. tall.

Stems usually decumbent at base, villous at the nodes; ovules 9 to 14...52. *L. littoralis*.

Stems erect or ascending, not villous at the nodes more than elsewhere. Shrubby at base only; seeds about 3 mm. long, without pale spots at the micropyle.....54. *L. rivularis*.

Plants becoming tall shrubs.

Leaflets usually less than 35 mm. long, glabrate or sparsely pubescent above; seeds 4 to 6 mm. long, with a pair of pale spots at the micropyle.....55. *L. arboreus*.

Largest leaflets usually 50 mm. long, silky above; seeds scarcely 4 mm. long, without pale spots at the micropyle....56. *L. longifolius*.

Stems with some long-petioled lower leaves at flowering time.

Leaflets glabrous or obscurely pubescent above, or at least not silky.

Stems elongated, rarely long-villous; leaves all cauline.53. *L. varicolor*.

Stems abbreviated, long-villous; leaves largely basal.....65. *L. saxosus*.

Leaflets usually silky-pubescent above.

Keel narrow, with long, slender acumen and narrowed toward the base, ciliate along upper edges of acumen; upper leaves usually short-petioled.....58. *L. albifrons*.

Keel broader, not narrowed toward the base, usually ciliate along most of the upper margins; upper leaves usually long-petioled.

Largest leaflets 14 to 30 mm. wide.

Stems and petioles appressed-silky.....59. *L. sericatus*.

Stems and petioles densely spreading-velvety...60. *L. cervinus*.

Largest leaflets not over 12 mm. wide.

Stems and petioles appressed-silky.....61. *L. excubitus*.

Stems and petioles spreading-pubescent.

Stems short-villous, elongated, with few scattered leaves.

62. *L. grayi*.

Stems long-villous, abbreviated, with the leaves mostly crowded at the base.....64. *L. magnificus*.

#### DIVISION 1.—Annuals.

1. *L. pusillus* Pursh var. *intermontanus* C. P. Sm. Loosely villous, about 1 dm. tall; leaves long-petioled, glabrous above, leaflets 5, 12 to 20 mm. long; racemes surpassed by the foliage; flowers not whorled, 7 to 9 mm. long, bracts persistent, pedicels 2 mm. long, glabrous or subvillous; calyx-cup subvillous, the lips quite villous; petals bluish to whitish, keel nearly straight, non-ciliate; pods oblong, constricted between the two seeds, which are rugose, flat, disk-like.—Dry sandy soil, Inyo and Modoc Cos.; Nev. to Ariz., w. Wyo. and e. Wash. (*L. intermontanus* Hel.)

2. *L. odoratus* Hel. Glabrous or sparsely villous, subacaulescent; leaves basal, long-petioled, glabrous above, leaflets 5 to 7, 10 to 20 mm. long; flowers about 10 mm. long, scattered, bracts persistent, pedicels 4 to 6 mm. long, glabrous; calyx glabrous; petals blue or purple, banner with a yellow center, keel somewhat curved; pods oblong, 17 to 20 mm. long, smooth or scaly on the sides, villous on the margins, ovules 2 to 6, seeds rough.—Sandy plains, Mohave Desert; e. to Ariz. and Nev. Var. *PILOSELLUS* C. P. Sm. Stems and petioles conspicuously pubescent with short, spreading hairs.—Nipton; Mohave.

3. *L. rubens* Rydb. Villous, 6 to 15 cm. tall, axial peduncles flowering before the branches fully develop; racemes exceeding the foliage; flowers 6 to 12 mm. long, approximate or well scattered, pedicels 1 to 2 mm. long, glabrous or subvillous; calyx-lips setose-villous; pods ovate, 8 to 12 mm. long, subvillous on the sides, ovules 2.—Sandy soils, Mohave Desert and Inyo Co.; e. to Utah and Ariz. Var. *FLAVOCULATUS* C. P. Sm. Branches early developing, widely spreading, floriferous; pedicels 1 to 4 mm. long.—E.

Mohave Desert (Barnwell and Cima sta.); Inyo Co.; e. to western Nev. (*L. flavoculatus* Hel.)

4. *L. shóckleyi* Wats. Densely pubescent with short, spreading hairs, subacaulescent, 1 to 2 dm. tall; leaves long-petioled, subappressed-silky below, glabrous above except near the margins, leaflets 7 to 10, 10 to 20 mm. long; racemes lax, equaled by the foliage; flowers 5 to 6 mm. long, well scattered, bracts persistent, pedicels 2 to 3 mm. long, often curved, spreading-pubescent; calyx densely spreading-pubescent; petals blue, purple, or pink, keel straight on upper edges, non-ciliate; pods ovate to oblong, smooth or scaly on the sides, ciliate on the edges, ovules 2, seeds wrinkled and rough.—Desert sands, Colorado and Mohave deserts and their borders; e. to Nev. and Ariz.

5. *L. brevicáulis* Wats. Densely villous, 3 to 10 cm. tall, stems scarcely 1 cm. long; leaves basal, long-petioled, glabrous above, leaflets 5 to 8, 5 to 15 mm. long; racemes subcapitate, barely surpassing the foliage; flowers 6 to 8 mm. long, crowded, pedicels 1 to 2 mm. long, villous; calyx villous; petals bright blue or paler, keel straight, non-ciliate; pods ovate, about 10 mm. long, ovules 2 or 3, seeds 2 mm. long.—Desert sands: Bishop Creek, Inyo Co.; New York Mts.; e. Ore. to Col., N. Mex. and Chihuahua. (*L. uncialis* Wats. *L. scaposus* Rydb. *L. dispersus* Hel.)

6. *L. horizontalis* Hel. Pubescent with short spreading hairs, 10 to 12 cm. tall; leaves glabrous above, petioles 4 to 6 cm. long, leaflets 7 to 9, 1 to 2 cm. long; racemes equaling or surpassing the foliage; flowers about 10 mm. long, ascending to suberect, whorled, bracts reflexed, persistent, pedicels 1 to 2 mm. long; calyx pubescent; petals pale violet-blue, banner almost plane, about 7 mm. wide, wings 4 to 5 mm. wide, keel straight, both wings and keel ciliate above and below near the claw; pods ovate, villous, 12 mm. long, ovules 2, seeds dotted.—Dry gravelly hillsides, Sunset, Kern Co. Seemingly a good species, but known from the type collection only. Var. *PLATYPÉTALUS* C. P. Sm. Flowers 13 to 15 mm. long, banner 11 to 12 mm. wide, its sides reflexed, wings 6 to 7 mm. wide.—Mohave Desert, n. side.

7. *L. microcárpus* Sims var. *rúber* C. P. Sm. Villous, 1 to 5 dm. tall, often much branched, the branches ascending to erect, floriferous; leaves long-petioled, glabrous above, leaflets 5 to 8, 1 to 2 cm. long; racemes of 2 to 5 verticils; flowers 8 to 10 mm. long, erect or ascending, bracts persistent, pedicels barely 1 mm. long; petals dull red to pink, banner almost plane, 4 to 6 mm. wide, keel straight, ciliate above near claw; pods ovate, 12 to 17 mm. long, more or less villous, ovules 2, seeds rugose.—Mostly dry soil, San Luis Obispo and Kern Cos. to L. Cal. (*L. ruber* Hel.)

8. *L. subvéxus* C. P. Sm. Intermediate between the last and the next; loosely villous, simple or branched, 2 to 4 dm. tall; flowers spreading in anthesis, becoming suberect later, 14 to 16 mm. long, in 3 to 7 distinct verticils, bracts soon reflexing, pedicels 2 mm. long; petals dark violet-purple to lilac and rose-pink, wings usually non-ciliate, keel nearly straight, ciliate above near claw; pods and ovules as in the last, seeds rough, dark brown.—Clay soils, Yolo Co. to Mt. Hamilton. (*L. microcarpus* of many writers and collectors.) Var. *TRANSMONTÁNUS* C. P. Sm. Plants 8 to 18 cm. tall, branched near the base; stems short and leaves crowded basally; verticils mostly 2 to 5, approximate; flowers 12 to 14 mm. long, banner angled at apex, 5 to 7 mm. wide.—Sandy soils, Lassen and Siskiyou Cos.; n. to southern and eastern Ore. Var. *PHOENÍCEUS* C. P. Sm. Like the last, but verticils 4 to 8; flowers about 10 mm. long, banner 9 to 11 mm. long; foliage greenish.—Mt. Hamilton Range. Var. *ALBILANÁTUS* C. P. Sm. Banner 12 to 14 mm. long; foliage conspicuously white woolly-villous.—Upper Salinas Valley.

9. *L. densiflorus* Benth. Pubescence appressed or subappressed, 2 to 5 dm. tall, simple, or branched well above the base, often succulent and fistulose; leaves long-petioled, glabrous above, leaflets 7 to 9; verticils 5 to 12, approximate or well separated; flowers 14 to 18 mm. long, spreading during and after anthesis, but becoming secund when the rachis becomes bent over with weight, bracts reflexing, pedicels 1 to 2 mm. long; upper calyx-lip short, scarious, lower lip green, bent and subsaccate near base; petals lilac or rose,

keel ciliate on upper edges near claws, as also sometimes the wings; pods ovate-oblong, ovules 2, seeds variable as to size, color, and surface.—Fields, hillsides, and ravines, San Francisco Bay region, as to the typical form. Var. *MENZIESII* C. P. Sm. Stout and fistulose, pubescence sparse and appressed, petals yellow.—Sacramento and Marin Cos. to Santa Barbara. (*L. menziesii* Agardh.) Var. *GLAREOSUS* C. P. Sm. Leaflets succulent, blackening in drying; petals light blue, banner with a white center.—Stream gravels, Mt. Pinos region. (*L. glareosus* Elmer.) Var. *LACTEUS* C. P. Sm. Pubescence spreading or retrorsely-spreading; lower calyx-lip nearly straight, scarcely bent or subsaccate near base; petals nearly white; usually acaulescent and unbranched.—Kern Co. and s. to desert slopes of San Diego Co. (*L. lacteus* Kell. *L. arenicola* Hel.) Var. *PALUSTRIS* C. P. Sm. Long-villous, especially the bent and subsaccate lower calyx-lip; petals deep purple; plants stout, 20 to 60 cm. tall.—Contra Costa Co. to Monterey Co. (*L. densiflorus* Agardh. *L. palustris* Kell.) Var. *CRINITUS* Eastw. Low, 8 to 15 cm. tall, very villous with hairs 3 to 5 mm. long; short stems and peduncles more or less decumbent or deflexed; verticils 2 to 4.—Bodega Point, Sonoma Co. Var. *AUSTRO-COLLUM* C. P. Sm. Lower calyx-lip spreading-villous, scarcely bent or subsaccate near base; petals pale-tinted, banner angled at apex.—Coastal cañons near San Diego. (For additional varieties see Bull. Torr. Club 45:167-202.)

10. *L. luteolus* Kell. Appressed-subsilky, similar to the last, but strictly fibrous and rigid, 3 to 9 dm. tall, widely branched above; leaves cuneate-oblong; verticils few or many, crowded; petals all pale yellow, banner ovate, wings ciliate above claw and often also below, keel densely ciliate both above and below near claws; seeds uniformly dark-brown, regularly and roughly tuberculate.—Alluvial gravels and hillsides, San Benito Co. to s. Ore. (*L. bridgesii* Gray.)

11. *L. succulentus* Dougl. Fig. 518. Glabrate or sparsely appressed-pubescent, 2 to 6 dm. tall, stout, usually succulent or fistulose, branched; leaves several, long-petioled, glabrous above, leaflets 7 to 9; flowers 12 to 17 mm. long, subverticillate in 4 to 8 whorls or groups, spreading in anthesis, ascending later, bracts early deciduous, pedicels 4 to 6 mm. long, spreading - pubescent; petals deep blue to almost white, banner with yellow center turning violet, wings slightly ciliate at the base above, keel ciliate near claws both above and below; pods about 5 cm. long, loosely pubescent or villous, ovules 8 to 10, seeds oblong, 4 to 5 mm. long, marbled with dark brown, a pair of whitish spots embracing the micropyle.—Ravines, moist hillsides and fields, Butte and Sonoma Cos. to L. Cal. (*L. affinis* of American authors, not Agardh.) Var. *LAYNEAE* C. P. Sm. Depressed, 1 dm. tall, branches decumbent; racemes short; pods densely long-villous. — Farallone City, San Mateo Co.

518. *Lupinus succulentus* Dougl.; a. fl. branchlet x  $\frac{1}{4}$ ; b, upper calyx-lip x 1; c, lower calyx-lip x 1; d, banner x 1; e, wing x 1; f, keel x 1.

12. *L. nānus* Deugl. Minutely spreading- or appressed-pubescent and more or less villous, simple or branched at the base, erect, 2 to 6 dm. tall; leaves long-petioled, usually appressed-hairy above, leaflets 5 to 7, linear to spatulate, 15 to 30 mm. long; verticils well separated; flowers 10 to 16 mm. long, bracts deciduous, pedicels 5 to 8 mm. long; petals rich blue, rarely pink, all broad, banner with white or yellow center changing to violet, keel ciliate on upper edges of acumen; pods appressed-pubescent, 20 to 35 mm. long, ovules usually 4 to 8, rarely 8 to 12, seeds 2 to 3 mm. long, variously colored and marked.—Grassy hills, common in the Coast Ranges from Mendocino Co. to Santa Barbara, less common in the Sierra Nevada foothills from Calaveras Co. to Tulare Co. (*L. affinis* Agardh.) Var. *PERLASIUS* C. P. Sm. Densely villous with hairs 2 to 3 mm. long; flowers about 4 mm. long.—Mariposa-Coulterville road. Var. *CARNOSULUS* C. P. Sm. Largest leaflets 25 to 40 mm. long; pods 30 to 50 mm. long by 7 to 9 mm. wide, seeds about 5 mm. long.—San Francisco Bay region; w. Ore. (*L. carnosulus* Greene. *L. affinis* var. *carnosulus* Jepson.) Var. *MÉNKERAE* C. P. Sm. Leaflets 10 to 15 mm. long, 2 to 3 mm. wide; flowers 10 to 12 mm. long; petals pale lilac, drying blue; pods 20 to 25 mm. long, barely 4 mm. wide, ovules 9 to 12, seeds pale flesh-color, obscurely marked.—Kern Co. to Coalinga, Fresno Co. Var. *VALLICOLA* C. P. Sm. Flowers 6 to 10 mm. long; banner usually wider than long, its apex not much reflexed from upper margins of wings, keel strongly curved; seeds pale.—Sierra Nevada foothills from Butte Co. to Kern Co.; probably casual at Wright, Santa Clara Co. (*L. persistens* and *vallicola* Hel.) Var. *APRICUS* C. P. Sm. Like the last, but banner not wider than long, its apex well reflexed from upper edges of wings; seeds dark, well marked.—Monterey Co. to sw. Ore. (*L. apricus* Greene. *L. vallicola* var. *apricus* C. P. Sm.)

13. *L. pachýlobus* Greene. Conspicuously villous, 1 to 3 dm. tall, stout, usually branched at the base; petioles 6 to 8 mm. long, leaflets 6 to 8, 15 to 25 mm. long, hairy both sides; racemes of 2 to 4 whorls; flowers few, 6 to 8 mm. long, sometimes scattered, pedicels 1 to 2 mm. long; petals blue, banner suborbicular, 6 to 8 mm. wide, with a white center, keel non-ciliate or nearly so; pods especially large, 25 to 30 mm. long, 6 to 9 mm. wide, thick and succulent when green, ovules 4 to 6, seeds 4 to 5 mm. long, brown, marked with darker shades.—Grassy hills, Shasta Co. to Mariposa and Santa Clara Cos. (*L. micranthus* var. *pachylobus* Jepson.)

519. *Lupinus bicolor* var. *microphyllus* C. P. Sm.; a, habit  $\times \frac{1}{2}$ ; b, banner  $\times 2$ ; c, wing  $\times 2$ ; d, keel  $\times 2$ .

14. *L. bicolor* Lindl. Usually villous, 1 to 4 dm. tall, erect and simple, or diffusely branched at the base; leaves pubescent both sides, petioles 3 to 7 cm. long, leaflets 5 to 7, 10 to 20 mm. long; verticils 1 to 3; flowers 8 to 12 mm. long, rarely scattered or umbellate by reduction of the raceme, pedicels 1 to 3 mm. long; petals blue and white, banner about 8 mm. long by 6 to 8 mm. wide, elliptic, rhombic, obovate to orbicular-obovate, the white center changing to violet, the sides much reflexed, keel slender, ciliate along upper edges of slender acumen; pods appressed-hairy, 15 to 20 mm. long by 3 to 5 mm. wide, ovules 5 to 8, seeds 2 to 3 mm. long, variously colored and marked.—Mostly sandy soils, common coastwise from San Luis Obispo Co. to Vancouver Isl.; less common in the Sierra foothills. (*L. micranthus* var. *bicolor* Wats. *L. sabulosus* Hel. *L.*

strigosus Gand.) Var. *UMBELLATUS* C. P. Sm. Racemes reduced to one verticil; flowers 6 to 8 mm. long.—Santa Cruz Isl. (*L. umbellatus* Greene.) Var. *TRIDENTATUS* Eastw. Verticils 3 to 6 or more; flowers 6 to 8 mm. long; lower calyx-lip tridentate.—Sandy loams or clays, San Diego Co. to Vancouver Isl., abundant in the San Francisco Bay region. Var. *PIPERSMITHII* C. P. Sm. Flowers 5 to 8 mm. long, keel non-ciliate or with 1 to 4 stray cilia.—San Joaquin Valley to Napa, San Mateo and Monterey Cos. (*L. piper-smithii* Hel.) Var. *MICROPHYLLUS* C. P. Sm. Fig. 519. Flowers 4 to 6 mm. long, keel ciliate; ovules 5 to 8.—San Diego Co. to Ore.; abundant in S. Cal., where known as *L. micranthus*. (*L. micranthus* var. *microphyllus* Wats. *L. rostratus* Eastw.) Var. *TETRASPERMUS* C. P. Sm. Similar to the last, but ovules mostly 4, the pods much like those of *Vicia tetrasperma*.—Wright, Santa Clara Co. Var. *TRIFIDUS* C. P. Sm. Flowers 5 to 8 mm. long; lower calyx-lip deeply trifid.—Coastal sands, San Francisco and Monterey. (*L. micranthus* var. *trifidus* Wats. *L. trifidus* Torr.)

15. *L. micranthus* Dougl. Appressed- or subappressed-pubescent and more or less villous, 1 to 4 dm. tall, simple or branched at the base, stout and succulent or slender and fibrous; leaves glabrous or sparsely hairy above, leaflets 5 to 7, linear to oblanceolate; verticils 2 to 7; flowers 5 to 8 mm. long, pedicels stout, 1 to 2 mm. long; calyx-lips broad; petals blue and white, banner cuneate or spatulate, center turning violet, the sides scarcely reflexing, keel short and broad, the blunt acumen scarcely upturned, ciliate above; pods 25 to 30 mm. long, appressed-hairy, ovules 6 or 7, seeds oblong, thick, 3 mm. long, gray- or brown-mottled.—Largely clay soils, San Diego Co. to Vancouver Isl., inland to Modoc and Plumas Cos.; abundant in the San Francisco Bay region. Much confused with the small-flowered forms of *L. bicolor*. (*L. polycarpus* Greene.)

16. *L. concinnus* Agardh. Densely villous, 6 to 20 cm. tall, simple or much-branched from the base; leaves long-petioled, hairy above, leaflets 5 to 8, 10 to 20 mm. long; racemes nearly sessile, 3 to 6 cm. long, surpassed by the leaves, a short raceme or one or two flowers sometimes representing all the growth from certain axillary buds; flowers 6 to 12 mm. long, usually well scattered, pedicels 1 mm. long, stout, long-villous; petals lilac, edged with rich reddish-purple, banner obovate, rounded or emarginate at apex, keel nearly straight; pods 10 to 15 mm. long, ovules 2 to 3 mm. long, angled, nearly square, pale, obscurely spotted.—Sandy soil, Monterey Co. to L. Cal., e. to N. Mex. Var. *ORCUTTII* C. P. Sm. Flowers 6 to 7 mm. long, banner narrower, about 3 mm. wide.—Monterey Co. to L. Cal. and Sonora, e. to southern Utah and N. Mex. (*L. orcuttii* Wats. *L. micensis* Jones.) Var. *OPTATUS* C. P. Sm. Larger throughout, 20 to 30 cm. tall; flowers 10 to 12 mm. long, banner 7 to 9 mm. wide.—Monterey Co. to San Bernardino and San Diego Cos.; apparently confined to Cal. and inhabiting soils with a greater water supply. Var. *AGARDHIANUS* C. P. Sm. Pubescence spreading but short and less dense; petals edged with rose-purple or bright blue, banner angled at apex.—Monterey Co. to San Diego, e. to Fort Tejon and Cajon Pass. (*L. gracilis* Agardh. *L. agardhianus* Hel.) Var. *PALLIDUS* C. P. Sm. Appressed-pubescent mainly; leaflets 5 or 6, spatulate; petals white or pale bluish.—S. San Diego Co.; adjacent L. Cal. (*L. pallidus* Bdg.) Var. *DESERTORUM* C. P. Sm. Pubescence mainly appressed; leaflets 6 to 9, oblanceolate; petals white or yellowish.—Mohave Desert (Randsburg and Ord Mts.). (*L. desertorum* Hel.)

17. *L. hirsutissimus* Benth. Hirsute with nettle-like stiff hairs 3 to 5 mm. long, stout, fistulose, 2 to 6 dm. tall; leaves long-petioled, leaflets 5 to 8, broadly cuneate-obovate; flowers 13 to 15 mm. long, scattered, spreading, pedicels 3 to 4 mm. long; petals violet or lilac, banner suborbicular, keel stout, straight, ciliate at the free edges below only; pods 25 to 35 mm. long, very hirsute, ovules about 7, seeds 3 to 4 mm. long, pale and obscurely marked or densely marbled with dark brown.—Lightly-shaded areas in the hills, San Mateo Co. to L. Cal.

18. *L. truncatus* Nutt. Sparsely appressed-pubescent or glabrate, 3 to 6 dm. tall, branched; leaves many, glabrate, petioles usually flattened, leaflets

5 to 7, linear, truncate, emarginate, or dentate at the apex; racemes lax and few-flowered; flowers 10 to 12 mm. long, spreading or drooping after anthesis, pedicels 2 to 3 mm. long, bracts usually persistent; petals violet or paler purple, keel densely ciliate above from the stout, blunt acumen to the claw, and below near the claw; pods spreading, about 3 cm. long, villous, ovules 6 or 7, seeds obscurely or conspicuously marked.—Open woods or thickets, Monterey to L. Cal.

19. *L. benthami* Hel. Villous, slender, erect, 3 to 6 dm. tall, simple or branched at the base; leaves long-petioled, leaflets 7 to 10, linear; flowers 10 to 12 mm. long, spreading, bracts linear, exceeding the buds, long-villous, deciduous, pedicels 4 to 10 mm. long; petals blue, banner suborbicular, the yellow center early changing to reddish-purple, keel slender, curved, ciliate on lower edges near claws; pods 2 to 3 cm. long, ovules 3 or 4, seeds marked with brown.—Rather moist slopes, near streams, Sierra foothills from Sacramento Co. to Kern Co.; Santa Barbara Co. to Monterey Co. (*L. leptophyllus* Benth., not S. & C.) Var. *OPIMUS* C. P. Sm. Larger in all parts except the calyx; stems stouter and fistulose; leaflets longer, 2 to 3 mm. wide; racemes 20 to 30 cm. long; flowers 14 to 16 mm. long, pedicels 7 to 9 mm. long; banner as wide or wider than long, keel more arcuate.—Eldorado Co. to Los Angeles and San Luis Obispo Cos.

20. *L. sparsiflorus* Benth. Appressed-pubescent and more or less villous or subhirsute, 2 to 4 dm. tall, slender, branched; leaves several, long-petioled, hairy or glabrate above, leaflets 5 to 9, linear to oblanceolate, angled at apex; flowers 8 to 13 mm. long, spreading in anthesis, soon becoming suberect, bracts villous, exceeding buds, often subsistent, pedicels 2 to 3 mm. long; petals bright blue or purplish, banner with a yellow spot, keel curved, usually ciliate on the lower edges near claw and often also on the upper margins; pods ascending, 12 to 18 mm. long, ovules 5 or 6, seeds dotted or marbled on a pale ground.—Grassy hillsides, clays or sands, Ventura Co. to L. Cal., e. to Ariz. and southern Nev. (*L. subhirsutus* Dav.) Var. *ARIZONICUS* C. P. Sm. Plants mostly 1 to 2 dm. tall; flowers 8 to 10 mm. long.—Desert sands, Mohave and Colorado deserts to Sonora, Ariz., and s. Nev. (*L. concinnus* var. *arizonicus* and *L. arizonicus* Wats.) Var. *BARBÁTULUS* Thornber. Stems stout and fistulose; petals pale lilac or purplish.—Needles; w. Ariz.; L. Cal. Var. *INOPINATUS* C. P. Sm. Branched above the middle; leaflets broad at the apex, truncate, rounded, or emarginate; racemes lax, 6 to 15 cm. long.—Cajon Pass to L. Cal. Var. *PONDII* C. P. Sm. Lower, branched at the base; leaflets as in the last; racemes compact, 2 to 8 cm. long.—San Diego Co. to L. Cal. (*L. pondii* Greene.)

21. *L. citrinus* Kell. Short hairy, 10 to 20 cm. tall, branched at the base; leaflets 6 to 8; flowers spreading in anthesis but soon deflexing, pedicels 3 mm. long, spreading-pubescent; petals bright orange or golden, keel nearly straight, ciliate on lower edges near claws; pods deflexed, glabrate, 12 to 15 mm. long, ovules 2 to 4, seeds black-spotted on a pale ground.—Sierra Nevada foothills of Fresno Co.

22. *L. deflexus* Congdon. Much like no. 21 but 20 to 40 cm. tall; pedicels 3 to 4 mm. long; petals dull white or pinkish; pods about 20 mm. long, ovules 5 to 8, seeds unspotted.—Sandy soil, Mariposa Creek, near Mariposa.

23. *L. stiversi* Kell. Minutely pubescent, 15 to 45 cm. tall, branches ascending; leaves long-petioled, appressed-pubescent both sides, leaflets 6 or 7; racemes 1 to 3 cm. long, few-flowered; flowers about 15 mm. long, pedicels about 2 mm. long, appressed-pubescent; banner bright yellow, wings rose-pink or purple, keel nearly straight, the acumen blunt, ciliate both above and below near claws; pods about 20 mm. long, ovules 5 to 7, seeds flat, angled, dark-spotted.—Sands or gravels in the foothills: Butte Co. to San Bernardino Mts.; Santa Lucia Mts.

#### DIVISION 2.—Perennials.

24. *L. lyallii* Gray. Subappressed-silky, low, woody at base, rarely over 1 dm. tall; leaves long-petioled, crowded near the base, leaflets 5 or 6, 4 to 10 mm. long, appressed-silky both sides; peduncles usually curved or bent,

spreading or decumbent, racemes capitate or subcapitate, rarely more than twice as long as wide; flowers 10 to 12 mm. long, bracts short, deciduous, pedicels 2 mm. long, spreading-pubescent; petals blue, banner glabrous, 8 to 12 mm. long, wings narrow, keel nearly straight, usually ciliate on the upper edges, rarely non-ciliate; pods silky, 10 to 15 mm. long, ovules 3 or 4.—Dry mountain tops, Sierra Nevada from Fresno and Inyo Cos. northw.; n. to Wash. Var. *DANAUS* Wats. Flowers only 6 to 8 mm. long, commonly white or pale lilac; leaflets silky, usually not over 6 mm. long.—High peaks, Sierra Nevada from Mono and Tuolumne Cos. to Eldorado Co.; w. Nev. (*L. danaus* Gray.) Var. *LOBBII* C. P. Sm. Flowers 6 to 8 mm. long; petals violet-blue or paler; leaflets distinctly greenish, usually 10 to 20 mm. long.—High peaks, Sierra Nevada from Eldorado Co. northw.; Mt. Rose, Nev.; Ore. (*L. lobbii* Gray. *L. aridus* var. *lobbii* Wats. *L. alpinus* Hel.)

25. *L. torreyi* Gray. Fig. 520. Appressed-silky, not woody at base, 12 to 20 cm. tall; leaves long-petioled, crowded near base, leaflets 6 to 8, appressed-silky both sides, 12 to 25 mm. long; peduncles ascending or erect, usually exceeding the foliage, racemes cylindric, dense, 5 to 10 cm. long; flowers 8 to 9 mm. long, bracts persistent, pedicels hardly 2 mm. long, appressed-pubescent; petals violet-blue, banner oval or ovate, glabrous, center changing from yellow to purple, keel scarcely curved, ciliate on upper margins; pods silky, about 12 mm. long, ovules 3 or 4, seeds whitish or pinkish. — Mostly dry soil, Sierra Nevada from Tulare Co. northw.; far n. to eastern Wash. (*L. sellulus* Kell.)

26. *L. confertus* Kell. Very much like no. 25, but flowers larger, 10 to 13 mm. long; stems usually elongated and leafy, 2 to 4 dm. tall; petioles 10 to 15 cm. long, leaflets silky both sides; racemes conoidal-cylindric, 8 to 16 cm. long; flowers many, crowded, all spreading.—San Bernardino Mts.; Mt. Pinos; n. in the Sierra Nevada to Plumas Co.; w. Nev.

27. *L. hypolasius* Greene. Loosely appressed-hairy and more or less villous, stems longer than the peduncles, stoutish, leafy, suberect, 5 to 15 cm. tall; lower leaves long-petioled, leaflets 5 to 7, 6 to 8 mm. long, appressed-hairy above, villous beneath; flowers in 3 or 4 whorls, spreading, 7 to 8 mm. long, bracts early deciduous or subpersistent, pedicels 1 to 2 mm. long, spreading-pubescent; petals purple or blue, banner suborbicular, keel nearly straight, ciliate on upper edges; pods 15 mm. long, villous, ovules 3 or 4, seeds obscurely mottled.—High mountain sides, Tulare Co. (Farewell Gap, Mineral Gap) and Fresno Co.

28. *L. pratensis* Hel. Appressed-pubescent, except in the inflorescence, stems fistulose, 6 to 9 dm. tall; leaves mostly short-petioled, finely appressed-pubescent both sides, leaflets 5 to 9, 3 to 8 cm. long, 3 to 8 mm. wide; racemes dense; flowers crowded, 10 to 12 mm. long, bracts persistent, lanceolate, pedicels 2 to 3 mm. long, densely spreading-pubescent; petals blue, violet, lilac or tawny, banner ovate or oval, glabrous, keel straight, ciliate on upper edges; ovules 5, pods 18 to 20 mm. long, loosely pubescent.—Moist sandy soil, foothills, w. Inyo and Mono Cos. Var. *ERIOSTACHYUS* C. P. Sm. Floral bracts inconspicuous in the creamy woolly immature racemes; banner pubescent on

520. *Lupinus torreyi* Gray; a, habit  $\times \frac{1}{3}$ ; b, banner  $\times 1$ ; c, wing  $\times 1$ ; d, keel  $\times 1$ ; e, pod  $\times 1$ .

the back, dark purple, wings pale blue.—Big Pine Creek, Inyo Co., 9000 ft. (Peirson 530).

29. *L. covillei* Greene. Similar to no. 28, but loosely shaggy with long, spreading hairs; peduncles 1 to 3 cm. long, not surpassing the uppermost foliage; flowers 12 to 14 mm. long, bracts and conspicuous calyx bractlets linear or filiform; banner suborbicular, keel sparsely ciliate on upper margins at base of acumen; ovules 5 to 6, pods about 25 mm. long, shaggy.—High mountain slopes, 9000 to 10,000 ft., Sierra Nevada from Farewell Gap to the Yosemite region. (*L. dasyphyllus* Greene.)

30. *L. leucophyllus* Dougl. Tomentose-canescens and more or less villous, often densely so, stout, erect, branched, 6 to 9 dm. tall; leaves woolly, lower long-petioled, leaflets 7 to 9, 3 to 6 cm. long, densely pubescent above; racemes 8 to 30 cm. long, usually dense and cylindrical, flowers crowded, 12 to 14 mm. long, bracts usually persistent, shorter or longer than the buds, pedicels densely spreading-pubescent, 1 to 2 mm. long; petals white, pinkish, bluish, or purple, often turning brown in drying, banner small, ovate or oblong, pubescent on the back, keel stout, ciliate on the upper margins; pods woolly, 20 to 25 mm. long, ovules 3 to 6, seeds reddish-brown and obscurely mottled, or drab and gray-spotted.—Dry soils, Colusa, Trinity and Lassen Cos.; n. to eastern Wash.

31. *L. canescens* Howell. Scarcely differing from no. 30 except in the absence of the longer hairs overlying the short appressed or tomentose canescence; probably not a good species.—Dry soils, Modoc Co.; n. to eastern Wash.

32. *L. breweri* Gray. Appressed-silvery-silky, shrubby, low, prostrate or decumbent, branched and matted, season's growth 2 to 15 cm. long; leaves crowded basally or scattered along the stem, leaflets 7 to 10, 5 to 20 mm. long; racemes densely flowered, 3 to 5 cm. long; flowers 7 to 10 mm. long, sometimes scattered, bracts deciduous, pedicels 1 to 3 mm. long; petals violet, banner obovate to suborbicular, center yellowish or white, back glabrous or pubescent near middle, keel straight on upper edges where non-ciliate or with a few cilia; pods about 12 mm. long, ovules 3 or 4, seeds flesh-color, marked with olive-brown.—Rocky mountain tops: San Bernardino Mts.; Mt. Pinos; Sierra Nevada; n. to southern Ore. (Ashland Butte). Var. *PARVULUS* C. P. Sm. Stems as in the species; flowers 5 to 7 mm. long; racemes usually subcapitate, little exceeding the foliage.—Sierra Co. (Gold Lake, Hall & Babcock 4507, type) to Ventura Co. Var. *BRYOIDES* C. P. Sm. Stems of season barely 1 cm. long; petioles about 1 cm. long; leaflets about 5 mm. long; flowers 4 to 6 mm. long; whole plant suggesting a congested mass of coarse moss.—Tulare Co. (Olancho Mt., Hall & Babcock 5247, type); Ventura Co. Var. *GRANDIFLORUS* C. P. Sm. Stems very short, about 1 cm., leaves crowded at the base, petioles 4 to 6 cm. long; flowers scattered, 11 to 12 mm. long, the banner more reflexed than usual for this species, raceme exceeding the foliage.—Mono Craters, Mono Co. (R. S. Ferris 1463).

33. *L. meionanthus* Gray. Densely subappressed-silky, woody at base only, erect or ascending, 3 to 6 dm. tall; leaves all short-petioled, leaflets 6 to 9, silky both sides, 12 to 20 mm. long; racemes densely flowered; flowers about 6 mm. long, pedicels 3 mm., subappressed-pubescent; petals blue or lilac, banner glabrous, suborbicular, yellow in the center, keel ciliate on upper edges, the acumen short, broad, and obtuse, fruit not seen.—Mountain forests, Madera Co. to Plumas Co.; Mt. Rose, Nev.

34. *L. laxiflorus* Dougl. var. *calcaratus* C. P. Sm. Appressed-pubescent, hardly silky, erect or ascending, 3 to 8 dm. tall; leaves cauline, lower long-petioled, subsericeous or glabrate above, leaflets 7 to 9, 3 to 4 cm. long; racemes 8 to 18 cm. long, compact or loose; flowers 11 to 14 mm. long, bracts early deciduous, pedicels 4 to 8 mm. long; calyx-cup distinctly spurred above, the spur 1 to 3 mm. long, often only the lower lip green, upper lip broad, notched, largely or entirely exposed, lower narrow; petals blue, rose, or pale yellow, banner long-clawed, more or less pubescent near middle of back, wings pubescent on sides near upper distal angle, keel ciliate on upper

edges of acumen; pods 25 mm. long, ovules 4 to 6, seeds reddish-brown or paler, obscurely mottled.—Open hillsides, east of the Sierra Nevada divide in Eldorado, Placer and Modoc Cos.; n. to southern Ida., e. to western Utah. (*L. calcaratus* Kell. *L. multinctus* A. Nels. *L. variegatus* Hel.) Var. *SILVICOLA* C. P. Sm. Calyx spur scarcely 1 mm. long; flowers only 8 to 9 mm. long; petals mostly blue, violet tinged.—Open forests, Mariposa Co. to Siskiyou Co.; n. to southern Ore. (*L. silvicola* Hel.) Var. *COGNATUS* C. P. Sm. Like the last, but flowers 10 to 13 mm. long and upper calyx-lip largely concealed by the reflexed sides of the broad short-clawed banner.—San Gabriel Mts.; Modoc Co.; n. to eastern Ore. (Wallowa Mts., Ore., Cusick 3187, type).

35. *L. gracilentus* Greene. Glabrate, some 6 dm. tall, slender throughout; petioles 5 to 12 cm. long, leaflets about 7, linear-falcate, 4 to 6 cm. long; racemes 6 to 12 cm.; flowers 8 to 10 mm. long, in 4 to 6 distinct whorls, pedicels 2 to 3 mm. long, appressed-pubescent; calyx-cup not spurred; petals blue, banner and wings glabrous, keel falcate, acumen with a few cilia on upper margins; ovules 7 to 8, pods and seeds not seen.—Tuolumne Cañon. Seemingly a fair species, though known only from the type collection.

36. *L. onustus* Wats. Sparsely appressed-silky, slender, decumbent, 15 to 21 cm. tall; leaves long-petioled, appressed-silky below, glabrous above, leaflets 5 to 8, 25 to 40 mm. long; racemes few-flowered; flowers 8 to 11 mm. long, scattered, bracts short, deciduous, pedicels appressed-pubescent, about 3 mm. long; calyx-cup not spurred; petals deep blue, banner and wings glabrous, keel nearly straight, ciliate on upper edges; pods 35 to 40 mm. long by 12 wide, subsilky, ovules 5 or 6, seeds brown.—Open pine woods, Plumas, Lassen and Siskiyou Cos. (*L. pinetorum* Jones. *L. violaceus* Hel.)

37. *L. ludovicianus* Greene. Densely woolly-pubescent and villous throughout, except the petals, almost woody at base, erect, 3 to 6 dm. tall; leaves velvety-woolly both sides, petioles 6 to 10 cm. long, leaflets 4 to 8, cuneate or spatulate; flowers 10 to 12 mm. long, whorled, pedicels 3 mm. long; calyx not gibbous; petals purplish, darkest in center of banner, apex of which is not much reflexed from wings, keel nearly straight on upper margins where distinctly ciliate; pods densely appressed-pubescent, 20 to 25 mm. long by 5 to 7 wide, ovules 5 to 7, seeds grayish-yellow, obscurely marked, or heavily mottled.—Dry soil, San Luis Obispo Co.

38. *L. caudatus* Kell. Densely appressed-silky or -satiny, subdecumbent to erect, 2 to 5 dm. tall; lower leaves long-petioled, densely silvery both sides, leaflets 5 to 7, 2 to 3 cm. long; flowers 10 to 14 mm. long, scattered or subverticillate, pedicels 3 to 4 mm. long, appressed-pubescent; calyx with a spur about 1 mm. long; petals violet-blue, banner silky on the back, wings glabrous, keel ciliate on the upper edges; pods about 3 cm. long, silky, ovules 5 or 6, seeds reddish-brown to flesh-pink.—Open dry soils, foothills, e. side Sierra Nevada from Mono Co. to Modoc Co.; w. Nev., e. Ore. and adjacent Ida. (*L. argentinus* Rydb.)

39. *L. inyoensis* Hel. Much like the last, but pubescence of stems and pedicels spreading and few or no long-petioled lower leaves at flowering time; flowers 12 to 14 mm. long, banner usually glabrous on the back, as wide as long, wings glabrous, keel ciliate.—Foothills, w. Inyo Co. Var. *ERIOCALYX* C. P. Sm. Plants 10 to 30 cm. tall; racemes 4 to 8 cm. long, compact; pedicels 1 to 2 mm. long, flowers 10 to 11 mm. long; calyx woolly-villous; banner woolly-pubescent on the back.—Dry soil, high Sierra Nevada from Madera Co. to Inyo Co. (e. of the Minarets, J. W. Congdon, type).

40. *L. corymbosus* Hel. Sparsely appressed-pubescent, erect, branched above, 3 to 6 dm. tall; leaves short-petioled, glabrate above, more or less silvery-silky below, leaflets 5 to 7; flowers 10 to 13 mm. long, scattered or subverticillate, pedicels 3 to 6 mm. long, appressed-pubescent; petals cream-colored, lilac, or blue, banner glabrous or slightly pubescent on the back, 9 to 12 mm. wide, wings glabrous, keel ciliate or non-ciliate, the acumen much-upturned; pods appressed-silky, 20 to 25 by 5 mm., ovules 2 to 4, seeds pale or dark flesh-colored, mostly unmarked.—Dry soils, Siskiyou Co.; Nev. to e. Ore. and s. Ida.

41. *L. polyphyllus* Lindl. Minutely appressed- or spreading-pubescent. erect, stout and fistulose, 3 to 10 dm. tall; leaves mostly long-petioled. glabrous or minutely hairy above, leaflets 10 to 17, 7 to 15 cm. long, 15 to 30 mm. wide; racemes 15 to 60 cm. long; flowers 12 to 14 mm. long, usually not crowded, more or less whorled, bracts early deciduous, pedicels 5 to 9 mm. long, usually appressed-pubescent; petals blue, purple, reddish, or yellowish, glabrous, keel falcate, non-ciliate; pods dark brown, loosely hairy. 25 to 40 mm. long, ovules 5 to 9, seeds 4 mm. long, variously marked.—Moist soil, Lake Co.; n. to B. C. Var. *GRANDIFOLIUS* C. P. Sm. Stems more or less villous; racemes compact; pedicels stouter, 6 to 9 mm. long, densely spreading-pubescent.—Near the coast from Mt. Hermon and New Years Point to Sonoma Co. (*L. grandifolius* Lindl. *L. magnus* Greene.)

42. *L. superbus* Hel. Similar to no. 41, but leaflets 5 to 9, usually not over 8 cm. long; racemes 15 to 20 cm. long, densely-flowered; flowers 10 to 12 mm. long; ovules 7 or 8. — Meadows near Bishop, Inyo Co. Var. *ELONGATUS* C. P. Sm. Fig. 521. Flowers larger, 12 to 15 mm. long, and scattered or in lax verticils.—Wet soil near streams in the Sierra Nevada from Tulare Co. to Modoc Co.; w. Nev. (*L. burkei* Wats. in part. *L. elongatus* Greene.) Var. *BERNARDINUS* Abrams. Flowers smaller, only 8 to 11 mm. long, usually scattered in loose racemes. — Wet soil near streams, San Bernardino Mts. (Deep Creek, Abrams & McGregor 733, type) to Butte Co.

521. *Lupinus superbus* var. *elongatus* C. P. Sm.; a, fl. stem  $\times \frac{1}{4}$ ; b, banner  $\times 1$ ; c, wing  $\times 1$ ; d, keel  $\times 1$ ; e, pod  $\times \frac{1}{2}$ .

43. *L. albicaulis* Dougl. Thinly appressed-pubescent, rather stout, branched above, 5 to 9 dm. tall; leaves cauline, short-petioled, leaflets 5 to 9, thinly appressed-hairy both sides; flowers 12 to 16 mm. long, not crowded, pedicels spreading-pubescent, 4 to 6 mm. long; petals purple to dirty-white, fading brown, all narrow, banner lance-ovate, acute at apex, keel much curved, non-ciliate, much exposed; pods 3 to 4 cm. long, 8 to 10 mm. wide, ovules about 6, seeds compressed, about 4 mm. long, gray-mottled.—Open dry or moist soil, Nevada Co. to Shasta and Siski-

you Cos.; n. to western Wash. (*L. falcifer* Nutt.) Var. *SHASTENSIS* C. P. Sm. More slender, the flowers only 8 to 10 mm. long.—Siskiyou Co.; s. Ore. (*L. shastensis* Hel.)

44. *L. andersøni* Wats. Much like no. 43, but banner and wings much broader, the keel little or not at all exposed; banner obtuse or rounded at apex, keel arcuate, non-ciliate, petals blue, purplish, or yellowish; flowers 10 to 13 mm. long.—San Bernardino Mts.; Sierra Nevada from Tulare Co. to Siskiyou Co.; w. Nev.; s. Ore. Var. *APERTUS* C. P. Sm. Stems 2 to 4 dm. tall, usually unbranched or with sterile branchlets, foliage greener; banner more or less pubescent near apex, dorsally.—Placer and Nevada Cos. near Donner Lake. (*L. apertus* Hel.) Var. *FULCRATUS* C. P. Sm. Branched or unbranched, 3 to 8 dm. tall; stipules green and leaflike, lanceolate, oblanceolate, elliptic, or oval, the stipules being linear or subulate in the species.—Sierra Nevada forests from Fresno Co. to Eldorado Co. (*L. fulcratus* and *L. fraxinetorum* Greene.)

45. *L. sylvestris* Drew. Much like *L. andersoni*, but flowers larger, 14 to 16 mm. long, petals all pale yellow, keel usually stouter, and less curved, the acumen shorter in proportion; ovules 4 or 5, seeds about 7 mm. long, flesh-pink, minutely speckled with olive-drab.—South Fork Mt.; Salmon Mts.; Mt. Eddy. (*L. albicaulis* var. *silvestris* Greene. *L. elmeri* Greene.)

46. *L. formosus* Greene. Silky-pubescent, decumbent to erect, 3 to 8 dm. tall; leaflets 7 to 9, densely pubescent above; flowers usually whorled, 12 to 16 mm. long, pedicels spreading-pubescent, 3 to 4 mm. long; petals rich purple, blue, lilac, or white, banner 11 to 14 mm. wide, keel usually slender and much curved, non-ciliate; pods silky, 30 to 35 mm. long, ovules 5 to 7, seeds mottled with gray or brown.—Open fields and woods, valleys or hills, Plumas, Shasta and Mendocino Cos. to San Diego Co. (*L. proximus* Hel.) Var. *BRIDGESI* Greene. Differing only in having many spreading hairs; stems 2 to 4 mm. thick; petioles 30 to 60 mm. long; flowers 14 to 16 mm. long; banner strictly glabrous.—Same range as the species. (*L. albicaulis* var. *bridgesii* Wats. *L. bridgesii* and *greenii* Hel.) Var. *ROBUSTUS* C. P. Sm. Stems stouter, 6 to 7 mm. thick; flowers 16 to 18 mm. long; lower calyx-lip 12 to 14 mm. long; banner oblong, 15 to 18 mm. long.—Valley fields, Colusa Co. (College City, Heller & Brown 5573, type) to Fresno Co. Var. *CLEMENSÆ* C. P. Sm. More or less villous, simple or with sterile foliaceous branches, 2 to 4 dm. tall; leaflets loosely pubescent above, petioles only 15 to 20 mm. long; flowers 10 to 14 mm. long, banner often pubescent on the back.—Hillsides, Plumas Co. (Greenville, Mary S. Clemens, type). Var. *HYACINTHINUS* C. P. Sm. Pubescence thinner and leaves decidedly greenish, hardly silky, 6 to 12 dm. tall; lower calyx-lip about 10 mm. long; banner 14 to 18 mm. wide, blue or purplish with yellow center.—San Gabriel and San Jacinto Mts. (*L. hyacinthinus* Greene.) Var. *ELATUS* C. P. Sm. Erect, branched above, 5 to 9 dm. tall; leaflets silvery-silky above, duller below; flowers 10 to 14 mm. long, banner sometimes pubescent near middle of back.—Under pines, San Antonio Mts. and San Bernardino Mts. (*L. elatus* Jtn.)

47. *L. adsurgens* Drew. Much like typical *L. formosus*, but flowers smaller, 9 to 12 mm. long, the petals pale yellow, lilac, or blue, the banner 6 to 8 mm. wide, not much reflexed from upper margin of wings; root large and woody.—Higher mountain slopes, inner Coast Ranges from Mt. Hamilton n. to Cascades of Ore. (*L. pendeltoni* Hel. *L. gormanii* Piper.) Var. *LILACINUS* Hel. Pubescence more spreading, hardly silky; pedicels stouter, 4 to 6 mm. long; flowers 12 to 14 mm. long; banner 10 to 11 mm. wide, wings much exceeding keel, petals pale lilac.—Glenn Co. (Heller 11,945, type). Var. *UNDULATUS* C. P. Sm. Differing from var. *lilacinus* in wings not exceeding keel and banner with undulate margin.—Yosemite to Tuolumne Grove (Eastwood 13, type).

48. *L. barbatus* (Henderson) Hel. Glabrate or sparsely villous, stout, fistulous, usually unbranched, 6 to 9 dm. tall; leaves short-petioled, glabrous above, sparsely subvillous below, stipules long and conspicuously villous, leaflets 6 to 9, oblanceolate, mostly obtuse; racemes 12 to 18 cm. long; flowers 8 to 10 mm. long, scattered or subverticillate, pedicels 2 to 4 mm. long, glabrate, bracts villous, exceeding buds, deciduous; petals lilac or yellowish, keel arcuate, ciliate on upper edges from middle to near claws.—Modoc Co.; s. Ore. (*L. ligulatus barbatus* Henderson.)

49. *L. viridifolius* Hel. Glabrate to sparsely appressed-pubescent, slender or stoutish and more or less fistulous below, much branched above, 6 to 10 dm. tall; leaves short-petioled, glabrous above, sparsely appressed-hairy beneath, stipules short and inconspicuous, leaflets 6 to 8, bright green oblanceolate, acutish; racemes 6 to 10 cm. long; flowers 8 to 11 mm. long, scattered or subverticillate, pedicels 2 to 4 mm. long, appressed-pubescent, bracts short, villous, early deciduous; petals pale violet-blue, keel more or less curved, ciliate as in the last; pods blackish, silky, about 20 mm. long, ovules about 7.—Wooded slopes, Shasta Co.; s. Ore.

50. *L. latifolius* Agardh. Glabrate or minutely appressed-pubescent, rarely with some spreading hairs, usually branched above, 6 to 12 dm. tall; long-

petioled lower leaves usually withered by flowering time, the middle leaves largest, petioles and leaflets 4 to 10 cm. long, the latter mostly acute, 5 to 8 in number; racemes 15 to 45 cm. long, rather lax; flowers 10 to 14 mm. long, verticillate or scattered, bracts early deciduous, pedicels 6 to 12 mm. long, spreading-pubescent; petals blue or purple, rarely yellowish, fading brown, keel somewhat exposed, arcuate, ciliate on upper edges from middle to claws; pods dark brown, about 3 cm. long, ovules 7 to 10, seeds mottled with dark brown.—Open woods and thickets, cañons or hillsides: common in the Coast Ranges from Humboldt Co. to Los Angeles Co., occasional in the Sierra Nevada. Var. *DUDLEYI* C. P. Sm. Densely villous with long spreading hairs; stems decumbent at base, 30 to 40 cm. tall; flowers 14 to 16 mm. long.—Montara Mts., San Mateo Co. Var. *PARISHI* C. P. Sm. Stoutier and taller, 9 to 15 dm.; flowers 14 to 18 mm. long; keel ciliation longer and denser; seeds often larger, pale and obscurely marked.—Cañons of the Sierra Nevada from Butte Co. s.; s. to San Diego Co.; rare northward, reaching the Coast Ranges only in S. Cal. (near Parris Hill, San Bernardino Co., S. B. Parish 11,302, type). Var. *LONGIPES* (Greene) C. P. Sm. Stoutish, striate, lower, hardly fistulose; leaves mostly basal, persistent at flowering time, with petioles 30 to 50 cm. long; racemes lax; flowers 12 to 14 mm. long; keel ciliate; seeds brown with a dark diagonal line.—Moist soil, evidently not common, Fresno Co. and n. to southern Oregon. (*L. longipes* Greene.) Var. *COLUMBIANUS* (Hel.) C. P. Sm. Wing petals broader, outcurved on the lower free edges, covering all or most of the keel; plants 3 to 24 dm. tall; flowers 10 to 14 mm. long.—Mountain sides and along streams, only in the Sierra Nevada from Mariposa Co. n.; n. to Wash. (*L. confusus* Hel., not Rose. *L. columbianus* Hel.)

51. *L. tidiestromii* Greene. Densely appressed-pubescent, unbranched, decumbent, stems slender, 10 to 30 cm. long, roots bright yellow; leaves short-petioled, scattered, silvery-silky both sides, leaflets commonly 3, sometimes 4 or 5; verticils 1 to 5; flowers 11 to 13 mm. long, bracts early deciduous, pedicels slender, 3 to 5 mm. long, spreading-pubescent; petals blue, banner glabrous, the white or yellow center turning violet, keel arcuate, ciliate above; pods 20 to 25 mm. long by 4 to 6 mm. wide, succulent and terete when green, flat and yellow when dry, ovules 5 to 8, seeds dotted or marbled with black.—Sand dunes near Pacific Grove.

52. *L. littoralis* Dougl. Appressed-silky and more or less villous, especially at the nodes, stems decumbent, slender, simple or branched, 10 to 40 cm. long, roots bright yellow; leaves usually short-petioled, leaflets 5 to 9, appressed-pubescent both sides, yet greenish; flowers 10 to 14 mm. long, verticillate or nearly so, bracts early deciduous, pedicels 3 to 6 mm. long, spreading-pubescent; petals blue, fading brownish, banner glabrous, keel arcuate, ciliate above; pods slender, about 30 mm. long by 5 to 6 mm. wide, dark brown, appressed-pubescent, ovules 9 to 14, seeds linear-oblong, mottled with brown or black.—Coastal sands, Del Norte Co.; n. to B. C.

53. *L. varicolor* Steud. Appressed-subsilky and more or less villous, the nodes and internodes equally hairy, greenish, stems usually branched, slender, decumbent or prostrate, 2 to 3 mm. thick, 2 to 8 dm. long; leaves usually long-petioled, appressed-pubescent or glabrate above, leaflets 7 to 9; flowers 11 to 16 mm. long, verticillate, bracts early deciduous, pedicels 4 to 6 mm. long, appressed- or spreading-pubescent; petals yellow, whitish, pinkish, bluish, or purple, the glabrous banner commonly paler than the wings, keel arcuate, ciliate above; pods 25 to 35 mm. long by 7 to 10 wide, dark brown, loosely- or appressed-pubescent, ovules 7 to 9, seeds mottled; roots not bright yellow.—Grassy fields and slopes near the coast, Monterey Co. to Humboldt Co. (*L. versicolor* Lindl., not Sweet. *L. franciscanus* and *micheneri* Greene.)

54. *L. rivularis* Dougl. Appressed-subsilky and more or less villous, green, stems simple or branched, usually ascending or erect, but sometimes decumbent, often fistulose, 4 to 10 or more mm. thick, 3 to 9 dm. tall; leaves short-petioled, not crowded, leaflets 5 to 9, sparsely appressed-pubescent below, becoming glabrous above in age; flowers 12 to 16 mm. long, verticillate more or less, bracts early deciduous, pedicels 4 to 10 mm. long, spreading- or rarely

appressed-pubescent; petals blue or variegated, banner glabrous, usually with the apical portion yellow, keel arcuate, ciliate above; pods 3 to 5 cm. long by 6 to 10 mm. wide, dull yellow and dark brown, subappressed-hairy, ovules 8 to 12, seeds mottled, usually with prominent lateral lines.—Sandy or gravelly soil along or near streams, coastwise, Mendocino Co. and n. to western Wash. (*L. lignipes* Hel.)

55. *L. arboreus* Sims. Appressed-pubescent to glabrate, rarely villous, branching shrub with a distinct trunk or rarely low and caespitose, 4 to 24 dm. tall; leaves short-petioled, leaflets 6 to 11, appressed-pubescent both sides or glabrate above; racemes 10 to 30 cm. long; flowers 14 to 18 mm. long, scattered or whorled, bracts early deciduous, pedicels 6 to 10 mm. long, spreading-pubescent; petals broad, commonly bright yellow, but sometimes lilac, blue, or violet, banner glabrous, keel curved, ciliate along upper edges; pods dark brown, appressed-pubescent, 5 to 8 cm. long by 8 to 12 mm. wide, ovules 8 to 12, seeds oblong, dark brown, unmarked or obscurely mottled, but with a pair of pale spots enclosing the micropyle.—Coastal sands and cañons, Humboldt Co. to Santa Barbara Co. (*L. propinquus* Greene.) Var. *EXIMIUS* C. P. Sm. More or less villous, internodes of season's growth much shortened; leaves and flowers crowded; racemes usually only 5 to 10 cm. long; wings blue, banner largely yellow.—Exposed slopes near summit of Montara Mts., San Mateo Co. (*L. eximius* Davy.)

56. *L. longifolius* (Wats.) Abrams. Appressed-pubescent, greenish subsilky, erect, stout, shrubby below, branched above, 8 to 15 dm. tall; leaves mostly short-petioled, crowded, leaflets 6 to 9, equally subsilky on both sides; racemes 20 to 40 cm. long; flowers 14 to 18 mm. long, scattered or more or less whorled, bracts deciduous, pedicels 4 to 10 mm. long, spreading-pubescent; petals blue or bluish, rarely yellowish, banner glabrous, keel more or less ciliate above, somewhat curved; pods dull yellow, 4 to 6 mm. long, ovules 6 to 8, seeds gray, variously mottled and with dark brown lateral lines.—Foothills and ocean bluffs, Los Angeles and San Bernardino Cos. to San Diego Co. (*L. chamissonis* var. *longifolius* Wats.)

57. *L. chamissonis* Esch. Minutely spreading-pubescent, often tomentose, erect branching shrub, 3 to 9 dm. tall; leaves short-petioled, axillary clusters well developed, petioles about 2 cm. long, leaflets 6 to 9, silky on both sides, 12 to 25 mm. long; flowers 12 to 16 mm. long, scattered or subverticillate, bracts early deciduous, long or short, pedicels 6 to 8 mm. long, spreading-pubescent; petals blue or lavender, banner with a yellow center, pubescent on the back near apex, keel arcuate, non-ciliate or nearly so; pods brown, sublanate, 30 to 35 mm. long by 8 to 10 mm. wide, ovules 6 to 7, seeds mottled or clouded with brown.—Coastal sand hills, San Francisco to Los Angeles Co. (*L. chamissonis* var. *longibracteatus* Wats.)

58. *L. albifrons* Benth. Appressed-silky, arborescent, often with a distinct woody trunk, much branched, 6 to 15 dm. tall; leaves many, the lower often long-petioled, petioles mostly longer than their leaflets, leaflets 7 to 10, oblanceolate to spatulate or obovate, acute or rounded at apex, silvery-silky on both sides; racemes 8 to 30 cm. long; flowers 10 to 14 mm. long, largely verticillate, bracts early deciduous, more or less exceeding buds, pedicels 4 to 8 mm. long, spreading-pubescent; petals blue or purplish, banner more or less pubescent on the back near the apex, with white or yellow center early changing to violet, keel ciliate above along acumen only, narrowed toward the base; pods dull yellow, 3 to 5 cm. long by about 8 mm. wide, ovules 5 to 9, seeds variously mottled or spotted and usually with a marginal line.—Hillsides and cañons, abundant in the Coast Ranges and occasional in the Sierra Nevada foothills. Var. *COLLINUS* Greene. Low and caespitose; leaves crowded basally and petioles more elongated; flowers averaging larger; keel often practically non-ciliate.—Hills, San Francisco Bay region. (*L. collinus* Hel.) Var. *DOUGLASII* C. P. Sm. Floral bracts much exceeding buds; leaflets 35 to 60 mm. long, linear-oblanceolate to oblong-oblanceolate.—Mt. Tamalpais and hillsides s. of Monterey. (*L. douglasii* Agardh. *L. fallax* Greene.) Var. *ÉMINENS* C. P. Sm. Pedicels appressed-pubescent; flowers often 16 mm. long.—Interior foothills and cañons, Butte

ciliate on upper edges above middle; pods silky, about 25 by 7 mm., ovules 4 or 5, matured seed not seen.—Peculiar to the higher peaks of n. Cal.: Mt. Shasta; Lassen Peak; Mt. Pleasant (Plumas Co.).
